  capture_dir          IN VARCHAR2,
  process_per_cpu      IN BINARY_INTEGER DEFAULT 4,
  threads_per_process  IN BINARY_INTEGER DEFAULT 50)
RETURN CLOB;
```

Parameters

Table 183-7 CALIBRATE Function Parameters

Parameter	Description
<code>capture_dir</code>	Name of the directory object that points to the (case sensitive) OS directory that contains processed capture data
<code>process_per_cpu</code>	Maximum number of processes allowed for each CPU (default is 4)
<code>threads_per_process</code>	Maximum number of threads allowed for each process (default is 50)

Return Values

Returns a `CLOB` formatted as XML that contains:

- Information about the capture
- Current database version
- Input parameters to this function
- Number of CPUs and replay clients needed to replay the given workload
- Information about the sessions captured (total number and maximum concurrency)

Usage Notes

- Prerequisite: The input workload capture was already processed using the [PROCESS_CAPTURE Procedure](#) (page 183-27) in the same database version.
- This procedure will return the same results as the workload replay client in calibrate mode, which can be run as follows.

```
$ wrc mode=calibrate replaydir=
```

183.3.7 CANCEL_REPLAY Procedure

This procedure cancels workload replay in progress. All the external replay clients (WRC) will automatically be notified to stop issuing the captured workload and exit.

Syntax

```
DBMS_WORKLOAD_REPLAY.CANCEL_REPLAY (
    error_msg    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 183-8 CANCEL_REPLAY Procedure Parameters

Parameter	Description
error_msg	An optional reason for cancelling the replay can be passed which is recorded into DBA_WORKLOAD_REPLAYS.ERROR_MESSAGE.

Usage Notes

Prerequisite: A call to the [INITIALIZE_REPLAY Procedure](#) (page 183-18), or [PREPARE_REPLAY Procedure](#) (page 183-23), or [START_REPLAY Procedure](#) (page 183-36) was already issued.

183.3.8 COMPARE_PERIOD_REPORT Procedure

This procedure generates a report comparing a replay to its capture or to another replay of the same capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_PERIOD_REPORT (
    replay_id1  IN  NUMBER,
    replay_id2  IN  NUMBER,
    format      IN  VARCHAR2,
    result      OUT CLOB );
```

Parameters

Table 183-9 COMPARE_PERIOD_REPORT Procedure Parameters

Parameter	Description
replay_id1	First ID of the workload replay whose report is requested

Table 183-9 (Cont.) COMPARE_PERIOD_REPORT Procedure Parameters

Parameter	Description
replay_id2	Second ID of the workload replay whose report is requested. If this is NULL, then the comparison is done with the capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML and DBMS_WORKLOAD_CAPTURE.TYPE_XML.
result	Output of the report (CLOB)

183.3.9 COMPARE_SQLSET_REPORT Function

This procedure generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_SQLSET_REPORT (
    replay_id1    IN NUMBER,
    replay_id2    IN NUMBER,
    format        IN VARCHAR2,
    r_level       IN VARCHAR2 DEFAULT 'ALL',
    r_sections    IN VARCHAR2 DEFAULT 'ALL',
    result        OUT CLOB )
RETURN VARCHAR2;
```

Parameters

Table 183-10 COMPARE_SQLSET_REPORT Function Parameters

Parameter	Description
replay_id1	First ID of the workload replay after a change
replay_id2	Second ID of the workload replay before a change. If this is NULL, then the comparison is done with the capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML, DBMS_WORKLOAD_CAPTURE.TYPE_XML and DBMS_WORKLOAD_CAPTURE.TYPE_TEXT.
r_level	See level parameter in the REPORT_ANALYSIS_TASK Function (page 156-8) in the DBMS_SQLPA (page 156-1) package
r_sections	See section parameter in the REPORT_ANALYSIS_TASK Function (page 156-8) in the DBMS_SQLPA (page 156-1) package
result	Output of the report (CLOB)

183.3.10 CREATE_FILTER_SET Procedure

This procedure creates a new filter set for the replays at `replay_dir`.

It includes all the replay filters that have already been added by the [ADD_FILTER Procedure](#) (page 183-5). After the procedure has completed and replay initiated, the newly-created filter set can be used to filter the replay in `replay_dir` by calling the [USE_FILTER_SET Procedure](#) (page 183-37).

Syntax

```
DBMS_WORKLOAD_REPLAY.CREATE_FILTER_SET(
    replay_dir      IN  VARCHAR2,
    filter_set      IN  VARCHAR2,
    default_action  IN  VARCHAR2 DEFAULT 'INCLUDE');
```

Parameters

Table 183-11 CREATE_FILTER_SET Procedure Parameters

Parameter	Description
<code>replay_dir</code>	Object directory of the replay to be filtered
<code>filter_set</code>	Name of the filter set to create (to use in USE_FILTER_SET Procedure (page 183-37))
<code>default_action</code>	<p>Can be either <code>INCLUDE</code> or <code>EXCLUDE</code>. Determines whether, by default, every captured call must be replayed or not. Also determines whether the workload filters specified must be considered as <code>INCLUSION</code> filters or <code>EXCLUSION</code> filters.)</p> <p>If it is <code>INCLUDE</code>, then by default all captured calls are replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the ADD_SCHEDULE_ORDERING Function (page 183-6) are treated as <code>EXCLUSION</code> filters, and will determine the workload that will not be replayed.</p> <p>If it is <code>EXCLUDE</code>, then by default no captured call to the database is replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the ADD_SCHEDULE_ORDERING Function (page 183-6) are treated as <code>INCLUSION</code> filters, and will determine the workload that is replayed.</p> <p>Default: <code>INCLUDE</code> and all the filters specified are assumed to be <code>EXCLUSION</code> filters</p>

Usage Notes

This operation must be invoked when no replay is initialized, prepared, or in progress.

183.3.11 DELETE_FILTER Procedure

This procedure deletes the named filter.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_FILTER(  
    fname      IN  VARCHAR2);
```

Parameters

Table 183-12 DELETE_FILTER Procedure Parameters

Parameter	Description
fname	(Mandatory) Name of the filter that must be deleted

183.3.12 DELETE_REPLAY_INFO Procedure

This procedure deletes the rows in `DBA_WORKLOAD_REPLAYS` that correspond to the given workload replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_REPLAY_INFO (  
    replay_id  IN  NUMBER);
```

Parameters

Table 183-13 DELETE_REPLAY_INFO Procedure Parameters

Parameter	Description
replay_id	(Mandatory) ID of the workload replay that must be deleted. Corresponds to <code>DBA_WORKLOAD_REPLAYS.ID</code>

183.3.13 END_REPLAY_SCHEDULE Procedure

This procedure wraps up the creation of the current schedule. The schedule is now saved and associated with the replay directory and can be used for a replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.END_REPLAY_SCHEDULE;
```

Usage Notes

The [BEGIN_REPLAY_SCHEDULE Procedure](#) (page 183-7) must have already been called.

183.3.14 EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a stipulated replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.EXPORT_AWR (
    replay_id    IN NUMBER);
```

Parameters

Table 183-14 EXPORT_AWR Function Parameters

Parameter	Description
replay_id	(Mandatory) ID of the replay whose AWR snapshots are to be exported

Usage Notes

- At the end of each replay, the corresponding AWR snapshots are automatically exported. Consequently, there is no need to do this manually after a workload replay is complete, unless the automatic `EXPORT_AWR` invocation failed.
- This procedure will work only if the corresponding workload replay was performed in the current database (meaning that the corresponding row in `DBA_WORKLOAD_REPLAYS` was not created by calling the [GET_REPLAY_INFO Function](#) (page 183-15)) and the AWR snapshots that correspond to that replay time period are still available.

183.3.15 GENERATE_CAPTURE_SUBSET Procedure

This procedure creates a new capture from an existing workload capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.GENERATE_CAPTURE_SUBSET (
    input_capture_dir    IN  VARCHAR2,
    output_capture_dir   IN  VARCHAR2,
    new_capture_name     IN  VARCHAR2,
    begin_time           IN  NUMBER,
    begin_include_incomplete IN  BOOLEAN DEFAULT TRUE,
    end_time             IN  NUMBER,
    end_include_incomplete IN  BOOLEAN DEFAULT FALSE,
    parallel_level       IN  NUMBER DEFAULT NULL);
```

Parameters

Table 183-15 GENERATE_CAPTURE_SUBSET Procedure Parameters

Parameter	Description
input_capture_dir	(Mandatory) Name of the directory object that points to an existing workload capture

Table 183-15 (Cont.) GENERATE_CAPTURE_SUBSET Procedure Parameters

Parameter	Description
output_capture_dir	(Mandatory) Name of the directory object that points to the new capture
new_capture_name	(Mandatory) Name of new capture
begin_time	Start of the time range - time offset in seconds from the start of a workload capture
begin_include_incomplete	Column to include incomplete calls caused by begin_time
end_time	End of the time range - time offset in seconds from the start of a workload capture. If end_time is zero or end_time is less or equal than begin_time, the time range is invalid. The new capture will use the whole duration of the input capture.
end_include_incomplete	Column to include incomplete calls caused by end_time
parallel_level	Number of Oracle processes used to process the input captures in a parallel fashion. The NULL default value will auto-compute the parallelism level based on number of CPUs, whereas a value of 1 will enforce serial execution.

183.3.16 GET_DIVERGING_STATEMENT Function

This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_DIVERGING_STATEMENT (
    replay_id    IN NUMBER,
    stream_id    IN NUMBER,
    call_counter IN NUMBER)
RETURN CLOB;
```

Parameters

Table 183-16 GET_DIVERGING_STATEMENT Function Parameters

Parameter	Description
replay_id	ID of the replay in which that call diverged
stream_id	Stream ID of the diverging call
call_counter	Call counter of the diverging call

Usage Notes

- Returns a CLOB formatted as XML that contains:
 - SQL ID
 - SQL Text
 - Bind information: position, name and value

- This function will silently invoke the [POPULATE_DIVERGENCE Procedure](#) (page 183-20) to read the information from the capture files. Therefore, if divergence has not been populated, then the first call to this function for a particular diverging call might take longer, especially in very large captures.

183.3.17 GET_REPLAY_DIRECTORY Function

This function returns the current replay directory set by the SET_REPLAY_DIRECTORY Procedure. It returns NULL if no replay directory has been set.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_DIRECTORY
RETURN VARCHAR2;
```

Related Topics:

- [SET_REPLAY_DIRECTORY Procedure](#) (page 183-33)
This procedure sets a directory that contains multiple workload captures as the current replay directory.

183.3.18 GET_REPLAY_INFO Function

This function retrieves information about the workload capture and the history of all the workload replay attempts from the stipulated directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO (
    replay_dir    IN VARCHAR2,
    load_details  IN BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

Parameters

Table 183-17 GET_REPLAY_INFO Function Parameters

Parameter	Description
replay_dir	(Mandatory) Name of the workload replay directory object (case sensitive).
load_details	Load the divergence and tracked commits data. The default value is FALSE.

Return Values

The procedure returns the CAPTURE_ID, which can be associated with both DBA_WORKLOAD_CAPTURES.ID and DBA_WORKLOAD_REPLAYS.CAPTURE_ID to access the imported information.

Usage Notes

- The procedure first imports a row into DBA_WORKLOAD_CAPTURES which will contain information about the capture. It then imports a row for every replay attempt retrieved from the given replay directory into DBA_WORKLOAD_REPLAYS.

- The procedure will not insert new rows to `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_REPLAYS` if these views already contain rows describing the capture and replay history present in the given directory.

183.3.19 GET_REPLAY_TIMEOUT Procedure

This procedure gets the replay timeout setting.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_TIMEOUT (
  enabled      OUT  BOOLEAN,
  min_delay    OUT  NUMBER,
  max_delay    OUT  NUMBER,
  delay_factor OUT  NUMBER);
```

Parameters

Table 183-18 GET_REPLAY_TIMEOUT Procedure Parameters

Parameter	Description
<code>enabled</code>	TRUE if the timeout action is enabled, FALSE otherwise.
<code>min_delay</code>	Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than <code>min_delay</code> .
<code>max_delay</code>	Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than <code>max_delay</code> .
<code>delay_factor</code>	Factor for the call delay that is between <code>min_delay</code> and <code>max_delay</code> . The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and <code>delay_factor</code> .

Usage Notes

This procedure can be called anytime during replay.

183.3.20 IMPORT_AWR Function

This procedure imports the AWR snapshots from a given replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.IMPORT_AWR (
  replay_id      IN  NUMBER,
  staging_schema IN  VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 183-19 IMPORT_AWR Function Parameters

Parameter	Description
replay_id	(Mandatory) ID of the replay whose AWR snapshots must be imported
staging_schema	(Mandatory) Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the replay directory to the SYS AWR schema. The SYS schema is not a valid input.

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_REPLAYS view.

Usage Notes

- This procedure will work provided those AWR snapshots were exported earlier from the original replay system using the [EXPORT_AWR Procedure](#) (page 183-13).
- IMPORT_AWR will fail if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM\$_SNAPSHOT or WRH\$_PARAMETER. Drop any such tables in the staging_schema before invoking IMPORT_AWR.

183.3.21 INITIALIZE_CONSOLIDATED_REPLAY Procedure

This procedure puts the database state in INIT for a multiple-capture replay.

It uses the replay_dir which has already been defined by the [SET_REPLAY_DIRECTORY Procedure](#) (page 183-33), pointing to a directory that contains all the capture directories involved in the schedule. It reads data about schedule schedule_name from the directory, and loads required connection data into the replay system.

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_CONSOLIDATED_REPLAY (
    replay_name      IN    VARCHAR2,
    schedule_name    IN    VARCHAR2,
    plsqli_mode      IN    VARCHAR2 DEFAULT 'TOP_LEVEL');
```

Parameters

Table 183-20 INITIALIZE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
replay_name	(Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.

Table 183-20 (Cont.) INITIALIZE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
schedule_name	Name of the schedule to be replayed. It must have been created through the BEGIN_REPLAY_SCHEDULE Procedure (page 183-7) for the replay directory <code>replay_dir</code> .
plsql_mode	Specifies the replay options for PL/SQL calls: <ul style="list-style-type: none"> • <code>TOP_LEVEL</code> — only top-level PL/SQL calls are replayed • <code>EXTENDED</code> — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in <code>'EXTENDED'</code> PL/SQL mode.

Usage Notes

Prerequisites:

- Workload capture was already processed using the [PROCESS_CAPTURE Procedure](#) (page 183-27) in the same database version.
- Database state has been logically restored to what it was at the beginning of the original workload capture.
- The [SET_REPLAY_DIRECTORY Procedure](#) (page 183-33) has been called.

183.3.22 INITIALIZE_REPLAY Procedure

This procedure puts the database state in `INIT` for `REPLAY` mode, and loads data into the replay system that is required before preparing for the replay (by executing the `PAUSE_REPLAY Procedure`).

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY (
    replay_name      IN  VARCHAR2,
    replay_dir       IN  VARCHAR2,
    plsql_mode       IN  VARCHAR2 DEFAULT 'TOP_LEVEL',
    rac_inst_list    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 183-21 INITIALIZE_REPLAY Procedure Parameters

Parameter	Description
replay_name	(Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.
replay_dir	Name of the directory object that points to the OS directory (case sensitive) that contains processed capture data

Table 183-21 (Cont.) INITIALIZE_REPLAY Procedure Parameters

Parameter	Description
plsql_mode	Specifies the replay options for PL/SQL calls: <ul style="list-style-type: none"> • <code>TOP_LEVEL</code> — only top-level PL/SQL calls are replayed • <code>EXTENDED</code> — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in 'EXTENDED' PL/SQL mode.
rac_inst_list	Specifies a list of Oracle Real Application Clusters (Oracle RAC) instances that will be used for replay. The parameter is a string of instance numbers that are separated by commas. For example: <code>rac_inst_list='1,3,5'</code>

Usage Notes

- Prerequisites:
 - Workload capture was already processed using the [PROCESS_CAPTURE Procedure](#) (page 183-27) in the same database version.
 - Database state has been logically restored to what it was at the beginning of the original workload capture.
- The subprogram loads data into the replay system that is required before preparing for the replay by calling the `PAUSE_REPLAY` Procedure.

For instance, during capture the user may record the connection string each session used to connect to the server. The `INITIALIZE_REPLAY` Procedure loads this data and allows the user to re-map the recorded connection string to new connection strings or service points.

Elaborating on the example described in the `PROCESS_CAPTURE` Procedure, the user could invoke the following:

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY('replay foo #1', 'rec_dir');
```

This command will load up the connection map and by default will set all replay time connection strings to be equal to `NULL`. A `NULL` replay time connection string means that the workload replay clients (WRCs) will connect to the default host as determined by the replay client's runtime environment settings. The user can change a particular connection string to a new one (or a new service point) for replay by using the `REMAP_CONNECTION` Procedure.

Related Topics:

- [PAUSE_REPLAY Procedure](#) (page 183-20)
This procedure pauses the in-progress workload replay.
- [INITIALIZE_REPLAY Procedure](#) (page 183-18)
This procedure puts the database state in `INIT` for `REPLAY` mode, and loads data into the replay system that is required before preparing for the replay (by executing the `PAUSE_REPLAY` Procedure).
- [PROCESS_CAPTURE Procedure](#) (page 183-27)
This procedure processes the workload capture found in `capture_dir` in place.

- [REMAP_CONNECTION Procedure](#) (page 183-29)
This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

183.3.23 IS_REPLAY_PAUSED Function

This function reports whether the replay is currently paused.

Syntax

```
DBMS_WORKLOAD_REPLAY.IS_REPLAY_PAUSED
RETURN BOOLEAN;
```

Return Values

Returns `TRUE` if the [PAUSE_REPLAY Procedure](#) (page 183-20) has been called successfully and the [RESUME_REPLAY Procedure](#) (page 183-31) has not been called yet.

Usage Notes

A call to the [START_REPLAY Procedure](#) (page 183-36) must have already been issued as a prerequisite.

183.3.24 PAUSE_REPLAY Procedure

This procedure pauses the in-progress workload replay.

All subsequent user calls from the replay clients will be stalled until either a call to the [RESUME_REPLAY Procedure](#) (page 183-31) is issued or the replay is cancelled.

Syntax

```
DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY;
```

Usage Notes

- Prerequisite: A call to the [START_REPLAY Procedure](#) (page 183-36) must have already been issued.
- User calls that were already in-progress when this procedure was invoked are allowed to run to completion. Only subsequent user calls, when issued, are paused.

183.3.25 POPULATE_DIVERGENCE Procedure

This procedure precomputes the divergence information for the given call, stream, or the whole replay so that the `GET_DIVERGING_STATEMENT` Function returns as quickly as possible for the precomputed calls.

Syntax

```
DBMS_WORKLOAD_REPLAY.POPULATE_DIVERGENCE (
    replay_id    IN    NUMBER,
    stream_id    IN    NUMBER DEFAULT NULL,
    call_counter IN    NUMBER DEFAULT NULL);
```

Parameters

Table 183-22 POPULATE_DIVERGENCE Procedure Parameters

Parameter	Description
replay_id	ID of the replay
stream_id	Stream ID of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given replay.
call_counter	Call counter of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given stream.

Related Topics:

- [GET_DIVERGING_STATEMENT Function](#) (page 183-14)
This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

183.3.26 PREPARE_CONSOLIDATED_REPLAY Procedure

Similar to the `PREPARE_REPLAY` Procedure, this procedure puts the database in a special "Prepare" mode for a multiple-capture replay. The difference is that this subprogram should be used only for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
    synchronization          IN BOOLEAN,
    connect_time_scale       IN NUMBER    DEFAULT 100,
    think_time_scale         IN NUMBER    DEFAULT 100,
    think_time_auto_correct  IN BOOLEAN   DEFAULT TRUE,
    capture_sts              IN BOOLEAN   DEFAULT FALSE,
    sts_cap_interval         IN NUMBER    DEFAULT 300);

DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
    synchronization          IN VARCHAR2  DEFAULT 'OBJECT_ID' , ,
    connect_time_scale       IN NUMBER    DEFAULT 100,
    think_time_scale         IN NUMBER    DEFAULT 100,
    think_time_auto_correct  IN BOOLEAN   DEFAULT TRUE,
    capture_sts              IN BOOLEAN   DEFAULT FALSE,
    sts_cap_interval         IN NUMBER    DEFAULT 300);
```

Parameters

Table 183-23 PREPARE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
synchronization	<p>Sets the synchronization mode for replay:</p> <ul style="list-style-type: none"> 'TIME' — The synchronization will be based on the time the action took place during capture (clock-based time). 'SCN' — The synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. 'OBJECT_ID' — Every replayed action will be executed only <i>after</i> the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. <p>This value is deprecated.</p> <p>For compatibility, an overloaded version of this procedure uses BOOLEAN for this parameter:</p> <ul style="list-style-type: none"> TRUE means 'SCN' FALSE means 'TIME'
connect_time_scale	<p>Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 183-1 (page 183-26)".</p>
think_time_scale	<p>Scales the time elapsed between two successive user calls "Example 183-1 (page 183-26)" from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 183-2 (page 183-26)".</p>
think_time_auto_correct	<p>Auto corrects the think time between calls appropriately when user calls takes longer to complete during replay than during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See "Example 183-3 (page 183-26)".</p>
capture_sts	<p>If this parameter is TRUE, then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure (page 183-13) along with the Automatic Workload Repository (AWR) data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). The default value is FALSE.</p>
sts_cap_interval	<p>Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.</p>

Usage Notes

A consolidated replay replays multiple captures in one replay. Each capture records different system change number (SCN) values. For this reason SCN-based sync is not supported for consolidated replays. Consolidated replays only support non-sync mode and the Object-ID based synchronization, and SCN-based synchronization is currently not supported.

Related Topics:

- [PREPARE_REPLAY Procedure](#) (page 183-23)
This procedure puts the database state in `PREPARE FOR REPLAY` mode.

183.3.27 PREPARE_REPLAY Procedure

This procedure puts the database state in `PREPARE FOR REPLAY` mode.

Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
  synchronization          IN BOOLEAN    DEFAULT TRUE,
  connect_time_scale      IN NUMBER     DEFAULT 100,
  think_time_scale        IN NUMBER     DEFAULT 100,
  think_time_auto_correct IN BOOLEAN    DEFAULT TRUE,
  scale_up_multiplier     IN NUMBER     DEFAULT 1,
  capture_sts             IN BOOLEAN    DEFAULT FALSE,
  sts_cap_interval        IN NUMBER     DEFAULT 300,
  rac_mode                IN NUMBER     DEFAULT GLOBAL_SYNC,
  query_only              IN BOOLEAN    DEFAULT FALSE);

DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
  synchronization          IN VARCHAR2  DEFAULT 'OBJECT_ID',
  connect_time_scale      IN NUMBER     DEFAULT 100,
  think_time_scale        IN NUMBER     DEFAULT 100,
  think_time_auto_correct IN BOOLEAN    DEFAULT TRUE,
  scale_up_multiplier     IN NUMBER     DEFAULT 1,
  capture_sts             IN BOOLEAN    DEFAULT FALSE,
  sts_cap_interval        IN NUMBER     DEFAULT 300),
  rac_mode                IN NUMBER     DEFAULT GLOBAL_SYNC,
  query_only              IN BOOLEAN    DEFAULT FALSE);
```

Parameters

Table 183-24 PREPARE_REPLAY Procedure Parameters

Parameter	Description
synchronization	<p>Sets the synchronization mode for replay:</p> <ul style="list-style-type: none"> 'TIME' — The synchronization will be based on the time the action took place during capture (clock-based time). 'SCN' — The synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. 'OBJECT_ID' — Every replayed action will be executed only <i>after</i> the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. <p>This value is deprecated.</p> <p>For compatibility, an overloaded version of this procedure uses BOOLEAN for this parameter:</p> <ul style="list-style-type: none"> TRUE means 'SCN' FALSE means 'TIME'
connect_time_scale	<p>Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 183-1 (page 183-26)".</p>
think_time_scale	<p>Scales the time elapsed between two successive user calls from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 183-2 (page 183-26)".</p>
think_time_auto_correct	<p>Auto corrects the think time between calls appropriately when a user call takes longer to complete during replay than during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See "Example 183-3 (page 183-26)".</p>
scale_up_multiplier	<p>Defines the number of times the query workload is scaled up during replay. Each captured session is replayed concurrently as many times as the value of the <code>scale_up_multiplier</code>. However, only one of the sessions in each set of identical replay sessions executes both queries and updates. The remaining sessions only execute queries.</p>

Table 183-24 (Cont.) PREPARE_REPLAY Procedure Parameters

Parameter	Description
capture_sts	If this parameter is <code>TRUE</code> , then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure (page 183-13) along with the AWR data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). The default value is <code>FALSE</code> .
sts_cap_interval	Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.
rac_mode	Specifies replay options in an Oracle Real Application Cluster (Oracle RAC) environment. This parameter accepts the following values: <ul style="list-style-type: none"> <code>GLOBAL_SYNC</code> — Synchronization across all Oracle RAC instances. This is the default value. <code>PER_INSTANCE_CLIENT</code> — Synchronization is global and each WRC client handles part of the workload that is sent to only one instance. <code>PER_INSTANCE_SYNC</code> — Synchronization is local (within each instance only) and each WRC client handles part of the workload that is sent to only one instance
query_only	Replays only the read-only queries of the workload capture. The default value is <code>FALSE</code> .

Usage Notes

- Prerequisites:
 - The database has been initialized for replay using the [INITIALIZE_REPLAY Procedure](#) (page 183-18).
 - Any capture time connection strings that require remapping have been already done using the [REMAP_CONNECTION Procedure](#) (page 183-29).
- One or more external replay clients (WRC) can be started once the `PREPARE_REPLAY` procedure has been executed.
- With regard to `scale_up_multiplier`:
 - One replay session (base session) of each set of identical sessions will replay every call from the capture as usual.
 - The remaining sessions (scale-up sessions) will only replay calls that are read-only. Thus, DDL, DML, and PL/SQL calls that modified the database is skipped. `SELECT FOR UPDATE` statements are also skipped.
 - Read-only calls from the scale-up are synchronized appropriately and obey the timings defined by `think_time_scale`, `connect_time_scale`, and `think_time_auto_correct`. Also, the queries are made to wait for the appropriate commits.
 - No replay data or error divergence records are generated for the scale-up sessions.

- All base or scale-up sessions that replay the same capture file will connect from the same workload replay client.

Example 183-1 Application of the connect_time_scale Parameter

If the following was observed during the original workload capture:

```
12:00 : Capture was started
12:10 : First session connect (10m after)
12:30 : Second session connect (30m after)
12:42 : Third session connect (42m after)
```

If the connect_time_scale is 50, then the session connects will happen as follows:

```
12:00 : Replay was started with 50% connect time scale
12:05 : First session connect ( 5m after)
12:15 : Second session connect (15m after)
12:21 : Third session connect (21m after)
```

If the connect_time_scale is 200, then the session connects will happen as follows:

```
12:00 : Replay was started with 200% connect time scale
12:20 : First session connect (20m after)
13:00 : Second session connect (60m after)
13:24 : Third session connect (84m after)
```

Example 183-2 Application of the think_time_scale Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4mins
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the think_time_scale is 50 during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:05 : First user call issued 5 mins (50% of 10m) after the completion of
       previous call
12:10 : First user call completes in 5m (takes a minute longer)
12:18 : Second user call issued 8 mins (50% of 16m) after the completion of prev
       call
12:25 : Second user call completes in 7m (takes 3 minutes less)
12:26 : Third user call issued 1 min (50% of 2m) after the completion of prev
       call
12:35 : Third user call completes in 9m (takes a minute longer)
```

Example 183-3 Application of the think_time_auto_correct Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4m
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the `think_time_scale` is 100 and the `think_time_auto_correct` is TRUE during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:10 : First user call issued 10 mins after the completion of prev call
12:15 : First user call completes in 5m (takes 1 minute longer)
12:30 : Second user call issued 15 mins (16m minus the extra time of 1m the prev
       call took) after the completion of prev call
12:44 : Second user call completes in 14m (takes 4 minutes longer)
12:44 : Third user call issued immediately (2m minus the extra time of 4m the prev
       call took) after the completion of prev call
12:52 : Third user call completes in 8m
```

183.3.28 PROCESS_CAPTURE Procedure

This procedure processes the workload capture found in `capture_dir` in place.

Syntax

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (
  capture_dir          IN  VARCHAR2,
  parallel_level       IN  NUMBER DEFAULT NULL,
  synchronization     IN  VARCHAR2 DEFAULT 'SCN',
  plsql_mode          IN  VARCHAR2 DEFAULT 'TOP_LEVEL');
```

Parameters

Table 183-25 PROCESS_CAPTURE Procedure Parameters

Parameter	Description
<code>capture_dir</code>	(Mandatory) Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has the appropriate permissions. New files are added to this directory.
<code>parallel_level</code>	Number of Oracle processes used to process the capture in parallel. The <code>NULL</code> default value will auto-compute the parallelism level, whereas a value of 1 will enforce serial execution.

Table 183-25 (Cont.) PROCESS_CAPTURE Procedure Parameters

Parameter	Description
synchronization	<p>Determines the synchronization mode that the user will be able to use for replay:</p> <ul style="list-style-type: none"> 'TIME' — When 'TIME' is selected, the replay can use 'TIME' synchronization mode only. When 'TIME' synchronization mode is used for replay, the synchronization will be based on the time the action took place during capture (clock-based time). 'SCN' — When 'SCN' is selected, the replay can use the 'TIME' or 'SCN' synchronization mode. This is the default. When 'SCN' synchronization mode is used for replay, the synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. 'OBJECT_ID' — When 'OBJECT_ID' is selected, replay can use the 'TIME', 'SCN', or 'OBJECT_ID' synchronization mode. When 'OBJECT_ID' synchronization mode is used for replay, every replayed action will be executed only <i>after</i> the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. This synchronization mode is deprecated.
plsqli_mode	<p>Specifies the processing mode for PL/SQL:</p> <ul style="list-style-type: none"> 'TOP_LEVEL' — metadata is generated for top-level PL/SQL calls only; 'TOP_LEVEL' will be the only option for replay. 'EXTENDED' — metadata is generated for both top-level PL/SQL calls and the SQL called from PL/SQL. A new directory ppe_X.X.X.X (where the Xs represent the current Oracle version) is created under the capture root directory. Capture must have been done with this same value for the plsqli_mode parameter. Replay can use either 'TOP_LEVEL' or 'EXTENDED'.

Usage Notes

- This subprogram analyzes the workload capture found in the capture_dir and creates new workload replay specific metadata files that are required to replay the given workload capture. It only creates new files and does not modify any files that were originally created during the workload capture. Therefore, this procedure can be run multiple times on the same capture directory, such as when the procedure encounters unexpected errors or is cancelled by the user.
- Once this procedure runs successfully, the capture_dir can be used as input to the INITIALIZE_REPLAY Procedure (page 183-18) in order to replay the captured workload present in capture_dir.

- Before a workload capture can be replayed in a particular database version, the capture must be processed using `PROCESS_CAPTURE` in the same database version. Once created, a processed workload capture can be used to replay the captured workload multiple times in the same database version.

For example, suppose workload "foo" was captured in `rec_dir` in Oracle database version 10.2.0.5. In order to replay the workload "foo" in version 11.1.0.1 the workload must be processed in version 11.1.0.1. The following procedure must be executed in an 11.1.0.1 database in order to process the capture directory `rec_dir`:

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE('rec_dir');
```

Now, `rec_dir` contains a valid 11.1.0.1 processed workload capture that can be used to replay the workload "foo" in 11.1.0.1 databases as many times as required.

183.3.29 REMAP_CONNECTION Procedure

This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
    connection_id      IN NUMBER,
    replay_connection  IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
    capture_number     IN VARCHAR2,
    connection_id      IN NUMBER,
    replay_connection  IN VARCHAR2);
```

Parameters

Table 183-26 REMAP_CONNECTION Procedure Parameters

Parameter	Description
<code>capture_number</code>	Pointing to a capture of the current replay schedule
<code>connection_id</code>	ID of the connection to be remapped. Corresponds to <code>DBA_WORKLOAD_CONNECTION_MAP.CONN_ID</code> .
<code>replay_connection</code>	New connection string to be used during replay

Usage Notes

- Prior to calling `REMAP_CONNECTION` all replay connection strings are set to `NULL` by default. If a `replay_connection` is `NULL`, then the replay sessions will connect as determined by the replay client's runtime environment. For example, if the environment variable `TNS_ADMIN` is defined and the user does not call the [REMAP_CONNECTION Procedure](#) (page 183-29), then the `wrc` executable will connect to the server specified in the `tnsnames.ora` file pointed to by `TNS_ADMIN`.
- A valid `replay_connection` must specify a connect identifier or a service point. See the *Oracle Database Net Services Reference* for ways to specify connect identifiers (such as net service names, database service names, and net service aliases) and naming methods that can be used to resolve a connect identifier to a connect descriptor.

- An error is returned if no row matches the given `connection_id`.
- Use the `DBA_WORKLOAD_CONNECTION_MAP` view to review all the connection strings that are used by the subsequent workload replay, and also to examine connection string remappings used for previous workload replays.

183.3.30 REMOVE_CAPTURE Procedure

This procedure removes the given capture from the current schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMOVE_CAPTURE (
    schedule_capture_number    IN    NUMBER);
```

Parameters

Table 183-27 REMOVE_CAPTURE Procedure Parameters

Parameter	Description
<code>schedule_capture_number</code>	Unique ID that identifies this capture within this schedule

183.3.31 REMOVE_SCHEDULE_ORDERING Procedure

This procedure removes an existing schedule order from the current replay schedule.

Together, `schedule_capture_id` and `waitfor_capture_id` form a schedule ordering that previously added by the [ADD_SCHEDULE_ORDERING Function](#) (page 183-6) (`schedule_capture_id`, `waitfor_capture_id`). The order is that replay of capture indicated by `schedule_capture_id` will not start unless the replay of capture indicated by `waiting_for_capture_id` finishes.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMOVE_SCHEDULE_ORDERING (
    schedule_capture_id    IN    NUMBER,
    waitfor_capture_id    IN    NUMBER);
```

Parameters

Table 183-28 REMOVE_SCHEDULE_ORDERING Procedure Parameters

Parameter	Description
<code>schedule_capture_id</code>	Points to a capture that has been added to the current replay schedule (see procedure description).
<code>waitfor_capture_id</code>	Points to a capture that has been added to the current replay schedule.

Usage Notes

Prerequisites:

- The [BEGIN_REPLAY_SCHEDULE Procedure](#) (page 183-7) must have been called.

- The replay schedule order should have already been added using the [ADD_SCHEDULE_ORDERING Function](#) (page 183-6).

183.3.32 REPORT Function

This function generates a report on the stipulated workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REPORT (
    replay_id      IN NUMBER,
    format         IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 183-29 REPORT Function Parameters

Parameter	Description
replay_id	(Mandatory) Specifies the ID of the workload replay whose report is requested.
format	(Mandatory) Specifies the report format. Valid values: <ul style="list-style-type: none"> • HTML - Generates the HTML version of the report • XML - Generates the XML version of the report • TEXT - Generates the text version of the report

Return Values

The report body in the desired format returned as a CLOB

183.3.33 RESUME_REPLAY Procedure

This procedure resumes a paused workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.RESUME_REPLAY;
```

Usage Notes

Prerequisite: A call to the [PAUSE_REPLAY Procedure](#) (page 183-20) must have already been issued.

183.3.34 REUSE_REPLAY_FILTER_SET Procedure

This procedure reuses filters in the specified filter set as if each were added using the [ADD_SCHEDULE_ORDERING Function](#).

Each call adds one filter set, which is a collection of individual filters on various attributes. Also, a new filter rule can be added, and an existing filter can be deleted before invoking the [CREATE_FILTER_SET Procedure](#) (page 183-11) to create a new filter set.

Syntax

```
DBMS_WORKLOAD_REPLAY.REUSE_REPLAY_FILTER_SET(
    replay_dir IN VARCHAR2,
    filter_set IN VARCHAR2);
```

Parameters

Table 183-30 REUSE_REPLAY_FILTER_SET Procedure Parameters

Parameter	Description
replay_dir	Capture ID of the existing filter set with which it is associated
filter_set	Name of the filter set to be reused

Related Topics:

- [ADD_SCHEDULE_ORDERING Function](#) (page 183-6)
This function adds a schedule order between two captures.

183.3.35 SET_ADVANCED_PARAMETER Procedure

This procedure sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure.

The advanced parameters control aspects of the replay that are more specialized. The advanced parameters are reset to their default values after the replay has finished.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
    pname IN VARCHAR2,
    pvalue IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
    pname IN VARCHAR2,
    pvalue IN NUMBER);
```

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
    pname IN VARCHAR2,
    pvalue IN BOOLEAN);
```

Parameters

Table 183-31 SET_ADVANCED_PARAMETER Procedure Parameters

Parameter	Description
pname	Name of the parameter (case insensitive)
pvalue	Value of the parameter

Usage Notes

The current parameters and values that can be used are:

'DO_NO_WAIT_COMMITS': (default: FALSE)

This parameter controls whether the `COMMIT` issued by replay sessions is `NOWAIT`. The default value for this parameter is `FALSE`. In this case all the `COMMIT`s are issued with the mode they were captured (`wait`, `no-wait`, `batch`, `no-batch`). If the parameter is set to `TRUE`, then all `COMMIT`s are issued in `no-wait` mode. This is useful in cases where the replay is becoming noticeably slow because of a high volume of concurrent `COMMIT`s. Setting the parameter to `TRUE` will significantly decrease the waits on the 'log file sync' event during the replay with respect to capture.

Related Topics:

- [PREPARE_REPLAY Procedure](#) (page 183-23)
This procedure puts the database state in `PREPARE FOR REPLAY` mode.

183.3.36 SET_REPLAY_DIRECTORY Procedure

This procedure sets a directory that contains multiple workload captures as the current replay directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_DIRECTORY (
    replay_dir    IN    VARCHAR2);
```

Parameters

Table 183-32 SET_REPLAY_DIRECTORY Procedure Parameters

Parameter	Description
replay_dir	Name of the OS directory containing the captures for a workload consolidation

183.3.37 SET_REPLAY_TIMEOUT Procedure

This procedure sets the replay timeout setting. The purpose is to abort user calls that might make the replay much slower or even cause a replay hang.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_TIMEOUT (
    enabled      OUT  BOOLEAN DEFAULT TRUE,
    min_delay    OUT  NUMBER  DEFAULT 10,
    max_delay    OUT  NUMBER  DEFAULT 120,
    delay_factor OUT  NUMBER  DEFAULT 8);
```

Parameters

Table 183-33 SET_REPLAY_TIMEOUT Procedure Parameters

Parameter	Description
enabled	TRUE to enable the timeout action, and FALSE to disable.
min_delay	Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than min_delay. Default = 10.

Table 183-33 (Cont.) SET_REPLAY_TIMEOUT Procedure Parameters

Parameter	Description
max_delay	Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay. Default = 120.
delay_factor	Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor. Default = 8.

Usage Notes

- This procedure can be called anytime during replay.
- Call delay is defined as the difference between replay and capture if replay elapsed time is longer than call elapsed time.
- Once a replay timeout action is enabled, a user call will exit with ORA-15569 if it has been delayed more than the condition specified by the replay action. The call and its error are reported as error divergence.
- Replay timeout operates as follows:
 - The timeout action has no effect if it is not enabled.
 - If the call delay in minutes is less than a lower bound specified by parameter min_delay, then the timeout action is non-operational.
 - If the delay in minutes is more than an upper bound specified by parameter max_delay, the timeout action will abort the user call and throw ORA-15569.
 - For delay that is between the lower bound and upper bound, the user call will abort with ORA-15569 only when the current replay elapsed time is more than the product of capture elapsed time and parameter delay_factor.

183.3.38 SET_SQL_MAPPING Procedure

This procedure specifies SQL statements to be skipped or replaced during a database replay operation.

Syntax

```
PROCEDURE SET_SQL_MAPPING (
  schedule_cap_id      IN NUMBER,
  sql_id               IN VARCHAR2,
  operation            IN VARCHAR2,
  replacement_sql_text IN VARCHAR2 DEFAULT NULL);
```

```
PROCEDURE SET_SQL_MAPPING (
  sql_id               IN VARCHAR2,
  operation            IN VARCHAR2,
  replacement_sql_text IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 183-34 SET_SQL_MAPPING Procedure Parameters

Parameter	Description
schedule_cap_id	ID of a capture in the schedule
sql_id	SQL identifier of the SQL statement at the time of capture
operation	<p>Directs that one of the following actions be performed for the specified statement during database replay:</p> <ul style="list-style-type: none"> 'SKIP' — Skip the SQL statement identified by <code>sql_id</code> 'REPLACE' — Replace this SQL statement identified by <code>sql_id</code> with the SQL statement in the <code>replacement_sql_text</code> parameter

Usage Notes

- `replacement_sql_text`: When 'SKIP' is specified for the `operation` parameter, this parameter is NULL. When 'REPLACE' is specified for the `operation` parameter, this parameter's value is the SQL statement to be used.
- `schedule_cap_id` is used for consolidated replay.

183.3.39 SET_USER_MAPPING Procedure

This procedure sets a new schema or user name to be used during replay instead of the captured user.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
  schedule_cap_id      IN NUMBER,
  capture_user         IN VARCHAR2,
  replay_user          IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
  capture_user         IN VARCHAR2,
  replay_user          IN VARCHAR2);
```

Parameters

Table 183-35 SET_USER_MAPPING Procedure Parameters

Parameter	Description
schedule_cap_id	ID of the a capture in the schedule
capture_user	User name during the time of the workload capture
replay_user	User name to which captured user is remapped during replay.

Usage Notes

- A `schedule_cap_id` of `NULL` is used for regular non-consolidate replay.
- The replay must be initialized but not prepared in order to use this subprogram.
- If `replay_user` is set to `NULL`, then the mapping is disabled.
- After multiple calls with the same `capture_user`, the last call always takes effect.
- To list all the mappings that will be in effect during the subsequent replay execute the following:

```
SELECT * FROM DBA_WORKLOAD_ACTIVE_USER_MAP
```

- The overloaded version without the `schedule_cap_id` calls the one with the `schedule_cap_id` argument by passing in `NULL`.
- Mappings are stored in a table made public through the view `DBA_WORKLOAD_USER_MAP`. To remove old mappings execute

```
DELETE * FROM DBA_WORKLOAD_USER_MAP
```

183.3.40 START_CONSOLIDATED_REPLAY Procedure

This procedure starts the replay of a multiple-capture capture. It should be used only for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_CONSOLIDATED_REPLAY;
```

Usage Notes

Prerequisites:

- The call to the [PREPARE_REPLAY Procedure](#) (page 183-23) was already issued.
- A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.

183.3.41 START_REPLAY Procedure

This procedure starts the workload replay.

All the external replay clients (WRC) that are currently connected to the replay database will automatically be notified, and those replay clients (WRC) will begin issuing the captured workload. It should only be used for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_REPLAY;
```

Usage Notes

- Prerequisites:
 - The call to the [PREPARE_REPLAY Procedure](#) (page 183-23) was already issued.

- A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.
- Use the WRC's `CALIBRATE` mode to determine the number of replay clients that might be required to faithfully replay the captured workload. For example:

```
$ wrc mode=calibrate replaydir=.
```

183.3.42 USE_FILTER_SET Procedure

This procedure applies a filter set to a capture in the current replay schedule.

The filter set must have been created by calling the [CREATE_FILTER_SET Procedure](#) (page 183-11).

Syntax

```
DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
  capture_number IN VARCHAR2,
  filter_set     IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
  filter_set     IN VARCHAR2);
```

Parameters

Table 183-36 USE_FILTER_SET Procedure Parameters

Parameter	Description
<code>capture_number</code>	Pointing to a capture of the current replay schedule
<code>filter_set</code>	Name of the filter set

Usage Notes

The filter set must have been created by calling the [CREATE_FILTER_SET Procedure](#) (page 183-11).

DBMS_WORKLOAD_REPOSITORY

The `DBMS_WORKLOAD_REPOSITORY` package lets you manage the Automatic Workload Repository (AWR) by performing operations, such as, managing snapshots and baselines.

The chapter contains the following topics:

- [Examples](#) (page 184-1)
- [Data Structures](#) (page 184-1)
- [Summary of DBMS_WORKLOAD_REPOSITORY Subprograms](#) (page 184-3)

See Also:

Oracle Database Performance Tuning Guide for more information about the Automatic Workload Repository

184.1 DBMS_WORKLOAD_REPOSITORY Examples

This example shows how to generate an AWR text report with the `DBMS_WORKLOAD_REPOSITORY` package for database ID 1557521192, instance ID 1, snapshot IDs 5390 and 5391, and with default options.

```
-- make sure to set line size appropriately
-- set linesize 152
SELECT output FROM TABLE(
  DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
    1557521192, 1, 5390, 5392) );
```

You can call the `DBMS_WORKLOAD_REPOSITORY` packaged functions directly as in the example, but Oracle recommends you use the corresponding supplied SQL script (`awrrpt.sql` in this case) for the packaged function, which prompts the user for required information.

184.2 DBMS_WORKLOAD_REPOSITORY Data Structures

The `DBMS_WORKLOAD_REPOSITORY` package defines an object and associated table types.

OBJECT Types

- [AWR_BASELINE_METRIC_TYPE Object Type](#) (page 184-2)

TABLE Types

- [AWR_BASELINE_METRIC_TYPE_TABLE Table Type](#) (page 184-3)
- [AWRRPT_INSTANCE_LIST_TYPE Table Type](#) (page 184-3)

184.2.1 DBMS_WORKLOAD_REPOSITORY AWR_BASELINE_METRIC_TYPE Object Type

This type shows the values of the metrics corresponding to a baseline.

Syntax

```
TYPE awr_baseline_metric_type AS OBJECT (  
    baseline_name    VARCHAR2(64),  
    dbid             NUMBER NOT NULL,  
    instance_number  NUMBER NOT NULL,  
    beg_time         DATE NOT NULL,  
    end_time         DATE NOT NULL,  
    metric_id        NUMBER NOT NULL,  
    metric_name      VARCHAR2(64) NOT NULL,  
    metric_unit      VARCHAR2(64) NOT NULL,  
    num_interval     NUMBER NOT NULL,  
    interval_size    NUMBER NOT NULL,  
    average          NUMBER NOT NULL,  
    minimum          NUMBER NOT NULL,  
    maximum          NUMBER NOT NULL);
```

Fields

Table 184-1 AWR_BASELINE_METRIC_TYPE Fields

Field	Description
baseline_name	Name of the Baseline
dbid	Database ID for the snapshot
instance_number	Instance number for the snapshot
beg_time	Begin time of the interval
end_time	End time of the interval
metric_id	Metric ID
metric_name	Metric name
metric_unit	Unit of measurement
num_interval	Number of intervals observed
interval_size	Interval size (in hundredths of a second)
average	Average over the period
minimum	Minimum value observed
maximum	Maximum value observed

184.2.2 DBMS_WORKLOAD_REPOSITORY AWR_BASELINE_METRIC_TYPE_TABLE Table Type

This type is used by the SELECT_BASELINE_METRIC Function.

Syntax

```
CREATE TYPE awr_baseline_metric_type_table AS TABLE OF awr_baseline_metric_type;
```

Related Topics:

- [SELECT_BASELINE_METRIC Function](#) (page 184-38)
This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

184.2.3 DBMS_WORKLOAD_REPOSITORY AWRRPT_INSTANCE_LIST_TYPE Table Type

This type provides an alternative to a comma-separated list.

Syntax

```
CREATE TYPE awrrpt_instance_list_type AS TABLE OF NUMBER;
```

184.3 Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

This table lists the DBMS_WORKLOAD_REPOSITORY subprograms and briefly describes them.

Table 184-2 DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
ADD_COLORED_SQL Procedure (page 184-5)	Adds a colored SQL ID
ASH_GLOBAL_REPORT_HTML Function (page 184-6)	Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.
ASH_GLOBAL_REPORT_TEXT Function (page 184-8)	Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in Text format.
ASH_REPORT_ANALYTICS Function (page 184-10)	Displays the ASH Analytics active report
ASH_REPORT_HTML Function (page 184-11)	Displays the ASH report in HTML
ASH_REPORT_TEXT Function (page 184-13)	Displays the ASH report in text
AWR_DIFF_REPORT_HTML Function (page 184-16)	Displays the AWR Diff-Diff report in HTML
AWR_DIFF_REPORT_TEXT Function (page 184-17)	Displays the AWR Diff-Diff report in text

Table 184-2 (Cont.) DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
AWR_GLOBAL_DIFF_REPORT_HTML Functions (page 184-18)	Displays the Global AWR Compare Periods Report in HTML
AWR_GLOBAL_DIFF_REPORT_TEXT Functions (page 184-19)	Displays the Global AWR Compare Periods Report in text
AWR_GLOBAL_REPORT_HTML Functions (page 184-20)	Displays the Global AWR report in HTML
AWR_GLOBAL_REPORT_TEXT Functions (page 184-21)	Displays the Global AWR report in text
AWR_REPORT_HTML Function (page 184-22)	Displays the AWR report in HTML
AWR_REPORT_TEXT Function (page 184-23)	Displays the AWR report in text
AWR_SET_REPORT_THRESHOLDS Procedure (page 184-23)	Configures specified report thresholds, including the number of rows in the report
AWR_SQL_REPORT_HTML Function (page 184-24)	Displays the AWR SQL Report in HTML format
AWR_SQL_REPORT_TEXT Function (page 184-25)	Displays the AWR SQL Report in text format
CONTROL_RESTRICTED_SNAPSHOT Procedure (page 184-26)	Controls the AWR snapshot creation for a database in the <i>restricted session</i> mode.
CREATE_BASELINE Functions & Procedures (page 184-26)	Creates a single baseline
CREATE_BASELINE_TEMPLATE Procedures (page 184-28)	Creates a baseline template
CREATE_REMOTE_SNAPSHOT Function and Procedure (page 184-29)	Creates a manual <i>remote</i> snapshot immediately using the Remote Management Framework (RMF)
CREATE_SNAPSHOT Function and Procedure (page 184-30)	Creates a manual <i>local</i> snapshot immediately
DROP_BASELINE Procedure (page 184-31)	Drops a previously-defined baseline
DROP_BASELINE_TEMPLATE Procedure (page 184-32)	Removes a baseline template that is no longer needed
DROP_SNAPSHOT_RANGE Procedure (page 184-32)	Drops a range of snapshots
LOCAL_AWR_DBID Function (page 184-33)	Returns the database identifier for the local AWR database
MODIFY_BASELINE_WINDOW_SIZE Procedure (page 184-33)	Modifies the window size for the Default Moving Window Baseline
MODIFY_SNAPSHOT_SETTINGS Procedures (page 184-34)	Modifies the snapshot settings
PURGE_SQL_DETAILS Procedure (page 184-35)	Purges SQL details, specifically rows from <code>WRH\$_SQLTEXT</code> and <code>WRH\$_SQL_PLAN</code> that do not have corresponding rows (DBID, SQL_ID) in <code>WRH\$_SQLSTAT</code> .

Table 184-2 (Cont.) DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
REGISTER_REMOTE_DATABASE Procedures (page 184-36)	Registers a remote database in the AWR using the Remote Management Framework (RMF)
REMOVE_COLORED_SQL Procedure (page 184-37)	Removes a colored SQL ID
RENAME_BASELINE Procedure (page 184-37)	Renames a baseline
SELECT_BASELINE_DETAILS Function (page 184-37)	Shows the values of the metrics corresponding to a baseline for a range of snapshots
SELECT_BASELINE_METRIC Function (page 184-38)	Shows the values of the metrics corresponding to a baseline for all the snapshots
UNREGISTER_REMOTE_DATA_BASE Procedures (page 184-39)	Removes all the statistics, metadata, and partitions of a remote database from the AWR using the Remote Management Framework (RMF)
UPDATE_DATAFILE_INFO Procedure (page 184-39)	Updates the data file and tablespace information stored in the AWR with the current information in the database
UPDATE_OBJECT_INFO Procedure (page 184-40)	Updates rows of WRH\$_SEG_STAT_OBJ table that represent objects in the local database

184.3.1 ADD_COLORED_SQL Procedure

This procedure adds a colored SQL ID.

If an SQL ID is colored, it will be captured in every snapshot, independent of its level of activities (so that it does not have to be a `TOP SQL`). Capture occurs if the SQL is found in the cursor cache at snapshot time. To uncolor the SQL, invoke the [REMOVE_COLORED_SQL Procedure](#) (page 184-37).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ADD_COLORED_SQL(
    sql_id      IN VARCHAR2,
    dbid       IN NUMBER DEFAULT NULL);
```

Parameters

Table 184-3 ADD_COLORED_SQL Procedure Parameters

Parameter	Description
sql_id	13-character external SQL ID
dbid	Optional DBID, defaults to Local DBID

184.3.2 ASH_GLOBAL_REPORT_HTML Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_HTML(
    l_dbid          IN NUMBER,
    l_inst_num      IN VARCHAR2((1023),
    l_btime         IN DATE,
    l_etime         IN DATE,
    l_options       IN NUMBER    DEFAULT 0,
    l_slot_width    IN NUMBER    DEFAULT 0,
    l_sid           IN NUMBER    DEFAULT NULL,
    l_sql_id        IN VARCHAR2  DEFAULT NULL,
    l_wait_class    IN VARCHAR2  DEFAULT NULL,
    l_service_hash  IN NUMBER    DEFAULT NULL,
    l_module        IN VARCHAR2  DEFAULT NULL,
    l_action        IN VARCHAR2  DEFAULT NULL,
    l_client_id     IN VARCHAR2  DEFAULT NULL,
    l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
    l_data_src      IN NUMBER    DEFAULT 0,
    l_container     IN VARCHAR2  DEFAULT NULL)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 184-4 ASH_GLOBAL_REPORT_HTML Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instances (such as '1,2,3'), or NULL to report on all instances in the database
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)

Table 184-4 (Cont.) ASH_GLOBAL_REPORT_HTML Parameters

Parameter	Description
<code>l_data_src</code>	Ignored since the report works off of data on disk only
<code>l_container</code>	<p>Name of the container for which report activity is limited. Valid values other than <code>NULL</code> (default) should be taken from container names in <code>V\$CONTAINERS</code>. Behavior is as follows:</p> <ul style="list-style-type: none"> • If <code>NULL</code>: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not <code>NULL</code>: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as <code>NULL</code> value for <code>l_container</code> regarding the connected PDB. <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p>

Return Values

The output will be one column of `VARCHAR2(1500)`.

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghijkl123'` pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghijkl123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, `AND` conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type `VARCHAR2`.

Table 184-5 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
<code>l_sid</code>	Session ID (for example, <code>V\$SESSION.SID</code>)	No
<code>l_sql_id</code>	SQL ID (for example, <code>V\$SQL.SQL_ID</code>)	Yes

Table 184-5 (Cont.) ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_wait_class	Wait class name (for example, V\$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V\$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V\$SESSION.MODULE)	Yes
l_action	Action name (for example, V\$SESSION.ACTION)	Yes
l_client_id	Client ID for end-to-end backtracing (for example, V\$SESSION.CLIENT_IDENTIFIER)	Yes
l_data_src	Wildcards are not allowed for l_data_src as it is of numeric datatype	No

184.3.3 ASH_GLOBAL_REPORT_TEXT Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_TEXT(
  l_dbid          IN VARCHAR2(1023),
  l_inst_num      IN NUMBER,
  l_btime         IN DATE,
  l_etime         IN DATE,
  l_options       IN NUMBER      DEFAULT 0,
  l_slot_width   IN NUMBER      DEFAULT 0,
  l_sid           IN NUMBER      DEFAULT NULL,
  l_sql_id        IN VARCHAR2    DEFAULT NULL,
  l_wait_class    IN VARCHAR2    DEFAULT NULL,
  l_service_hash  IN NUMBER      DEFAULT NULL,
  l_module        IN VARCHAR2    DEFAULT NULL,
  l_action        IN VARCHAR2    DEFAULT NULL,
  l_client_id     IN VARCHAR2    DEFAULT NULL,
  l_plsql_entry   IN VARCHAR2    DEFAULT NULL,
  l_data_src      IN NUMBER      DEFAULT 0,
  l_container     IN VARCHAR2    DEFAULT NULL)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 184-6 ASH_GLOBAL_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instances (such as '1,2,3'), or NULL to report on all instances in the database
l_btime	The 'begin time'

Table 184-6 (Cont.) ASH_GLOBAL_REPORT_TEXT Parameters

Parameter	Description
<code>l_etime</code>	The 'end time'
<code>l_options</code>	Report level (currently not used)
<code>l_slot_width</code>	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between <code>l_btime</code> and <code>l_etime</code> is appropriately split into not more than 10 slots.
<code>l_sid</code>	Session ID (see Usage Notes)
<code>l_sql_id</code>	SQL ID (see Usage Notes)
<code>l_wait_class</code>	Wait class name (see Usage Notes)
<code>l_service_hash</code>	Service name hash (see Usage Notes)
<code>l_module</code>	Module name (see Usage Notes)
<code>l_action</code>	Action name (see Usage Notes)
<code>l_client_id</code>	Client ID for end-to-end backtracing (see Usage Notes)
<code>l_plsql_entry</code>	PL/SQL entry point (see Usage Notes)
<code>l_data_src</code>	Ignored since the report works off of data on disk only
<code>l_container</code>	Name of the container for which report activity is limited. Valid values other than <code>NULL</code> (default) should be taken from container names in <code>V\$CONTAINERS</code> . Behavior is as follows: <ul style="list-style-type: none"> • If <code>NULL</code>: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not <code>NULL</code>: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as <code>NULL</code> value for <code>l_container</code> regarding the connected PDB. <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p>

Return Values

The output will be one column of `VARCHAR2(320)`.

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghij123'` pass that `SQL_ID` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghij123'
```

Table 184-7 ASH_GLOBAL_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sid	Session ID (for example, V\$SESSION.SID)	No
l_sql_id	SQL ID (for example, V\$SQL.SQL_ID)	Yes
l_wait_class	Wait class name (for example, V\$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V\$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V\$SESSION.MODULE)	Yes
l_action	Action name (for example, V\$SESSION.ACTION)	Yes
l_client_id	Client ID for end-to-end backtracing (for example, V\$SESSION.CLIENT_IDENTIFIER)	Yes
l_plsql_entry	PL/SQL entry point (for example, "SYS.DBMS_LOB.*")	Yes
l_data_src	Wildcards are not allowed for l_data_src as it is of numeric datatype	No

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

184.3.4 ASH_REPORT_ANALYTICS Function

This function returns the ASH Analytics active report.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_ANALYTICS(
  dbid          IN NUMBER DEFAULT NULL,
  inst_id       IN NUMBER DEFAULT NULL,
  begin_time    IN DATE,
  end_time      IN DATE,
  report_level  IN VARCHAR2 DEFAULT NULL,
  filter_list   IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 184-8 ASH_REPORT_ANALYTICS Parameters

Parameter	Description
dbid	Database identifier. If its value is set to NULL, then the database identifier for the local database is used. Its default value is NULL.
inst_id	Instance number of the database for which the statistics are required. If its value is set to NULL, then the statistics for the local database are returned. Its default value is NULL.
begin_time	The start time of the interval for which the ASH report is required.
end_time	The end time of the interval for which the ASH report is required.
report_level	Describes the list of components to build.
filter_list	Describes the list of filters to apply. Its default value is NULL (no filters to apply).

Return Values

Returns the ASH Analytics active report.

184.3.5 ASH_REPORT_HTML Function

This table function displays the ASH Spot report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
  l_dbid          IN NUMBER,
  l_inst_num     IN NUMBER,
  l_btime       IN DATE,
  l_etime       IN DATE,
  l_options     IN NUMBER   DEFAULT 0,
  l_slot_width  IN NUMBER   DEFAULT 0,
  l_sid         IN NUMBER   DEFAULT NULL,
  l_sql_id      IN VARCHAR2  DEFAULT NULL,
  l_wait_class  IN VARCHAR2  DEFAULT NULL,
  l_service_hash IN NUMBER   DEFAULT NULL,
  l_module      IN VARCHAR2  DEFAULT NULL,
  l_action      IN VARCHAR2  DEFAULT NULL,
  l_client_id   IN VARCHAR2  DEFAULT NULL,
  l_plsql_entry IN VARCHAR2  DEFAULT NULL,
  l_data_src    IN NUMBER   DEFAULT 0,
  l_container   IN VARCHAR2  DEFAULT NULL)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 184-9 ASH_REPORT_HTML Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number

Table 184-9 (Cont.) ASH_REPORT_HTML Parameters

Parameter	Description
<code>l_btime</code>	The 'begin time'
<code>l_etime</code>	The 'end time'
<code>l_options</code>	Report level (currently not used)
<code>l_slot_width</code>	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between <code>l_btime</code> and <code>l_etime</code> is appropriately split into not more than 10 slots.
<code>l_sid</code>	Session ID (see Usage Notes)
<code>l_sql_id</code>	SQL ID (see Usage Notes)
<code>l_wait_class</code>	Wait class name (see Usage Notes)
<code>l_service_hash</code>	Service name hash (see Usage Notes)
<code>l_module</code>	Module name (see Usage Notes)
<code>l_action</code>	Action name (see Usage Notes)
<code>l_client_id</code>	Client ID for end-to-end backtracing (see Usage Notes)
<code>l_plsql_entry</code>	PL/SQL entry point (see Usage Notes)
<code>l_data_src</code>	Can be used to specify a data source (see Usage Notes) <ul style="list-style-type: none"> • 1 => memory (<code>V\$ACTIVE_SESSION_HISTORY</code>) • 2 => disk (<code>DBA_HIST_ACTIVE_SESS_HISTORY</code>) • 0 => both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.
<code>l_container</code>	Name of the container for which report activity is limited. Valid values other than <code>NULL</code> (default) should be taken from container names in <code>V\$CONTAINERS</code> . Behavior is as follows: <ul style="list-style-type: none"> • If <code>NULL</code>: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not <code>NULL</code>: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as <code>NULL</code> value for <code>l_container</code> regarding the connected PDB. <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p>

Return Values

The output will be one column of `VARCHAR2(500)`.

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (`l_btime` and `l_etime`, respectively) to find all rows in that time range either from memory, or

disk, or both. However, using `l_data_src`, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between `l_btime` and `l_time` found in memory, use

```
l_data_src => 1
```

Similarly, to generate a report on samples found only on disk, use

```
l_data_src => 2
```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghij123'` pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghij123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type `VARCHAR2`.

Table 184-10 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
<code>l_sid</code>	Session ID (for example, <code>V\$SESSION.SID</code>)	No
<code>l_sql_id</code>	SQL ID (for example, <code>V\$SQL.SQL_ID</code>)	Yes
<code>l_wait_class</code>	Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code>)	Yes
<code>l_service_hash</code>	Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code>)	No
<code>l_module</code>	Module name (for example, <code>V\$SESSION.MODULE</code>)	Yes
<code>l_action</code>	Action name (for example, <code>V\$SESSION.ACTION</code>)	Yes
<code>l_client_id</code>	Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code>)	Yes

184.3.6 ASH_REPORT_TEXT Function

This table function displays the ASH Spot report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_TEXT(  
  l_dbid          IN NUMBER,
```

```

l_inst_num      IN NUMBER,
l_btime         IN DATE,
l_etime         IN DATE,
l_options       IN NUMBER   DEFAULT 0,
l_slot_width    IN NUMBER   DEFAULT 0,
l_sid           IN NUMBER   DEFAULT NULL,
l_sql_id        IN VARCHAR2 DEFAULT NULL,
l_wait_class    IN VARCHAR2 DEFAULT NULL,
l_service_hash  IN NUMBER   DEFAULT NULL,
l_module        IN VARCHAR2 DEFAULT NULL,
l_action        IN VARCHAR2 DEFAULT NULL,
l_client_id     IN VARCHAR2 DEFAULT NULL,
l_plsql_entry   IN VARCHAR2 DEFAULT NULL,
l_data_src      IN NUMBER   DEFAULT 0,
l_container     IN VARCHAR2 DEFAULT NULL)
RETURN awrrpt_text_type_table PIPELINED;

```

Parameters

Table 184-11 *ASH_REPORT_TEXT* Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)
l_data_src	Can be used to specify a data source (see Usage Notes) <ul style="list-style-type: none"> • 1 => memory (V\$ACTIVE_SESSION_HISTORY) • 2 => disk (DBA_HIST_ACTIVE_SESS_HISTORY) • 0 => both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.

Table 184-11 (Cont.) ASH_REPORT_TEXT Parameters

Parameter	Description
<code>l_container</code>	<p>Name of the container for which report activity is limited. Valid values other than <code>NULL</code> (default) should be taken from container names in <code>V\$CONTAINERS</code>. Behavior is as follows:</p> <ul style="list-style-type: none"> • If <code>NULL</code>: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not <code>NULL</code>: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as <code>NULL</code> value for <code>l_container</code> regarding the connected PDB. <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p>

Return Values

The output will be one column of `VARCHAR2(80)`.

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (`l_btime` and `l_etime`, respectively) to find all rows in that time range either from memory, or disk, or both. However, using `l_data_src`, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between `l_btime` and `l_time` found in memory, use

```
l_data_src => 1
```

Similarly, to generate a report on samples found only on disk, use

```
l_data_src => 2
```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghij123'` pass that `SQL_ID` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghij123'
```

Table 184-12 ASH_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
<code>l_sid</code>	Session ID (for example, <code>V\$SESSION.SID</code>)	No
<code>l_sql_id</code>	SQL ID (for example, <code>V\$SQL.SQL_ID</code>)	Yes
<code>l_wait_class</code>	Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code>)	Yes

Table 184-12 (Cont.) ASH_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
<code>l_service_hash</code>	Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code>)	No
<code>l_module</code>	Module name (for example, <code>V\$SESSION.MODULE</code>)	Yes
<code>l_action</code>	Action name (for example, <code>V\$SESSION.ACTION</code>)	Yes
<code>l_client_id</code>	Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code>)	Yes
<code>l_plsql_entry</code>	PL/SQL entry point (for example, <code>"SYS.DBMS_LOB.*"</code>)	Yes
<code>l_data_src</code>	Wildcards are not allowed for <code>l_data_src</code> as it is of numeric datatype	No

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type `VARCHAR2`.

184.3.7 AWR_DIFF_REPORT_HTML Function

This table function displays the AWR Compare Periods report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_HTML(
  dbid1      IN NUMBER,
  inst_num1  IN NUMBER,
  bid1       IN NUMBER,
  eid1       IN NUMBER,
  dbid2      IN NUMBER,
  inst_num2  IN NUMBER,
  bid2       IN NUMBER,
  eid2       IN NUMBER)
RETURN awrd rpt_text_type_table PIPELINED;
```

Parameters

Table 184-13 AWR_DIFF_REPORT_HTML Parameters

Parameter	Description
<code>dbid1</code>	1st database identifier
<code>inst_num1</code>	1st instance number
<code>bid1</code>	1st beginning snapshot ID

Table 184-13 (Cont.) AWR_DIFF_REPORT_HTML Parameters

Parameter	Description
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrddrpt.sql` script which prompts users for the required information.

184.3.8 AWR_DIFF_REPORT_TEXT Function

This table function displays the AWR Compare Periods report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_TEXT(
    dbid1      IN NUMBER,
    inst_num1  IN NUMBER,
    bid1       IN NUMBER,
    eid1       IN NUMBER,
    dbid2      IN NUMBER,
    inst_num2  IN NUMBER,
    bid2       IN NUMBER,
    eid2       IN NUMBER)
RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 184-14 AWR_DIFF_REPORT_TEXT Parameters

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrddrpt.sql` script which prompts users for the required information.

184.3.9 AWR_GLOBAL_DIFF_REPORT_HTML Functions

This table function displays Global AWR Compare Periods Report in HTML format.

The first overload accepts comma-separated lists of instance numbers for `inst_num1` and `inst_num2`. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
    dbid1      IN      NUMBER,
    inst_num1  IN      AWRRPT_INSTANCE_LIST_TYPE,
    bid1       IN      NUMBER,
    eid1       IN      NUMBER,
    dbid2      IN      NUMBER,
    inst_num2  IN      AWRRPT_INSTANCE_LIST_TYPE,
    bid2       IN      NUMBER,
    eid2       IN      NUMBER)
RETURN awrrpt_html_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
    dbid1      IN      NUMBER,
    inst_num1  IN      VARCHAR2,
    bid1       IN      NUMBER,
    eid1       IN      NUMBER,
    dbid2      IN      NUMBER,
    inst_num2  IN      VARCHAR2,
    bid2       IN      NUMBER,
    eid2       IN      NUMBER)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 184-15 AWR_GLOBAL_DIFF_REPORT_HTML Function Parameters

Parameter	Description
<code>dbid1</code>	1st database identifier
<code>inst_num1</code>	1st list of instance numbers. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
<code>bid1</code>	1st beginning snapshot ID
<code>eid1</code>	1st ending snapshot ID
<code>dbid2</code>	2nd database identifier

Table 184-15 (Cont.) AWR_GLOBAL_DIFF_REPORT_HTML Function Parameters

Parameter	Description
inst_num2	2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of VARCHAR2(1500).

184.3.10 AWR_GLOBAL_DIFF_REPORT_TEXT Functions

This table function displays Global AWR Compare Periods Report in text format.

The first overload accepts comma-separated lists of instance numbers for inst_num1 and inst_num2. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
  dbid1      IN      NUMBER,
  inst_num1  IN      AWRRPT_INSTANCE_LIST_TYPE,
  bid1       IN      NUMBER,
  eid1       IN      NUMBER,
  dbid2      IN      NUMBER,
  inst_num2  IN      AWRRPT_INSTANCE_LIST_TYPE,
  bid2       IN      NUMBER,
  eid2       IN      NUMBER)
RETURN awrd rpt_text_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
  dbid1      IN      NUMBER,
  inst_num1  IN      VARCHAR2,
  bid1       IN      NUMBER,
  eid1       IN      NUMBER,
  dbid2      IN      NUMBER,
  inst_num2  IN      VARCHAR2,
  bid2       IN      NUMBER,
  eid2       IN      NUMBER)
RETURN awrd rpt_text_type_table PIPELINED;
```

Parameters

Table 184-16 AWR_GLOBAL_DIFF_REPORT_TEXT Functions Parameters

Parameter	Description
dbid1	1st database identifier

Table 184-16 (Cont.) AWR_GLOBAL_DIFF_REPORT_TEXT Functions Parameters

Parameter	Description
inst_num1	1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of VARCHAR2(320).

184.3.11 AWR_GLOBAL_REPORT_HTML Functions

This table function displays the Global AWR report in HTML.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
    l_dbid      IN    NUMBER,
    l_inst_num  IN    AWR_RPT_INSTANCE_LIST_TYPE,
    l_bid       IN    NUMBER,
    l_eid       IN    NUMBER,
    l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
    l_dbid      IN    NUMBER,
    l_inst_num  IN    VARCHAR2,
    l_bid       IN    NUMBER,
    l_eid       IN    NUMBER,
    l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 184-17 AWR_GLOBAL_REPORT_HTML Function Parameters

Parameter	Description
l_dbid	Database identifier

Table 184-17 (Cont.) AWR_GLOBAL_REPORT_HTML Function Parameters

Parameter	Description
<code>l_inst_num</code>	List of instance numbers to be included in report. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
<code>l_bid</code>	Beginning snapshot ID
<code>l_eid</code>	Ending snapshot ID
<code>l_options</code>	Report level (currently not used)

Return Values

The output will be one column of `VARCHAR2(1500)`.

184.3.12 AWR_GLOBAL_REPORT_TEXT Functions

This table function displays the Global AWR report in text.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
  l_dbid      IN    NUMBER,
  l_inst_num  IN    AWRRPT_INSTANCE_LIST_TYPE,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awdrpt_text_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
  l_dbid      IN    NUMBER,
  l_inst_num  IN    VARCHAR2,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awdrpt_text_type_table PIPELINED;
```

Parameters

Table 184-18 AWR_GLOBAL_REPORT_TEXT Function Parameters

Parameter	Description
<code>l_dbid</code>	Database identifier
<code>l_inst_num</code>	List of instance numbers to be included in report. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
<code>l_bid</code>	Beginning snapshot ID
<code>l_eid</code>	Ending snapshot ID

Table 184-18 (Cont.) AWR_GLOBAL_REPORT_TEXT Function Parameters

Parameter	Description
<code>l_options</code>	A flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of `VARCHAR2(320)`.

184.3.13 AWR_REPORT_HTML Function

This table function displays the AWR report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_HTML(
  l_dbid      IN   NUMBER,
  l_inst_num  IN   NUMBER,
  l_bid       IN   NUMBER,
  l_eid       IN   NUMBER,
  l_options   IN   NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 184-19 AWR_REPORT_HTML Parameters

Parameter	Description
<code>l_dbid</code>	Database identifier
<code>l_inst_num</code>	Instance number
<code>l_bid</code>	Beginning snapshot ID
<code>l_eid</code>	Ending snapshot ID
<code>l_options</code>	A flag to specify to control the output of the report. Currently, Oracle supports one value: <ul style="list-style-type: none"> <code>l_options = 8</code>. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of `VARCHAR2(1500)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

184.3.14 AWR_REPORT_TEXT Function

This table function displays the AWR report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
  l_dbid      IN      NUMBER,
  l_inst_num  IN      NUMBER,
  l_bid       IN      NUMBER,
  l_eid       IN      NUMBER,
  l_options   IN      NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 184-20 AWR_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID
l_options	A flag to specify to control the output of the report. Currently, Oracle supports one value: <ul style="list-style-type: none"> l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of VARCHAR2(80).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

184.3.15 AWR_SET_REPORT_THRESHOLDS Procedure

This procedure configure specified report thresholds, including the number of rows in the report.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS(
  top_n_events      IN      NUMBER DEFAULT NULL,
  top_n_files       IN      NUMBER DEFAULT NULL,
  top_n_segments    IN      NUMBER DEFAULT NULL,
  top_n_services    IN      NUMBER DEFAULT NULL,
  top_n_sql         IN      NUMBER DEFAULT NULL,
  top_n_sql_max     IN      NUMBER DEFAULT NULL,
  top_sql_pct       IN      NUMBER DEFAULT NULL,
  shmem_threshold   IN      NUMBER DEFAULT NULL,
```

```
versions_threshold IN NUMBER DEFAULT NULL,
top_n_disks       IN NUMBER DEFAULT NULL,
outlier_pct      IN NUMBER DEFAULT NULL,
outlier_cpu_pct  IN NUMBER DEFAULT NULL);
```

Parameters

Table 184-21 AWR_SET_REPORT_THRESHOLDS Procedure Parameters

Parameter	Description
top_n_events	Number of most significant wait events to be included
top_n_files	Number of most active files to be included
top_n_segments	Number of most active segments to be included
top_n_services	Number of most active services to be included
top_n_sql	Number of most significant SQL statements to be included
top_n_sql_max	Number of SQL statements to be included if their activity is greater than that specified by top_sql_pct
top_sql_pct	Significance threshold for SQL statements between top_n_sql and top_n_sql_max
shmem_threshold	Shared memory low threshold
versions_threshold	Plan version count low threshold
top_n_disks	Number of cell disks with most I/O
outlier_pct	Percentage of maximum capacity before displaying outliers for Exadata sections
outlier_cpu_pct	Threshold for mean percentage CPU to display outliers

User Notes

- The effect of each setting depends on the type of report being generated as well as on the underlying AWR data. Not all settings are meaningful for each report type. Invalid settings (such as negative numbers) are ignored.
- Settings are effective only in the context of the session that executes the AWR_SET_REPORT_THRESHOLDS procedure. For example, to get a report that lists top 12 segments as compared to the default, one can invoke as follows:

```
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS (top_n_segments=>12);
```

184.3.16 AWR_SQL_REPORT_HTML Function

This table function displays the AWR SQL Report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_HTML(
  l_dbid      IN NUMBER,
  l_inst_num  IN NUMBER,
  l_bid       IN NUMBER,
  l_eid       IN NUMBER,
  l_sqlid     IN VARCHAR2,
  l_options   IN NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 184-22 *AWR_SQL_REPORT_HTML Parameters*

Parameter	Description
<code>l_dbid</code>	Database identifier
<code>l_inst_num</code>	Instance number
<code>l_bid</code>	Beginning snapshot ID
<code>l_eid</code>	Ending snapshot ID
<code>l_sqlid</code>	SQL ID of statement to be analyzed
<code>l_options</code>	A flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of `VARCHAR2(500)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.

184.3.17 AWR_SQL_REPORT_TEXT Function

This table function displays the AWR SQL Report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_TEXT(
  l_dbid      IN      NUMBER,
  l_inst_num  IN      NUMBER,
  l_bid       IN      NUMBER,
  l_eid       IN      NUMBER,
  l_sqlid    IN      VARCHAR2,
  l_options   IN      NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 184-23 *AWR_SQL_REPORT_TEXT Parameters*

Parameter	Description
<code>l_dbid</code>	Database identifier
<code>l_inst_num</code>	Instance number
<code>l_bid</code>	Beginning snapshot ID
<code>l_eid</code>	Ending snapshot ID
<code>l_sqlid</code>	SQL ID of statement to be analyzed
<code>l_options</code>	Flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of `VARCHAR2(120)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.

184.3.18 CONTROL_RESTRICTED_SNAPSHOT Procedure

This procedure controls the AWR snapshot creation for a database in the *restricted session* mode. If this procedure is not used, then by default, the AWR snapshots cannot be created for a database in the *restricted session* mode. This procedure affects the local database on which it is executed.

Note:

To enable AWR snapshot creation for an Oracle RAC in the *restricted session* mode, this procedure must be executed on every database instance in the Oracle RAC.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CONTROL_RESTRICTED_SNAPSHOT(
    allow IN BOOLEAN);
```

Parameters

Table 184-24 CONTROL_RESTRICTED_SNAPSHOT Parameters

Parameter	Description
allow	This parameter can have one of the following values: <ul style="list-style-type: none"> TRUE: AWR snapshots can be created for the database in the <i>restricted session</i> mode. FALSE: AWR snapshots cannot be created for the database in the <i>restricted session</i> mode.

184.3.19 CREATE_BASELINE Functions and Procedures

This function and procedure creates a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
    start_snap_id IN NUMBER,
    end_snap_id   IN NUMBER,
    baseline_name IN VARCHAR2,
    dbid          IN NUMBER DEFAULT NULL,
    expiration    IN NUMBER DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
```

```

start_snap_id    IN NUMBER,
end_snap_id      IN NUMBER,
baseline_name    IN VARCHAR2,
dbid             IN NUMBER DEFAULT NULL,
expiration       IN NUMBER DEFAULT NULL)
RETURN NUMBER;

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
start_time       IN DATE,
end_time         IN DATE,
baseline_name    IN VARCHAR2,
dbid             IN NUMBER DEFAULT NULL,
expiration       IN NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
start_time       IN DATE,
end_time         IN DATE,
baseline_name    IN VARCHAR2,
dbid             IN NUMBER DEFAULT NULL,
expiration       IN NUMBER DEFAULT NULL);
RETURN NUMBER;

```

Parameters

Table 184-25 CREATE_BASELINE Function & Procedure Parameters

Parameter	Description
start_snap_id	Start snapshot sequence number for the baseline.
end_snap_id	End snapshot sequence number for the baseline.
start_time	Start time for the baseline.
end_time	End time for the baseline.
baseline_name	Name of baseline.
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL.

Exceptions

- An error will be returned if this baseline name already exists in the system.
- The snapshot range that is specified for this interface must be an existing pair of snapshots in the database. An error will be returned if the inputted snapshots do not exist in the system.

Examples

This example creates a baseline (named 'oltp_peakload_bl') between snapshots 105 and 107 for the local database:

```

EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (start_snap_id => 105,
                                                    end_snap_id   => 107,
                                                    baseline_name =>
'oltp_peakload_bl');

```

If you query the DBA_HIST_BASELINE view after the CREATE BASELINE action, you will see the newly created baseline in the Workload Repository.

184.3.20 CREATE_BASELINE_TEMPLATE Procedures

This procedure specifies a template for how they would like baselines to be created for future time periods.

Syntax

Specifies a template for generating a baseline for a single time period in the future.

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
  start_time          IN DATE,
  end_time            IN DATE,
  baseline_name       IN VARCHAR2,
  template_name       IN VARCHAR2,
  expiration          IN NUMBER,
  dbid                IN NUMBER   DEFAULT NULL);
```

Specifies a template for creating and dropping baseline based on repeating time periods:

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
  day_of_week         IN VARCHAR2,
  hour_in_day         IN NUMBER,
  duration            IN NUMBER,
  start_time          IN DATE,
  end_time            IN DATE,
  baseline_name_prefix IN VARCHAR2,
  template_name       IN VARCHAR2,
  expiration          IN NUMBER,
  dbid                IN NUMBER   DEFAULT NULL);
```

Parameters

Table 184-26 CREATE_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
start_time	Start Time for the baseline to be created'
end_time	End Time for the baseline to be created
baseline_name	Name of baseline to be created
template_name	Name for the template
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL
dbid	Database ID for which the baseline template needs to be used. If NULL, this takes the database identifier of the local database. Defaults to NULL.
day_of_week	Day of week that the baseline should repeat on. Specify one of the following values: SUNDAY, MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY.
hour_in_day	Value of 0-23 to specify the Hour in the Day the baseline should start

Table 184-26 (Cont.) CREATE_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
duration	Duration (in number of hours) after hour in the day that the baseline should last
baseline_name_prefix	Name for baseline prefix. When creating the baseline, the name of the baseline will be the prefix appended with the date information.

184.3.21 CREATE_REMOTE_SNAPSHOT Function and Procedure

This function and procedure create a remote snapshot using the Remote Management Framework (RMF). The function returns the snapshot ID.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
  node_id      IN NUMBER,
  flush_level  IN VARCHAR2 DEFAULT 'BESTFIT');
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
  node_id      IN NUMBER,
  flush_level  IN VARCHAR2 DEFAULT 'BESTFIT')
RETURN NUMBER;
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
  node_name    IN VARCHAR2,
  topology_name IN VARCHAR2 DEFAULT NULL,
  flush_level  IN VARCHAR2 DEFAULT 'BESTFIT');
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(
  node_name    IN VARCHAR2,
  topology_name IN VARCHAR2 DEFAULT NULL,
  flush_level  IN VARCHAR2 DEFAULT 'BESTFIT')
RETURN NUMBER;
```

Parameters

Table 184-27 CREATE_REMOTE_SNAPSHOT Parameters

Parameter	Description
node_id	RMF node identifier of the database for which the snapshot needs to be created.
node_name	RMF node name of the database for which the snapshot needs to be created.
topology_name	RMF topology name of the database for which the snapshot needs to be created.

Table 184-27 (Cont.) CREATE_REMOTE_SNAPSHOT Parameters

Parameter	Description
flush_level	<p>The flush level can be one of the following:</p> <ul style="list-style-type: none"> • BESTFIT: Uses the default value depending on the type of snapshot being taken. • LITE: Lightweight snapshot. Only the most important statistics are collected. This is default for a pluggable database (PDB) and application container. • TYPICAL: Regular snapshot. Most of the statistics are collected. This is default for a container database root (CDB root) and non-CDB database. • ALL: Heavyweight snapshot. All the possible statistics are collected. This consumes a considerable amount of disk space and takes a long time to create.

Examples

This example creates a remote snapshot of the database having the RMF node identifier of 10:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(10);
```

If you query the DBA_HIST_SNAPSHOT view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

184.3.22 CREATE_SNAPSHOT Function and Procedure

This function and procedure create a snapshot. The function returns the snapshot ID. If both, the database ID and the database name are not specified in this subprogram, then the snapshot is created for the local database on which the subprogram is executed.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
    flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
    dbid        IN NUMBER   DEFAULT NULL,
    source_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
    flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
    dbid        IN NUMBER   DEFAULT NULL,
    source_name IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 184-28 CREATE_SNAPSHOT Parameters

Parameter	Description
flush_level	The flush level can be one of the following: <ul style="list-style-type: none"> BESTFIT: Uses the default value depending on the type of snapshot being taken. LITE: Lightweight snapshot. Only the most important statistics are collected. This is default for a pluggable database (PDB) and application container. TYPICAL: Regular snapshot. Most of the statistics are collected. This is default for a container database root (CDB root) and non-CDB database. ALL: Heavyweight snapshot. All the possible statistics are collected. This consumes a considerable amount of disk space and takes a long time to create.
dbid	Database ID of the database for which the snapshot needs to be created.
source_name	Name of the database for which the snapshot needs to be created.

Examples

This example creates a snapshot of the local database with the flush level of `ALL`:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT('ALL');
```

If you query the `DBA_HIST_SNAPSHOT` view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

184.3.23 DROP_BASELINE Procedure

This procedure drops a previously-defined baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE(
  baseline_name IN VARCHAR2,
  cascade       IN BOOLEAN  DEFAULT FALSE,
  dbid          IN NUMBER   DEFAULT NULL);
```

Parameters

Table 184-29 DROP_BASELINE Parameters

Parameter	Description
baseline_name	Name of baseline to drop from the system

Table 184-29 (Cont.) DROP_BASELINE Parameters

Parameter	Description
cascade	If TRUE, the pair of snapshots associated with the baseline will also be dropped. Otherwise, only the baseline is removed.
dbid	Database ID for which the baseline needs to be dropped (defaults to local DBID).

Examples

This example drops the baseline 'oltp_peakload_bl' without dropping the underlying snapshots:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (
    baseline_name => 'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the DROP_BASELINE action, you will see the specified baseline definition is removed. You can query the DBA_HIST_SNAPSHOT view to find that the underlying snapshots are left intact.

184.3.24 DROP_BASELINE_TEMPLATE Procedure

This procedure removes a template that is no longer needed.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE_TEMPLATE(
    template_name    IN VARCHAR2,
    dbid             IN NUMBER   DEFAULT NULL);
```

Parameters

Table 184-30 DROP_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
template_name	Name of the template to remove
dbid	Database ID for which the baseline template needs to be dropped. If NULL, this takes the database identifier of the local database. Defaults to NULL.

184.3.25 DROP_SNAPSHOT_RANGE Procedure

This procedure drops a range of snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(
    low_snap_id     IN NUMBER,
    high_snap_id    IN NUMBER,
    dbid            IN NUMBER   DEFAULT NULL);
```

Parameters

Table 184-31 DROP_SNAPSHOT_RANGE Procedure Parameters

Parameter	Description
low_snap_id	Low snapshot id of snapshots to drop.
high_snap_id	High snapshot id of snapshots to drop.
dbid	Database id (defaults to local DBID).

Examples

This example drops the range of snapshots between snapshot id 102 to 105 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(102, 105);
```

If you query the `dba_hist_snapshot` view after the Drop Snapshot action, you will see that snapshots 102 to 105 are removed from the Workload Repository.

184.3.26 LOCAL_AWR_DBID Function

This function returns the database identifier for the local AWR database.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.LOCAL_AWR_DBID()  
RETURN NUMBER;
```

184.3.27 MODIFY_BASELINE_WINDOW_SIZE Procedure

This procedure modifies the window size for the Default Moving Window Baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_BASELINE_WINDOW_SIZE(  
    window_size    IN    NUMBER,  
    dbid            IN    NUMBER    DEFAULT NULL);
```

Parameters

Table 184-32 MODIFY_BASELINE_WINDOW_SIZE Procedure Parameters

Parameter	Description
window_size	New Window size for the default Moving Window Baseline, in number of days.
dbid	Database ID (defaults to local DBID).

Usage Notes

The window size must be less than or equal to the AWR retention setting. If the window size needs to be greater than the retention setting, the

[MODIFY_SNAPSHOT_SETTINGS Procedures](#) (page 184-34) can be used to adjust the retention setting. A moving window can be set to a maximum of 13 weeks.

184.3.28 MODIFY_SNAPSHOT_SETTINGS Procedures

This procedure controls three aspects of snapshot generation.

- The `INTERVAL` setting affects how often snapshots are automatically captured.
- The `RETENTION` setting affects how long snapshots are retained in the Workload Repository.
- The number of SQL captured for each Top criteria. If the user manually specifies a value for Top N SQL, the AWR SQL collection will use the user-specified number for both automatic and manual snapshots.

There are two overloads. The first takes a `NUMBER` and the second takes a `VARCHAR2` for the `topnsql` argument. The differences are described under the Parameters description.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
    retention      IN NUMBER      DEFAULT NULL,
    interval       IN NUMBER      DEFAULT NULL,
    topnsql        IN NUMBER      DEFAULT NULL,
    dbid           IN NUMBER      DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
    retention      IN NUMBER      DEFAULT NULL,
    interval       IN NUMBER      DEFAULT NULL,
    topnsql        IN VARCHAR2,
    dbid           IN NUMBER      DEFAULT NULL);
```

Parameters

Table 184-33 MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

Parameter	Description
retention	<p>New retention time (in minutes). The specified value must be in the range of <code>MIN_RETENTION</code> (1 day) to <code>MAX_RETENTION</code> (100 years).</p> <p>If <code>ZERO</code> is specified, snapshots will be retained forever. A large system-defined value will be used as the retention setting.</p> <p>If <code>NULL</code> is specified, the old value for retention is preserved.</p> <p>NOTE: The retention setting must be greater than or equal to the window size of the 'SYSTEM_MOVING_WINDOW' baseline. If the retention needs to be less than the window size, the MODIFY_BASELINE_WINDOW_SIZE Procedure (page 184-33) can be used to adjust the window size.</p>

Table 184-33 (Cont.) MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

Parameter	Description
interval	<p>New interval setting between each snapshot, in units of minutes. The specified value must be in the range <code>MIN_INTERVAL</code> (10 minutes) to <code>MAX_INTERVAL</code> (1 year).</p> <p>If <code>ZERO</code> is specified, automatic and manual snapshots will be disabled. A large system-defined value will be used as the retention setting.</p> <p>If <code>NULL</code> is specified, the current value is preserved.</p>
topnsql	<ul style="list-style-type: none"> If <code>NUMBER</code>: Top N SQL size. The number of Top SQL to flush for each SQL criteria (Elapsed Time, CPU Time, Parse Calls, Shareable Memory, Version Count). The value for this setting will not be affected by the statistics/flush level and will override the system default behavior for the AWR SQL collection. The setting will have a minimum value of 30 and a maximum value of 50,000. Specifying <code>NULL</code> will keep the current setting. If <code>VARCHAR2</code>: Users are allowed to specify the following values: (<code>DEFAULT</code>, <code>MAXIMUM</code>, <code>N</code>), where <code>N</code> is the number of Top SQL to flush for each SQL criteria. Specifying <code>DEFAULT</code> will revert the system back to the default behavior of Top 30 for statistics level <code>TYPICAL</code> and Top 100 for statistics level <code>ALL</code>. Specifying <code>MAXIMUM</code> will cause the system to capture the complete set of SQL in the cursor cache. Specifying the number <code>N</code> is equivalent to setting the Top N SQL with the <code>NUMBER</code> type. Specifying <code>NULL</code> for this argument will keep the current setting.
dbid	<p>Database identifier in AWR for which to modify the snapshot settings. If <code>NULL</code> is specified, the local <code>dbid</code> will be used. Defaults to <code>NULL</code>.</p>

Examples

This example changes the `interval` setting to one hour and the `retention` setting to two weeks for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
  interval => 60,
  retention => 20160);
```

If you query the `DBA_HIST_WR_CONTROL` table after this procedure is executed, you will see the changes to these settings.

184.3.29 PURGE_SQL_DETAILS Procedure

This procedure purges SQL details, specifically rows from `WRH$_SQLTEXT`, `WRH$_SQL_PLAN`, and `WRH$_SQL_BIND_METADATA` that do not have corresponding rows (`DBID`, `SQL_ID`) in `WRH$_SQLSTAT`.

The subprogram calls for the `DBID` for which to run the purge. If the `DBID` is not specified, the database `DBID` is used. You can constrain runtime by specifying the maximum number of rows to purge per table. If no maximum is specified, the subprograms tries to purge all applicable rows.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.PURGE_SQL_DETAILS(
    numrows IN NUMBER DEFAULT NULL,
    dbid    IN NUMBER DEFAULT NULL);
```

Parameters

Table 184-34 PURGE_SQL_DETAILS Procedure Parameters

Parameter	Description
numrows	Number of rows
dbid	Database ID (default to local DBID)

184.3.30 REGISTER_REMOTE_DATABASE Procedures

This procedure registers a remote database in the Automatic Workload Repository (AWR) using the Remote Management Framework (RMF).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(
    node_id IN NUMBER);
```

```
DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(
    node_name      IN VARCHAR2,
    topology_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 184-35 REGISTER_REMOTE_DATABASE Parameters

Parameter	Description
node_id	RMF node identifier of the database that needs to be registered in the AWR.
node_name	RMF node name of the database that needs to be registered in the AWR.
topology_name	RMF topology name of the database that needs to be registered in the AWR.

Examples

This example registers the remote database having the RMF node identifier of 10 in the AWR:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(10);
```

184.3.31 REMOVE_COLORED_SQL Procedure

This procedure removes a colored SQL ID. After a SQL is uncolored, it will no longer be captured in a snapshot automatically, unless it makes the `TOP` list.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.REMOVE_COLORED_SQL(
  sql_id      IN VARCHAR2,
  dbid        IN NUMBER DEFAULT NULL);
```

Parameters

Table 184-36 REMOVE_COLORED_SQL Procedure Parameters

Parameter	Description
sql_id	13-character external SQL ID
dbid	Optional dbid, defaults to Local DBID

184.3.32 RENAME_BASELINE Procedure

This procedure renames a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.RENAME_BASELINE(
  old_baseline_name  IN VARCHAR2,
  new_baseline_name  IN VARCHAR2,
  dbid               IN NUMBER  DEFAULT NULL);
```

Parameters

Table 184-37 RENAME_BASELINE Procedure Parameters

Parameter	Description
old_baseline_name	Old baseline name.
new_baseline_name	New baseline name.
dbid	Database ID for which the baseline needs to be renamed (defaults to local DBID).

184.3.33 SELECT_BASELINE_DETAILS Function

This table function shows the values of the metrics corresponding to a baseline for a range of snapshots.

This table function returns an object of [AWR_BASELINE_METRIC_TYPE Object Type](#) (page 184-2).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_DETAILS(
    l_baseline_id    IN NUMBER,
    l_begin_snap     IN NUMBER DEFAULT NULL,
    l_end_snap       IN NUMBER DEFAULT NULL,
    l_dbid           IN NUMBER DEFAULT NULL)
RETURN awrbl_details_type_table PIPELINED;
```

Parameters

Table 184-38 SELECT_BASELINE_DETAILS Function Parameters

Parameter	Description
l_baseline_id	ID of the baseline for which the statistics need to be retrieved. Specifying the value 0 returns the statistics for the moving window baseline.
l_begin_snap	Start snapshot sequence number for the baseline.
l_end_snap	End snapshot sequence number for the baseline.
l_dbid	Database identifier for the baseline. If its value is set to NULL, then the database identifier for the local database is used. Its default value is NULL.

184.3.34 SELECT_BASELINE_METRIC Function

This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

This table function returns an object of [AWR_BASELINE_METRIC_TYPE Object Type](#) (page 184-2).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_METRIC(
    l_baseline_name  IN VARCHAR2,
    l_dbid           IN NUMBER DEFAULT NULL,
    l_instance_num   IN NUMBER DEFAULT NULL)
RETURN awr_metric_type_table PIPELINED;
```

Parameters

Table 184-39 SELECT_BASELINE_METRIC Function Parameters

Parameter	Description
l_baseline_name	Name of the baseline for which the metrics need to be viewed.
l_dbid	Database identifier for the baseline. If set to NULL, the database identifier for the local database is used. Default is NULL.
l_instance_num	The instance number for which the metrics need to be viewed. If set to NULL, metrics for the local database instance are shown. Default is NULL.

184.3.35 UNREGISTER_REMOTE_DATABASE Procedures

This procedure removes all the statistics, metadata, partitions, and so on of a remote database from the Automatic Workload Repository (AWR). After executing this procedure, the remote database cannot be used for any AWR operations, such as creating remote snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(
  node_id      IN NUMBER,
  remote_check IN BOOLEAN DEFAULT TRUE);
```

```
DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(
  node_name      IN VARCHAR2,
  topology_name  IN VARCHAR2 DEFAULT NULL,
  remote_check   IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 184-40 UNREGISTER_REMOTE_DATABASE Parameters

Parameter	Description
node_id	Identifier of the remote database whose data needs to be removed from the AWR.
node_name	Name of the remote database whose data needs to be removed from the AWR.
topology_name	RMF topology name of the remote database.
remote_check	If set to <code>TRUE</code> , the remote database's metadata is validated before removing its data from the AWR. This option requires the remote database to be available. If set to <code>FALSE</code> , the remote database's data is removed from the AWR without validating its metadata. This option must be selected to unregister a remote database that is not available (it is offline or there is a network outage).

Examples

This example removes the AWR data related to the remote database having the database identifier of 10:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(10);
```

184.3.36 UPDATE_DATAFILE_INFO Procedure

This procedure updates the data file and tablespace information stored in the Automatic Workload Repository (AWR) with the current information in the database. This procedure is useful when a data file or a tablespace has been moved or renamed. As this change is not always captured in the next snapshot, AWR report may not show the most current information.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_DATAFILE_INFO();
```

184.3.37 UPDATE_OBJECT_INFO Procedure

This procedure updates rows of WRH\$_SEG_STAT_OBJ table that represent objects in the local database. It attempts to determine the current names for all object belonging to the local database, except those with 'MISSING' and/or 'TRANSIENT' values in the name columns.

The amount of work performed at each invocation of this routine may be controlled by setting the input parameter.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_OBJECT_INFO(
    maxrows IN NUMBER DEFAULT 0);
```

Parameters

Table 184-41 UPDATE_OBJECT_INFO Procedure Parameters

Parameter	Description
maxrows	Maximum number of rows to be updated. Default= 0, meaning there is no limit.

The `DBMS_XA` package contains the XA/Open interface for applications to call XA interface in PL/SQL. Using this package, application developers can switch or share transactions across SQL*Plus sessions or processes using PL/SQL.

The chapter contains the following topics:

- [Overview](#) (page 185-1)
- [Security Model](#) (page 185-1)
- [Constants](#) (page 185-2)
- [Operational Notes](#) (page 185-3)
- [Data Structures](#) (page 185-4)
- [Summary of DBMS_XA Subprograms](#) (page 185-5)

 **See Also:**

Oracle Database Advanced Application Developer's Guide for more information about "Developing Applications with Oracle XA"

185.1 DBMS_XA Overview

These subprograms allow a PL/SQL application to define a global transaction branch ID (`XID`) and associate or disassociate the current session with the transaction branch.

Subsequently, these transaction branches may be prepared and committed by following the two-phase commit protocol. A single-phase commit protocol is also supported if only one resource manager is involved.

Interfaces are also provided for a PL/SQL application to set the timeout values for any new global transaction branches that may start with the current session.

185.2 DBMS_XA Security Model

This package is created under `sys`. Operations provided by this package are performed under the current calling user, not under the package owner `sys`. Any `DBMS_XA` subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any `DBMS_XA` subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

`SELECT` or `READ` privilege on `SYS.DBA_PENDING_TRANSACTIONS` is required for users who need to execute `XA_RECOVER` subprogram.

`FORCE ANY TRANSACTION` privilege is required for users who need to manipulate XA transactions created by other users.

185.3 DBMS_XA Constants

The `DBMS_XA` package defines several constants that can be used for specifying parameter values.

The package uses the constants shown in [Table 185-1](#) (page 185-2) for use in the flag field of the `XA_START` Function (page 185-11) and the `XA_END` Function (page 185-7).

Table 185-1 DBMS_XA Constants for Flag Field of XA_START & XA_END Functions

Name	Type	Value	Description
TMNOFLAGS	PLS_INTEGER	00000000	Indicates no flag value is selected.
TMSUCCESS	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('04000000')	Dissociates caller from transaction branch
TMJOIN	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('00200000')	Caller is joining existing transaction branch.
TMSUSPEND	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('02000000')	Caller is suspending, not ending, association
TMRESUME	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('08000000')	Caller is resuming association with suspended transaction branch.

The `DBMS_XA` package uses the constants shown in [Table 185-2](#) (page 185-2) for Possible Return Values

Table 185-2 DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_RBBASE	PLS_INTEGER	100	Inclusive lower bound of the rollback codes
XA_RBROLLBACK	PLS_INTEGER	XA_RBBASE	Rollback was caused by an unspecified reason
XA_RBCOMMFAIL	PLS_INTEGER	XA_RBBASE+1	Rollback was caused by a communication failure
XA_RBDEADLOCK	PLS_INTEGER	XA_RBBASE+2	Deadlock was detected
XA_RBINTEGRITY	PLS_INTEGER	XA_RBBASE+3	Condition that violates the integrity of the resources was detected
XA_RBOTHER	PLS_INTEGER	XA_RBBASE+4	Resource manager rolled back the transaction for an unlisted reason
XA_RBPROTO	PLS_INTEGER	XA_RBBASE+5	Protocol error occurred in the resource manager

Table 185-2 (Cont.) DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_RBTIMEOUT	PLS_INTEGER	XA_RBBASE+6	transaction branch took long
XA_RBTRANSIENT	PLS_INTEGER	XA_RBBASE+7	May retry the transaction branch
XA_RBEND	PLS_INTEGER	XA_RBTRANSIENT	Inclusive upper bound of the rollback codes
XA_NOMIGRATE	PLS_INTEGER	9	Transaction branch may have been heuristically completed
XA_HEURHAZ	PLS_INTEGER	8	Transaction branch may have been heuristically completed
XA_HEURCOM	PLS_INTEGER	7	Transaction branch has been heuristically committed
XA_HEURRB	PLS_INTEGER	6	Transaction branch has been heuristically rolled back
XA_HEURMIX	PLS_INTEGER	5	Some of the transaction branches have been heuristically committed, others rolled back
XA_RETRY	PLS_INTEGER	4	Routine returned with no effect and may be re-issued
XA_RDONLY	PLS_INTEGER	3	Transaction was read-only and has been committed
XA_OK	PLS_INTEGER	0	Normal execution
XAER_ASYNC	PLS_INTEGER	-2	Asynchronous operation already outstanding
XAER_RMERR	PLS_INTEGER	-3	Resource manager error occurred in the transaction branch
XAER_NOTA	PLS_INTEGER	-4	XID is not valid
XAER_INVALID	PLS_INTEGER	-5	Invalid arguments were given
XAER_PROTO	PLS_INTEGER	-6	Routine invoked in an improper context
XAER_RMFAIL	PLS_INTEGER	-7	Resource manager unavailable
XAER_DUPID	PLS_INTEGER	-8	XID already exists
XAER_OUTSIDE	PLS_INTEGER	-9	Resource manager doing work outside global transaction

185.4 DBMS_XA Operational Notes

In compliance with the XA specification of the X/Open CAE Standard for Distributed Transaction Processing, `XA_PREPARE/COMMIT/ROLLBACK/FORGET` may not be called when the transaction is still associated with the current session. Only after `XA_END` has been

called so that there is not any transaction associated with the current session, the application may call `XA_PREPARE/COMMIT/ROLLBACK/FORGET`.

`XAER_PROTO` error is returned from `XA_PREPARE/COMMIT/ROLLBACK/FORGET` if a transaction is being associated with the current session.

Prior to calling any of the package subprograms, a connection/session must have already been established to the Oracle database server backend, or a resource manager. Resource manager identifiers are not supported. If multiple resource managers are involved, multiple connections/sessions must be pre-established to each resource manager before calling any the package subprograms. If multiple connections/sessions are established during the course of global transaction processing, the caller must ensure that all of those connections/sessions associated with a specific global transaction branch identifier (XID) are established to the same resource manager.

185.5 DBMS_XA Data Structures

The `DBMS_XA` package uses this `OBJECT` type and associated `TABLE` type.

OBJECT Types

- [DBMS_XA_XID Object Type](#) (page 185-4)

TABLE Types

- [DBMS_XA_XID_ARRAY Table Type](#) (page 185-5)

185.5.1 DBMS_XA DBMS_XA_XID Object Type

The PL/SQL XA interface allows the PL/SQL application to define a global transaction branch id (XID) and associate/disassociate the current session with the transaction branch. XID is defined as a PL/SQL object type.

 **Note:**

For more information, see "Distributed Transaction Processing: The XA Specification" in the public XA Standard.

Syntax

```
TYPE DBMS_XA_XID IS OBJECT(  
    formatid    NUMBER,  
    gtrid       RAW(64),  
    bqual       RAW(64),  
    constructor function DBMS_XA_XID(  
        gtrid    IN    NUMBER)  
        RETURN SELF AS RESULT,  
    constructor function DBMS_XA_XID (  
        gtrid    IN    RAW,  
        bqual    IN    RAW)  
        RETURN SELF AS RESULT,  
    constructor function DBMS_XA_XID(  
        formatid IN    NUMBER,
```

```

gtrid      IN RAW,
bqual     IN RAW DEFAULT HEXTORAW('00000000000000000000000000000001')
RETURN SELF AS RESULT)

```

Attributes

Table 185-3 DBMS_XA_XID Object Type

Attribute	Description
formatid	Format identifier, a number identifying different transaction managers (TM)
gtrid	Global transaction identifier uniquely identifying a global transaction, of which the maximum size is 64 bytes
bqual	Branch qualifier, of which the maximum size is 64 bytes

185.5.2 DBMS_XA DBMS_XA_XID_ARRAY Table Type

This type is used to define an array of `xid` that represent a list of global transaction branches.

Syntax

```
TYPE DBMS_XA_XID_ARRAY as TABLE of DBMS_XA_XID
```

185.6 Summary of DBMS_XA Subprograms

This table lists the `DBMS_XA` subprograms and briefly describes them.

Table 185-4 DBMS_XA Package Subprograms

Subprogram	Description
DIST_TXN_SYNC Procedure (page 185-6)	Used in recovery of synchronization when utilizing Oracle Real Application Clusters (Oracle RAC)
XA_COMMIT Function (page 185-6)	Commits the global transaction specified by <code>xid</code>
XA_END Function (page 185-7)	Disassociates the current session from the transaction branch specified by <code>xid</code>
XA_FORGET Function (page 185-8)	Informs the resource manager to forget about a heuristically committed or rolled back transaction branch.
XA_GETLASTOER Function (page 185-8)	Obtains the last Oracle error code, in case of failure of previous XA calls.
XA_PREPARE Function (page 185-8)	Prepares the transaction branch specified in <code>xid</code> for committing the transaction subsequently if possible
XA_RECOVER Function (page 185-9)	Obtains a list of prepared or heuristically completed transaction branches from a resource manager
XA_ROLLBACK Function (page 185-9)	Informs the resource manager to roll back work done on behalf of a transaction branch
XA_SETTIMEOUT Function (page 185-10)	Sets the transaction timeout in seconds for the current session

Table 185-4 (Cont.) DBMS_XA Package Subprograms

Subprogram	Description
XA_START Function (page 185-11)	Associates the current session with the transaction branch specified by <code>xid</code>

185.6.1 DIST_TXN_SYNC Procedure

This procedure can be used to synchronize in-doubt transactions when one of the Oracle Real Application Clusters (Oracle RAC) instances fails.

Syntax

```
DBMS_XA.DIST_TXN_SYNC;
```

185.6.2 XA_COMMIT Function

This function commits the global transaction specified by `xid`.

Syntax

```
DBMS_XA.XA_COMMIT (
  xid          IN DBMS_XA_XID,
  onePhase    IN BOOLEAN)
RETURN PLS_INTEGER;
```

Parameters

Table 185-5 XA_COMMIT Function Parameters

Parameter	Description
<code>xid</code>	See DBMS_XA_XID Object Type (page 185-4)
<code>onePhase</code>	If <code>TRUE</code> , apply single phase commit

Return Values

See [Table 185-2](#) (page 185-2). Possible return values indicating error are: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVALID`, or `XAER_PROTO`. Other possible return values include: `XA_OK`, `XA_RB*`, `XA_HEURHAZ`, `XA_HEURCOM`, `XA_HEURRB`, and `XA_HEURMIX`.

Usage Notes

- An application must not call `COMMIT`, but instead must call `XA_COMMIT` to commit the global transaction specified by `xid`. If a user needs to commit a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- If `onePhase` is `TRUE`, the resource manager should use a one-phase commit protocol to commit the work done on behalf of `xid`. Otherwise, only if all branches of the global transaction have been prepared successfully and the preceding `XA_PREPARE` call has returned `XA_OK`, should `XA_COMMIT` be called.
- The application must make a separate `XA_COMMIT` call for each of the transaction branches of the global transaction for which `XA_PREPARE` has returned `XA_OK`.

- If the resource manager did not commit the transaction and the parameter `onePhase` is set to `TRUE`, the resource manager may return one of the `XA_RB*` code. Upon return, the resource manager has rolled back the branch's work and has released all held resources.

185.6.3 XA_END Function

This function disassociates the current session from the transaction branch specified by `xid`.

A transaction manager calls `XA_END` when a thread of control finishes, or needs to suspend work on, a transaction branch. This occurs when the application completes a portion of its work, either partially or in its entirety (for example, before blocking on some event in order to let other threads of control work on the branch). When `XA_END` successfully returns, the calling thread of control is no longer actively associated with the branch but the branch still exists

Syntax

```
DBMS_XA.XA_END (
    xid   IN DBMS_XA_XID,
    flag  IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 185-6 XA_END Function Parameters

Parameter	Description
<code>xid</code>	See DBMS_XA_XID Object Type (page 185-4)
<code>flag</code>	See Table 185-1 (page 185-2).

Return Values

See [Table 185-2](#) (page 185-2). Possible return values in error are `XAER_RMERR`, `XAER_RMFAILED`, `XAER_NOTA`, `XAER_INVAL`, `XAER_PROTO`, or `XA_RB*`.

Usage Notes

- `TMSUCCESS` or `TMSUSPEND` may be specified in `flag`, and the transaction branch is disassociated with the current session in detached state if the return value is `XA_OK`. `TMFAIL` is not supported. `XA_END` may be called with either `TMSUCCESS` or `TMSUSPEND` to disassociate the transaction branch identified by `xid` from the current session.
- `XA_OK` is returned if `XA_END` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the application should proceed for other normal operations.
- Executing a `ROLLBACK` statement without calling `XA_END` first will rollback the changes made by the current transaction. However, the transaction context is still associated with the current session until `XA_END` is called.
- Executing a `COMMIT` statement without calling `XA_END` first will result in `ORA-02089`: `COMMIT` is not allowed in a subordinate session.

- Executing a COMMIT or a ROLLBACK statement after `XA_END` has no effect on the transaction identified by `xid`, since this transaction is no longer associated with the current session. To commit the transaction ID or the [XA_ROLLBACK Function](#) (page 185-9) to commit/rollback the transaction specified by the `xid`.

185.6.4 XA_FORGET Function

This function informs the resource manager to forget about a heuristically committed or rolled back transaction branch.

Syntax

```
DBMS_XA.XA_FORGET (  
    xid          IN DBMS_XA_XID)  
RETURN PLS_INTEGER;
```

Parameters

Table 185-7 XA_FORGET Function Parameters

Parameter	Description
<code>xid</code>	See DBMS_XA_XID Object Type (page 185-4)

Return Values

See [Table 185-2](#) (page 185-2). Possible return values are `XA_OK`, `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVAL`, or `XAER_PROTO`.

185.6.5 XA_GETLASTOER Function

This function obtains the last Oracle error code, in case of failure of previous XA calls.

Syntax

```
DBMS_XA.XA_GETLASTOER  
RETURN PLS_INTEGER;
```

Return Values

The return value carries the last Oracle error code.

185.6.6 XA_PREPARE Function

This function prepares the transaction branch specified in `xid` for committing the transaction subsequently if possible.

Syntax

```
DBMS_XA.XA_PREPARE (  
    xid IN DBMS_XA_XID)  
RETURN PLS_INTEGER;
```

Parameters

Table 185-8 XA_PREPARE Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type (page 185-4)

Return Values

See [Table 185-2](#) (page 185-2). Possible return codes include: XA_OK, XA_RDONLY, XA_RB*, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

Usage Notes

- If a user needs to prepare a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- An application must keep track of all the branches of one global transaction, and prepare each transaction branch. Only if all branches of the global transaction have been prepared successfully and `XA_PREPARE` has returned `XA_OK`, the application may proceed to call `XA_COMMIT`.

185.6.7 XA_RECOVER Function

This function obtains a list of prepared or heuristically completed transaction branches from a resource manager.

Syntax

```
DBMS_XA.XA_RECOVER
RETURN DBMS_XA_XID_ARRAY;
```

Return Values

See [DBMS_XA_XID_ARRAY Table Type](#) (page 185-5)

Usage Notes

- The flags `TMSTARTSCAN`, `TMENDSCAN`, `TMNOFLAGS` are not supported.
- The privilege `SELECT ON DBA_PENDING_TRANSACTIONS` must be granted to the user who needs to call `XA_RECOVER`.

185.6.8 XA_ROLLBACK Function

This function informs the resource manager to roll back work done on behalf of a transaction branch.

Syntax

```
DBMS_XA.XA_ROLLBACK (
    xid          IN DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

Table 185-9 *XA_ROLLBACK Function Parameters*

Parameter	Description
xid	See DBMS_XA_XID Object Type (page 185-4)

Return Values

See [Table 185-2](#) (page 185-2). Possible return values are: XA_OK, XA_RB*, XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, or XA_HEURMIX.

Usage Notes

If a user needs to rollback a transaction branch that created by other users, the privilege `FORCE ANY TRANSACTION` must be granted to the user.

185.6.9 XA_SETTIMEOUT Function

This function sets the transaction timeout in seconds for the current session.

Syntax

```
DBMS_XA.XA_SETTIMEOUT (
    seconds IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 185-10 *XA_SETTIMEOUT Function Parameters*

Parameter	Description
seconds	The timeout value indicates the maximum time in seconds that a transaction branch may be disassociated from the session before the system automatically aborts the transaction. The default value is 60 seconds.

Return Values

See [Table 185-2](#) (page 185-2). Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, or XAER_INVALID.

Usage Notes

Only if return value is XA_OK, is the timeout value successfully set.

185.6.10 XA_START Function

This function associates the current session with a transaction branch specified by the `xid`.

Syntax

```
DBMS_XA.XA_START (  
    xid IN DBMS_XA_XID,    flag IN PLS_INTEGER) RETURN PLS_INTEGER;
```

Parameters

Table 185-11 XA_START Function Parameters

Parameter	Description
<code>xid</code>	See DBMS_XA_XID Object Type (page 185-4)
<code>flag</code>	See Table 185-1 (page 185-2).

Return Values

See [Table 185-2](#) (page 185-2)

Usage Notes

- If `TMJOIN` or `TMRESUME` is specified in `flag`, the start is for joining an existing transaction branch identified by the `xid`. `TMJOIN` flag should be used when the transaction is detached with `TMSUCCESS` flag. `TMRESUME` should be used when the transaction branch is detached with `TMSUSPEND` flag. `XA_START` may be called with either flag to join an existing transaction branch.
- If `TMNOFLAGS` is specified in `flag`, and neither `TMJOIN` nor `TMRESUME` is specified, a new transaction branch is to be started. If the transaction branch specified in `xid` already exists, `XA_START` returns an `XAER_DUPID` error code.
- Possible return values in error include: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_DUPID`, `XAER_OUTSIDE`, `XAER_NOTA`, `XAER_INVALID`, and `XAER_PROTO`.
- `XA_OK` is returned if `XA_START` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the PL/SQL application should proceed for other normal operations. Transaction stacking is not supported. If there is an active transaction associated with the current session, may not be called to start or join another transaction. `XAER_PROTO` will be returned if `XA_START` is called with an active global transaction branch associated with the session. `XAER_OUTSIDE` will be returned if `XA_START` is called with a local transaction associated with the current session.

DBMS_XDB

The `DBMS_XDB` package subprograms and constants are deprecated with Oracle Database 12c. While all features continue to be supported for backward compatibility, Oracle recommends that you use the alternative procedures provided in each case.

Note:

For more information, see [Deprecated Subprograms](#) (page 186-2) and [Constants](#) (page 186-5).

The `DBMS_XDB` package supports the following features:

- Resource Management subprograms which complement Resource Views
- The Access Control List (ACL)-based Security Mechanism
- Configuration Session Management
- Creation of the XDB username

This chapter contains the following topics:

- [Overview](#) (page 186-1)
- [Deprecated Subprograms](#) (page 186-2)
- [Security Model](#) (page 186-5)
- [Constants](#) (page 186-5)
- [Summary of DBMS_XDB Subprograms](#) (page 186-6)

See Also:

- *Oracle XML DB Developer's Guide*
- *Oracle Database New Features Guide*

186.1 DBMS_XDB Overview

`DBMS_XDB` provides a range of management functions. However, `DBMS_XDB` package subprograms and constants are deprecated with Oracle Database 12c. While all features continue to be supported for backward compatibility, Oracle recommends that you use the alternative procedures provided in each case.

The `DBMS_XDB` package supports the following features:

- The Resource Management functionality provides [LINK Procedures](#) (page 186-41), [EXISTSRESOURCE Function](#) (page 186-29), [LOCKRESOURCE Function](#) (page 186-41), [GETLOCKTOKEN Procedure](#) (page 186-35), [UNLOCKRESOURCE Function](#) (page 186-48), [CREATERESOURCE Functions](#) (page 186-21), [RENAMERESOURCE Procedure](#) (page 186-43), [DELETERESOURCE Procedure](#) (page 186-24), [GETRESOID Function](#) (page 186-37), [CREATEOIDPATH Function](#) (page 186-21), and [CREATEFOLDER Function](#) (page 186-20) subprograms which complement Resource Views.
- The Access Control List (ACL)-based Security Mechanism can be used with in-hierarchy ACLs stored by the database or in-memory ACLs that may be stored outside the database. Some of these methods can be used for both Oracle resources and arbitrary database objects. Use [CHECKPRIVILEGES Function](#) (page 186-19), [GETACLDOCUMENT Function](#) (page 186-30), and [CHANGEPRIVILEGES Function](#) (page 186-18) for Oracle Resources. [ACLCHECKPRIVILEGES Function](#) (page 186-10) provides access to Oracle's ACL-based Security mechanism without storing objects in the Hierarchy.
- Configuration Session Management is supported by [CFG_REFRESH Procedure](#) (page 186-17), [CFG_GET Function](#) (page 186-17) and [CFG_UPDATE Procedure](#) (page 186-17). methods.
- The XDB username is created during XDB installation. This user owns a set of default tables and packages. [GETXDB_TABLESPACE Function](#) (page 186-37) and the `DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE` Procedure enable movement of schemas to a specified tablespace, and support the default `SYSAUX` tablespace introduction

186.2 DBMS_XDB Deprecated Subprograms

All subprograms in the `DBMS_XDB` package are deprecated with Oracle Database 12c and substituted by the alternative subprograms with the same names in either the `DBMS_XDB_CONFIG` package or the `DBMS_XDB_REPOS` package as listed in the table.

 **Note:**

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only and may be terminated in future releases.

Table 186-1 DBMS_XDB Deprecated Subprograms and their Alternatives

186.3 DBMS_XDB Security Model

Owned by XDB, the DBMS_XDB package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is SYS or XDB, or the current user has the XDBADMIN or DBA role.

186.4 DBMS_XDB Constants

All constants described in the following table are deprecated in Oracle Release 12c.

They are relocated to either the DBMS_XDB_CONFIG (page 188-1) package or the DBMS_XDB_REPOS (page 190-1) package. The specifics of transference in each case are detailed in the **Relocated** column.

Oracle recommends that you do not use constants in their DBMS_XDB context in new applications. Support for deprecated features is for backward compatibility only and may be terminated in future releases.

Table 186-2 DBMS_XDB Constants

Constant	Type	Value	Description	Relocated
DELETE_RESOURCE	NUMBER	1	Deletes a resource; fails if the resource has children.	DBMS_XDB_RE POS
DELETE_RECURSIVE	NUMBER	2	Deletes a resource and its children, if any.	DBMS_XDB_RE POS
DELETE_FORCE	NUMBER	3	Deletes the resource, even if the object it contains is invalid.	DBMS_XDB_RE POS
DELETE_RECURSIVE_FORCE	NUMBER	4	Deletes a resource and its children, if any, even if the object it contains is invalid.	DBMS_XDB_RE POS
DELETE_RES_METADATA_CASCADE	NUMBER	1	Deletes the corresponding row in the metadata table	DBMS_XDB_RE POS
DELETE_RES_METADATA_NOCASCADE	NUMBER	2	Does not delete the row in the metadata table	DBMS_XDB_RE POS
DEFAULT_LOCK_TIMEOUT_CONSTANT	PLS_INTEGER	(60*60)	Default time (in seconds) after which lock will expire	DBMS_XDB_RE POS
LINK_TYPE_HARD	NUMBER	1	Type of link to be created (default)	DBMS_XDB_RE POS
LINK_TYPE_WEAK	NUMBER	2	Type of link to be created	DBMS_XDB_RE POS
LINK_TYPE_SYMBOLIC	NUMBER	3	Type of link to be created	DBMS_XDB_RE POS
ON_DENY_NEXT_CUSTOM	NUMBER	1	If access denied, the next custom authorization is tried	DBMS_XDB_CO NFIG
ON_DENY_BASIC	NUMBER	2	If access denied, basic authentication is used	DBMS_XDB_CO NFIG
XDB_ENDPOINT_HTTP	NUMBER	1	Defining listener for first HTTP port	DBMS_XDB_CO NFIG
XDB_ENDPOINT_HTTP2	NUMBER	2	Defining listener for second HTTP port	DBMS_XDB_CO NFIG
XDB_PROTOCOL_TCP	NUMBER	1	Defining listener for HTTP protocol	DBMS_XDB_CO NFIG
XDB_PROTOCOL_TCPS	NUMBER	2	Defining listener for HTTPS protocol	DBMS_XDB_CO NFIG

186.5 Summary of DBMS_XDB Subprograms

This table lists the DBMS_XDB subprograms and briefly describes them.

Table 186-3 DBMS_XDB Package Subprograms

Subprogram	Description
ACLCHECKPRIVILEGES Function (page 186-10)	Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.
ADDHTTPEXPIREMAPPING Procedure (page 186-10)	Adds to <code>xdb\$config</code> a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.
ADDMIMEMAPPING Procedure (page 186-11)	Adds a mime mapping to the XDB configuration
ADDSCHEMALOCMAPPING Procedure (page 186-12)	Adds a schema location mapping to the XDB configuration
ADDSERVLET Procedure (page 186-12)	Adds a servlet to XDB configuration
ADDSERVLETMAPPING Procedure (page 186-14)	Adds a servlet mapping to XDB configuration
ADDSERVLETSECROLE Procedure (page 186-14)	Adds a security role <code>REF</code> to a specified servlet in the XDB configuration
ADDXMLEXTENSION Procedure (page 186-15)	Adds adds an XML extension to the XDB configuration
APPENDRESOURCEMETADATA Procedure (page 186-16)	Takes in user-defined metadata either as a <code>REF</code> to <code>XMLTYPE</code> or an <code>XMLTYPE</code> and adds it to the desired resource
CFG_GET Function (page 186-17)	Retrieves the session's configuration information
CFG_REFRESH Procedure (page 186-17)	Refreshes the session's configuration information to the latest configuration
CFG_UPDATE Procedure (page 186-17)	Updates the configuration information
CHANGEOWNER Procedure (page 186-18)	Changes the owner of the resource/s to the specified owner.
CHANGEPRIVILEGES Function (page 186-18)	Adds a specified ACE to a specified resource's ACL
CHECKPRIVILEGES Function (page 186-19)	Checks access privileges granted to the current user on the specified resource
CREATEFOLDER Function (page 186-20)	Creates a new folder resource in the hierarchy
CREATEOIDPATH Function (page 186-21)	Creates a virtual path to the resource based on object ID
CREATERESOURCE Functions (page 186-21)	Creates a new resource
DELETEHTTPEXPIREMAPPING Procedure (page 186-23)	Deletes from <code>xdb\$config</code> all mappings of the URL pattern to an expiration date
DELETEMIMEMAPPING Procedure (page 186-24)	Deletes the mime mapping from the XDB configuration
DELETERESOURCE Procedure (page 186-24)	Deletes a resource from the hierarchy

Table 186-3 (Cont.) DBMS_XDB Package Subprograms

Subprogram	Description
DELETERESOURCEMETADATA Procedures (page 186-25)	Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)
DELETESCHEMALOCMAPPING Procedure (page 186-26)	Deletes the schema location mapping for the specified schema URL from the XDB configuration.
DELETESERVLET Procedure (page 186-26)	Deletes a servlet from XDB configuration
DELETESERVLETMAPPING Procedure (page 186-27)	Deletes the servlet mapping for the specified servlet name from the XDB configuration
DELETESERVLETSECCROLE Procedure (page 186-27)	Deletes the specified role from a servlet in the XDB configuration
DELETXMLEXTENSION Procedure (page 186-28)	Deletes the specified XML extension from the XDB configuration
ENABLEDIGESTAUTHENTICATION Procedure (page 186-29)	Enables digest authentication
EXISTSRESOURCE Function (page 186-29)	Determines if a resource is the hierarchy, based on its absolute path
GETACLDOCUMENT Function (page 186-30)	Retrieves ACL document that protects resource given its path name
GETCONTENTBLOB Function (page 186-30)	Retrieves the contents of a resource returned as a BLOB
GETCONTENTCLOB Function (page 186-31)	Retrieves the contents of a resource returned as a CLOB
GETCONTENTVARCHAR2 Function (page 186-32)	Retrieves the contents of a resource returned as a string
GETCONTENTXMLREF Function (page 186-32)	Retrieves the contents of a resource returned as a REF to an XMLTYPE
GETCONTENTXMLTYPE Function (page 186-33)	Retrieves the contents of a resource returned as an XMLTYPE
GETFTPPORT Function (page 186-33)	Gets the value of the current FTP port
GETHTTPPORT Function (page 186-34)	Gets the value of the current HTTP port
GETHTTPREQUESTHEADER Function (page 186-34)	Gets the values of the passed header
GETLISTENERENDPOINT Procedure (page 186-35)	Retrieves the parameters of a listener end point corresponding to the XML DB HTTP server
GETLOCKTOKEN Procedure (page 186-35)	Returns that resource's lock token for the current user given a path to a resource
GETPRIVILEGES Function (page 186-36)	Gets all privileges granted to the current user on a specified resource
GETRESOID Function (page 186-37)	Returns the object ID of the resource from its absolute path
GETXDB_TABLESPACE Function (page 186-37)	Returns the current tablespace of the XDB (user)

Table 186-3 (Cont.) DBMS_XDB Package Subprograms

Subprogram	Description
HASBLOBCONTENT Function (page 186-38)	Returns <code>TRUE</code> if the resource has BLOB content
HASCHARCONTENT Function (page 186-38)	Returns <code>TRUE</code> if the resource has character content
HASXMLCONTENT Function (page 186-39)	Returns <code>TRUE</code> if the resource has XML content
HASXMLREFERENCE Function (page 186-39)	Returns <code>TRUE</code> if the resource has <code>REF</code> to XML content
ISFOLDER Function (page 186-40)	Returns <code>TRUE</code> if the resource is a folder or container
LINK Procedures (page 186-41)	Creates a link to an existing resource
LOCKRESOURCE Function (page 186-41)	Gets a WebDAV-style lock on that resource given a path to that resource
PROCESSLINKS Procedure (page 186-42)	Processes document links in the specified resource
PURGERESOURCEMETADATA Procedure (page 186-43)	Deletes all user metadata from a resource
RENAMERESOURCE Procedure (page 186-43)	Renames the XDB resource
SETACL Procedure (page 186-44)	Sets the ACL on a specified resource
SETFTPPORT Procedure (page 186-45)	Sets the FTP port to a new value
SETHHTPPORT Procedure (page 186-45)	Sets the HTTP port to a new value
SETLISTENERENDPOINT Procedure (page 186-46)	Sets the parameters of a listener end point corresponding to the XML DB HTTP server
SETLISTENERLOCALACCESS Procedure (page 186-46)	Restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface or on both localhost and non-localhost interfaces
SPLITPATH Procedure (page 186-47)	Splits the path into a parentpath and childpath
TOUCHRESOURCE Procedure (page 186-48)	Changes the modification time of the resource to the current time
UNLOCKRESOURCE Function (page 186-48)	Unlocks the resource given a lock token and resource path
UPDATERESOURCEMETADATA Procedures (page 186-49)	Updates metadata for a resource

186.5.1 ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the `OWNER` of the resource. Returns positive integer if all privileges are granted.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [ACLCHECKPRIVILEGES Function](#) (page 190-4).

Syntax

```
DBMS_XDB.ACLCHECKPRIVILEGES(
  acl_path IN VARCHAR2,
  owner    IN VARCHAR2,
  privs    IN xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 186-4 *ACLCHECKPRIVILEGES Function Parameters*

Parameter	Description
<code>acl_path</code>	Absolute path in the Hierarchy for ACL document
<code>owner</code>	Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution
<code>privs</code>	An <code>XMLType</code> instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function (page 186-19).

186.5.2 ADDHTTPEXPIREMAPPING Procedure

This procedure adds to `xdb$config` a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [ADDHTTPEXPIREMAPPING Procedure](#) (page 188-4).

Syntax

```
DBMS_XDB.ADDHTTPEXPIREMAPPING (
  pattern IN VARCHAR2,
  expire  IN VARCHAR2);
```

Parameters

Table 186-5 *ADDHTTPEXPIREMAPPING Procedure Parameters*

Parameter	Description
pattern	URL pattern (only * accepted as wildcards)
expire	Expiration directive, follows the ExpireDefault in Apache's mod_expires: base [plus] (num type)* -- base: now modification -- type: year years month months week weeks day days minute minutess second seconds

Examples

```
DBMS_XDB.ADDHTTPEXPIREMAPPING ('/public/test1/*', 'now plus 4 weeks');
DBMS_XDB.ADDHTTPEXPIREMAPPING (
    '/public/test2/*', 'modification plus 1 day 30 seconds');
```

186.5.3 ADDMIMEMAPPING Procedure

This procedure adds the following mime mapping to XDB configuration:

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [ADDMIMEMAPPING Procedure](#) (page 188-5).

```
<mime-mapping>
<extension>extension</extension>
<mime-type>mimetype</mime-type>
</mime-mapping>
```

Syntax

```
DBMS_XDB.ADDMIMEMAPPING(
    extension IN VARCHAR2,
    mimetype IN VARCHAR2);
```

Parameters

Table 186-6 *ADDMIMEMAPPING Procedure Parameters*

Parameter	Description
extension	Extension for which a mime type is being added
mimetype	Mime type

186.5.4 ADDSCHEMALOCMAPPING Procedure

This procedure adds the following schema location mapping to the XDB configuration:

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [ADDMIMEMAPPING Procedure](#) (page 188-5).

```
<schemaLocation-mapping>
  <namespace>namespace</namespace>
  <element>element</element>
  <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

Syntax

```
DBMS_XDB.ADDSCHEMALOCMAPPING(
  namespace   IN   VARCHAR2,
  element     IN   VARCHAR2,
  schemaURL   IN   VARCHAR2);
```

Parameters

Table 186-7 *ADDSCHEMALOCMAPPING Procedure Parameters*

Parameter	Description
namespace	Namespace
element	Element
schemaURL	Schema URL

186.5.5 ADDSERVLET Procedure

This procedure adds A servlet to XDB configuration.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [ADDSERVLET Procedure](#) (page 188-6).

It adds the following servlet to XDB configuration:

```
<servlet>
  <servlet-name>name</servlet-name>
  <servlet-language>language</servlet-language>
  <display-name>dispname</display-name>
```

```

    <description>descript</description>
    <servlet-class>class</servlet-class>
    <servlet-schema>schema</servlet-schema>
</servlet>

```

Syntax

```

DBMS_XDB.ADDSERVLET(
    name          IN   VARCHAR2,
    language      IN   VARCHAR2,
    dispname      IN   VARCHAR2,
    icon          IN   VARCHAR2 := NULL,
    descript      IN   VARCHAR2 := NULL,
    class         IN   VARCHAR2 := NULL,
    jspfile       IN   VARCHAR2 := NULL,
    plsqli        IN   VARCHAR2 := NULL,
    schema        IN   VARCHAR2 := NULL);

```

Parameters

Table 186-8 *ADDSERVLET Procedure Parameters*

Parameter	Description
name	Servlet name
language	Must be one of "C", "Java", "PL/SQL"
dispname	Display name
icon	Icon
descript	Description
class	The <code>class / jspfile / plsqli</code> function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
jspfile	This parameter is not supported. Always provide NULL value for this parameter. System throws an error if the value is not NULL.
plsqli	The <code>class / jspfile / plsqli</code> function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
schema	Schema is used to specify <code>servlet-schema</code> xml element name in <code>xdbconfig.xml</code> . It indicates the Oracle schema in which the Java class is loaded. If you do not specify any value, then the schema is searched using the default resolver specification.

186.5.6 ADDSERVLETMAPPING Procedure

This procedure adds a servlet mapping to XDB configuration:

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [ADDSERVLETMAPPING Procedure](#) (page 188-7).

It adds the following servlet mapping:

```
<servlet-mapping>      <servlet-pattern>pattern</servlet-pattern>      <servlet-
name>name</servlet-name></servlet-mapping>
```

Syntax

```
DBMS_XDB.ADDSERVLETMAPPING(
    pattern IN VARCHAR2,    name      IN VARCHAR2);
```

Parameters

Table 186-9 *ADDSERVLETMAPPING Procedure Parameters*

Parameter	Description
pattern	Sservlet pattern
name	Servlet name

186.5.7 ADDSERVLETSECROLE Procedure

This procedure adds the security role `REF` to a specified servlet in XDB configuration.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [ADDSERVLETSECROLE Procedure](#) (page 188-7).

It adds the following security role, as shown below:

```
<security-role-ref>
  <role-name>rolename</role-name>
  <role-link>rolelink</role-link>
  <description>descript</description>
</security-role-ref>
```

Syntax

```
DBMS_XDB.ADDSERVLETSECROLE(
    servname IN VARCHAR2,    rolename IN VARCHAR2,    rolelink IN
    VARCHAR2,    descript IN VARCHAR2 := NULL);
```

Parameters**Table 186-10** *ADDSERVLETSECROLE Procedure Parameters*

Parameter	Description
servname	Servlet name
rolename	Role name
rolelink	Role link
descript	Description

186.5.8 ADDXMLEXTENSION Procedure

This procedure adds an XML extension to the XDB configuration under `<xml-extensions>`.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [ADDXMLEXTENSION Procedure](#) (page 188-8).

It adds the following XML extension:

```
<extension>extension</extension>
```

Syntax

```
DBMS_XDB.ADDXMLEXTENSION(
    extension IN VARCHAR2);
```

Parameters**Table 186-11** *ADDXMLEXTENSION Procedure Parameters*

Parameter	Description
extension	XML extension to be added

186.5.9 APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a `REF` to `XMLTYPE` or an `XMLTYPE` and adds it to the desired resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` (page 190-1) package - the `APPENDRESOURCEMETADATA Procedure` (page 190-5).

Syntax

```
DBMS_XDB.APPENDRESOURCEMETADATA (
  abspath  IN  VARCHAR2,
  metadata IN  XMLTYPE);
```

```
DBMS_XDB.APPENDRESOURCEMETADATA (
  abspath  IN  VARCHAR2,
  metadata IN  REF SYS.XMLTYPE);
```

Parameters

Table 186-12 APPENDRESOURCEMETADATA Procedure

Parameter	Description
<code>abspath</code>	Absolute path of the resource
<code>metadata</code>	Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table.

Usage Notes

- In the case in which a `REF` is passed in, the procedure stores the `REF` in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the `RESID` column for the metadata table. Note that the `REF` passed in must be unique. In other words, there must not be a `REF` with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a `REF` that already exists.
- In the case where the `XMLTYPE` is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

186.5.10 CFG_GET Function

This function retrieves the session's configuration information as an `XMLType` instance.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [CFG_GET Function](#) (page 188-8).

Syntax

```
DBMS_XDB.CFG_GET  
RETURN SYS.XMLType;
```

186.5.11 CFG_REFRESH Procedure

This procedure refreshes the session's configuration information to the latest configuration. This procedure is deprecated in Release 12c.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [CFG_REFRESH Procedure](#) (page 188-8).

Syntax

```
DBMS_XDB.CFG_REFRESH;
```

186.5.12 CFG_UPDATE Procedure

This procedure updates the configuration information and commits the change. This procedure is deprecated in Release 12c.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [CFG_UPDATE Procedure](#) (page 188-8).

Syntax

```
DBMS_XDB.CFG_UPDATE(  
  xdbconfig IN SYS.XMLTYPE);
```

Parameters

Table 186-13 CFG_UPDATE Procedure Parameters

Parameter	Description
xdbconfig	The new configuration data

186.5.13 CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner. This procedure is deprecated in Release 12c.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [CHANGEOWNER Procedure](#) (page 190-5).

Syntax

```
DBMS_XDB.CHANGEOWNER(
  abspath   IN  VARCHAR2,
  owner     IN  VARCHAR2,
  recurse   IN  BOOLEAN := FALSE);
```

Parameters

Table 186-14 CHANGEOWNER Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
owner	New owner for the resource
recurse	If TRUE, recursively change owner of all resources in the folder tree

186.5.14 CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL. This procedure is deprecated in Release 12c.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [CHANGEPRIVILEGES Function](#) (page 190-6).

Syntax

```
DBMS_XDB.CHANGEPRIVILEGES(
    res_path IN VARCHAR2,
    ace      IN xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 186-15 CHANGEPRIVILEGES Function Parameters

Parameter	Description
res_path	Path name of the resource for which privileges need to be changed
ace	An XMLType instance of the <ace> element which specifies the <principal>, the operation <grant> and the list of privileges

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (*grant/deny*) already exists in the ACL, the new ACE is added at the end of the ACL.

186.5.15 CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [CHECKPRIVILEGES Function](#) (page 190-6).

Syntax

```
DBMS_XDB.CHECKPRIVILEGES(
    res_path IN VARCHAR2,
    privs    IN xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 186-16 CHECKPRIVILEGES Function Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource

Table 186-16 (Cont.) CHECKPRIVILEGES Function Parameters

Parameter	Description
privs	An XMLType instance of the privilege element specifying the requested set of access privileges

Return Values

A positive integer if all requested privileges granted.

186.5.16 CREATEFOLDER Function

This deprecated function creates a new folder resource in the hierarchy.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [CREATEFOLDER Function](#) (page 190-7).

Syntax

```
DBMS_XDB.CREATEFOLDER(
  path IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters**Table 186-17 CREATEFOLDER Function Parameters**

Parameter	Description
path	Path name for the new folder

Return Values

TRUE if operation successful; FALSE, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if '/folder1/folder2' is passed as the path parameter, then '/folder1' must already exist.

186.5.17 CREATEOIDPATH Function

This deprecated function creates a virtual path to the resource based on object ID.

Note:

This function is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [CREATEOIDPATH Function](#) (page 190-7).

Syntax

```
DBMS_XDB.CREATEOIDPATH(
    oid    IN RAW)
RETURN VARCHAR2;
```

Parameters

Table 186-18 CREATEOIDPATH Function Parameters

Parameter	Description
oid	Object ID of the resource

186.5.18 CREATERESOURCE Functions

The deprecated function creates a new resource. The description of the overload options precede each version of the syntax

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [CREATERESOURCE Functions](#) (page 190-8).

Syntax

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB.CREATERESOURCE(
    abspath      IN VARCHAR2,
    datarow     IN REF SYS.XMLTYPE,
    createfolders IN BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```

DBMS_XDB.CREATERESOURCE(
    abspath      IN  VARCHAR2,
    data         IN  BLOB,
    csid         IN  NUMBER :=0,
    createfolders IN BOOLEAN := FALSE)
RETURN BOOLEAN;

```

Creates a resource with a specified `BFILE` as its contents, and specifies character set of the source `BFILE`:

```

DBMS_XDB.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  BFILE,
    csid         IN  NUMBER :=0,
    createfolders IN BOOLEAN := FALSE)
RETURN BOOLEAN;

```

Creates a resource with a specified `CLOB` as its contents:

```

DBMS_XDB.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  CLOB,
    createfolders IN BOOLEAN := FALSE)
RETURN BOOLEAN;

```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```

DBMS_XDB.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  VARCHAR2,
    schemaurl    IN  VARCHAR2 := NULL,
    elem         IN  VARCHAR2 := NULL)
RETURN BOOLEAN;

```

Given an `XMLTYPE` and a schema URL, inserts a new resource into the hierarchy with the `XMLTYPE` as the contents:

```

DBMS_XDB.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  SYS.XMLTYPE,
    schemaurl    IN  VARCHAR2 := NULL,
    elem         IN  VARCHAR2 := NULL)
RETURN BOOLEAN;

```

Parameters

Table 186-19 CREATERESOURCE Function Parameters

Parameter	Description
<code>abspath</code>	Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if <code>/foo/bar.txt</code> is passed in, then folder <code>/foo</code> must already exist.
<code>data</code>	String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.
<code>datarow</code>	REF to an <code>XMLType</code> row to be used as the contents

Table 186-19 (Cont.) CREATERESOURCE Function Parameters

Parameter	Description
csid	Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: <ul style="list-style-type: none"> From the abspath extension, determine the resource's MIME type. If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at http://www.w3.org/TR/2000/REC-xml-20001006; Otherwise, it is defaulted to the database character set.
createfolders	If TRUE, create the parent folders if they do not exist
schemaur1	For XML data, schema URL data conforms to (default NULL)
elem	Element name (default NULL)

Return Values

TRUE if operation successful; FALSE, otherwise.

186.5.19 DELETEHTTPEXPIREMAPPING Procedure

This deprecated procedure deletes from `xdb$config` all mappings of the URL pattern to an expiration date.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [DELETEHTTPEXPIREMAPPING Procedure](#) (page 188-9).

Syntax

```
DBMS_XDB.DELETEHTTPEXPIREMAPPING(
    pattern IN VARCHAR2);
```

Parameters**Table 186-20 DELETEHTTPEXPIREMAPPING Procedure Parameters**

Parameter	Description
pattern	URL pattern (only * accepted as wildcards)

186.5.20 DELETEMIMEMAPPING Procedure

This deprecated procedure deletes the mime mapping for a specified extension from the XDB configuration.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [CFG_GET Function](#) (page 188-8).

Syntax

```
DBMS_XDB.DELETEMIMEMAPPING(
    extension    IN    VARCHAR2);
```

Parameters

Table 186-21 *DELETEMIMEMAPPING Procedure Parameters*

Parameter	Description
extension	Extension for which a mime type is to be deleted

186.5.21 DELETERESOURCE Procedure

This **deprecated procedure** deletes a resource from the hierarchy.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [DELETERESOURCE Procedure](#) (page 190-10).

Syntax

```
DBMS_XDB.DELETERESOURCE(
    path          IN    VARCHAR2,
    delete_option IN    PLS_INTEGER);
```

Parameters

Table 186-22 *DELETERESOURCE Procedure Parameters*

Parameter	Description
path	Path name of the resource to delete

Table 186-22 (Cont.) DELETERESOURCE Procedure Parameters

Parameter	Description
delete_option	The option that controls how a resource is deleted; defined in Table 186-2 (page 186-6): <ul style="list-style-type: none"> DELETE_RESOURCE DELETE_RECURSIVE DELETE_FORCE DELETE_RECURSIVE_FORCE

186.5.22 DELETERESOURCEMETADATA Procedures

This **deprecated procedure** takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [DELETERESOURCEMETADATA Procedures](#) (page 190-10).

Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
  abspath      IN VARCHAR2,
  metadata     IN REF SYS.XMLTYPE,
  delete_option IN pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
  abspath      IN VARCHAR2,
  metadatans   IN VARCHAR2,
  metadataname IN VARCHAR2,
  delete_option IN pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Parameters

Table 186-23 DELETERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
metadata	REF to the piece of metadata (schema based) to be deleted

Table 186-23 (Cont.) DELETERESOURCEMETADATA Procedure Parameters

Parameter	Description
mettadatans	Namespace of the metadata fragment to be removed
mettadataname	Local name of the metadata fragment to be removed
delete_option	Only applicable for schema-based metadata, this can be one of the following: <ul style="list-style-type: none"> DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table

186.5.23 DELETESCHEMALOCMAPPING Procedure

This **deprecated procedure** deletes the schema location mapping for a specified schema URL from the XDB configuration.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [DELETESCHEMALOCMAPPING Procedure](#) (page 188-9).

Syntax

```
DBMS_XDB.DELETESCHEMALOCMAPPING(
    schemaURL    IN    VARCHAR2);
```

Parameters

Table 186-24 DELETESCHEMALOCMAPPING Procedure Parameters

Parameter	Description
schemaURL	Schema URL

186.5.24 DELETESERVLET Procedure

This **deprecated procedure** deletes a servlet from the XDB configuration.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [DELETESERVLET Procedure](#) (page 188-10).

Syntax

```
DBMS_XDB.DELETESERVLET(
    name          IN  VARCHAR2);
```

Parameters

Table 186-25 *DELETESERVLET Procedure Parameters*

Parameter	Description
name	Servlet name

186.5.25 DELETESERVLETMAPPING Procedure

This **deprecated procedure** deletes the servlet mapping for a specified servlet name from the XDB configuration.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [DELETESERVLETMAPPING Procedure](#) (page 188-10).

Syntax

```
DBMS_XDB.DELETESERVLETMAPPING(
    name          IN  VARCHAR2);
```

Parameters

Table 186-26 *DELETESERVLETMAPPING Procedure Parameters*

Parameter	Description
name	Servlet name

186.5.26 DELETESERVLETSECROLE Procedure

This **deprecated procedure** deletes the specified role from a servlet in the XDB configuration.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [DELETESERVLETSECROLE Procedure](#) (page 188-10).

Syntax

```
DBMS_XDB.DELETESERVLETSECROLE(  
    servname    IN    VARCHAR2,    rolename    IN    VARCHAR2);
```

Parameters

Table 186-27 *DELETESERVLETSECROLE Procedure Parameters*

Parameter	Description
servname	Servlet name
rolename	Name of the role to be deleted

186.5.27 DELETEXMLEXTENSION Procedure

This **deprecated procedure** deletes the specified XML extension from the XDB configuration.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [DELETEXMLEXTENSION Procedure](#) (page 188-11).

Syntax

```
DBMS_XDB.DELETEXMLEXTENSION(  
    extension    IN    VARCHAR2);
```

Parameters

Table 186-28 *DELETEXMLEXTENSION Procedure Parameters*

Parameter	Description
extension	XML extension to be deleted

186.5.28 ENABLEDIGESTAUTHENTICATION Procedure

This deprecated procedure enabling digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [ENABLEDIGESTAUTHENTICATION Procedure](#) (page 188-11).

Syntax

```
DBMS_XDB.ENABLEDIGESTAUTHENTICATION;
```

186.5.29 EXISTSRESOURCE Function

This deprecated function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [EXISTSRESOURCE Function](#) (page 190-11).

Syntax

```
DBMS_XDB.EXISTSRESOURCE(  
    abspath    IN    VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 186-29 EXISTSRESOURCE Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

TRUE if the resource is found.

186.5.30 GETACLDOCUMENT Function

This deprecated function retrieves ACL document that protects resource given its path name.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [GETACLDOCUMENT Function](#) (page 190-11).

Syntax

```
DBMS_XDB.GETACLDOCUMENT(  
  abspath IN VARCHAR2)  
RETURN sys.xmltype;
```

Parameters

Table 186-30 GETACLDOCUMENT Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

The `XMLType` for ACL document.

186.5.31 GETCONTENTBLOB Function

This deprecated function retrieves the contents of a resource returned as a `BLOB`.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [GETCONTENTBLOB Function](#) (page 190-12).

Syntax

```
DBMS_XDB.GETCONTENTBLOB(  
  abspath IN VARCHAR2,  
  csid OUT PLS_INTEGER,  
  locksrc IN BOOLEAN := FALSE)  
RETURN BLOB;
```

Parameters

Table 186-31 GETCONTENTBLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource
csid	If <code>TRUE</code> , lock and return the source LOB. If <code>FALSE</code> , return a temp LOB copy.
locksrc	Contents of the resource as a BLOB

Return Values

The contents of the resource as a BLOB.

186.5.32 GETCONTENTCLOB Function

This deprecated function gets the contents of a resource returned as a CLOB.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [GETCONTENTCLOB Function](#) (page 190-12).

Syntax

```
DBMS_XDB.GETCONTENTCLOB(  
    abspath IN VARCHAR2,  
    RETURN CLOB;
```

Parameters

Table 186-32 GETCONTENTCLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a CLOB.

186.5.33 GETCONTENTVARCHAR2 Function

This deprecated function gets the contents of a resource returned as a string.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [GETCONTENTVARCHAR2 Function](#) (page 190-13).

Syntax

```
DBMS_XDB.GETCONTENTVARCHAR2(  
    abspath IN VARCHAR2,  
    RETURN BLOB;
```

Parameters

Table 186-33 GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a string.

186.5.34 GETCONTENTXMLREF Function

This deprecated function retrieves the contents of a resource returned as a `REF` to an `XMLTYPE`.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [GETCONTENTXMLREF Function](#) (page 190-13).

Syntax

```
DBMS_XDB.GETCONTENTXMLREF(  
    abspath IN VARCHAR2,  
    RETURN SYS.XMLTYPE;
```

Parameters

Table 186-34 GETCONTENTXMLREF Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a REF to an XMLTYPE.

186.5.35 GETCONTENTXMLTYPE Function

This deprecated function retrieves the contents of a resource returned as an XMLTYPE.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [GETCONTENTXMLTYPE Function](#) (page 190-14).

Syntax

```
DBMS_XDB.GETCONTENTXMLTYPE(
    abspath IN VARCHAR2,
    RETURN SYS.XMLTYPE;
```

Parameters

Table 186-35 GETCONTENTXMLTYPE Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as an XMLTYPE.

186.5.36 GETFTPPORT Function

This deprecated procedure gets the value of the current FTP port.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [GETFTPPORT Function](#) (page 188-11).

Syntax

```
DBMS_XDB.GETFTPPORT
RETURN NUMBER;
```

186.5.37 GETHTTTPORT Function

This procedure gets the value of the current HTTP port.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [GETHTTTPORT Function](#) (page 188-12).

Syntax

```
DBMS_XDB.GETHTTTPORT
RETURN NUMBER;
```

186.5.38 GETHTTPREQUESTHEADER Function

This deprecated function, if called during an HTTP request serviced by XDB, returns the values of the passed header. It is used by routines that implement custom authentication.

 **Note:**

This procedure is deprecated in Release 12c.

Syntax

```
DBMS_XDB.GETHTTPREQUESTHEADER(
    header_name IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters**Table 186-36** GETHTTPREQUESTHEADER Function Parameters

Parameter	Description
header_name	Passed header

Return Values

Returns `NULL` in case the header is not present in the request, or for `AUTHENTICATION`, for security reasons.

186.5.39 GETLISTENERENDPOINT Procedure

This deprecated procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [GETLISTENERENDPOINT Procedure](#) (page 188-12).

Syntax

```
DBMS_XDB.GETLISTENERENDPOINT (
  endpoint IN NUMBER,
  host     OUT VARCHAR2,  port     OUT NUMBER,
  protocol OUT NUMBER);
```

Parameters

Table 186-37 GETLISTENERENDPOINT Procedure Parameters

Parameter	Description
endpoint	End point to be retrieved. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.
host	Interface on which the listener end point listens
port	Port on which the listener end point listens
protocol	Transport protocol accepted by the listener end point

186.5.40 GETLOCKTOKEN Procedure

Given a path to a resource, this deprecated procedure returns that resource's lock token for the current user.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [GETLOCKTOKEN Procedure](#) (page 190-14).

Syntax

```
DBMS_XDB.GETLOCKTOKEN(
  path      IN   VARCHAR2,
  locktoken OUT  VARCHAR2);
```

Parameters

Table 186-38 GETLOCKTOKEN Procedure Parameters

Parameter	Description
path	Path name to the resource
locktoken	Logged-in user's lock token for the resource

Usage Notes

The user must have `READPROPERTIES` privilege on the resource.

186.5.41 GETPRIVILEGES Function

This deprecated function gets all privileges granted to the current user on a specified resource.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the `DBMS_XDB_REPOS` (page 190-1) package - the [GETPRIVILEGES Function](#) (page 190-15).

Syntax

```
DBMS_XDB.GETPRIVILEGES(
    res_path IN VARCHAR2)
RETURN sys.xmltype;
```

Parameters

Table 186-39 GETPRIVILEGES Function Parameters

Parameter	Description
res_path	Absolute path in the hierarchy of the resource

Return Values

An `XMLType` instance of `<privilege>` element, which contains the list of all leaf privileges granted on this resource to the current user.

186.5.42 GETRESOID Function

This deprecated procedure returns the object ID of the resource from its absolute path.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [GETRESOID Function](#) (page 190-15).

Syntax

```
DBMS_XDB.GETRESOID(  
    abspath IN VARCHAR2)  
RETURN RAW;
```

Parameters

Table 186-40 GETRESOID Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

NULL if the resource is not present.

186.5.43 GETXDB_TABLESPACE Function

This deprecated function returns the current tablespace of the XDB (user).

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [GETXDB_TABLESPACE Function](#) (page 190-15).

Syntax

```
DBMS_XDB.GETXDB_TABLESPACE  
RETURN VARCHAR2;
```

186.5.44 HASBLOBCONTENT Function

This deprecated function returns `TRUE` if the resource has BLOB content.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [HASBLOBCONTENT Function](#) (page 190-16).

Syntax

```
DBMS_XDB.HASBLOBCONTENT  
    abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 186-41 HASBLOBCONTENT Function Parameters

Parameter	Description
<code>abspath_path</code>	Absolute path of the resource

Return Values

`TRUE` if the resource has BOB content.

186.5.45 HASCHARCONTENT Function

This deprecated function returns `TRUE` if the resource has character content.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [HASCHARCONTENT Function](#) (page 190-16).

Syntax

```
DBMS_XDB.HASCHARCONTENT  
    abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 186-42 HASCHARCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

`TRUE` if the resource has character content.

186.5.46 HASXMLCONTENT Function

This deprecated function returns `TRUE` if the resource has XML content.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [HASXMLCONTENT Function](#) (page 190-16).

Syntax

```
DBMS_XDB.HASXMLCONTENT
  abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 186-43 HASXMLCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

`TRUE` if the resource has XML content.

186.5.47 HASXMLREFERENCE Function

This deprecated function returns `TRUE` if the resource has a `REF` to XML content.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [HASXMLREFERENCE Function](#) (page 190-17).

Syntax

```
DBMS_XDB.HASXMLREFERENCE
  abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 186-44 HASXMLREFERENCE Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE resource has a REF to XML content.

186.5.48 ISFOLDER Function

This deprecated function returns TRUE if the resource is a folder or container.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [ISFOLDER Function](#) (page 190-17).

Syntax

```
DBMS_XDB.ISFOLDER
  abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 186-45 DBMS_XDB.ISFOLDER Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource is a folder or container.

186.5.49 LINK Procedures

This deprecated procedure creates a link from a specified folder to a specified resource.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [LINK Procedures](#) (page 190-18).

Syntax

```
DBMS_XDB.LINK(
  srcpath      IN  VARCHAR2,
  linkfolder   IN  VARCHAR2,
  linkname     IN  VARCHAR2);

DBMS_XDB.LINK(
  srcpath      IN  VARCHAR2,
  linkfolder   IN  VARCHAR2,
  linkname     IN  VARCHAR2,
  linktype     IN  PLS_INTEGER := DBMS_XDB.LINK_TYPE_HARD);
```

Parameters

Table 186-46 LINK Procedure Parameters

Parameter	Description
srcpath	Path name of the resource to which a link is created
linkfolder	Folder in which the new link is placed
linkname	Name of the new link
linktype	Type of link to be created: <ul style="list-style-type: none"> • DBMS_XDB.LINK_TYPE_HARD (default) • DBMS_XDB.LINK_TYPE_WEAK • DBMS_XDB.LINK_TYPE_SYMBOLIC

186.5.50 LOCKRESOURCE Function

Given a path to a resource, this deprecated function gets a WebDAV-style lock on that resource.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [LOCKRESOURCE Function](#) (page 190-18).

Syntax

```
DBMS_XDB.LOCKRESOURCE(
    path      IN  VARCHAR2,
    depthzero IN  BOOLEAN,
    shared    IN  boolean)
RETURN BOOLEAN;
```

Parameters

Table 186-47 LOCKRESOURCE Function Parameters

Parameter	Description
path	Path name of the resource to lock.
depthzero	Currently not supported
shared	Passing TRUE obtains a shared write lock

Return Values

TRUE if successful.

Usage Notes

The user must have UPDATE privileges on the resource.

186.5.51 PROCESSLINKS Procedure

This deprecated procedure processes document links in the specified resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [PROCESSLINKS Procedure](#) (page 190-19).

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(
    abspath IN  VARCHAR2,
    recurse IN  BOOLEAN := FALSE);
```

Parameters

Table 186-48 PROCESSLINKS Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource. If the path is a folder, use the recurse flag.

Table 186-48 (Cont.) PROCESSLINKS Procedure Parameters

Parameter	Description
recurse	Used only if <code>abspath</code> specifies a folder. If <code>TRUE</code> , process links of all resources in the folder hierarchy rooted at the specified resource. If <code>FALSE</code> , process links of all documents in this folder only.

186.5.52 PURGERESOURCEMETADATA Procedure

This deprecated procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [PURGERESOURCEMETADATA Procedure](#) (page 190-19).

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(
  abspath IN VARCHAR2);
```

Parameters

Table 186-49 PURGERESOURCEMETADATA Procedure Parameters

Parameter	Description
<code>abspath</code>	Absolute path of the resource

186.5.53 RENAMERESOURCE Procedure

This deprecated procedure renames the XDB resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [RENAMERESOURCE Procedure](#) (page 190-20).

Syntax

```
DBMS_XDB.RENAMERESOURCE(
  srcpath IN VARCHAR2,
```

```
destfolder IN CARCHAR2,  
newname   IN VARCHAR2);
```

Parameters

Table 186-50 RENAMERESOURCE Procedure Parameters

Parameter	Description
srcpath	Absolute path in the Hierarchy for the source resource destination folder
destfolder	Absolute path in the Hierarchy for the destination folder
newname	Name of the child in the destination folder

186.5.54 SETACL Procedure

This deprecated procedure set the ACL on a specified resource to be the ACL specified by path.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [SETACL Procedure](#) (page 190-20).

Syntax

```
DBMS_XDB.SETACL(  
  res_path IN VARCHAR2,  
  acl_path IN VARCHAR2);
```

Parameters

Table 186-51 SETACL Procedure Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
acl_path	Absolute path in the Hierarchy for ACL

Usage Notes

The user must have `<write-acl>` privileges on the resource.

186.5.55 SETFTPPORT Procedure

This deprecated procedure set the FTP port to a new value.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [SETFTPPORT Procedure](#) (page 188-13).

Syntax

```
DBMS_XDB.SETFTPPORT(  
    new_port IN NUMBER);
```

Parameters

Table 186-52 SETFTPPORT Procedure Parameters

Parameter	Description
new_port	Value to which the FTP port is set

186.5.56 SETHTTTPORT Procedure

This deprecated procedure set the HTTP port to a new value.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [SETHTTTPORT Procedure](#) (page 188-15).

Syntax

```
DBMS_XDB.SETHTTTPORT(  
    new_port IN NUMBER);
```

Parameters

Table 186-53 SETHTTTPORT Procedure Parameters

Parameter	Description
new_port	Value to which the HTTP port is set

186.5.57 SETLISTENERENDPOINT Procedure

This deprecated procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server. Both HTTP and HTTP2 end points can be set by invoking this procedure.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [SETLISTENERENDPOINT Procedure](#) (page 188-16).

Syntax

```
DBMS_XDB.SETLISTENERENDPOINT (
  endpoint IN NUMBER,
  host     IN VARCHAR2,  port     IN NUMBER,
  protocol IN NUMBER);
```

Parameters

Table 186-54 SETLISTENERENDPOINT Procedure Parameters

Parameter	Description
endpoint	End point to be set. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.
host	Interface on which the listener end point is to listen. Its value can be 'LOCALHOST,' NULL, or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces.
port	Port on which the listener end point is to listen
protocol	Transport protocol that the listener end point is to accept. Its value can be XDB_PROTOCOL_TCP or XDB_PROTOCOL_TCPS

186.5.58 SETLISTENERLOCALACCESS Procedure

This deprecated procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when `l_access` is set to `TRUE`) or to listen on both localhost and non-localhost interfaces (when `l_access` is set to `FALSE`).

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_CONFIG](#) (page 188-1) package - the [SETLISTENERLOCALACCESS Procedure](#) (page 188-16).

Syntax

```
DBMS_XDB.SETLISTENERLOCALACCESS (
    l_access    BOOLEAN);
```

Parameters

Table 186-55 SETLISTENERLOCALACCESS Procedure Parameters

Parameter	Description
l_access.	TRUE or FALSE.

186.5.59 SPLITPATH Procedure

This deprecated procedure splits the path into a parentpath and childpath.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [SPLITPATH Procedure](#) (page 190-20).

Syntax

```
DBMS_XDB.SPLITPATH(
    abspath    IN  VARCHAR2,
    parentpath OUT VARCHAR2,
    childpath  OUT VARCHAR2);
```

Parameters

Table 186-56 SPLITPATH Procedure Parameters

Parameter	Description
abspath	Absolute path to be split
parentpath	Parentpath
childpath	Childpath

186.5.60 TOUCHRESOURCE Procedure

This **deprecated procedure** changes the modification time of the resource to the current time.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [TOUCHRESOURCE Procedure](#) (page 190-21).

Syntax

```
DBMS_XDB.TOUCHRESOURCE
  abspath IN VARCHAR2;
```

Parameters

Table 186-57 DBMS_XDB.TOUCHRESOURCE Procedure Parameters

Parameter	Description
abspath_path	Absolute path of the resource

186.5.61 UNLOCKRESOURCE Function

This deprecated function unlocks the resource given a lock token and a path to the resource.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [UNLOCKRESOURCE Function](#) (page 190-21).

Syntax

```
DBMS_XDB.UNLOCKRESOURCE(
  path IN VARCHAR2,
  deltoken IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 186-58 UNLOCKRESOURCE Function Parameters

Parameter	Description
path	Path name to the resource

Table 186-58 (Cont.) UNLOCKRESOURCE Function Parameters

Parameter	Description
deltoken	Lock token to be removed

Return Values

TRUE if operation successful.

Usage Notes

The user must have UPDATE privileges on the resource.

186.5.62 UPDATERESOURCEMETADATA Procedures

This deprecated procedure updates metadata for a resource.

 **Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS_XDB_REPOS](#) (page 190-1) package - the [UPDATERESOURCEMETADATA Procedures](#) (page 190-22).

The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
  abspath IN VARCHAR2,
  oldmetadata IN REF SYS.XMLTYPE,
  newmetadata IN REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
  abspath IN VARCHAR2,
  oldmetadata IN REF SYS.XMLTYPE,
  newmetadata IN XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
  abspath IN VARCHAR2,
  oldns IN VARCHAR2,
  oldname IN VARCHAR,
```

```
newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(  
  abspath      IN  VARCHAR2,  
  oldns        IN  VARCHAR2,  
  oldname      IN  VARCHAR,  
  newmetadata  IN  REF SYS.XMLTYPE);
```

Parameters

Table 186-59 UPDATERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
oldmetadata	REF to the old of metadata
newmetadata	REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)
oldns	Namespace identifying old metadata
oldname	Local name identifying old metadata

Usage Notes

In the case of REF, it stores the REF in the resource and the metadata is stored in a separate table. Uniqueness of REFs is enforced. In the case where the XMLTYPE is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

DBMS_XDB_ADMIN

The `DBMS_XDB_ADMIN` package provides an interface to manage the Oracle XML DB repository.

This chapter contains the following topics:

- [DBMS_XDB_ADMIN Security Model](#) (page 187-1)
- [Summary of DBMS_XDB_ADMIN Subprograms](#) (page 187-1)

See Also:

Oracle XML DB Developer's Guide for information about Oracle XML DB Repository

187.1 DBMS_XDB_ADMIN Security Model

Owned by `XDB`, the `DBMS_XDB_ADMIN` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `SYS` or `XDB` or `DBA`. Subprograms in this package are executed using the privileges of the current user.

187.2 Summary of DBMS_XDB_ADMIN Subprograms

This table lists the package subprograms in alphabetical order.

Table 187-1 DBMS_XDB_ADM Package Subprograms

Subprogram	Description
CREATENONCEKEY Procedure (page 187-1)	Generates a nonce value for use in digest authentication
INSTALLDEFAULTWALLET Procedure (page 187-2)	Installs the default XDB wallet in the default XDB wallet directory
MOVEXDB_TABLESPACE Procedure (page 187-2)	Moves the XDB (user) to the specified tablespace
REBUILDHIERARCHICALINDEX Procedure (page 187-2)	Rebuilds the hierarchical index after import or export operations

187.2.1 CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

Syntax

```
DBMS_XDB_ADMIN.CREATENONCEKEY;
```

187.2.2 INSTALLDEFAULTWALLET Procedure

This procedure installs the default XDB wallet in the default XDB wallet directory.

The directory name where the XDB wallet is stored is prefixed either by `ORACLE_BASE` when it is defined, or `ORACLE_HOME`. It is then followed by `/admin/db_name/xdb_wallet` where `db_name` is the unique database name.

Syntax

```
DBMS_XDB_ADMIN.INSTALLDEFAULTWALLET;
```

Usage Notes

Only `sys` can install or replace the default wallet.

187.2.3 MOVEXDB_TABLESPACE Procedure

This procedure moves the XDB (user) to the specified tablespace.

Syntax

```
DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE(
    new_tablespace IN VARCHAR2);
```

Parameters

Table 187-2 MOVEXDB_TABLESPACE Procedure Parameters

Parameter	Description
<code>new_tablespace</code>	Name of the tablespace to where the XDB is moved

Usage Notes

- This operation waits for all concurrent XDB sessions to exit.
- If `MOVEXDB_TABLESPACE` fails, the user should restart the database before issuing any further command. Failure to do so will result into unexpected behavior from the database.
- The XDB repository by default resides in the `SYSAUX` tablespace. Using this procedure it can be moved to another tablespace. As a best practice we recommend to create a dedicated tablespace for the XDB repository only and not share it with other objects (such as tables). The tablespace containing the XDB repository should never be set to `READ ONLY` because this might affect various XML operations being executed.

187.2.4 REBUILDHIERARCHICALINDEX Procedure

This procedure rebuilds the hierarchical index after import or export operations. This is necessary because data cannot be exported from index tables.

Syntax

```
DBMS_XDB_ADMIN.REBUILDHIERARCHICALINDEX;
```

DBMS_XDB_CONFIG

The `DBMS_XDB_CONFIG` package provides an interface for configuring Oracle XML DB and its repository.

This chapter contains the following topics:

- [Overview](#) (page 188-1)
- [Security Model](#) (page 188-1)
- [Constants](#) (page 188-2)
- [Summary of DBMS_XDB_CONFIG Subprograms](#) (page 188-2)

See Also:

Oracle XML DB Developer's Guide

188.1 DBMS_XDB_CONFIG Overview

PL/SQL package `DBMS_XDB_CONFIG` is the Oracle XML DB resource application program interface (API) for PL/SQL for DBAs to configure their system. This API provides functions and procedures to access and manage Oracle XML DB Repository resources using PL/SQL. It includes methods for managing resource security and Oracle XML DB configuration.

Oracle XML DB Repository is modeled on XML, and provides a database file system for any data. The repository maps path names (or URLs) onto database objects of XMLType and provides management facilities for these objects.

PL/SQL package `DBMS_XDB_CONFIG` is an API that you can use to manage all of the following:

- Oracle XML DB resources
- Oracle XML DB security based on access control lists (ACLs). An ACL is a list of access control entries (ACEs) that determines which principals (users and roles) have access to which resources.
- Oracle XML DB configuration

188.2 DBMS_XDB_CONFIG Security Model

Owned by `XDB`, the `DBMS_XDB_CONFIG` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

188.3 DBMS_XDB_CONFIG Constants

The `DBMS_XDB_CONFIG` package defines several enumerated constants that should be used for specifying parameter values.

These constants are shown in the following table.

Table 188-1 DBMS_XDB_CONFIG Constants

Constant	Type	Value	Description
<code>XDB_ENDPOINT_HTTP</code>	NUMBER	1	Defining listener for first HTTP port
<code>XDB_ENDPOINT_HTTP2</code>	NUMBER	2	Defining listener for second HTTP port
<code>XDB_ENDPOINT_RHTTP</code>	NUMBER	3	Defining listener for a remote HTTP port
<code>XDB_ENDPOINT_RHTTPS</code>	NUMBER	4	Defining listener for a remote HTTPS port
<code>XDB_PROTOCOL_TCP</code>	NUMBER	1	Defining listener for HTTP protocol
<code>XDB_PROTOCOL_TCPS</code>	NUMBER	2	Defining listener for HTTPS protocol

188.4 Summary of DBMS_XDB_CONFIG Subprograms

The `DBMS_XDB_CONFIG` package uses subprograms for configuring Oracle XML DB and its repository.

These subprograms are listed in the following table.

Table 188-2 DBMS_XDB_CONFIG Package Subprograms

Subprogram	Description
ADDHTTPEXPIREMAPPING Procedure (page 188-4)	Adds to <code>XDB\$CONFIG</code> a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.
ADDMIMEMAPPING Procedure (page 188-5)	Adds a mime mapping to XDB configuration
ADDSCHEMALOCMAPPING Procedure (page 188-5)	Adds a schema location mapping to the XDB configuration
ADDSERVLET Procedure (page 188-6)	Adds a servlet to XDB configuration
ADDSERVLETMAPPING Procedure (page 188-7)	Adds a servlet mapping to XDB configuration
ADDSERVLETSECROLE Procedure (page 188-7)	Adds a security role <code>REF</code> to a specified servlet in XDB configuration
ADDXMLEXTENSION Procedure (page 188-8)	Adds adds the following XML extension to the XDB configuration under <code><xml-extensions></code> : <code><extension>extension</extension></code>
CFG_GET Function (page 188-8)	Retrieves the session's configuration information as an <code>XMLType</code> instance

Table 188-2 (Cont.) DBMS_XDB_CONFIG Package Subprograms

Subprogram	Description
CFG_REFRESH Procedure (page 188-8)	Refreshes the session's configuration information to the latest configuration
CFG_UPDATE Procedure (page 188-8)	Updates the configuration information and commits the change.
DELETEHTTPEXPIREMAPPING Procedure (page 188-9)	Deletes from XDB\$CONFIG all mappings of the URL pattern to an expiration date
DELETEMIMEMAPPING Procedure (page 188-9)	Deletes the mime mapping for a specified extension from the XDB configuration
DELETESCHEMALOCMAPPING Procedure (page 188-9)	Deletes the schema location mapping for a specified schema URL from the XDB configuration
DELETESERVLET Procedure (page 188-10)	Deletes a servlet from the XDB configuration
DELETESERVLETMAPPING Procedure (page 188-10)	Deletes the servlet mapping for a specified servlet name from the XDB configuration
DELETESERVLETSECROLE Procedure (page 188-10)	Deletes the specified role from a servlet in the XDB configuration
DELETXMLEXTENSION Procedure (page 188-11)	Deletes the specified XML extension from the XDB configuration
ENABLEDIGESTAUTHENTICATION Procedure (page 188-11)	Enables enables digest authentication
GETFTPSPORT Function (page 188-11)	Gets the value of the current FTP port
GETHTTPSPORT Function (page 188-12)	Gets the value of the current HTTP port
GETHTTPCONFIGREALM Function (page 188-11)	Gets the realm name
GETHTTPSSPORT Function (page 188-12)	Gets the value of the current HTTPS port
GETLISTENERENDPOINT Procedure (page 188-12)	Gets the parameters of a listener end point corresponding to the XML DB HTTP server
GETREMOTEHTTPSPORT Function (page 188-13)	Gets the value of a remote HTTP port
GETREMOTEHTTPSSPORT Function (page 188-13)	Gets the value of a remote HTTPS port
ISGLOBALPORTENABLED Function (page 188-13)	Returns the value of the DBMS_XDB_CONFIG.SETGLOBALPORTENABLED procedure setting
SETGLOBALPORTENABLED Procedure (page 188-14)	Enables the use of a global port for Oracle Enterprise Manager Database Express (EM Express) clients
SETFTPSPORT Procedure (page 188-13)	Sets the FTP port to a new value
SETHTTPSPORT Procedure (page 188-15)	Sets the HTTP port to a new value
SETHTTPCONFIGREALM Procedure (page 188-15)	Sets the realm to a new value

Table 188-2 (Cont.) DBMS_XDB_CONFIG Package Subprograms

Subprogram	Description
SETHTTSPORT Procedure (page 188-15)	Sets the HTTPS port to a new value
SETLISTENERENDPOINT Procedure (page 188-16)	Sets the parameters of a listener end point corresponding to the XML DB HTTP server
SETLISTENERLOCALACCESS Procedure (page 188-16)	Restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when <code>l_access</code> is set to <code>TRUE</code>) or to listen on both localhost and non-localhost interfaces (when <code>l_access</code> is set to <code>FALSE</code>)
SETREMOTEHTTPPORT Procedure (page 188-17)	Sets the remote HTTP port to a new value
SETREMOTEHTTSPORT Procedure (page 188-17)	Sets the remote HTTPS port to a new value
USEDPORT Procedure (page 188-17)	Obtains the port numbers used by other pluggable databases in the same consolidation database

188.4.1 ADDHTTPEXPIREMAPPING Procedure

This procedure adds to `XDB$CONFIG` a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.

Syntax

```
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (
    pattern    IN    VARCHAR2,
    expire     IN    VARCHAR2);
```

Parameters

Table 188-3 ADDHTTPEXPIREMAPPING Procedure Parameters

Parameter	Description
<code>pattern</code>	URL pattern (only * accepted as wildcards)
<code>expire</code>	Expiration directive, follows the <code>ExpireDefault</code> in Apache's <code>mod_expires</code> : <code>base [plus] (num type)*</code> <code>-- base: now modification</code> <code>-- type: year years month months week weeks day days minute minutess second seconds</code>

Examples

```
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING ('/public/test1/*', 'now plus 4 weeks');
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (
    '/public/test2/*', 'modification plus 1 day 30 seconds');
```

188.4.2 ADDMIMEMAPPING Procedure

This procedure adds the following mime mapping to XDB configuration:

```
<mime-mapping>
  <extension>extension</extension>
  <mime-type>mimetype</mime-type>
</mime-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDMIMEMAPPING(
  extension IN VARCHAR2,
  mimetype  IN VARCHAR2);
```

Parameters

Table 188-4 *ADDMIMEMAPPING Procedure Parameters*

Parameter	Description
extension	Extension for which a mime type is being added
mimetype	Mime type

188.4.3 ADDSCHEMALOCMAPPING Procedure

This procedure adds the following schema location mapping to the XDB configuration:

```
<schemaLocation-mapping>
  <namespace>namespace</namespace>
  <element>element</element>
  <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSCHEMALOCMAPPING(
  namespace IN VARCHAR2,
  element   IN VARCHAR2,
  schemaURL IN VARCHAR2);
```

Parameters

Table 188-5 *ADDSCHEMALOCMAPPING Procedure Parameters*

Parameter	Description
namespace	Namespace
element	Element
schemaURL	Schema URL

188.4.4 ADDSERVLET Procedure

This procedure adds a servlet to XDB configuration.

IT adds the following servlet:

```
<servlet>
  <servlet-name>name</servlet-name>      <servlet-language>language</servlet-
language>
  <display-name>dispname</display-name>
  <description>descript</description>
  <servlet-class>class</servlet-class>
  <servlet-schema>schema</servlet-schema>
</servlet>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLET(
  name          IN  VARCHAR2,
  language      IN  VARCHAR2,
  dispname      IN  VARCHAR2,
  icon          IN  VARCHAR2 := NULL,
  descript      IN  VARCHAR2 := NULL,
  class         IN  VARCHAR2 := NULL,
  jspfile       IN  VARCHAR2 := NULL,
  plsqli        IN  VARCHAR2 := NULL,
  schema        IN  VARCHAR2 := NULL);
```

Parameters

Table 188-6 ADDSERVLET Procedure Parameters

Parameter	Description
name	Servlet name
language	Must be one of "C", "Java", "PL/SQL"
dispname	Display name
icon	Icon
descript	Description
class	The <code>class</code> / <code>jspfile</code> / <code>plsqli</code> function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
jspfile	This parameter is not supported. Always provide NULL value for this parameter. System throws an error if the value is not NULL.
plsqli	The <code>class</code> / <code>jspfile</code> / <code>plsqli</code> function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
schema	Schema is used to specify <code>servlet-schema</code> xml element name in <code>xdbconfig.xml</code> . It indicates the Oracle schema in which the Java class is loaded. If you do not specify any value, then the schema is searched using the default resolver specification.

188.4.5 ADDSERVLETMAPPING Procedure

This procedure adds a servlet mapping to XDB configuration.

It adds the following servlet mapping:

```
<servlet-mapping>
  <servlet-pattern>pattern</servlet-pattern>
  <servlet-name>name</servlet-name>
</servlet-mapping>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLETMAPPING(
  pattern IN VARCHAR2, name IN VARCHAR2);
```

Parameters

Table 188-7 *ADDSERVLETMAPPING Procedure Parameters*

Parameter	Description
pattern	Sservlet pattern
name	Servlet name

188.4.6 ADDSERVLETSECROLE Procedure

This procedure adds the security role `REF` to a specified servlet in XDB configuration.

It adds the following security role as shown in the following:

```
<security-role-ref>
  <role-name>rolename</role-name>
  <role-link>rolelink</role-link>
  <description>descript</description>
</security-role-ref>
```

Syntax

```
DBMS_XDB_CONFIG.ADDSERVLETSECROLE(
  servname IN VARCHAR2, rolename IN VARCHAR2, rolelink IN
  VARCHAR2, descript IN VARCHAR2 := NULL);
```

Parameters

Table 188-8 *ADDSERVLETSECROLE Procedure Parameters*

Parameter	Description
servname	Sservlet name
rolename	Role name
rolelink	Role link
descript	Description

188.4.7 ADDXMLEXTENSION Procedure

This procedure adds an XML extension to the XDB configuration under `<xml-extensions>`.

It adds the following XML extension to the XDB configuration, under `<xml-extensions>`:

```
<extension>extension</extension>
```

Syntax

```
DBMS_XDB_CONFIG.ADDXMLEXTENSION(  
    extension IN VARCHAR2);
```

Parameters

Table 188-9 *ADDXMLEXTENSION Procedure Parameters*

Parameter	Description
extension	XML extension to be added

188.4.8 CFG_GET Function

This function retrieves the session's configuration information as an `XMLType` instance.

Syntax

```
DBMS_XDB_CONFIG.CFG_GET  
RETURN SYS.XMLType;
```

188.4.9 CFG_REFRESH Procedure

This procedure refreshes the session's configuration information to the latest configuration.

Syntax

```
DBMS_XDB_CONFIG.CFG_REFRESH;
```

188.4.10 CFG_UPDATE Procedure

This procedure updates the configuration information and commits the change.

Syntax

```
DBMS_XDB_CONFIG.CFG_UPDATE(  
    xdbconfig IN SYS.XMLTYPE);
```

Parameters

Table 188-10 CFG_UPDATE Procedure Parameters

Parameter	Description
xdbconfig	The new configuration data

188.4.11 DELETEHTTPEXPIREMAPPING Procedure

This procedure deletes from XDB\$CONFIG all mappings of the URL pattern to an expiration date.

Syntax

```
DBMS_XDB_REPOS.DELETEHTTPEXPIREMAPPING(
    pattern IN VARCHAR2);
```

Parameters

Table 188-11 DELETEHTTPEXPIREMAPPING Procedure Parameters

Parameter	Description
pattern	URL pattern (only * accepted as wildcards)

188.4.12 DELETEMIMEMAPPING Procedure

This procedure deletes the mime mapping for a specified extension from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETEMIMEMAPPING(
    extension IN VARCHAR2);
```

Parameters

Table 188-12 DELETEMIMEMAPPING Procedure Parameters

Parameter	Description
extension	Extension for which a mime type is to be deleted

188.4.13 DELETESCHEMALOCMAPPING Procedure

This procedure deletes the schema location mapping for a specified schema URL from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESCHEMALOCMAPPING(
    schemaURL IN VARCHAR2);
```

Parameters

Table 188-13 *DELETESCHEMALOCMAPPING Procedure Parameters*

Parameter	Description
schemaURL	Schema URL

188.4.14 DELETESERVLET Procedure

This procedure deletes a servlet from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLET(
    name          IN  VARCHAR2);
```

Parameters

Table 188-14 *DELETESERVLET Procedure Parameters*

Parameter	Description
name	Servlet name

188.4.15 DELETESERVLETMAPPING Procedure

This procedure deletes the servlet mapping for a specified servlet name from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETMAPPING(
    name          IN  VARCHAR2);
```

Parameters

Table 188-15 *DELETESERVLETMAPPING Procedure Parameters*

Parameter	Description
name	Servlet name

188.4.16 DELETESERVLETSECROLE Procedure

This procedure deletes the specified role from a servlet in the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETSECROLE(
    servname      IN  VARCHAR2,    rolename      IN  VARCHAR2);
```

Parameters

Table 188-16 *DELETESERVLETSECROLE Procedure Parameters*

Parameter	Description
servname	Servlet name
rolename	Name of the role to be deleted

188.4.17 DELETEXMLEXTENSION Procedure

This procedure deletes the specified XML extension from the XDB configuration.

Syntax

```
DBMS_XDB_CONFIG.DELETEXMLEXTENSION(
    extension IN VARCHAR2);
```

Parameters

Table 188-17 *DELETEXMLEXTENSION Procedure Parameters*

Parameter	Description
extension	XML extension to be deleted

188.4.18 ENABLEDIGESTAUTHENTICATION Procedure

This procedure enables digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

Syntax

```
DBMS_XDB_CONFIG.ENABLEDIGESTAUTHENTICATION;
```

188.4.19 GETFTPPORT Function

This procedure gets the value of the current FTP port.

Syntax

```
DBMS_XDB_CONFIG.GETFTPPORT
RETURN NUMBER;
```

188.4.20 GETHTTPCONFIGREALM Function

This function gets the realm name. Definition of a realm is referenced in IETF's RFC2617.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPCONFIGREALM
RETURN VARCHAR2;
```

188.4.21 GETHTTPPORT Function

This function gets the value of the current HTTP port.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPPORT  
RETURN NUMBER;
```

188.4.22 GETHTTPSPORT Function

This procedure gets the value of the current HTTPS port.

Syntax

```
DBMS_XDB_CONFIG.GETHTTPSPORT  
RETURN NUMBER;
```

Usage Notes

Returns `NULL` if no port has been configured

188.4.23 GETLISTENERENDPOINT Procedure

This procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

Syntax

```
DBMS_XDB_CONFIG.GETLISTENERENDPOINT (  
  endpoint IN NUMBER,  
  host     OUT VARCHAR2,   port     OUT NUMBER,  
  protocol OUT NUMBER);
```

Parameters

Table 188-18 GETLISTENERENDPOINT Procedure Parameters

Parameter	Description
endpoint	End point to be retrieved. Its value can be <code>XDB_ENDPOINT_HTTP</code> or <code>XDB_ENDPOINT_HTTP2</code> .
host	Interface on which the listener end point listens
port	Port on which the listener end point listens
protocol	Transport protocol accepted by the listener end point

188.4.24 GETREMOTEHTTPPORT Function

This function gets the value of a remote HTTP port.

Syntax

```
DBMS_XDB_CONFIG.GETREMOTEHTTPPORT
RETURN NUMBER;
```

188.4.25 GETREMOTEHTTPSPORT Function

This function gets the value of a remote HTTPS port.

Syntax

```
DBMS_XDB_CONFIG.GETREMOTEHTTPSPORT
RETURN NUMBER;
```

188.4.26 ISGLOBALPORTENABLED Function

This procedure returns the value of the `GlobalPortEnabled` setting.

Syntax

```
DBMS_XDB_CONFIG.ISGLOBALPORTENABLED RETURN BOOLEAN;
```

Usage Notes

- This procedure returns `TRUE` if `GlobalPortEnabled` has been set to `TRUE`; otherwise it returns `FALSE`.
- In a multitenant environment, you can execute this function in both the CDB root and PDBs.

188.4.27 SETFTPSPORT Procedure

This procedure sets the FTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETFTPSPORT(
    new_port IN NUMBER);
```

Parameters

Table 188-19 SETFTPSPORT Procedure Parameters

Parameter	Description
<code>new_port</code>	Value to which the FTP port is set

188.4.28 SETGLOBALPORTENABLED Procedure

This procedure enables Oracle Enterprise Manager Database Express (EM Express) clients to use a single port (called a global port), for the session rather than using a port dedicated to the PDB.

Syntax

```
DBMS_XDB_CONFIG.SETGLOBALPORTENABLED (
    isenabled IN BOOLEAN);
```

Parameters

Table 188-20 SETGLOBALPORTENABLED Procedure Parameters

Parameter	Description
isenabled	<p>TRUE enables the EM Express client to use a global port for the session rather than using the PDB that allocated the port.</p> <p>FALSE enables the port ID to determine the PDB to use.</p> <p>The default is TRUE for PDBs but FALSE for the CDB root.</p>

Usage Notes

- Use the `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` procedure if you use EM Express to manage database ports in a multitenant environment.
- To use a global port, you must enable it in both the CDB and the PDB. PDBs have it enabled by default. For CDBs, you must run the `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` procedure in the CDB root.
- After you set `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` to `TRUE`, then you must specify a PDB to use for the global port. You can do so by specifying the PDB name in the **Container Name** field of the EM Express login page. For example, if you enter `hr_pdb`, then the EM Express URL becomes `http://server_name:5500/hr_pdb/em`. This example uses the port 5500 in the CDB root, which in turn routes messages to the EM Express in the PDB `hr_pdb`. The port can be an HTTP or HTTPS port.
- The PDB that you specify in the EM Express login page must be open in read/write mode before you can run `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED`. You can check the read/write mode status of a PDB by connecting to the PDB and then querying the `OPEN_MODE` column of the `V$PDBS` dynamic view.
- The `DBMS_XDB_CONFIG.ISGLOBALPORTENABLED` function returns the value of the `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` setting.
- You can use the `XDB_PROTOCOLS` lockdown profile to control the security for the global port.

 **See Also:**

- *Oracle Database 2 Day DBA* for information about using `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` to start EM Express for a PDB
- *Oracle Database Security Guide* for information about lockdown profiles

188.4.29 SETHTTPPORT Procedure

This procedure sets the HTTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPPORT(
    new_port IN NUMBER);
```

Parameters

Table 188-21 SETHTTPPORT Procedure Parameters

Parameter	Description
<code>new_port</code>	Value to which the HTTP port is set

188.4.30 SETHTTPCONFIGREALM Procedure

This procedure modifies the realm value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPCONFIGREALM(
    realm IN VARCHAR2);
```

Parameters

Table 188-22 SETHTTPCONFIGREALM Procedure Parameters

Parameter	Description
<code>realm</code>	Realm as defined in IETF's RFC2617

188.4.31 SETHTTPSPORT Procedure

This procedure sets the HTTPS port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETHTTPSPORT(
    new_port IN NUMBER);
```

Parameters

Table 188-23 SETHTTPSPORT Procedure Parameters

Parameter	Description
new_port	Value to which the HTTPS port is set

188.4.32 SETLISTENERENDPOINT Procedure

This procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server.

Both HTTP and HTTP2 end points can be set by invoking this procedure.

Syntax

```
DBMS_XDB_CONFIG.SETLISTENERENDPOINT (
    endpoint IN NUMBER,
    host     IN VARCHAR2,    port     IN NUMBER,
    protocol IN NUMBER);
```

Parameters

Table 188-24 SETLISTENERENDPOINT Procedure Parameters

Parameter	Description
endpoint	End point to be set. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.
host	Interface on which the listener end point is to listen. Its value can be 'LOCALHOST,' NULL, or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces.
port	Port on which the listener end point is to listen
protocol	Transport protocol that the listener end point is to accept. Its value can be XDB_PROTOCOL_TCP or XDB_PROTOCOL_TCPS

188.4.33 SETLISTENERLOCALACCESS Procedure

This procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when `l_access` is set to `TRUE`) or to listen on both localhost and non-localhost interfaces (when `l_access` is set to `FALSE`).

Syntax

```
DBMS_XDB_CONFIG.SETLISTENERLOCALACCESS (
    l_access BOOLEAN);
```

Parameters**Table 188-25 SETLISTENERLOCALACCESS Procedure Parameters**

Parameter	Description
<code>l_access.</code>	TRUE OR FALSE.

188.4.34 SETREMOTEHTTPPORT Procedure

This procedure sets a remote HTTP port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETREMOTEHTTPPORT(
    new_port IN NUMBER);
```

Parameters**Table 188-26 SETREMOTEHTTPPORT Procedure Parameters**

Parameter	Description
<code>new_port</code>	Value to which the remote HTTP port is set

188.4.35 SETREMOTEHTTPSPORT Procedure

This procedure sets a remote HTTPS port to a new value.

Syntax

```
DBMS_XDB_CONFIG.SETREMOTEHTTPSPORT (
    new_port IN NUMBER);
```

Parameters**Table 188-27 SETREMOTEHTTPSPORT Procedure Parameters**

Parameter	Description
<code>new_port</code>	Value to which the remote HTTPS port is set

188.4.36 USEDPORT Function

This function obtains the port numbers used by other pluggable databases in the same consolidation database.

Syntax

```
DBMS_XDB_CONFIG.USEDPORT RETURN XMLTYPE;
```

DBMS_XDB_CONSTANTS

The `DBMS_XDB_CONSTANTS` package provides an interface to commonly used constants. Users should use constants instead of dynamic strings to avoid typographical errors.

This chapter contains the following topics:

- [Security Model](#) (page 189-1)
- [Summary of DBMS_XDB_CONSTANTS Subprograms](#) (page 189-1)

189.1 DBMS_XDB_CONSTANTS Security Model

Owned by `XDB`, the `DBMS_XDB_CONSTANTS` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

189.2 Summary of DBMS_XDB_CONSTANTS Subprograms

This table lists the `DBMS_XDB_CONSTANTS` subprograms and briefly describes them.

Table 189-1 DBMS_XDB_CONSTANTS Package Subprograms

Subprograms	Description
ENCODING_DEFAULT Function (page 189-3)	Returns 'AL32UTF8'
ENCODING_ISOLATIN1 Function (page 189-3)	Returns 'WE8ISO8859P1'
ENCODING_UTF8 Function (page 189-3)	Returns 'AL32UTF8'
ENCODING_WIN1252 Function (page 189-3)	Returns 'WE8MSWIN1252'
NAMESPACE_ACL Function (page 189-4)	Returns 'http://xmlns.oracle.com/xdb/acl.xsd'
NAMESPACE_METADATA Function (page 189-4)	Returns 'http://xmlns.oracle.com/xdbuserMetaData'
NAMESPACE_ORACLE Function (page 189-4)	Returns 'http://xmlns.oracle.com'
NAMESPACE_ORACLE_XDB Function (page 189-4)	Returns 'http://xmlns.oracle.com/xdb'
NAMESPACE_RESOURCE Function (page 189-5)	Returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'
NAMESPACE_RESOURCE_EVENT Function (page 189-5)	Returns 'http://xmlns.oracle.com/resourceEvent'

Table 189-1 (Cont.) DBMS_XDB_CONSTANTS Package Subprograms

Subprograms	Description
NAMESPACE_RESOURCE_CONFIG Function (page 189-5)	Returns 'http://xmlns.oracle.com/XDBResConfig.xsd'
NAMESPACE_XDBSCHEMA Function (page 189-5)	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'
NAMESPACE_XMLDIFF Function (page 189-6)	Returns 'http://xmlns.oracle.com/xdb/xdiff.xsd'
NAMESPACE_XMLINSTANCE Function (page 189-6)	Returns 'http://www.w3.org/2001/XMLSchema-instance'
NAMESPACE_XMLSCHEMA Function (page 189-6)	Returns 'http://www.w3.org/2001/XMLSchema'
NSPREFIX_ACL_ACL Function (page 189-6)	Returns 'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'
NSPREFIX_RESCONFIG_RC Function (page 189-7)	Returns 'xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd" '
NSPREFIX_RESOURCE_R Function (page 189-7)	Returns 'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd'
NSPREFIX_XDB_XDB Function (page 189-7)	Returns 'http://xmlns.oracle.com/xdb'
NSPREFIX_XMLINSTANCE_XSI Function (page 189-7)	Returns 'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" '
NSPREFIX_XMLDIFF_XD Function (page 189-8)	Returns 'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd" '
NSPREFIX_XMLSCHEMA_XSD Function (page 189-8)	Returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema" '
SCHEMAURL_ACL Function (page 189-8)	Returns 'http://xmlns.oracle.com/xdb/acl.xsd'
SCHEMAELEM_RES_ACL Function (page 189-8)	Returns 'http://xmlns.oracle.com/xdb/acl.xsd#acl'
SCHEMAELEM_RESCONTENT_BINARY Function (page 189-9)	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'
SCHEMAELEM_RESCONTENT_TEXT Function (page 189-9)	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'
SCHEMAURL_RESOURCE Function (page 189-9)	Returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'
SCHEMAURL_XDBSCHEMA Function (page 189-9)	Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'
XDBSCHEMA_PREFIXES Function (page 189-10)	Returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/xdb'
XSD_ATTRIBUTE Function (page 189-10)	Returns 'attribute'
XSD_COMPLEX_TYPE Function (page 189-10)	Returns 'complexType'
XSD_ELEMENT Function (page 189-10)	Returns 'element'

Table 189-1 (Cont.) DBMS_XDB_CONSTANTS Package Subprograms

Subprograms	Description
XSD_GROUP Function (page 189-11)	Returns 'group'

189.2.1 ENCODING_DEFAULT Function

This function returns 'AL32UTF8'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_DEFAULT  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'AL32UTF8'

189.2.2 ENCODING_ISOLATIN1 Function

This function returns 'WE8ISO8859P1'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_ISOLATIN1  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'WE8ISO8859P1'

189.2.3 ENCODING_UTF8 Function

This function returns 'AL32UTF8'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_UTF8  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'AL32UTF8'

189.2.4 ENCODING_WIN1252 Function

This function returns 'WE8MSWIN1252'.

Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_WIN1252  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'WE8MSWIN1252'

189.2.5 NAMESPACE_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ACL  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/acl.xsd'

189.2.6 NAMESPACE_METADATA Function

This function returns 'http://xmlns.oracle.com/xdbuserMetaData'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_METADATA  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdbuserMetaData'

189.2.7 NAMESPACE_ORACLE Function

This function returns 'http://xmlns.oracle.com'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com'

189.2.8 NAMESPACE_ORACLE_XDB Function

This function returns 'http://xmlns.oracle.com/xdb'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE_XDB  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb'

189.2.9 NAMESPACE_RESOURCE Function

This function returns '/XDBResource.xsd'

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBResource.xsd'

189.2.10 NAMESPACE_RESOURCE_EVENT Function

This function returns 'http://xmlns.oracle.com/resourceEvent'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_EVENT  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/resourceEvent'

189.2.11 NAMESPACE_RESOURCE_CONFIG Function

This function returns 'http://xmlns.oracle.com/XDBResConfig.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_CONFIG  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/XDBResConfig.xsd'

189.2.12 NAMESPACE_XDBSCHEMA Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XDBSCHEMA  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd'

189.2.13 NAMESPACE_XMLDIFF Function

This function returns 'http://xmlns.oracle.com/xdb/xdiff.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLDIFF  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/xdiff.xsd'

189.2.14 NAMESPACE_XMLINSTANCE Function

This function returns 'http://www.w3.org/2001/XMLSchema-instance'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLINSTANCE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://www.w3.org/2001/XMLSchema-instance'

189.2.15 NAMESPACE_XMLSCHEMA Function

This function returns 'http://www.w3.org/2001/XMLSchema'.

Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLSCHEMA  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://www.w3.org/2001/XMLSchema'

189.2.16 NSPREFIX_ACL_ACL Function

This function returns 'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_ACL_ACL  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'

189.2.17 NSPREFIX_RESCONFIG_RC Function

This function returns 'xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd" '.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_RESCONFIG_RC  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

Returns 'xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd" '.

189.2.18 NSPREFIX_RESOURCE_R Function

This function returns 'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_RESOURCE_R  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd'

189.2.19 NSPREFIX_XDB_XDB Function

This function returns 'http://xmlns.oracle.com/xdb'.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XDB_XDB  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb'

189.2.20 NSPREFIX_XMLINSTANCE_XSI Function

This function returns 'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" '.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLINSTANCE_XSI  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" '.

189.2.21 NSPREFIX_XMLDIFF_XD Function

This function returns 'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd" '.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLDIFF_XD  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd" '

189.2.22 NSPREFIX_XMLSCHEMA_XSD Function

This function returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema" '.

Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLSCHEMA_XSD  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:xsd="http://www.w3.org/2001/XMLSchema" '

189.2.23 SCHEMAURL_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_ACL  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/acl.xsd'

189.2.24 SCHEMAELEM_RES_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd#acl'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RES_ACL  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/acl.xsd#acl'

189.2.25 SCHEMAELEM_RESCONTENT_BINARY Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_BINARY  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'

189.2.26 SCHEMAELEM_RESCONTENT_TEXT Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_TEXT  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'

189.2.27 SCHEMAURL_RESOURCE Function

This function returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_RESOURCE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBResource.xsd'

189.2.28 SCHEMAURL_XDBSCHEMA Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'.

Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_XDBSCHEMA  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd'

189.2.29 XDBSCHEMA_PREFIXES Function

This function returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/xdb"'.
xmlns:xdb="http://xmlns.oracle.com/xdb".

Syntax

```
DBMS_XDB_CONSTANTS.XDBSCHEMA_PREFIXES  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/xdb"'

189.2.30 XSD_ATTRIBUTE Function

This function returns 'attribute'.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_ATTRIBUTE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'attribute'

189.2.31 XSD_COMPLEX_TYPE Function

This function returns 'complexType'.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_COMPLEX_TYPE  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'complexType'

189.2.32 XSD_ELEMENT Function

This function returns 'element'.

Syntax

```
DBMS_XDB_CONSTANTS.XSD_ELEMENT  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'element'

189.2.33 XSD_GROUP Function

This function returns 'group'

Syntax

```
DBMS_XDB_CONSTANTS.XSD_GROUP  
RETURN VARCHAR2 DETERMINISTIC;
```

Return Value

'group'

DBMS_XDB_REPOS

The `DBMS_XDB_REPOS` package provides an interface to operate on the Oracle XML database Repository.

This chapter contains the following topics:

- [Overview](#) (page 190-1)
- [Security Model](#) (page 190-1)
- [Constants](#) (page 190-2)
- [Summary of DBMS_XDB_REPOS Subprograms](#) (page 190-2)

See Also:

Oracle XML DB Developer's Guide for more information regarding:

- Using and managing repository resources
- ACL-based security management (controlling access to repository resources)
- Managing XLink and XInclude links
- Loading documents into the repository
- Creating, deleting, and managing resource metadata

190.1 DBMS_XDB_REPOS Overview

The `DBMS_XDB_REPOS` package lets you operate on the Oracle XML DB Repository to create, modify and delete resources, including managing security based on access control lists (ACLs). The interface provides both query and DML functions.

Using a combination of PL/SQL packages - `DBMS_XDB_REPOS`, [DBMS_XDBZ](#) (page 194-1), and [DBMS_XDB_VERSION](#) (page 191-1) - you can create, delete, and rename documents and folders, move a file or folder within the folder hierarchy, set and change the access permissions on a file or folder, and initiate and manage versioning.

190.2 DBMS_XDB_REPOS Security Model

Owned by XDB, the `DBMS_XDB_REPOS` package must be created by `sys` or XDB. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is `sys` or XDB, or the current user has the `XDBADMIN` or `DBA` role.

190.3 DBMS_XDB_REPOS Constants

The `DBMS_XDB_REPOS` package defines several constants that can be used for specifying parameter values.

These constants are shown in the following table.

Table 190-1 DBMS_XDB_REPOS Constants

Constant	Type	Value	Description
<code>DELETE_RESOURCE</code>	NUMBER	1	Deletes a resource; fails if the resource has children.
<code>DELETE_RECURSIVE</code>	NUMBER	2	Deletes a resource and its children, if any.
<code>DELETE_FORCE</code>	NUMBER	3	Deletes the resource, even if the object it contains is invalid
<code>DELETE_RECURSIVE_FORCE</code>	NUMBER	4	Deletes a resource and its children, if any, even if the object it contains is invalid
<code>DELETE_RES_METADATA_CASCADE</code>	NUMBER	1	Deletes the row in the metadata
<code>DELETE_RES_METADATA_NOCASCADE</code>	NUMBER	2	Does not delete the row
<code>DEFAULT_LOCK_TIMEOUT</code>	PLS_INTEGER	(60*60)	Timeout value (in seconds) of the webdav lock
<code>LINK_TYPE_HARD</code>	NUMBER	1	Hard link of a folder to a resource
<code>LINK_TYPE_WEAK</code>	NUMBER	2	Weak link of a folder to a resource
<code>LINK_TYPE_SYMBOLIC</code>	NUMBER	3	Symbolic link of a folder to a resource

190.4 Summary of DBMS_XDB_REPOS Subprograms

This table lists the `DBMS_XDB_REPOS` subprograms and briefly describes them.

Table 190-2 DBMS_XDB_REPOS Package Subprograms

Subprogram	Description
ACLCHECKPRIVILEGES Function (page 190-4)	Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.
APPENDRESOURCEMETADATA Procedure (page 190-5)	Takes in user-defined metadata either as a <code>REF</code> to <code>XMLTYPE</code> or an <code>XMLTYPE</code> and adds it to the desired resource
CHANGEOWNER Procedure (page 190-5)	Changes the owner of the resource/s to the specified owner.
CHANGEPRIVILEGES Function (page 190-6)	Adds a specified ACE to a specified resource's ACL
CHECKPRIVILEGES Function (page 190-6)	Checks access privileges granted to the current user on the specified resource

Table 190-2 (Cont.) DBMS_XDB_REPOS Package Subprograms

Subprogram	Description
CREATEFOLDER Function (page 190-7)	Creates a new folder resource in the hierarchy
CREATEOIDPATH Function (page 190-7)	Creates a virtual path to the resource based on object ID
CREATERESOURCE Functions (page 190-8)	Creates a new resource
DELETERESOURCE Procedure (page 190-10)	Deletes a resource from the hierarchy
DELETERESOURCEMETADATA Procedures (page 190-10)	Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)
EXISTSRESOURCE Function (page 190-11)	Determines if a resource is in the hierarchy, based on its absolute path
GETACLDOCUMENT Function (page 190-11)	Retrieves ACL document that protects resource given its path name
GETCONTENTBLOB Function (page 190-12)	Retrieves the contents of a resource returned as a BLOB
GETCONTENTCLOB Function (page 190-12)	Retrieves the contents of a resource returned as a CLOB
GETCONTENTVARCHAR2 Function (page 190-13)	Retrieves the contents of a resource returned as a string
GETCONTENTXMLREF Function (page 190-13)	Retrieves the contents of a resource returned as a <code>REF</code> to an <code>XMLTYPE</code>
GETCONTENTXMLTYPE Function (page 190-14)	Retrieves the contents of a resource returned as an <code>XMLTYPE</code>
GETLOCKTOKEN Procedure (page 190-14)	Returns that resource's lock token for the current user given a path to a resource
GETPRIVILEGES Function (page 190-15)	Gets all privileges granted to the current user on a specified resource
GETRESOID Function (page 190-15)	Returns the object ID of the resource from its absolute path
GETXDB_TABLESPACE Function (page 190-15)	Returns the current tablespace of the XDB (user)
HASBLOBCONTENT Function (page 190-16)	Returns <code>TRUE</code> if the resource has BLOB content
HASCHARCONTENT Function (page 190-16)	Returns <code>TRUE</code> if the resource has character content
HASXMLCONTENT Function (page 190-16)	Returns <code>TRUE</code> if the resource has XML content
HASXMLREFERENCE Function (page 190-17)	Returns <code>TRUE</code> if the resource has <code>REF</code> to XML content
ISFOLDER Function (page 190-17)	Returns <code>TRUE</code> if the resource is a folder or container
LINK Procedures (page 190-18)	Creates a link to an existing resource
LOCKRESOURCE Function (page 190-18)	Gets a WebDAV-style lock on that resource given a path to that resource

Table 190-2 (Cont.) DBMS_XDB_REPOS Package Subprograms

Subprogram	Description
PROCESSLINKS Procedure (page 190-19)	Processes document links in the specified resource
PURGERESOURCEMETADATA Procedure (page 190-19)	Deletes all user metadata from a resource
RENAMERESOURCE Procedure (page 190-20)	Renames the XDB resource
SETACL Procedure (page 190-20)	Sets the ACL on a specified resource
SPLITPATH Procedure (page 190-20)	Splits the path into a parentpath and childpath
TOUCHRESOURCE Procedure (page 190-21)	Changes the modification time of the resource to the current time
UNLOCKRESOURCE Function (page 190-21)	Unlocks the resource given a lock token and resource path
UPDATERESOURCEMETADATA Procedures (page 190-22)	Updates metadata for a resource

190.4.1 ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the `OWNER` of the resource. Returns positive integer if all privileges are granted.

Syntax

```
DBMS_XDB_REPOS.ACLCHECKPRIVILEGES(
    acl_path IN VARCHAR2,
    owner    IN VARCHAR2,
    privs    IN xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 190-3 ACLCHECKPRIVILEGES Function Parameters

Parameter	Description
<code>acl_path</code>	Absolute path in the Hierarchy for ACL document
<code>owner</code>	Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution
<code>privs</code>	An <code>XMLType</code> instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function (page 190-6).

190.4.2 APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a `REF` to `XMLTYPE` or an `XMLTYPE` and adds it to the desired resource.

Syntax

```
DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (
  abspath  IN  VARCHAR2,
  metadata IN  XMLTYPE);
```

```
DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (
  abspath  IN  VARCHAR2,
  metadata IN  REF SYS.XMLTYPE);
```

Parameters

Table 190-4 APPENDRESOURCEMETADATA Procedure

Parameter	Description
abspath	Absolute path of the resource
metadata	Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table.

Usage Notes

- In the case in which a `REF` is passed in, the procedure stores the `REF` in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the `RESID` column for the metadata table. Note that the `REF` passed in must be unique. In other words, there must not be a `REF` with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a `REF` that already exists.
- In the case where the `XMLTYPE` is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

190.4.3 CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner.

Syntax

```
DBMS_XDB_REPOS.CHANGEOWNER(
  abspath  IN  VARCHAR2,
  owner    IN  VARCHAR2,
  recurse  IN  BOOLEAN := FALSE);
```

Parameters

Table 190-5 CHANGEOWNER Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource

Table 190-5 (Cont.) CHANGEOWNER Procedure Parameters

Parameter	Description
owner	New owner for the resource
recurse	If TRUE, recursively change owner of all resources in the folder tree

190.4.4 CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL.

Syntax

```
DBMS_XDB_REPOS.CHANGEPRIVILEGES(
  res_path  IN  VARCHAR2,
  ace       IN  xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 190-6 CHANGEPRIVILEGES Function Parameters

Parameter	Description
res_path	Path name of the resource for which privileges need to be changed
ace	An XMLType instance of the <ace> element which specifies the <principal>, the operation <grant> and the list of privileges

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (*grant/deny*) already exists in the ACL, the new ACE is added at the end of the ACL.

190.4.5 CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

Syntax

```
DBMS_XDB_REPOS.CHECKPRIVILEGES(
  res_path  IN  VARCHAR2,
  privs     IN  xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 190-7 CHECKPRIVILEGES Function Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
privs	An XMLType instance of the privilege element specifying the requested set of access privileges

Return Values

A positive integer if all requested privileges granted.

190.4.6 CREATEFOLDER Function

This function creates a new folder resource in the hierarchy.

Syntax

```
DBMS_XDB_REPOS.CREATEFOLDER(
    path IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 190-8 CREATEFOLDER Function Parameters

Parameter	Description
path	Path name for the new folder

Return Values

TRUE if operation successful; FALSE, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if '/folder1/folder2' is passed as the path parameter, then '/folder1' must already exist.

190.4.7 CREATEOIDPATH Function

This function creates a virtual path to the resource based on object ID.

Syntax

```
DBMS_XDB_REPOS.CREATEOIDPATH(
    oid IN RAW)
RETURN VARCHAR2;
```

Parameters

Table 190-9 CREATEOIDPATH Function Parameters

Parameter	Description
oid	Object ID of the resource

190.4.8 CREATERESOURCE Functions

The functions create a new resource. The description of the overload options precede each version of the syntax

Syntax

Creates a new resource with a specified string as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath      IN  VARCHAR2,
    data         IN  VARCHAR2)
RETURN BOOLEAN;
```

Creates a new resource with a specified XMLType data as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath      IN  VARCHAR2,
    data         IN  SYS.XMLTYPE)
RETURN BOOLEAN;
```

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath      IN  VARCHAR2,
    datarow      IN  REF SYS.XMLTYPE)
RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```
DBMS_XDB_REPOS.CREATERESOURCE(
    abspath      IN  VARCHAR2,
    data         IN  BLOB,
    csid         IN  NUMBER :=0)
RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  BFILE,
    csid         IN  NUMBER :=0)
RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN VARCHAR2,
    data         IN CLOB)
RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN VARCHAR2,
    data         IN VARCHAR2,
    schemaur1    IN VARCHAR2 := NULL,
    elem         IN VARCHAR2 := NULL)
RETURN BOOLEAN;
```

Given an `XMLTYPE` and a schema URL, inserts a new resource into the hierarchy with the `XMLTYPE` as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN VARCHAR2,
    data         IN SYS.XMLTYPE,
    schemaur1    IN VARCHAR2 := NULL,
    elem         IN VARCHAR2 := NULL)
RETURN BOOLEAN;
```

Parameters

Table 190-10 CREATERESOURCE Function Parameters

Parameter	Description
abspath	Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if <code>/foo/bar.txt</code> is passed in, then folder <code>/foo</code> must already exist.
data	String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.
datarow	REF to an <code>XMLType</code> row to be used as the contents
csid	Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: <ul style="list-style-type: none"> From the abspath extension, determine the resource's MIME type. If the MIME type is <code>*xml</code>, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at http://www.w3.org/TR/2000/REC-xml-20001006; Otherwise, it is defaulted to the database character set.
schemaur1	For XML data, schema URL data conforms to (default <code>NULL</code>)
elem	Element name (default <code>NULL</code>)

Return Values

`TRUE` if operation successful; `FALSE`, otherwise.

190.4.9 DELETERESOURCE Procedure

This procedure deletes a resource from the hierarchy.

Syntax

```
DBMS_XDB_REPOS.DELETERESOURCE(
  path          IN    VARCHAR2,
  delete_option IN    PLS_INTEGER);
```

Parameters

Table 190-11 DELETERESOURCE Procedure Parameters

Parameter	Description
path	Path name of the resource to delete
delete_option	The option that controls how a resource is deleted: <ul style="list-style-type: none"> • DELETE_RESOURCE • DELETE_RECURSIVE • DELETE_FORCE • DELETE_RECURSIVE_FORCE

190.4.10 DELETERESOURCEMETADATA Procedures

This procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (
  abspath      IN  VARCHAR2,
  metadata     IN  REF SYS.XMLTYPE,
  delete_option IN  pls_integer :=
DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (
  abspath      IN  VARCHAR2,
  metadatans   IN  VARCHAR2,
  metadataname IN  VARCHAR2,
  delete_option IN  pls_integer := DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_CASCADE);
```

Parameters

Table 190-12 DELETERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
metadata	REF to the piece of metadata (schema based) to be deleted
mettadatans	Namespace of the metadata fragment to be removed
mettadataname	Local name of the metadata fragment to be removed
delete_option	Only applicable for schema-based metadata, this can be one of the following: <ul style="list-style-type: none"> DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table

190.4.11 EXISTSRESOURCE Function

This function indicates if a resource is in the hierarchy. It matches the resource by a string that represents its absolute path.

Syntax

```
DBMS_XDB_REPOS.EXISTSRESOURCE(
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 190-13 EXISTSRESOURCE Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

TRUE if the resource is found.

190.4.12 GETACLDOCUMENT Function

This function retrieves ACL document that protects resource given its path name.

Syntax

```
DBMS_XDB_REPOS.GETACLDOCUMENT(
    abspath IN VARCHAR2)
RETURN sys.xmltype;
```

Parameters

Table 190-14 GETACLDOCUMENT Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

The XMLType for ACL document.

190.4.13 GETCONTENTBLOB Function

This function retrieves the contents of a resource returned as a BLOB.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTBLOB(  
    abspath    IN    VARCHAR2,  
    csid       OUT   PLS_INTEGER,  
    locksrc    IN    BOOLEAN := FALSE)  
RETURN BLOB;
```

Parameters

Table 190-15 GETCONTENTBLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource
csid	If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.
locksrc	Contents of the resource as a BLOB

Return Values

The contents of the resource as a BLOB.

190.4.14 GETCONTENTCLOB Function

This function gets the contents of a resource returned as a CLOB.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTCLOB(  
    abspath    IN    VARCHAR2,  
    RETURN CLOB;
```

Parameters

Table 190-16 GETCONTENTCLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a CLOB.

190.4.15 GETCONTENTVARCHAR2 Function

This function gets the contents of a resource returned as a string.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTVARCHAR2(
    abspath IN VARCHAR2,
    RETURN BLOB;
```

Parameters

Table 190-17 GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a string.

190.4.16 GETCONTENTXMLREF Function

This function retrieves the contents of a resource returned as a REF to an XMLTYPE.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTXMLREF(
    abspath IN VARCHAR2,
    RETURN SYS.XMLTYPE;
```

Parameters

Table 190-18 GETCONTENTXMLREF Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a REF to an XMLTYPE.

190.4.17 GETCONTENTXMLTYPE Function

This function retrieves the contents of a resource returned as an `XMLTYPE`.

Syntax

```
DBMS_XDB_REPOS.GETCONTENTXMLTYPE(  
    abspath    IN    VARCHAR2,  
    RETURN SYS.XMLTYPE;
```

Parameters

Table 190-19 GETCONTENTXMLTYPE Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as an `XMLTYPE`.

190.4.18 GETLOCKTOKEN Procedure

Given a path to a resource, this procedure returns that resource's lock token for the current user.

Syntax

```
DBMS_XDB_REPOS.GETLOCKTOKEN(  
    path        IN    VARCHAR2,  
    locktoken   OUT   VARCHAR2);
```

Parameters

Table 190-20 GETLOCKTOKEN Procedure Parameters

Parameter	Description
path	Path name to the resource
locktoken	Logged-in user's lock token for the resource

Usage Notes

The user must have `READPROPERTIES` privilege on the resource.

190.4.19 GETPRIVILEGES Function

This function gets all privileges granted to the current user on a specified resource.

Syntax

```
DBMS_XDB_REPOS.GETPRIVILEGES(
    res_path IN VARCHAR2)
RETURN sys.xmltype;
```

Parameters

Table 190-21 GETPRIVILEGES Function Parameters

Parameter	Description
res_path	Absolute path in the hierarchy of the resource

Return Values

An XMLType instance of <privilege> element, which contains the list of all leaf privileges granted on this resource to the current user.

190.4.20 GETRESOID Function

The GETRESOID function returns the object ID of the resource from its absolute path.

Syntax

```
DBMS_XDB_REPOS.GETRESOID(
    abspath IN VARCHAR2)
RETURN RAW;
```

Parameters

Table 190-22 GETRESOID Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

NULL if the resource is not present.

190.4.21 GETXDB_TABLESPACE Function

This function returns the current tablespace of the XDB (user).

Syntax

```
DBMS_XDB_REPOS.GETXDB_TABLESPACE
RETURN VARCHAR2;
```

190.4.22 HASBLOBCONTENT Function

This function returns `TRUE` if the resource has BLOB content.

Syntax

```
DBMS_XDB_REPOS.HASBLOBCONTENT  
    abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 190-23 HASBLOBCONTENT Function Parameters

Parameter	Description
<code>abspath_path</code>	Absolute path of the resource

Return Values

`TRUE` if the resource has BOB content.

190.4.23 HASCHARCONTENT Function

This function returns `TRUE` if the resource has character content.

Syntax

```
DBMS_XDB_REPOS.HASCHARCONTENT  
    abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 190-24 HASCHARCONTENT Function Parameters

Parameter	Description
<code>abspath_path</code>	Absolute path of the resource

Return Values

`TRUE` if the resource has character content.

190.4.24 HASXMLCONTENT Function

This function returns `TRUE` if the resource has XML content.

Syntax

```
DBMS_XDB_REPOS.HASXMLCONTENT  
    abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 190-25 HASXMLCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

`TRUE` if the resource has XML content.

190.4.25 HASXMLREFERENCE Function

This function returns `TRUE` if the resource has a `REF` to XML content.

Syntax

```
DBMS_XDB_REPOS.HASXMLREFERENCE
  abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 190-26 HASXMLREFERENCE Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

`TRUE` resource has a `REF` to XML content.

190.4.26 ISFOLDER Function

This function returns `TRUE` if the resource is a folder or container.

Syntax

```
DBMS_XDB_REPOS.ISFOLDER
  abspath IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 190-27 ISFOLDER Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

`TRUE` if the resource is a folder or container.

190.4.27 LINK Procedures

This procedure creates from a specified folder to a specified resource.

Syntax

```
DBMS_XDB_REPOS.LINK(
    srcpath      IN  VARCHAR2,
    linkfolder   IN  VARCHAR2,
    linkname     IN  VARCHAR2);

DBMS_XDB_REPOS.LINK(
    srcpath      IN  VARCHAR2,
    linkfolder   IN  VARCHAR2,
    linkname     IN  VARCHAR2,
    linktype     IN  PLS_INTEGER := DBMS_XDB_REPOS.LINK_TYPE_HARD);
```

Parameters

Table 190-28 LINK Procedure Parameters

Parameter	Description
srcpath	Path name of the resource to which a link is created
linkfolder	Folder in which the new link is placed
linkname	Name of the new link
linktype	Type of link to be created: <ul style="list-style-type: none"> • DBMS_XDB.LINK_TYPE_HARD (default) • DBMS_XDB.LINK_TYPE_WEAK • DBMS_XDB.LINK_TYPE_SYMBOLIC

190.4.28 LOCKRESOURCE Function

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

Syntax

```
DBMS_XDB_REPOS.LOCKRESOURCE(
    path          IN  VARCHAR2,
    depthzero    IN  BOOLEAN,
    shared       IN  boolean)
RETURN BOOLEAN;
```

Parameters

Table 190-29 LOCKRESOURCE Function Parameters

Parameter	Description
path	Path name of the resource to lock.
depthzero	Currently not supported
shared	Passing TRUE obtains a shared write lock

Return Values

TRUE if successful.

Usage Notes

The user must have UPDATE privileges on the resource.

190.4.29 PROCESSLINKS Procedure

This procedure processes document links in the specified resource.

Syntax

```
DBMS_XDB_REPOS.PURGERESOURCEMETADATA(
  abspath IN VARCHAR2,
  recurse IN BOOLEAN := FALSE);
```

Parameters**Table 190-30 PROCESSLINKS Procedure Parameters**

Parameter	Description
abspath	Absolute path of the resource. If the path is a folder, use the <code>recurse</code> flag.
recurse	Used only if <code>abspath</code> specifies a folder. If TRUE, process links of all resources in the folder hierarchy rooted at the specified resource. If FALSE, process links of all documents in this folder only.

190.4.30 PURGERESOURCEMETADATA Procedure

This procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

Syntax

```
DBMS_XDB_REPOS.PURGERESOURCEMETADATA(
  abspath IN VARCHAR2);
```

Parameters**Table 190-31 PURGERESOURCEMETADATA Procedure Parameters**

Parameter	Description
abspath	Absolute path of the resource

190.4.31 RENAMERESOURCE Procedure

This procedure renames the XDB resource.

Syntax

```
DBMS_XDB_REPOS.RENAMERESOURCE(
  srcpath   IN  VARCHAR2,
  destfolder IN  CARCHAR2,
  newname   IN  VARCHAR2);
```

Parameters

Table 190-32 RENAMERESOURCE Procedure Parameters

Parameter	Description
srcpath	Absolute path in the Hierarchy for the source resource destination folder
destfolder	Absolute path in the Hierarchy for the destination folder
newname	Name of the child in the destination folder

190.4.32 SETACL Procedure

This procedure sets the ACL on a specified resource to be the ACL specified by path.

Syntax

```
DBMS_XDB_REPOS.SETACL(
  res_path  IN  VARCHAR2,
  acl_path  IN  VARCHAR2);
```

Parameters

Table 190-33 SETACL Procedure Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
acl_path	Absolute path in the Hierarchy for ACL

Usage Notes

The user must have `<write-acl>` privileges on the resource.

190.4.33 SPLITPATH Procedure

This procedure splits the path into a parentpath and childpath.

Syntax

```
DBMS_XDB_REPOS.SPLITPATH(
  abspath   IN  VARCHAR2,
  parentpath OUT VARCHAR2,
  childpath  OUT VARCHAR2);
```

Parameters

Table 190-34 SPLITPATH Procedure Parameters

Parameter	Description
abspath	Absolute path to be split
parentpath	Parentpath
childpath	Childpath

190.4.34 TOUCHRESOURCE Procedure

This procedure changes the modification time of the resource to the current time.

Syntax

```
DBMS_XDB_REPOS.TOUCHRESOURCE
    (abspath IN VARCHAR2);
```

Parameters

Table 190-35 TOUCHRESOURCE Procedure Parameters

Parameter	Description
abspath_path	Absolute path of the resource

190.4.35 UNLOCKRESOURCE Function

This function unlocks the resource given a lock token and a path to the resource.

Syntax

```
DBMS_XDB_REPOS.UNLOCKRESOURCE(
    path IN VARCHAR2,
    deltoken IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 190-36 UNLOCKRESOURCE Function Parameters

Parameter	Description
path	Path name to the resource
deltoken	Lock token to be removed

Return Values

TRUE if operation successful.

Usage Notes

The user must have `UPDATE` privileges on the resource.

190.4.36 UPDATERESOURCEMETADATA Procedures

This procedure updates metadata for a resource.

The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its `REF`. It replaces that piece of metadata with user-defined metadata which is either in the form of a `REF` to `XMLTYPE` or an `XMLTYPE`.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
  abspath IN VARCHAR2,
  oldmetadata IN REF SYS.XMLTYPE,
  newmetadata IN REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
  abspath IN VARCHAR2,
  oldmetadata IN REF SYS.XMLTYPE,
  newmetadata IN XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
  abspath IN VARCHAR2,
  oldns IN VARCHAR2,
  oldname IN VARCHAR,
  newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA(
  abspath IN VARCHAR2,
  oldns IN VARCHAR2,
  oldname IN VARCHAR,
  newmetadata IN REF SYS.XMLTYPE);
```

Parameters

Table 190-37 UPDATERESOURCEMETADATA Procedure Parameters

Parameter	Description
<code>abspath</code>	Absolute path of the resource
<code>oldmetadata</code>	<code>REF</code> to the old of metadata

Table 190-37 (Cont.) UPDATERESOURCEMETADATA Procedure Parameters

Parameter	Description
newmetadata	REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)
oldns	Namespace identifying old metadata
oldname	Local name identifying old metadata

Usage Notes

In the case of REF, it stores the REF in the resource and the metadata is stored in a separate table. Uniqueness of REFs is enforced. In the case where the XMLTYPE is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

DBMS_XDB_VERSION

Oracle XML DB versioning interfaces are found in the `DBMS_XDB_VERSION` package. Functions and procedures of `DBMS_XDB_VERSION` help to create a VCR and manage the versions in the version history.

This chapter contains the following topic:

- [Security Model](#) (page 191-1)
- [Summary of DBMS_XDB_VERSION Subprograms](#) (page 191-1)

See Also:

Oracle XML DB Developer's Guide

191.1 DBMS_XDB_VERSION Security Model

Owned by `XDB`, the `DBMS_XDB_VERSION` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

191.2 Summary of DBMS_XDB_VERSION Subprograms

This table lists the `DBMS_XDB_VERSION` subprograms and briefly describes them.

Table 191-1 *DBMS_XDB_VERSION Package Subprograms*

Method	Description
CHECKIN Function (page 191-2)	Checks in a checked-out VCR and returns the resource id of the newly-created version
CHECKOUT Procedure (page 191-3)	Checks out a VCR before updating or deleting it
GETCONTENTSBLobbyRESID Function (page 191-3)	Obtain contents as a <code>BLOB</code>
GETCONTENTSCLobbyRESID Function (page 191-3)	Obtain contents as a <code>CLOB</code>
GETCONTENTSXMLBYRESID Function (page 191-4)	Obtain contents as an <code>XMLType</code>
GETPREDECESSORS Function (page 191-4)	Retrieves the list of predecessors by path name
GETPREDSBYRESID Function (page 191-5)	Retrieves the list of predecessors by resource id

Table 191-1 (Cont.) DBMS_XDB_VERSION Package Subprograms

Method	Description
GETRESOURCEBYRESID Function (page 191-5)	Obtains the resource as an XMLType, given the resource object ID
GETSUCCESSORS Function (page 191-6)	Retrieves the list of successors by path name
GETSUCCSBYRESID Function (page 191-6)	Retrieves the list of successors by resource id
MAKEVERSIONED Function (page 191-7)	Turns a regular resource whose path name is given into a version-controlled resource
UNCHECKOUT Function (page 191-7)	Checks in a checked-out resource, returns the resource id of the version before the resource is checked out

191.2.1 CHECKIN Function

This function checks in a checked-out VCR and returns the resource id of the newly-created version.

Syntax

```
DBMS_XDB_VERSION.CHECKIN(
    pathname VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

Table 191-2 CHECKIN Function Parameters

Parameter	Description
pathname	The path name of the checked-out resource.

Usage Notes

This is not an auto-commit SQL operation. [CHECKIN Function](#) (page 191-2) doesn't have to take the same path name that was passed to [CHECKOUT Procedure](#) (page 191-3) operation. However, the [CHECKIN Function](#) (page 191-2) path name and the [CHECKOUT Procedure](#) (page 191-3) path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to [CHECKIN Function](#) (page 191-2) because the old name is either invalid or is currently bound with a different resource. Exception is raised if the path name does not exist. If the path name has been changed, the new path name must be used to [CHECKIN Function](#) (page 191-2) the resource.

191.2.2 CHECKOUT Procedure

This procedure checks out a VCR before updating or deleting it.

Syntax

```
DBMS_XDB_VERSION.Checkout (
    pathname    VARCHAR2);
```

Parameters

Table 191-3 CHECKOUT Procedure Parameters

Parameter	Description
pathname	The path name of the VCR to be checked out.

Usage Notes

This is not an auto-commit SQL operation. Two users of the same workspace cannot [CHECKOUT Procedure](#) (page 191-3) the same VCR at the same time. If this happens, one user must rollback. As a result, it is good practice to commit the [CHECKOUT Procedure](#) (page 191-3) operation before updating a resource and avoid loss of the update if the transaction is rolled back. An exception is raised if the given resource is not a VCR, if the VCR is already checked out, if the resource doesn't exist.

191.2.3 GETCONTENTSbloobyresid Function

This function obtain contents as a BLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSbloobyresid(
    resid    DBMS_XDB.resid_type)
RETURN BLOB;
```

Parameters

Table 191-4 GETCONTENTSbloobyresid Function Parameters

Parameter	Description
resid	The resource id.

191.2.4 GETCONTENTScloobyresid Function

This function obtains contents as a CLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTScloobyresid(
    resid    DBMS_XDB.resid_type)
RETURN CLOB;
```

Parameters

Table 191-5 GETCONTENTSCLOBYRESID Function Parameters

Parameter	Description
resid	The resource id.

191.2.5 GETCONTENTSXMLBYRESID Function

This function obtains contents as an `XMLType`.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSXMLBYRESID(
    resid      DBMS_XDB.resid_type)
RETURN XMLType;
```

Parameters

Table 191-6 GETCONTENTSXMLBYRESID Function Parameters

Parameter	Description
resid	The resource id.

Return Values

If the contents are not valid XML, returns `NULL`.

191.2.6 GETPREDECESSORS Function

This function retrieves the list of predecessors by the path name.

Syntax

```
DBMS_XDB_VERSION.GETPREDECESSORS(
    pathname  VARCHAR2)
RETURN resid_list_type;
```

Parameters

Table 191-7 GETPREDECESSORS Function Parameters

Parameter	Description
pathname	The path name of the resource.

Return Values

An exception is raised if `pathname` is illegal.

191.2.7 GETPREDSBYRESID Function

This function retrieves the list of predecessors by resource id.

Syntax

```
DBMS_XDB_VERSION.GETPREDSBYRESID(  
    resid      resid_type)  
RETURN resid_list_type;
```

Parameters

Table 191-8 GETPREDSBYRESID Function Parameters

Parameter	Description
resid	The resource id.

Usage Notes

Getting predecessors by `RESID` is more efficient than by `pathname`.

Exceptions

An exception is raised if the `RESID` is illegal.

191.2.8 GETRESOURCEBYRESID Function

This function obtains the resource as an `XMLType`, given the resource object ID. Because the system does not create a path name for versions, this function is useful for retrieving the resource using its resource id.

Syntax

```
DBMS_XDB_VERSION.GETRESOURCEBYRESID(  
    resid      resid_type)  
RETURN XMLType;
```

Parameters

Table 191-9 GETRESOURCEBYRESID Function Parameters

Parameter	Description
resid	The resource id.

191.2.9 GETSUCCESSORS Function

Given a version resource or a VCR, this function retrieves the list of the successors of the resource by the path name.

Syntax

```
DBMS_XDB_VERSION.GETSUCCESSORS(  
    pathname VARCHAR2)  
RETURN resid_list_type;
```

Parameters

Table 191-10 GETSUCCESSORS Function Parameters

Parameter	Description
pathname	The path name of the resource.

Usage Notes

Getting successors by `RESID` is more efficient than by `pathname`.

Exceptions

An exception is raised if the `pathname` is illegal.

191.2.10 GETSUCCSBYRESID Function

This function retrieves the list of the successors of the resource by resource id using version resource or VCR.

Syntax

```
DBMS_XDB_VERSION.GETSUCCSBYRESID(  
    resid resid_type)  
RETURN resid_list_type;
```

Parameters

Table 191-11 GETSUCCSBYRESID Function Parameters

Parameter	Description
resid	The resource id.

Usage Notes

Getting successors by `RESID` is more efficient than by `pathname`.

Exceptions

An exception is raised if the `pathname` is illegal.

191.2.11 MAKEVERSIONED Function

This function turns a regular resource whose path name is given into a version-controlled resource. This new resource is then put under version control. All other path names continue to refer to the original resource.

Syntax

```
DBMS_XDB_VERSION.MAKEVERSIONED(
    pathname  VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

Table 191-12 MAKEVERSIONED Function Parameters

Parameter	Description
pathname	The path name of the resource to be put under version control.

Return Values

This function returns the resource ID of the first version, or root, of the VCR.

Usage Notes

If two or more path names are bound with the same resource, a copy of the resource is created, and the given path name is bound with the newly-created copy.

This is not an auto-commit SQL operation. An exception is raised if the resource doesn't exist.

- This call is legal for VCR, and neither exception nor warning is raised.
- This call is illegal for folder, version history, version resource, and ACL.
- No support for Schema-based resources is provided.

191.2.12 UNCHECKOUT Function

This function checks-in a checked-out resource and returns the resource id of the version before the resource is checked out.

Syntax

```
DBMS_XDB_VERSION.UNCHECKOUT(
    pathname  VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

Table 191-13 UNCHECKOUT Function Parameters

Parameter	Description
pathname	The path name of the checked-out resource.

Usage Notes

This is not an auto-commit SQL operation. The [UNCHECKOUT Function](#) (page 191-7) does not have to take the same path name that was passed to the operation by the [CHECKOUT Procedure](#) (page 191-3). However, the [UNCHECKOUT Function](#) (page 191-7) path name and the [CHECKOUT Procedure](#) (page 191-3) path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to [UNCHECKOUT Function](#) (page 191-7), because the old name is either invalid or is currently bound with a different resource. If the path name has been changed, the new path name must be used to [UNCHECKOUT Function](#) (page 191-7) the resource.

Exceptions

An exception is raised if the path name doesn't exist.

DBMS_XDBRESOURCE

The `DBMS_XDBRESOURCE` package provides the interface to operate on the resource's metadata and contents.

This chapter contains the following topics:

- [Overview](#) (page 192-1)
- [Security Model](#) (page 192-1)
- [Summary of DBMS_XDBRESOURCE Subprograms](#) (page 192-1)

See Also:

Oracle XML DB Developer's Guide for examples of "Using `DBMS_XDBRESOURCE`"

192.1 DBMS_XDBRESOURCE Overview

The `DBMS_XDBRESOURCE` package provides routines to get and set the resource's metadata and contents. To take advantage of the DOM traversal facility, provided in `DBMS_XMLDOM` package, an `XDBResource` instance could be converted to a `DOMDocument` type by using `DBMS_XDBRESOURCE.MAKEDOCUMENT` routine.

192.2 DBMS_XDBRESOURCE Security Model

Owned by `XDB`, the `DBMS_XDBRESOURCE` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

192.3 Summary of DBMS_XDBRESOURCE Subprograms

This table lists the `DBMS_XDBRESOURCE` subprograms and briefly describes them.

Table 192-1 *DBMS_XDBRESOURCE Package Subprograms*

Subprogram	Description
FREERESOURCE Procedure (page 192-4)	Frees any memory associated with an <code>XDBResource</code>
GETACL Function (page 192-4)	Given an <code>XDBResource</code> , returns its ACL as string
GETACLDOCFROMRES Function (page 192-5)	Returns the ACL Document for the given resource as <code>XMLType</code>
GETAUTHOR Function (page 192-5)	Given an <code>XDBResource</code> , returns its author

Table 192-1 (Cont.) DBMS_XDBRESOURCE Package Subprograms

Subprogram	Description
GETCHARACTERSET Function (page 192-5)	Given an XDBResource, returns its character set
GETCOMMENT Function (page 192-6)	Given an XDBResource, returns its comment
GETCONTENTBLOB Function (page 192-6)	Returns the contents of the resource as a BLOB
GETCONTENTCLOB Function (page 192-6)	Returns the contents of the resource as a CLOB
GETCONTENTREF Function (page 192-7)	Returns the contents of the resource as an XMLTypeRef
GETCONTENTTYPE Function (page 192-7)	Given an XDBResource, returns its content-type
GETCONTENTXML Function (page 192-7)	Returns the contents of the resource as XML
GETCONTENTVARCHAR2 Function (page 192-8)	Returns the contents of the resource as a string
GETCREATIONDATE Function (page 192-8)	Given an XDBResource, returns its creation date
GETCREATOR Function (page 192-8)	Given an XDBResource, returns its creator
GETCUSTOMMETADATA Function (page 192-9)	Returns the requested custom metadata given the xpath and namespace to the metadata
GETDISPLAYNAME Function (page 192-9)	Given an XDBResource, returns its display name
GETLANGUAGE Function (page 192-10)	Given an XDBResource, returns its language
GETLASTMODIFIER Function (page 192-10)	Given an XDBResource, returns its last modifier
GETMODIFICATIONDATE Function (page 192-10)	Given an XDBResource, returns its modification date
GETOWNER Function (page 192-11)	Given an XDBResource, returns its owner.
GETREFCOUNT Function (page 192-11)	Given an XDBResource, returns its reference count
GETVERSIONID Function (page 192-11)	Given an XDBResource, returns its version ID.
HASACLCHANGED Function (page 192-12)	Returns TRUE if the ACL of the given resource has changed, FALSE otherwise
HASAUTHORCHANGED Function (page 192-12)	Returns TRUE if the ACL of the given resource has changed FALSE otherwise
HASCHANGED Function (page 192-12)	Returns TRUE if the element or attribute represented by the given XPath has changed, FALSE otherwise
HASCHARACTERSETCHANGED Function (page 192-13)	Returns TRUE if the character set of the given resource has changed, FALSE otherwise
HASCOMMENTCHANGED Function (page 192-13)	Returns TRUE if the comment of the given resource has changed, FALSE otherwise
HASCONTENTCHANGED Function (page 192-14)	Returns TRUE if the contents of the given resource has changed, FALSE otherwise

Table 192-1 (Cont.) DBMS_XDBRESOURCE Package Subprograms

Subprogram	Description
HASCONTENTTYPECHANGED Function (page 192-14)	Returns <code>TRUE</code> if the content-type of the given resource has changed, <code>FALSE</code> otherwise
HASCREATIONDATECHANGED Function (page 192-14)	Returns <code>TRUE</code> if the creation date of the given resource has changed, <code>FALSE</code> otherwise
HASCREATORCHANGED Function (page 192-15)	Returns <code>TRUE</code> if the creator of the given resource has changed, <code>FALSE</code> otherwise
HASCUSTOMMETADATACHANGED Function (page 192-15)	Returns <code>TRUE</code> if custom-metadata for this XPath has changed, <code>FALSE</code> otherwise
HASDISPLAYNAMECHANGED Function (page 192-16)	Returns <code>TRUE</code> if the display name of the given resource has changed, <code>FALSE</code> otherwise
HASLANGUAGECHANGED Function (page 192-16)	Returns <code>TRUE</code> if the language of the given resource has changed, <code>FALSE</code> otherwise
HASLASTMODIFIERCHANGED Function (page 192-16)	Returns <code>TRUE</code> if the last modifier of the given resource has changed, <code>FALSE</code> otherwise
HASMODIFICATIONDATECHANGED Function (page 192-17)	Returns <code>TRUE</code> if the modification date of the given resource has changed, <code>FALSE</code> otherwise
HASOWNERCHANGED Function (page 192-17)	Returns <code>TRUE</code> if the owner of the given resource has changed, <code>FALSE</code> otherwise
HASREFCOUNTCHANGED Function (page 192-18)	Returns <code>TRUE</code> if the reference count of the given resource has changed, <code>FALSE</code> otherwise
HASVERSIONIDCHANGED Function (page 192-18)	Returns <code>TRUE</code> if the version ID of the given resource has changed, <code>FALSE</code> otherwise
ISFOLDER Function (page 192-18)	Returns <code>TRUE</code> if the given resource is a folder, <code>FALSE</code> otherwise
ISNULL Function (page 192-19)	Returns <code>TRUE</code> if input resource is <code>NULL</code> , <code>FALSE</code> otherwise
MAKEDOCUMENT Function (page 192-19)	Converts the XDBResource to a <code>DOMDocument</code> which can be operated on using the <code>XMLDOM</code> interface
SAVE Procedure (page 192-20)	Updates the resource with any modifications
SETACL Procedure (page 192-20)	Sets the ACL of the given XDBResource to the path specified
SETAUTHOR Procedure (page 192-20)	Sets the author of the given XDBResource to the specified string
SETCHARACTERSET Procedure (page 192-21)	Sets the character set of the given XDBResource to a specified character set
SETCOMMENT Procedure (page 192-21)	Sets a comment associated with the given XDBResource
SETCONTENT Procedures (page 192-21)	Replaces the contents of the given resource with the given <code>CLOB</code>
SETCONTENTTYPE Procedure (page 192-22)	Sets the content-type of the given XDBResource
SETCUSTOMMETADATA Procedure (page 192-23)	Sets the custom metadata specified by the XPath and namespace to new data

Table 192-1 (Cont.) DBMS_XDBRESOURCE Package Subprograms

Subprogram	Description
SETDISPLAYNAME Procedure (page 192-23)	Sets the display name of the given XDBResource
SETLANGUAGE Procedure (page 192-24)	Sets the language of the given XDBResource
SETOWNER Procedure (page 192-24)	Sets the owner of the given XDBResource

192.3.1 FREERESOURCE Procedure

This procedure frees any memory associated with an XDBResource.

Syntax

```
DBMS_XDBRESOURCE.FREERESOURCE (
    res IN XDBResource)
RETURN VARCHAR2;
```

Parameters

Table 192-2 FREERESOURCE Procedure Parameters

Parameter	Description
res	XDBResource to free

192.3.2 GETACL Function

Given an XDBResource, this function returns its ACL as string.

Syntax

```
DBMS_XDBRESOURCE.GETACL (
    res IN XDBResource)
RETURN VARCHAR2;
```

Parameters

Table 192-3 GETACL Function Parameters

Parameter	Description
res	XDBResource

192.3.3 GETACLDOCFROMRES Function

This function returns the ACL Document for the given resource as XMLType.

Syntax

```
DBMS_XDBRESOURCE.GETACLDOCFROMRES (  
    res IN XDBResource)  
RETURN SYS.XMLTYPE;
```

Parameters

Table 192-4 GETACLDOCFROMRES Function Parameters

Parameter	Description
res	XDBResource

192.3.4 GETAUTHOR Function

Given an XDBResource, this function returns its author.

Syntax

```
DBMS_XDBRESOURCE.GETAUTHOR (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 192-5 GETAUTHOR Function Parameters

Parameter	Description
res	XDBResource

192.3.5 GETCHARACTERSET Function

Given an XDBResource, this function returns its character set.

Syntax

```
DBMS_XDBRESOURCE.GETCHARACTERSET (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 192-6 GETCHARACTERSET Function Parameters

Parameter	Description
res	XDBResource

192.3.6 GETCOMMENT Function

Given an XDBResource, this function returns its comment.

Syntax

```
DBMS_XDBRESOURCE.GETCOMMENT (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 192-7 GETCOMMENT Function Parameters

Parameter	Description
res	XDBResource

192.3.7 GETCONTENTBLOB Function

This function returns the contents of the resource as a BLOB.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTBLOB (  
    res IN XDBResource,  
    csid OUT PLS_INTEGER)  
RETURN BLOB;
```

Parameters

Table 192-8 GETCONTENTBLOB Function Parameters

Parameter	Description
res	XDBResource
csid	Character set ID of the BLOB returned

192.3.8 GETCONTENTCLOB Function

This function returns the contents of the resource as a CLOB.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTCLOB (  
    res IN XDBResource)  
RETURN CLOB;
```

Parameters**Table 192-9 GETCONTENTCLOB Function Parameters**

Parameter	Description
res	XDBResource

192.3.9 GETCONTENTREF Function

This function returns the contents of the resource as an `XMLTypeRef`.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTREF (
  res IN XDBResource)
RETURN VARCHAR2;
```

Parameters**Table 192-10 GETCONTENTREF Function Parameters**

Parameter	Description
res	XDBResource

192.3.10 GETCONTENTTYPE Function

Given an `XDBResource`, this function returns its content-type.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTTYPE (
  res IN XDBResource)
RETURN VARCHAR2;
```

Parameters**Table 192-11 GETCONTENTTYPE Function Parameters**

Parameter	Description
res	XDBResource

192.3.11 GETCONTENTXML Function

This function returns the contents of the resource as an `XMLTypeRef`.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTXML (
  res IN XDBResource)
RETURN XMLType;
```

Parameters**Table 192-12 GETCONTENTXML Function Parameters**

Parameter	Description
res	XDBResource

192.3.12 GETCONTENTVARCHAR2 Function

This function returns the contents of the resource as a string.

Syntax

```
DBMS_XDBRESOURCE.GETCONTENTVARCHAR2 (
  res IN XDBResource)
RETURN VARCHAR2;
```

Parameters**Table 192-13 GETCONTENTVARCHAR2 Function Parameters**

Parameter	Description
res	XDBResource

192.3.13 GETCREATIONDATE Function

Given an XDBResource, this function returns its creation date.

Syntax

```
DBMS_XDBRESOURCE.GETCREATIONDATE (
  res IN XDBResource)
RETURN TIMESTAMP;
```

Parameters**Table 192-14 GETCREATIONDATE Function Parameters**

Parameter	Description
res	XDBResource

192.3.14 GETCREATOR Function

Given an XDBResource, this function returns its creator.

Syntax

```
DBMS_XDBRESOURCE.GETCREATOR (
  res IN XDBResource)
RETURN VARCHAR2;
```

Parameters

Table 192-15 GETCREATOR Function Parameters

Parameter	Description
res	XDBResource

192.3.15 GETCUSTOMMETADATA Function

This function returns the requested custom metadata given the xpath and namespace to the metadata.

Syntax

```
DBMS_XDBRESOURCE.GETCUSTOMMETADATA (
  res          IN    XDBResource,
  xpath       IN    VARCHAR2,   namespace IN    VARCHAR2)
RETURN XMLType;
```

Parameters

Table 192-16 GETCUSTOMMETADATA Function Parameters

Parameter	Description
res	XDBResource
xpath	XPath for custom metadata
namespace	Namespace

Usage Notes

The first component of the XPath expression must be "Resource".

192.3.16 GETDISPLAYNAME Function

Given an XDBResource, this function returns its display name.

Syntax

```
DBMS_XDBRESOURCE.GETDISPLAYNAME (
  res IN XDBResource)
RETURN VARCHAR2;
```

Parameters

Table 192-17 GETDISPLAYNAME Function Parameters

Parameter	Description
res	XDBResource

192.3.17 GETLANGUAGE Function

Given an XDBResource, this function returns its language.

Syntax

```
DBMS_XDBRESOURCE.GETLANGUAGE (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 192-18 GETLANGUAGE Function Parameters

Parameter	Description
res	XDBResource

192.3.18 GETLASTMODIFIER Function

Given an XDBResource, this function returns its last modifier.

Syntax

```
DBMS_XDBRESOURCE.GETLASTMODIFIER (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 192-19 GETLASTMODIFIER Function Parameters

Parameter	Description
res	XDBResource

192.3.19 GETMODIFICATIONDATE Function

Given an XDBResource, this function returns its modification date.

Syntax

```
DBMS_XDBRESOURCE.GETMODIFICATIONDATE (  
    res IN XDBResource)  
RETURN TIMESTAMP;
```

Parameters

Table 192-20 GETMODIFICATIONDATE Function Parameters

Parameter	Description
res	XDBResource

192.3.20 GETOWNER Function

Given an XDBResource, this function returns its owner.

Syntax

```
DBMS_XDBRESOURCE.GETOWNER (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 192-21 GETOWNER Function Parameters

Parameter	Description
res	XDBResource

192.3.21 GETREFCOUNT Function

Given an XDBResource, this function returns its reference count.

Syntax

```
DBMS_XDBRESOURCE.GETREFCOUNT (  
    res IN XDBResource)  
RETURN PLS_INTEGER;
```

Parameters

Table 192-22 GETREFCOUNT Function Parameters

Parameter	Description
res	XDBResource

192.3.22 GETVERSIONID Function

Given an XDBResource, this function returns its version ID.

Syntax

```
DBMS_XDBRESOURCE.GETVERSIONID (  
    res IN XDBResource)  
RETURN PLS_INTEGER;
```

Parameters

Table 192-23 GETVERSIONID Function Parameters

Parameter	Description
res	XDBResource

192.3.23 HASACLCHANGED Function

This function returns `TRUE` if the ACL of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASACLCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 192-24 HASACLCHANGED Function Parameters

Parameter	Description
res	XDBResource

192.3.24 HASAUTHORCHANGED Function

This function returns `TRUE` if the author of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASAUTHORCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 192-25 HASAUTHORCHANGED Function Parameters

Parameter	Description
res	XDBResource

192.3.25 HASCHANGED Function

Given an XPath, this function determines whether the element or attribute represented by the XPath has changed.

Syntax

```
DBMS_XDBRESOURCE.HASCHANGED (  
    res IN XDBResource,  
    xpath IN VARCHAR2,  
    namespace IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 192-26 HASCHANGED Function Parameters

Parameter	Description
res	XDBResource
xpath	XPath to check
bnamespace	Namespace to use

192.3.26 HASCHARACTERSETCHANGED Function

This function returns `TRUE` if the character set of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCHARACTERSETCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 192-27 HASCHARACTERSETCHANGED Function Parameters

Parameter	Description
res	XDBResource

192.3.27 HASCOMMENTCHANGED Function

This function returns `TRUE` if the comment of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCOMMENTCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 192-28 HASCOMMENTCHANGED Function Parameters

Parameter	Description
res	XDBResource

192.3.28 HASCONTENTCHANGED Function

This function returns `TRUE` if the contents of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCONTENTCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 192-29 HASCONTENTCHANGED Function Parameters

Parameter	Description
res	XDBResource

192.3.29 HASCONTENTTYPECHANGED Function

This function returns `TRUE` if the content-type of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCONTENTTYPECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 192-30 HASCONTENTTYPECHANGED Function Parameters

Parameter	Description
res	XDBResource

192.3.30 HASCREATIONDATECHANGED Function

This function returns `TRUE` if the creation date of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASCREATIONDATECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 192-31 HASCREATIONDATECHANGED Function Parameters

Parameter	Description
res	XDBResource

192.3.31 HASCREATORCHANGED Function

This function returns `TRUE` if the creator of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESOURCE.HASCREATORCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 192-32 HASCREATORCHANGED Function Parameters

Parameter	Description
res	XDBResource

192.3.32 HASCUSTOMMETADATACHANGED Function

This function checks whether the custom-metadata for a given resource has changed.

Syntax

```
DBMS_XDBRESOURCE.HASCUSTOMMETADATACHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 192-33 HASCUSTOMMETADATACHANGED Function Parameters

Parameter	Description
res	XDBResource

192.3.33 HASDISPLAYNAMECHANGED Function

This function returns `TRUE` if the display name of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASDISPLAYNAMECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 192-34 HASDISPLAYNAMECHANGED Function Parameters

Parameter	Description
res	XDBResource

192.3.34 HASLANGUAGECHANGED Function

This function returns `TRUE` if the language of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASLANGUAGECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 192-35 HASLANGUAGECHANGED Function Parameters

Parameter	Description
res	XDBResource

192.3.35 HASLASTMODIFIERCHANGED Function

This function returns `TRUE` if the last modifier of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASLASTMODIFIERCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters**Table 192-36 HASLASTMODIFIERCHANGED Function Parameters**

Parameter	Description
res	XDBResource

192.3.36 HASMODIFICATIONDATECHANGED Function

This function returns `TRUE` if the modification date of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESOURCE.HASMODIFICATIONDATECHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters**Table 192-37 HASMODIFICATIONDATECHANGED Function Parameters**

Parameter	Description
res	XDBResource

192.3.37 HASOWNERCHANGED Function

This function returns `TRUE` if the owner of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASOWNERCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters**Table 192-38 HASOWNERCHANGED Function Parameters**

Parameter	Description
res	XDBResource

192.3.38 HASREFCOUNTCHANGED Function

This function returns `TRUE` if the reference count of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASREFCOUNTCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 192-39 HASREFCOUNTCHANGED Function Parameters

Parameter	Description
res	XDBResource

192.3.39 HASVERSIONIDCHANGED Function

This function returns `TRUE` if the version ID of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.HASVERSIONIDCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 192-40 HASVERSIONIDCHANGED Function Parameters

Parameter	Description
res	XDBResource

192.3.40 ISFOLDER Function

This function returns `TRUE` if the given resource is a folder, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESOURCE.ISFOLDER (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 192-41 ISFOLDER Function Parameters

Parameter	Description
res	XDBResource

192.3.41 ISNULL Function

This function returns `TRUE` if input resource is `NULL`.

Syntax

```
DBMS_XDBRESOURCE.ISNULL (
    res IN XDBResource)
RETURN BOOLEAN;
```

Parameters

Table 192-42 ISNULL Function Parameters

Parameter	Description
res	Input resource

192.3.42 MAKEDOCUMENT Function

This function converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface.

See Also:

The [DBMS_XMLDOM](#) (page 196-1) package

Syntax

```
DBMS_XDBRESOURCE.MAKEDOCUMENT (
    res IN XDBResource)
RETURN DBMS_XMLDOM.DOMDocument;
```

Parameters

Table 192-43 MAKEDOCUMENT Function Parameters

Parameter	Description
res	XDBResource

192.3.43 SAVE Procedure

This procedure updates the resource with any modifications.

Syntax

```
DBMS_XDBRESOURCE.SAVE (
    res IN XDBResource);
```

Parameters

Table 192-44 SAVE Procedure Parameters

Parameter	Description
res	XDBResource

192.3.44 SETACL Procedure

This procedure sets the ACL of the given XDBResource to the path specified.

Syntax

```
DBMS_XDBRESOURCE.SETACL (
    res IN OUT XDBResource,
    ACLPath IN VARCHAR2);
```

Parameters

Table 192-45 SETACL Procedure Parameters

Parameter	Description
res	XDBResource
ACLPath	Absolute path of the new ACL

192.3.45 SETAUTHOR Procedure

This procedure sets the author of the given XDBResource to the specified string.

Syntax

```
DBMS_XDBRESOURCE.SETAUTHOR (
    res IN OUT XDBResource,
    author IN VARCHAR2);
```

Parameters

Table 192-46 SETAUTHOR Procedure Parameters

Parameter	Description
res	XDBResource

Table 192-46 (Cont.) SETAUTHOR Procedure Parameters

Parameter	Description
author	Author

192.3.46 SETCHARACTERSET Procedure

This procedure sets the character set of the given XDBResource to a specified character set.

Syntax

```
DBMS_XDBRESOURCE.SETCHARACTERSET (
    res      IN OUT  XDBResource,
    charSet IN      VARCHAR2);
```

Parameters

Table 192-47 SETCHARACTERSET Procedure Parameters

Parameter	Description
res	XDBResource
charset	New character set

192.3.47 SETCOMMENT Procedure

This procedure sets a comment associated with the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETCOMMENT (
    res      IN OUT  XDBResource,
    comment IN      VARCHAR2);
```

Parameters

Table 192-48 SETCOMMENT Procedure Parameters

Parameter	Description
res	XDBResource
comment	New comment

192.3.48 SETCONTENT Procedures

This procedure replaces the contents of the given resource with the given datatype.

Syntax

```
DBMS_XDBRESOURCE.SETCONTENT (
    res      IN OUT  XDBResource,
```

```

data      IN      BFILE,
csid      IN      NUMBER);

DBMS_XDBRESOURCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      BLOB,
  csid     IN      PLS_INTEGER);

DBMS_XDBRESOURCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      CLOB);

DBMS_XDBRESOURCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      REF SYS.XMLType,
  sticky   IN      BOOLEAN := TRUE);

DBMS_XDBRESOURCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      VARCHAR2);

DBMS_XDBRESOURCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      SYS.XMLType);

```

Parameters

Table 192-49 SETCONTENT Procedure Parameters

Parameter	Description
res	XDBResource
data	Data input as BFILE, BLOB, CLOB, string, XMLType
csid	Character set ID of the BFILE, BLOB
sticky	If TRUE creates a sticky REF, otherwise non-sticky

192.3.49 SETCONTENTTYPE Procedure

This procedure sets the content-type of the given XDBResource.

Syntax

```

DBMS_XDBRESOURCE.SETCONTENTTYPE (
  res      IN OUT  XDBResource,
  conttype IN      VARCHAR2);

```

Parameters

Table 192-50 SETCONTENTTYPE Procedure Parameters

Parameter	Description
res	XDBResource
conttype	New content-type

192.3.50 SETCUSTOMMETADATA Procedure

This procedure sets the custom metadata specified by the xpath and namespace to new data.

Syntax

```
DBMS_XDBRESOURCE.SETCUSTOMMETADATA (
  res          IN OUT  XDBResource,
  xpath        IN      VARCHAR2,
  namespace    IN      VARCHAR2,
  newMetadata  IN      XMLType);
```

Parameters

Table 192-51 SETCUSTOMMETADATA Procedure Parameters

Parameter	Description
res	XDBResource
xpath	XPath to change
namespace	Namespace to use
newMetadata	New data that should replace the metadata at the given XPath

Usage Notes

The first component of the XPath expression must be "Resource".

192.3.51 SETDISPLAYNAME Procedure

This procedure sets the display name of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETDISPLAYNAME (
  res          IN OUT  XDBResource,
  name         IN      VARCHAR2);
```

Parameters

Table 192-52 SETDISPLAYNAME Procedure Parameters

Parameter	Description
res	XDBResource
name	New display name

192.3.52 SETLANGUAGE Procedure

This procedure sets the language of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETLANGUAGE (
    res      IN OUT XDBResource,
    ACLPath IN      VARCHAR2);
```

Parameters

Table 192-53 SETLANGUAGE Procedure Parameters

Parameter	Description
res	XDBResource
ACLPath	New path

192.3.53 SETOWNER Procedure

This procedure sets the owner of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETOWNER (
    res      IN OUT XDBResource,
    owner    IN      VARCHAR2);
```

Parameters

Table 192-54 SETOWNER Procedure Parameters

Parameter	Description
res	XDBResource
owner	New owner

Usage Notes

The user must have the XDBADMIN privilege to call this subprogram.

DBMS_XDBT

The `DBMS_XDBT` package provides a convenient mechanism for administrators to set up a `CONTEXT` index on the Oracle XML DB hierarchy.

The package contains procedures to create default preferences, create the index and set up automatic synchronization of the `CONTEXT` index

The `DBMS_XDBT` package also contains a set of package variables that describe the configuration settings for the index. These are intended to cover the basic customizations that installations may require, but is by no means a complete set.

This chapter contains the following topics:

- [Overview](#) (page 193-1)
- [Security Model](#) (page 193-2)
- [Operational Notes](#) (page 193-2)
- [Summary of DBMS_XDBT Subprograms](#) (page 193-3)

See Also:

Oracle XML DB Developer's Guide

193.1 DBMS_XDBT Overview

The `DBMS_XDBT` package contains a set of package variables that describe the configuration settings for the index.

The `DBMS_XDBT` package can be used in the following ways:

- Customize the package to set up the appropriate configuration.
- Use the [DROPPREFERENCES Procedure](#) (page 193-7) to drop any existing index preferences
- Create new index preferences using the [CREATEPREFERENCES Procedure](#) (page 193-6) procedure
- Create the `CONTEXT` index using the [CREATEINDEX Procedure](#) (page 193-5) procedure
- Set up automatic synchronization of the index using the [CONFIGUREAUTOSYNC Procedure](#) (page 193-4)

193.2 DBMS_XDBT Security Model

Owned by XDB, the DBMS_XDBT package must be created by SYS or XDB. The EXECUTE privilege is granted to SYS or XDB. Subprograms in this package are executed using the privileges of the current user.

193.3 DBMS_XDBT Operational Notes

Configuration settings, or package variables, are available to customize the DBMS_XDBT package.

The DBMS_XDBT package can be customized by using a PL/SQL procedure or an anonymous block to set the relevant package variables, configuration settings, and then execute the procedures. A more general approach would be to introduce the appropriate customizations by modifying this package in place, or as a copy. The system must be configured to use job queues, and the jobs can be viewed through the USER_JOBS catalog views.

Table 193-1 General Indexing Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
IndexName	XDB\$CI	Name of the CONTEXT index.
IndexTablespace	XDB\$RESINFO	Tablespace used by tables and indexes comprising the CONTEXT index.
IndexMemory	128M	Memory used by index creation and SYNC; less than or equal to the MAX_INDEX_MEMORY system parameter (see the CTX_ADMIN package).
LogFile	'XdbCtxLog'	The log file used for ROWID during indexing. The LOG_DIRECTORY system parameter must be set already. NULL turns off ROWID logging.

Table 193-2 Filtering Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
SkipFilter_Types	image/%, audio/%, video/%, model/%	List of mime types that should not be indexed.
NullFilter_Types	text/plain, text/html, text/xml	List of mime types that do not need to use the INSO filter. Use this for text-based documents.
FilterPref	XDB\$CI_FILTER	Name of the filter preference.

Table 193-3 Stoplist Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
StoplistPref	XDB\$CI_STOPLIST	Name of the stoplist.
StopWords	0..9; 'a'..'z'; 'A'..'Z'	List of stopwords, in excess of CTXSYS.DEFAULT_STOPLIST.

Table 193-4 Sectioning and Section Group Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
SectionGroup	HTML_SECTION_GROUP	Default sectioner. Use PATH_SECTION_GROUP or AUTO_SECTION_GROUP if repository contains mainly XML documents.
SectiongroupPref	XDB\$CI_SECTIONGROUP	Name of the section group.

Table 193-5 Other Index Preference Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
DatastorePref	XDB\$CI_DATASTORE	Name of the datastore preference
StoragePref	XDB\$CI_STORAGE	Name of the storage preference.
WordlistPref	XDB\$CI_WORDLIST	Name of the wordlist preference.
DefaultLexerPref	XDB\$CI_DEFAULT_LEXER	Name of the default lexer preference.

Table 193-6 SYNC (CONTEXT Synchronization) Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
AutoSyncPolicy	SYNC_BY_PENDING_COUNT NT	Indicates when the index should be SYNCed. One of SYNC_BY_PENDING_COUNT, SYNC_BY_TIME, or SYNC_BY_PENDING_COUNT_AND_TIME.
MaxPendingCount	2	Maximum number of documents in the CTX_USER_PENDING queue before an index SYNC is triggered. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.
CheckPendingCountInterval	10 minutes	How often, in minutes, the pending queue should be checked. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.
SyncInterval	60 minutes	Indicates how often, in minutes, the index should be SYNCed. Only if the AutoSyncPolicy is SYNC_BY_TIME or SYNC_BY_PENDING_COUNT_AND_TIME.

193.4 Summary of DBMS_XDBT Subprograms

This table lists the DBMS_XDBT subprograms in alphabetical order and briefly describes them.

Table 193-7 DBMS_XDBT Package Subprograms

Subprogram	Description
CONFIGUREAUTOSYNC Procedure (page 193-4)	Configures the CONTEXT index for automatic maintenance, SYNC
CREATEDATASTOREPREF Procedure (page 193-5)	Creates a USER datastore preference for the CONTEXT index

Table 193-7 (Cont.) DBMS_XDBT Package Subprograms

Subprogram	Description
CREATEFILTERPREF Procedure (page 193-5)	Creates a filter preference for the <code>CONTEXT</code> index
CREATEINDEX Procedure (page 193-5)	Creates the <code>CONTEXT</code> index on the XML DB hierarchy
CREATELEXERPREF Procedure (page 193-6)	Creates a lexer preference for the <code>CONTEXT</code> index
CREATEPREFERENCES Procedure (page 193-6)	Creates preferences required for the <code>CONTEXT</code> index on the XML DB hierarchy
CREATESECTIONGROUPPREF Procedure (page 193-6)	Creates a storage preference for the <code>CONTEXT</code> index
CREATESTOPLISTPREF Procedure (page 193-6)	Creates a section group for the <code>CONTEXT</code> index
CREATESTORAGEPREF Procedure (page 193-7)	Creates a wordlist preference for the <code>CONTEXT</code> index
CREATEWORLDLISTPREF Procedure (page 193-7)	Creates a stoplist for the <code>CONTEXT</code> index
DROPPREFERENCES Procedure (page 193-7)	Drops any existing preferences

193.4.1 CONFIGUREAUTOSYNC Procedure

This procedure sets up jobs for automatic SYNCs of the `CONTEXT` index.

Syntax

```
DBMS_XDBT.CONFIGUREAUTOSYNC;
```

Usage Notes

- The system must be configured for job queues for automatic synchronization. The jobs can be viewed using the `USER_JOBS` catalog views
- The configuration parameter `AutoSyncPolicy` can be set to choose an appropriate synchronization policy.

The synchronization can be based on one of the following:

Sync Basis	Description
<code>SYNC_BY_PENDING_COUNT</code>	The SYNC is triggered when the number of documents in the pending queue is greater than a threshold (See the MaxPendingCount (page 193-3) configuration setting). The pending queue is polled at regular intervals (See the CheckPendingCountInterval (page 193-3) configuration parameter) to determine if the number of documents exceeds the threshold.
<code>SYNC_BY_TIME</code>	The SYNC is triggered at regular intervals. (See the SyncInterval (page 193-3) configuration parameter).
<code>SYNC_BY_PENDING_COUNT_AND_TIME</code>	A combination of both of the preceding options.

193.4.2 CREATEDATASTOREPREF Procedure

This procedure creates a user datastore preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEDATASTOREPREF;
```

Usage Notes

- The name of the datastore preference can be modified; see the `DatastorePref` configuration setting.
- The default `USER` datastore procedure also filters the incoming document. The `DBMS_XDBT` package provides a set of configuration settings that control the filtering process.
- The `SkipFilter_Types` array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not indexed. Some of the properties of the document metadata, such as author, remain unindexed.
 - The `NullFilter_Types` array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not filtered; however, they are still indexed. This is intended to be used for documents that are text-based, such as HTML, XML and plain-text.
 - All other documents use the INSO filter through the `IFILTER` API.

193.4.3 CREATEFILTERPREF Procedure

This procedure creates a `NULL` filter preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEFILTERPREF;
```

Usage Notes

- The name of the filter preference can be modified; see `FilterPref` configuration setting.
- The `USER` datastore procedure filters the incoming document; see [CREATEDATASTOREPREF Procedure](#) (page 193-5) for more details.

193.4.4 CREATEINDEX Procedure

This procedure creates the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEINDEX;
```

Usage Notes

- The name of the index can be changed; see the `IndexName` configuration setting.

- Set the `LogFile` configuration parameter to enable `ROWID` logging during index creation.
- Set the `IndexMemory` configuration parameter to determine the amount of memory that index creation, and later `SYNCs`, will use.

193.4.5 CREATELEXERPREF Procedure

This procedure creates a `BASIC` `lexer` preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATELEXERPREF;
```

Usage Notes

- The name of the `lexer` preference can be modified; see `LexerPref` configuration setting. No other configuration settings are provided.
- `MultiLexer` preferences are not supported.
- Base letter translation is turned on by default.

193.4.6 CREATEPREFERENCES Procedure

This procedure creates a set of default preferences based on the configuration settings.

Syntax

```
DBMS_XDBT.CREATEPREFERENCES;
```

193.4.7 CREATESECTIONGROUPPREF Procedure

This procedure creates a section group for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESECTIONGROUPPREF;
```

Usage Notes

- The name of the section group can be changed; see the `SectiongroupPref` configuration setting.
- The HTML sectioner is used by default. No zone sections are created by default. If the vast majority of documents are XML, consider using the `AUTO_SECTION_GROUP` or the `PATH_SECTION_GROUP`; see the `SectionGroup` configuration setting.

193.4.8 CREATESTOPLISTPREF Procedure

This procedure creates a stoplist for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESTOPLISTPREF;
```

Usage Notes

- The name of the stoplist can be modified; see the `StoplistPref` configuration setting.
- Numbers are not indexed.
- The `StopWords` array is a configurable list of stopwords. These are meant to be stopwords in addition to the set of stopwords in `CTXSYS.DEFAULT_STOPLIST`.

193.4.9 CREATESTORAGEPREF Procedure

This procedure creates a `BASIC_STORAGE` preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESTORAGEPREF;
```

Usage Notes

- The name of the storage preference can be modified; see the `StoragePref` configuration setting.
- A tablespace can be specified for the tables and indexes comprising the `CONTEXT` index; see the `IndexTablespace` configuration setting.
- Prefix and Substring indexing are not turned on by default.
- The `I_INDEX_CLAUSE` uses key compression.

193.4.10 CREATEWORDLISTPREF Procedure

This procedure creates a word list preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEWORDLISTPREF;
```

Usage Notes

- The name of the word list preference can be modified; see the `WordlistPref` configuration setting. No other configuration settings are provided.
- `FUZZY_MATCH` and `STEMMER` attributes are set to `AUTO` (auto-language detection)

193.4.11 DROPPREFERENCES Procedure

This procedure drops any previously created preferences for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.DROPPREFERENCES;
```

DBMS_XDBZ

The DBMS_XDBZ package controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).

This chapter contains the following topics:

- [Security Model](#) (page 194-1)
- [Constants](#) (page 194-1)
- [Summary of DBMS_XDBZ Subprograms](#) (page 194-2)

See Also:

Oracle XML DB Developer's Guide

194.1 DBMS_XDBZ Security Model

Owned by XDB, the DBMS_XDBZ package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

194.2 DBMS_XDBZ Constants

The DBMS_XDBZ package defines several constants that can be used for specifying parameter values.

The package uses the constants shown in following tables.

Table 194-1 DBMS_XDBZ Constants - Name Format

Constant	Type	Value	Description
NAME_FORMAT_SHORT	PLS_INTEGER	1	DB user name or LDAP nickname
NAME_FORMAT_DISTINGUISHED	PLS_INTEGER	2	LDAP distinguished name

Table 194-2 DBMS_XDBZ Constants - Enable Option

Constant	Type	Value	Description
ENABLE_CONTENTS	PLS_INTEGER	1	Enables hierarchy for contents and is used by users when calling the ENABLE_HIERARCHY Procedure (page 194-3)

Table 194-2 (Cont.) DBMS_XDBZ Constants - Enable Option

Constant	Type	Value	Description
ENABLE_RESMETADATA	PLS_INTEGER	2	Enables hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources

Table 194-3 DBMS_XDBZ Constants - Enable Option Exercised

Constant	Type	Value	Description
IS_ENABLED_CONTENTS	PLS_INTEGER	1	If hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure (page 194-3) was called with <code>hierarchy_type</code> as <code>ENABLE_CONTENTS</code>
IS_ENABLED_RESMETADATA	PLS_INTEGER	2	If hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure (page 194-3) was called with <code>hierarchy_type</code> as <code>ENABLE_RESMETADATA</code>

194.3 Summary of DBMS_XDBZ Subprograms

This table lists the DBMS_XDBZ subprograms and briefly describes them.

Table 194-4 DBMS_XDBZ Package Subprograms

Method	Description
DISABLE_HIERARCHY Procedure (page 194-3)	Disables repository support for the specified XMLTYPE table or view
ENABLE_HIERARCHY Procedure (page 194-3)	Enables repository support for the specified XMLTYPE table or view
GET_ACLOID Function (page 194-4)	Retrieves the ACL Object ID for the specified resource
GET_USERID Function (page 194-4)	Retrieves the user ID for the specified user
IS_HIERARCHY_ENABLED Function (page 194-5)	Determines if repository support for the specified XMLTYPE table or view is enabled
PURGELDAPCACHE Function (page 194-6)	Purges the LDAP nickname cache

194.3.1 CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

Syntax

```
DBMS_XDBZ.CREATENONCEKEY;
```

194.3.2 DISABLE_HIERARCHY Procedure

This procedure disables repository support for a particular `XMLType` table or view.

Syntax

```
DBMS_XDBZ.DISABLE_HIERARCHY(  
  object_schema IN VARCHAR2,  
  object_name   IN VARCHAR2);
```

Parameters

Table 194-5 DISABLE_HIERARCHY Procedure Parameters

Parameter	Description
object_schema	Schema name of the <code>XMLType</code> table or view
object_name	Name of the <code>XMLType</code> table or view

194.3.3 ENABLE_HIERARCHY Procedure

This procedure enables repository support for a particular `XMLType` table or view. This allows the use of a uniform ACL-based security model across all documents in the repository.

See Also:

Oracle XML DB Developer's Guide for more information about

Syntax

```
DBMS_XDBZ.ENABLE_HIERARCHY(  
  object_schema IN VARCHAR2,  
  object_name   IN VARCHAR2,  
  hierarchy_type IN PLS_INTEGER := DBMS_XDBZ.ENABLE_CONTENTS);
```

Parameters

Table 194-6 ENABLE_HIERARCHY Procedure Parameters

Parameter	Description
object_schema	Schema name of the <code>XMLType</code> table or view

Table 194-6 (Cont.) ENABLE_HIERARCHY Procedure Parameters

Parameter	Description
object_name	Name of the XMLType table or view
hierarchy_type	How to enable the hierarchy. <ul style="list-style-type: none"> ENABLE_CONTENTS - enable hierarchy for contents, that is, this table will store contents of resources in the repository ENABLE_RESMETADATA - enable hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources <p>If this subprogram is called on a table, another call will have no effect. Note that you cannot enable hierarchy for both contents and resource metadata.</p>

194.3.4 GET_ACLOID Function

This function retrieves the ACL Object ID for the specified resource, if the repository path is known.

Syntax

```
DBMS_XDBZ.GET_ACLOID(
  aclpath IN VARCHAR2,
  acloid  OUT RAW)
RETURN BOOLEAN;
```

Parameters

Table 194-7 GET_ACLOID Function Parameters

Parameter	Description
aclpath	ACL resource path for the repository
acloid	Returned Object ID

Return Values

Returns `TRUE` if successful.

194.3.5 GET_USERID Function

This function retrieves the user ID for the specified user name. The local database is searched first, and if found, the `USERID` is returned in 4-byte database format. Otherwise, the LDAP directory is searched, if available, and if found, the `USERID` is returned in 4-byte database format.

Syntax

```
DBMS_XDBZ.GET_USERID(
  username IN VARCHAR2,
  userid  OUT RAW,
  format  IN BINARY_INTEGER := NAME_FORMAT_SHORT)
RETURN BOOLEAN;
```

Parameters

Table 194-8 GET_USERID Function Parameters

Parameter	Description
username	Name of the database or LDAP user.
userid	Return parameter for the matching user id.
format	Format of the specified user name; valid options are: <ul style="list-style-type: none"> DBMS_XDBZ.NAME_FORMAT_SHORT (default) -- DB user name or LDAP nickname DBMS_XDBZ.NAME_FORMAT_DISTINGUISHED -- LDAP distinguished name.

Return Values

Returns `TRUE` if successful.

194.3.6 IS_HIERARCHY_ENABLED Function

This function determines if repository support for the specified `XMLType` table or view is enabled.

Syntax

```
DBMS_XDBZ.IS_HIERARCHY_ENABLED(
  object_schema IN VARCHAR2,
  object_name   IN VARCHAR2,
  hierarchy_type IN PLS_INTEGER := IS_ENABLED_CONTENTS)
RETURN BOOLEAN;
```

Parameters

Table 194-9 IS_HIERARCHY_ENABLED Function Parameters

Parameter	Description
object_schema	Schema name of the <code>XMLType</code> table or view
object_name	Name of the <code>XMLType</code> table or view
hierarchy_type	Type of hierarchy to check for: <ul style="list-style-type: none"> <code>IS_ENABLED_CONTENTS</code> - if hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure (page 194-3) was called with <code>hierarchy_type</code> as <code>ENABLE_CONTENTS</code> <code>IS_ENABLED_RESMETADATA</code> - if hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure (page 194-3) was called with <code>hierarchy_type</code> as <code>ENABLE_RESMETADATA</code>

Return Values

Returns `TRUE` if the given `XMLTYPE` table or view has the XDB Hierarchy enabled with the specified type.

194.3.7 PURGELDAPCACHE Function

This function purges the LDAP nickname cache.

It returns `TRUE` if successful.

Syntax

```
DBMS_XDBZ.PURGELDAPCACHE  
RETURN BOOLEAN;
```

DBMS_XEVENT

The `DBMS_XEVENT` package provides event-related types and supporting subprograms.

This chapter contains the following topics:

- [Security Model](#) (page 195-1)
- [Constants](#) (page 195-1)
- [Subprogram Groups](#) (page 195-2)
- [Summary of DBMS_XEVENT Subprograms](#) (page 195-6)

See Also:

Oracle XML DB Developer's Guide for more information about "Oracle XML DB Repository Events"

195.1 DBMS_XEVENT Security Model

Owned by `XDB`, the `DBMS_XEVENT` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

195.2 DBMS_XEVENT Constants

The `DBMS_XEVENT` package defines several constants that can be used for specifying parameter values.

The constants are defined in the following table.

Table 195-1 DBMS_XEVENT Constants

Name	Type	Value	Description
<code>RENDER_EVENT</code>	<code>PLS_INTEGER</code>	1	
<code>PRE_CREATE_EVENT</code>	<code>PLS_INTEGER</code>	2	
<code>POST_CREATE_EVENT</code>	<code>PLS_INTEGER</code>	3	
<code>PRE_DELETE_EVENT</code>	<code>PLS_INTEGER</code>	4	
<code>POST_DELETE_EVENT</code>	<code>PLS_INTEGER</code>	5	
<code>PRE_UPDATE_EVENT</code>	<code>PLS_INTEGER</code>	6	
<code>POST_UPDATE_EVENT</code>	<code>PLS_INTEGER</code>	7	
<code>PRE_LOCK_EVENT</code>	<code>PLS_INTEGER</code>	8	

Table 195-1 (Cont.) DBMS_XEVENT Constants

Name	Type	Value	Description
POST_LOCK_EVENT	PLS_INTEGER	9	
PRE_UNLOCK_EVENT	PLS_INTEGER	10	
POST_UNLOCK_EVENT	PLS_INTEGER	11	
PRE_LINKIN_EVENT	PLS_INTEGER	12	
POST_LINKIN_EVENT	PLS_INTEGER	13	
PRE_LINKTO_EVENT	PLS_INTEGER	14	
POST_LINKTO_EVENT	PLS_INTEGER	15	
PRE_UNLINKIN_EVENT	PLS_INTEGER	16	
POST_UNLINKIN_EVENT	PLS_INTEGER	17	
PRE_UNLINKFROM_EVENT	PLS_INTEGER	18	
POST_UNLINKFROM_EVENT	PLS_INTEGER	19	
PRE_CHECKIN_EVENT	PLS_INTEGER	20	
POST_CHECKIN_EVENT	PLS_INTEGER	21	
PRE_CHECKOUT_EVENT	PLS_INTEGER	22	
POST_CHECKOUT_EVENT	PLS_INTEGER	23	
PRE_UNCHECKOUT_EVENT	PLS_INTEGER	24	
POST_UNCHECKOUT_EVENT	PLS_INTEGER	25	
PRE_VERSIONCONTROL_EVENT	PLS_INTEGER	26	
POST_VERSIONCONTROL_EVENT	PLS_INTEGER	27	
PRE_OPEN_EVENT	PLS_INTEGER	28	
POST_OPEN_EVENT	PLS_INTEGER	29	
PRE_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	30	
POST_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	21	
POST_CHECKIN_EVENT	PLS_INTEGER	21	

195.3 Subprogram Groups

The subprograms in the `DBMS_XEVENT` package can be divided in groups.

- [XDBEvent Type Subprograms](#) (page 195-3)
- [XDBRepositoryEvent Type Subprograms](#) (page 195-3)
- [XDBHandlerList Type Subprograms](#) (page 195-4)
- [XDBHandler Type Subprograms](#) (page 195-4)
- [XDBPath Type Subprograms](#) (page 195-5)
- [XDBLink Type Subprograms](#) (page 195-5)

195.3.1 DBMS_XEVENT XDBEvent Type Subprograms

This subprogram group provides an interface for use with the XDBEvent type.

Table 195-2 XDBEvent Subprograms

Subprogram	Description
GETCURRENTUSER Function (page 195-10)	Returns the name of the user executing the operation that triggers the event
GETEVENT Function (page 195-10)	Returns a value identifying the triggering event
ISNULL Functions (page 195-25)	Returns <code>TRUE</code> if input argument is <code>NULL</code>

The [Summary of DBMS_XEVENT Subprograms](#) (page 195-6) contains a complete listing of all subprograms in the package.

195.3.2 DBMS_XEVENT XDBRepositoryEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBRepositoryEvent type.

Table 195-3 XDBRepositoryEvent Subprograms

Subprogram	Description
GETAPPLICATIONDATA Function (page 195-9)	Returns the <code><applicationData></code> element extracted from the resource configuration that defines the invoking handler
GETHANDLERLIST Function (page 195-11)	Returns an <code>XDBHandlerList</code> object containing the list of handlers that will be executed after the currently executing handler
GETINTERFACE Function (page 195-12)	Returns the top-level interface used to initiate the operation that triggered the event
GETLINK Function (page 195-13)	Returns an <code>XDBLink</code> object for the target resource
GETLOCK Function (page 195-14)	Returns the lock object corresponding to the current operation
GETOLDRESOURCE Function (page 195-16)	Returns the original <code>XDBResource</code> object before the operation was executed
GETOPENACCESSMODE Function (page 195-16)	Returns the access mode for the open operation
GETOPENDENYMODE Function (page 195-17)	Returns the deny mode for the open operation
GETOUTPUTSTREAM Function (page 195-18)	Returns the output BLOB in which the handler can write the rendered data
GETPARAMETER Function (page 195-18)	Returns the value of a request or session-specific parameter
GETPARENT Function (page 195-19)	Returns the resource object corresponding to a parent folder of the target resource
GETPATH Function (page 195-21)	Returns the <code>XDBPath</code> object representing the path of the resource for which the event was fired

Table 195-3 (Cont.) XDBRepositoryEvent Subprograms

Subprogram	Description
GETRESOURCE Function (page 195-21)	Returns an <code>XDBResource</code> object that provides methods to access and modify the contents and metadata of the target resource
GETUPDATEBYTECOUNT Function (page 195-23)	If the current operation is a byte-range write, returns the byte count
GETUPDATEBYTEOFFSET Function (page 195-24)	If the current operation is a byte-range write, function returns the byte offset at which the range begins
GETXDBEVENT Function (page 195-24)	Converts an <code>XDBRepositoryEvent</code> object to an <code>XDBEvent</code> type
ISNULL Functions (page 195-25)	Returns <code>TRUE</code> if input argument is <code>NULL</code>
SETRENDERPATH Procedure (page 195-26)	Specifies the path of the resource that contains the rendered contents
SETRENDERSTREAM Procedure (page 195-27)	sets the <code>BLOB</code> from which the rendered contents can be read

The [Summary of DBMS_XEVENT Subprograms](#) (page 195-6) contains a complete listing of all subprograms in the package.

195.3.3 DBMS_XEVENT XDBHandlerList Type Subprograms

This subprogram group provides an interface for use in conjunction with the `XDBHandlerList` type.

Table 195-4 XDBHandlerList Subprograms

Subprogram	Description
CLEAR Procedure (page 195-8)	Clears the handler list
GETFIRST Function (page 195-11)	Returns the first handler in the list
GETNAME Function (page 195-15)	Returns the next handler in the list
ISNULL Functions (page 195-25)	Returns <code>TRUE</code> if input argument is <code>NULL</code>
REMOVE Procedure (page 195-26)	Removes the specified handler from the handler list

The [Summary of DBMS_XEVENT Subprograms](#) (page 195-6) contains a complete listing of all subprograms in the package.

195.3.4 DBMS_XEVENT XDBHandler Type Subprograms

This subprogram group provides an interface for use in conjunction with the `XDBHandler` type.

Table 195-5 XDBHandler Type Subprograms

Subprogram	Description
GETLANGUAGE Function (page 195-12)	Returns the implementation language of the handler
GETSCHEMA Function (page 195-22)	Returns the schema of the handler's source
GETSOURCE Function (page 195-23)	Returns the name of the Java class, PL/SQL package or object type implementing the handler
ISNULL Functions (page 195-25)	Returns <code>TRUE</code> if input argument is <code>NULL</code>

The [Summary of DBMS_XEVENT Subprograms](#) (page 195-6) contains a complete listing of all subprograms in the package.

195.3.5 DBMS_XEVENT XDBPath Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBPath type.

Table 195-6 XDBPath Type Subprograms

Subprogram	Description
GETNAME Function (page 195-15)	Returns the string representation of the path
GETPARENTPATH Function (page 195-20)	Returns the parent's path
ISNULL Functions (page 195-25)	Returns <code>TRUE</code> if input argument is <code>NULL</code>

The [Summary of DBMS_XEVENT Subprograms](#) (page 195-6) contains a complete listing of all subprograms in the package.

195.3.6 DBMS_XEVENT XDblink Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDblink type.

Table 195-7 XDblink Type Subprograms

Subprogram	Description
GETCHILDROID Function (page 195-9)	Returns the OID of the resource to which the link is pointing
GETPARENTNAME Function (page 195-19)	Returns the link's parent folder's name
GETPARENTOID Function (page 195-20)	Returns the link's parent folder's OID
ISNULL Functions (page 195-25)	Returns <code>TRUE</code> if input argument is <code>NULL</code>

The [Summary of DBMS_XEVENT Subprograms](#) (page 195-6) contains a complete listing of all subprograms in the package.

195.4 Summary of DBMS_XEVENT Subprograms

This table lists the DBMS_XEVENT subprograms and briefly describes them.

Table 195-8 DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
CLEAR Procedure (page 195-8)	Clears the handler list	XDBHandlerList Type Subprograms (page 195-4)
GETAPPLICATIONDATA Function (page 195-9)	Returns the <applicationData> element extracted from the resource configuration that defines the invoking handler	XDBRepositoryEvent Type Subprograms (page 195-3)
GETCHILDROID Function (page 195-9)	Returns the OID of the resource to which the link is pointing	XDBLink Type Subprograms (page 195-5)
GETCURRENTUSER Function (page 195-10)	Returns the name of the user executing the operation that triggers the event	XDBEvent Type Subprograms (page 195-3)
GETEVENT Function (page 195-10)	Returns a value identifying the triggering event	XDBEvent Type Subprograms (page 195-3)
GETFIRST Function (page 195-11)	Returns the first handler in the list	XDBHandlerList Type Subprograms (page 195-4)
GETHANDLERLIST Function (page 195-11)	Returns an <code>XDBHandlerList</code> object containing the list of handlers that will be executed after the currently executing handler	XDBRepositoryEvent Type Subprograms (page 195-3)
GETINTERFACE Function (page 195-12)	Returns the top-level interface used to initiate the operation that triggered the event	XDBRepositoryEvent Type Subprograms (page 195-3)
GETLANGUAGE Function (page 195-12)	Returns the implementation language of the handler	XDBHandler Type Subprograms (page 195-4)
GETLINK Function (page 195-13)	Returns an <code>XDBLink</code> object for the target resource	XDBRepositoryEvent Type Subprograms (page 195-3)
GETLOCK Function (page 195-14)	Returns the lock object corresponding to the current operation	XDBRepositoryEvent Type Subprograms (page 195-3)
GETNAME Function (page 195-15)	Returns the string representation of the path	XDBPath Type Subprograms (page 195-5)
GETNAME Function (page 195-15)	Returns the next handler in the list	XDBHandlerList Type Subprograms (page 195-4)
GETOLDRESOURCE Function (page 195-16)	Returns the original <code>XDBResource</code> object before the operation was executed	XDBRepositoryEvent Type Subprograms (page 195-3)

Table 195-8 (Cont.) DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
GETOPENACCESSMODE Function (page 195-16)	Returns the access mode for the open operation	XDBRepositoryEvent Type Subprograms (page 195-3)
GETOPENDENYMODE Function (page 195-17)	Returns the deny mode for the open operation	XDBRepositoryEvent Type Subprograms (page 195-3)
GETOUTPUTSTREAM Function (page 195-18)	Returns the output BLOB in which the handler can write the rendered data	XDBRepositoryEvent Type Subprograms (page 195-3)
GETPARAMETER Function (page 195-18)	Returns the value of a request or session-specific parameter	XDBRepositoryEvent Type Subprograms (page 195-3)
GETPARENT Function (page 195-19)	Returns the resource object corresponding to a parent folder of the target resource	XDBRepositoryEvent Type Subprograms (page 195-3)
GETPARENTNAME Function (page 195-19)	Returns the link's parent folder's name	XDBLink Type Subprograms (page 195-5)
GETPARENTOID Function (page 195-20)	Returns the link's parent folder's OID	XDBLink Type Subprograms (page 195-5)
GETPARENTNAME Function (page 195-19)	Returns the parent's path	XDBPath Type Subprograms (page 195-5)
GETPATH Function (page 195-21)	Returns the <code>XDBPath</code> object representing the path of the resource for which the event was fired	XDBRepositoryEvent Type Subprograms (page 195-3)
GETRESOURCE Function (page 195-21)	Returns an <code>XDBResource</code> object that provides methods to access and modify the contents and metadata of the target resource	XDBRepositoryEvent Type Subprograms (page 195-3)
GETSCHEMA Function (page 195-22)	Returns the schema of the handler's source	XDBHandler Type Subprograms (page 195-4)
GETSOURCE Function (page 195-23)	Returns the name of the Java class, PL/SQL package or object type implementing the handler	XDBHandler Type Subprograms (page 195-4)
GETUPDATEBYTECOUNT Function (page 195-23)	If the current operation is a byte-range write, returns the byte count	XDBRepositoryEvent Type Subprograms (page 195-3)
GETUPDATEBYTEOFFSET Function (page 195-24)	If the current operation is a byte-range write, function returns the byte offset at which the range begins	XDBRepositoryEvent Type Subprograms (page 195-3)
GETXDBEVENT Function (page 195-24)	Converts an <code>XDBRepositoryEvent</code> object to an <code>XDBEvent</code> type	XDBRepositoryEvent Type Subprograms (page 195-3)

Table 195-8 (Cont.) DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
ISNULL Functions (page 195-25)	Returns TRUE if input argument is NULL	XDBEvent Type Subprograms (page 195-3) XDBRepositoryEvent Type Subprograms (page 195-3) XDBHandlerList Type Subprograms (page 195-4) XDBHandler Type Subprograms (page 195-4) XDBPath Type Subprograms (page 195-5)
REMOVE Procedure (page 195-26)	Removes the specified handler from the handler list	XDBHandlerList Type Subprograms (page 195-4)
SETRENDERPATH Procedure (page 195-26)	Specifies the path of the resource that contains the rendered contents	XDBRepositoryEvent Type Subprograms (page 195-3)
SETRENDERSTREAM Procedure (page 195-27)	sets the BLOB from which the rendered contents can be read	XDBRepositoryEvent Type Subprograms (page 195-3)

195.4.1 CLEAR Procedure

This procedure clears the handler list.

See Also:

[XDBHandlerList Type Subprograms](#) (page 195-4) for other subprograms in this group

Syntax

```
DBMS_XEVENT.CLEAR (
    hl          IN OUT  XDBHandlerList);
```

Parameters

Table 195-9 CLEAR Procedure Parameters

Parameter	Description
hl	Handler list

195.4.2 GETAPPLICATIONDATA Function

This function returns the <applicationData> element extracted from the resource configuration that defines the invoking handler.

See Also:

[XDBRepositoryEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETAPPLICATIONDATA (  
    ev IN XDBRepositoryEvent)  
RETURN XMLType;
```

Parameters

Table 195-10 GETAPPLICATIONDATA Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

195.4.3 GETCHILDROID Function

This function returns the OID of the resource to which the link is pointing.

See Also:

[XDBLink Type Subprograms](#) (page 195-5) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCHILDROID (  
    link IN XDBLink)  
RETURN RAW;
```

Parameters

Table 195-11 GETCHILDROID Function Parameters

Parameter	Description
link	Link

195.4.4 GETCURRENTUSER Function

This function returns the name of the user executing the operation that triggers the event.

See Also:

[XDBEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCURRENTUSER (
    ev IN XDBEvent)
RETURN VARCHAR2;
```

Parameters

Table 195-12 GETCURRENTUSER Function Parameters

Parameter	Description
ev	Event of XDBEvent type

195.4.5 GETEVENT Function

This function returns the name of the user executing the operation that triggers the event.

See Also:

[XDBEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETEVENT (
    ev IN XDBEvent)
RETURN XDBEventID;
```

Parameters

Table 195-13 GETEVENT Function Parameters

Parameter	Description
ev	Event of XDBEvent type

195.4.6 GETFIRST Function

This function returns the first handler in the list.

See Also:

[XDBHandlerList Type Subprograms](#) (page 195-4) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETFIRST (  
    hl IN XDBHandlerList)  
RETURN XDBHandler;
```

Parameters

Table 195-14 GETFIRST Function Parameters

Parameter	Description
hl	Handler list

195.4.7 GETHANDLERLIST Function

This function returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler.

The current handler can then filter out some of the subsequent handlers if necessary, subject to security checks. An insufficient privilege exception is raised if the executing user does not have the required access privilege to any of the resource configuration associating with a handler in the list.

See Also:

[XDBRepositoryEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETHANDLERLIST (  
    ev IN XDBRepositoryEvent)  
RETURN XDBHandlerList;
```

Parameters

Table 195-15 GETHANDLERLIST Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

195.4.8 GETINTERFACE Function

This function returns the top-level interface used to initiate the operation that triggered the event. This could be HTTP, FTP or SQL.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETINTERFACE (
    ev IN XDBRepositoryEvent)
RETURN VARCHAR2;
```

Parameters

Table 195-16 GETINTERFACE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

195.4.9 GETLANGUAGE Function

This function returns the implementation language of the handler.

**See Also:**

[XDBHandler Type Subprograms](#) (page 195-4) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler IN XDBHandler)
RETURN VARCHAR2;
```

Parameters

Table 195-17 GETLANGUAGE Function Parameters

Parameter	Description
handler	Handler

195.4.10 GETLINK Function

This function returns an `XDBLink` object for the target resource.

For a `link*` or `unlink*` event, this will be the link involved in the operation. For other events, an error is returned. Using this object the handler can access link properties, such as, `ParentName`, `ParentOID`, `ChildOID` and `LinkName`.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINK (
    ev IN XDBRepositoryEvent)
RETURN XDBLink;
```

Parameters

Table 195-18 GETLINK Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

195.4.11 GETLINKNAME Function

This function returns the name of the link.

**See Also:**

[XDBLink Type Subprograms](#) (page 195-5) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINKNAME (
    link IN XDBLink)
RETURN VARCHAR2;
```

Parameters

Table 195-19 GETLINKNAME Function Parameters

Parameter	Description
link	Link

195.4.12 GETLOCK Function

This function returns the lock object corresponding to the current operation. It is only valid for lock and unlock events.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLOCK (
    ev IN XDBRepositoryEvent)
RETURN XDBLock;
```

Parameters

Table 195-20 GETLOCK Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

195.4.13 GETLANGUAGE Function

This function returns the implementation language of the handler.

**See Also:**

[XDBHandler Type Subprograms](#) (page 195-4) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler IN XDBHandler)
RETURN VARCHAR2;
```

Parameters

Table 195-21 GETLANGUAGE Function Parameters

Parameter	Description
handler	Handler

195.4.14 GETNAME Function

This function returns the string representation of the path.

See Also:

[XDBPath Type Subprograms](#) (page 195-5) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNAME (  
    path IN XDBPath)  
    RETURN VARCHAR2;
```

Parameters

Table 195-22 GETNAME Function Parameters

Parameter	Description
path	Path

195.4.15 GETNEXT Function

This function returns the next handler in the list.

See Also:

[XDBHandlerList Type Subprograms](#) (page 195-4) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNEXT (  
    hl IN XDBHandlerList)  
    RETURN XDBHandler;
```

Parameters

Table 195-23 GETNEXT Function Parameters

Parameter	Description
hl	Handler list

195.4.16 GETOLDRESOURCE Function

This function returns the original `XDBResource` object before the operation was executed.

This method applies only to update event. For other events, an error is returned. This is a read-only object, and consequently none of the modifier methods will work on this object.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOLDRESOURCE (
    ev IN XDBRepositoryEvent)
RETURN XDBResource;
```

Parameters

Table 195-24 GETOLDRESOURCE Function Parameters

Parameter	Description
ev	Event of <code>XDBRepositoryEvent</code> type

195.4.17 GETOPENACCESSMODE Function

This function returns the access mode for the open operation.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENACCESSMODE (
    ev IN XDBRepositoryEvent)
RETURN PLS_INTEGER;
```

Parameters**Table 195-25 GETOPENACCESSMODE Function Parameters**

Parameter	Description
ev	Event of XDBRepositoryEvent type

Return Values

- XDBRepositoryEvent.OPEN_ACCESS_READ (value 1)
- XDBRepositoryEvent.OPEN_ACCESS_WRITE (value 2)
- XDBRepositoryEvent.OPEN_ACCESS_READ_WRITE (value 3)

195.4.18 GETOPENDENYMODE Function

This function returns the deny mode for the open operation. It is only valid for the open event.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENDENYMODE (
    ev IN XDBRepositoryEvent)
RETURN PLS_INTEGER;
```

Parameters**Table 195-26 GETOPENDENYMODE Function Parameters**

Parameter	Description
ev	Event of XDBRepositoryEvent type

Return Values

- XDBRepositoryEvent.OPEN_DENY_NONE (value 0)
- XDBRepositoryEvent.OPEN_DENY_READ (value 1)
- XDBRepositoryEvent.OPEN_DENY_READ_WRITE (value 2)

195.4.19 GETOUTPUTSTREAM Function

This function returns the output BLOB in which the handler can write the rendered data. It is only valid for the render event.

See Also:

[XDBRepositoryEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOUTPUTSTREAM (  
    ev IN XDBRepositoryEvent)  
RETURN BLOB;
```

Parameters

Table 195-27 GETOUTPUTSTREAM Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

195.4.20 GETPARAMETER Function

This function returns the value of a request or session-specific parameter. The definition of the `key` parameter can be found in RFC 2616 (HTTP/1.1). They will be mapped to equivalent SQL session parameters (if any).

See Also:

[XDBRepositoryEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARAMETER (  
    ev IN XDBRepositoryEvent,  
    key IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 195-28 GETPARAMETER Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

Table 195-28 (Cont.) GETPARAMETER Function Parameters

Parameter	Description
key	Supported parameters: <ul style="list-style-type: none"> • ACCEPT • ACCEPT-LANGUAGE • ACCEPT-CHARSET • ACCEPT_ENCODING

195.4.21 GETPARENT Function

This function returns the resource object corresponding to a parent folder of the target resource. Note that this could be any folder that contains a link to the target resource. This is a read-only object, and consequently none of the modifier methods will work on this object. For a link* or unlink* event, this method returns the link's parent folder.

See Also:

[XDBRepositoryEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENT (
    ev IN XDBRepositoryEvent)
RETURN XDBResource;
```

Parameters

Table 195-29 GETPARENT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

195.4.22 GETPARENTNAME Function

This function returns the link's parent folder's name.

See Also:

[XDBLink Type Subprograms](#) (page 195-5) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTNAME (
    link IN XDBLink)
RETURN VARCHAR2;
```

Parameters**Table 195-30** GETPARENTNAME Function Parameters

Parameter	Description
link	Link

195.4.23 GETPARENTOID Function

This function returns the link's parent folder's OID.

**See Also:**

[XDBLink Type Subprograms](#) (page 195-5) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTOID (
    link IN XDBLink)
RETURN RAW;
```

Parameters**Table 195-31** GETPARENTOID Function Parameters

Parameter	Description
link	Link

195.4.24 GETPARENTPATH Function

This function returns the parent's path. The level indicates the number of levels up the hierarchy. This value must be greater than zero. Level 1 means the immediate parent. If level exceeds the height of the tree then a `NULL` is returned.

**See Also:**

[XDBPath Type Subprograms](#) (page 195-5) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTPATH (
    path IN XDBPath,
    level IN INTEGER)
RETURN XDBPath;
```

Parameters

Table 195-32 GETPARENTPATH Function Parameters

Parameter	Description
path	Path
level	Number of levels up the hierarchy

195.4.25 GETPATH Function

This function returns the `XDBPath` object representing the path of the resource for which the event was fired. From this object, functions are provided to get the different path segments.

**See Also:**

[XDBRepositoryEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPATH (
    ev IN XDBRepositoryEvent)
RETURN XDBPath;
```

Parameters

Table 195-33 GETPATH Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

195.4.26 GETRESOURCE Function

This function returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource. This object reflects any changes made by previous handlers to the resource.

The modifier methods will work only in the pre-create and pre-update event handlers. For a link* or unlink* event, this method returns the resource that the link is pointing to. For a create event, this method returns the resource that is being created.

See Also:

[XDBRepositoryEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVT.GETRESOURCE (
    ev IN XDBRepositoryEvent)
RETURN XDBResource;
```

Parameters

Table 195-34 GETRESOURCE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

195.4.27 GETSCHEMA Function

This function returns the schema of the handler's source.

See Also:

[XDBHandler Type Subprograms](#) (page 195-4) for other subprograms in this group

Syntax

```
DBMS_XEVT.GETSCHEMA (
    handler IN XDBHandler)
RETURN VARCHAR2;
```

Parameters

Table 195-35 GETSCHEMA Function Parameters

Parameter	Description
handler	Handler

195.4.28 GETSOURCE Function

This function returns the name of the Java class, PL/SQL package or object type implementing the handler.

See Also:

[XDBHandler Type Subprograms](#) (page 195-4) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSOURCE (  
    handler IN XDBHandler)  
    RETURN VARCHAR2;
```

Parameters

Table 195-36 GETSOURCE Function Parameters

Parameter	Description
handler	Handler

195.4.29 GETUPDATEBYTECOUNT Function

If the current operation is a byte-range write, the `GETUPDATEBYTECOUNT` function returns the byte count. It is only valid for the inconsistent-update event.

See Also:

[XDBRepositoryEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTECOUNT (  
    ev IN XDBRepositoryEvent)  
    RETURN NUMBER;
```

Parameters

Table 195-37 GETUPDATEBYTECOUNT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

195.4.30 GETUPDATEBYTEOFFSET Function

If the current operation is a byte-range write, the `GETUPDATEBYTEOFFSET` function returns the byte offset at which the range begins. It is only valid for the inconsistent-update event.

See Also:

[XDBRepositoryEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTEOFFSET (  
    ev IN XDBRepositoryEvent)  
RETURN NUMBER;
```

Parameters

Table 195-38 GETUPDATEBYTEOFFSET Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

195.4.31 GETXDBEVENT Function

This function converts an `XDBRepositoryEvent` object to an `XDBEvent` type.

See Also:

[XDBRepositoryEvent Type Subprograms](#) (page 195-3) for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETXDBEVENT (  
    ev IN XDBRepositoryEvent)  
RETURN XDBEvent;
```

Parameters

Table 195-39 GETXDBEVENT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

195.4.32 ISNULL Functions

This function returns `TRUE` if input argument is `NULL`.

See Also:

- [XDBEvent Type Subprograms](#) (page 195-3) for other subprograms in this group
- [XDBRepositoryEvent Type Subprograms](#) (page 195-3) for other subprograms in this group
- [XDBHandlerList Type Subprograms](#) (page 195-4) for other subprograms in this group
- [XDBHandler Type Subprograms](#) (page 195-4) for other subprograms in this group
- [XDBPath Type Subprograms](#) (page 195-5) for other subprograms in this group
- [XDBLink Type Subprograms](#) (page 195-5) for other subprograms in this group

Syntax

```
DBMS_XEVENT.ISNULL (
    ev          IN  XDBEvent)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    ev          IN  XDBRepositoryEvent)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    hl          IN  XDBHandlerList)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    handler     IN  XDBHandler)
RETURN BOOLEAN;
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    path        IN  XDBPath)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    link        IN  XDBLink)
RETURN BOOLEAN;
```

Parameters

Table 195-40 ISNULL Function Parameters

Parameter	Description
ev	Event of specified type
hl	Handler list
handler	Handler
path	Path

195.4.33 REMOVE Procedure

This procedure removes the specified handler from the handler list.

**See Also:**

[XDBHandlerList Type Subprograms](#) (page 195-4) for other subprograms in this group

Syntax

```
DBMS_XEVENT.REMOVE (
    hl          IN OUT  XDBHandlerList,
    handler     IN      XDBHandler);
```

Parameters

Table 195-41 REMOVE Procedure Parameters

Parameter	Description
hl	Handler list
handler	Handler

195.4.34 SETRENDERPATH Procedure

This procedure specifies the path of the resource that contains the rendered contents.

This should not be called after the stream returned by [GETOUTPUTSTREAM Function](#) (page 195-18) is written to or after the [SETRENDERSTREAM Procedure](#) (page 195-27) is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERPATH (
    ev          IN  XDBRepositoryEvent,
    path        IN  VARCHAR2);
```

Parameters

Table 195-42 SETRENDERPATH Procedure Parameters

Parameter	Description
ev	XDB Repository Event object
path	Path of the resource containing the rendered contents

195.4.35 SETRENDERSTREAM Procedure

This procedure sets the `BLOB` from which the rendered contents can be read.

This should not be called after the stream returned by `GETOUTPUTSTREAM` is written to or after `SETRENDERPATH` is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERSTREAM (  
    ev    IN    XDBRepositoryEvent,  
    istr  IN    BLOB);
```

Parameters

Table 195-43 SETRENDERSTREAM Procedure Parameters

Parameter	Description
ev	XDBRepositoryEvent object
istr	Input stream from which to get the rendered contents

DBMS_XMLDOM

The `DBMS_XMLDOM` package is used to access `XMLType` objects, and implements the Document Object Model (DOM), an application programming interface for HTML and XML documents.

This chapter contains the following topics:

- [Overview](#) (page 196-1)
- [Security Model](#) (page 196-3)
- [Constants](#) (page 196-3)
- [Types](#) (page 196-4)
- [Exceptions](#) (page 196-4)
- [Subprogram Groups](#) (page 196-5)
- [Subprogram Groups](#) (page 196-5)
- [Summary of DBMS_XMLDOM Subprograms](#) (page 196-15)

 **See Also:**

Oracle XML Developer's Kit Programmer's Guide

196.1 DBMS_XMLDOM Overview

The Document Object Model (DOM) is an application programming interface (API) for HTML and XML documents. It defines the logical structure of documents, and the manner in which they are accessed and manipulated.

In the DOM specification, the term "document" is used in the broad sense. XML is being increasingly used to represent many different kinds of information that may be stored in diverse systems. This information has been traditionally be seen as "data"; nevertheless, XML presents this data as documents, and the `DBMS_XMLDOM` package allows you access to both schema-based and non schema-based documents.

 **Note:**

- Before database startup, the read-from and write-to directories in the `init.ORA` file must be specified; for example: `UTL_FILE_DIR=/mypath/insidemypath`.
- Read-from and write-to files must be on the server file system.

 **Note:**

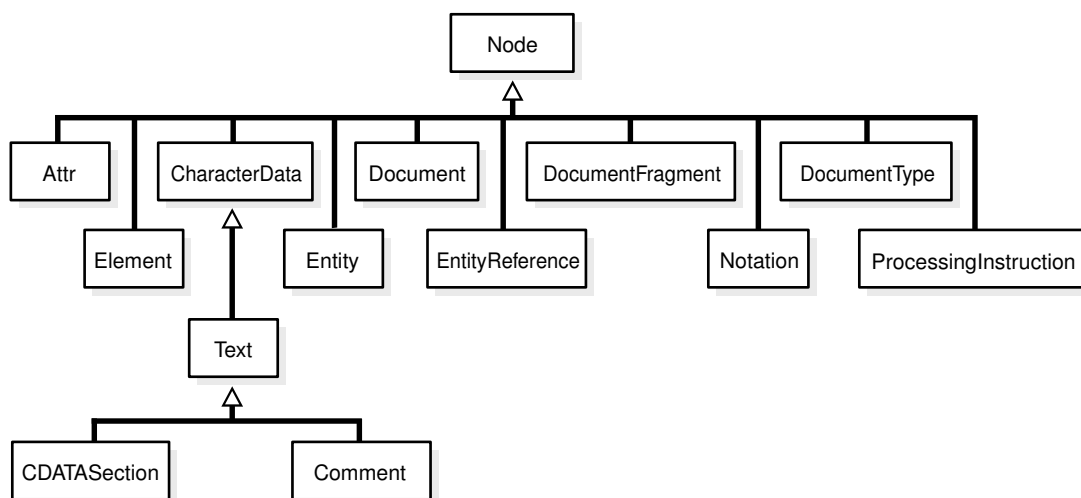

In prior releases, you used the `UTL_FILE_DIR` initialization parameter to specify a directory location. However, as of Oracle Database 12c Release 2 (12.2), the `UTL_FILE_DIR` initialization parameter is deprecated. It is still supported for backward compatibility, but Oracle recommends that you instead use directory objects.

With DOM, anything found in an HTML or XML document can be accessed, changed, deleted, or added using the Document Object Model, with a few exceptions. In particular, the DOM interfaces for the XML internal and external subsets have not yet been specified.

One important objective of the W3C DOM specification is to provide a standard programming interface that can be used in a wide variety of environments, programming languages, and applications. Because the DOM standard is object-oriented while PL/SQL is essentially a procedural language, some changes had to be made:

- Various DOM interfaces such as `Node`, `Element`, and others have equivalent PL/SQL types `DOMNode`, `DOMElement`, respectively.
- Various `DOMException` codes such as `WRONG_DOCUMENT_ERR`, `HIERARCHY_REQUEST_ERR`, and others, have similarly named PL/SQL exceptions.
- Various DOM Node type codes such as `ELEMENT_NODE`, `ATTRIBUTE_NODE`, and others, have similarly named PL/SQL constants.
- Subprograms defined on a DOM type become functions or procedures that accept it as a parameter. For example, to perform [APPENDCHILD Function](#) (page 196-26) on a `DOMNode` `n`, the [APPENDCHILD Function](#) (page 196-26) PL/SQL function is provided.
- To perform `setAttribute` on a `DOMElement` `elem`, [SETATTRIBUTE Procedures](#) (page 196-84), use PL/SQL procedure .

DOM defines an inheritance hierarchy. For example, `Document`, `Element`, and `Attr` are defined to be subtypes of `Node` (see [Figure 196-1](#) (page 196-3)). Thus, a method defined in the `Node` interface should be available in these as well. Since such inheritance is not supported in PL/SQL, it is implemented through direct invocation of the `MAKENODE` function. Calling `MAKENODE` on various DOM types converts these types into a `DOMNode`. The appropriate functions or procedures that accept `DOMNodes` can then be called to operate on these types. If, subsequently, type specific functionality is desired, the `DOMNode` can be converted back into the original type by the `makeXXX` functions, where `DOMXXX` is the desired DOM type.

Figure 196-1 Inheritance Diagram for DOM Types

The implementation of this interface follows the REC-DOM-Level-1-19981001.

196.2 DBMS_XMLDOM Security Model

Owned by XDB, the DBMS_XMLDOM package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

196.3 DBMS_XMLDOM Constants

The DBMS_XMLDOM package defines several constants that can be used for specifying parameter values.

These constants are listed in the following table.

Table 196-1 Defined Constants for DBMS_XMLDOM

Constant	Type	Value	Description
ELEMENT_NODE	PLS_INTEGER	1	The Node is an Element.
ATTRIBUTE_NODE	PLS_INTEGER	2	The Node is an Attribute.
TEXT_NODE	PLS_INTEGER	3	The Node is a Text node.
CDATA_SECTION_NODE	PLS_INTEGER	4	The Node is a CDataSection.
ENTITY_REFERENCE_NODE	PLS_INTEGER	5	The Node is an Entity Reference.
ENTITY_NODE	PLS_INTEGER	6	The Node is an Entity.
PROCESSING_INSTRUCTION_NODE	PLS_INTEGER	7	The Node is a Processing Instruction.
COMMENT_NODE	PLS_INTEGER	8	The Node is a Comment.
DOCUMENT_NODE	PLS_INTEGER	9	The Node is a Document.

Table 196-1 (Cont.) Defined Constants for DBMS_XMLDOM

Constant	Type	Value	Description
DOCUMENT_TYPE_NODE	PLS_INTEGER	10	The Node is a Document Type Definition.
DOCUMENT_FRAGMENT_NODE	PLS_INTEGER	11	The Node is a Document fragment.
NOTATION_NODE	PLS_INTEGER	12	The Node is a Notation.

196.4 DBMS_XMLDOM Types

This table lists and briefly describes the types for the `DBMS_XMLDOM.DOMTYPE` package.

Table 196-2 XDB_XMLDOM Types

Type	Description
DOMATTR	Implements the DOM Attribute interface.
DOMCDATASECTION	Implements the DOM CDATASection interface.
DOMCHARACTERDATA	Implements the DOM Character Data interface.
DOMCOMMENT	Implements the DOM Comment interface.
DOMDOCUMENT	Implements the DOM Document interface.
DOMDOCUMENTFRAGMENT	Implements the DOM DocumentFragment interface.
DOMDOCUMENTTYPE	Implements the DOM Document Type interface.
DOMELEMENT	Implements the DOM Element interface.
DOMENTITY	Implements the DOM Entity interface.
DOMENTITYREFERENCE	Implements the DOM EntityReference interface.
DOMIMPLEMENTATION	Implements the DOM Implementation interface.
DOMNAMEDNODEMAP	Implements the DOM Named Node Map interface.
DOMNODE	Implements the DOM Node interface.
DOMNODELIST	Implements the DOM NodeList interface.
DOMNOTATION	Implements the DOM Notation interface.
DOMPROCESSINGINSTRUCTION	Implements the DOM Processing instruction interface.
DOMTEXT	Implements the DOM Text interface.

196.5 DBMS_XMLDOM Exceptions

DBMS_XMLDOM generates an exception when it encounters an issue.

This table lists the exceptions defined for `DBMS_XMLDOM`:

Table 196-3 Exceptions for DBMS_XMLDOM

Exception	Description
DOMSTRING_SIZE_ERR	If the specified range of text does not fit into a DOMString.
HIERARCHY_REQUEST_ERR	If any node is inserted somewhere it doesn't belong.
INDEX_SIZE_ERR	If index or size is negative, or greater than the allowed value.
INUSE_ATTRIBUTE_ERR	If an attempt is made to add an attribute that is already in use elsewhere.
INVALID_CHARACTER_ERR	If an invalid or illegal character is specified, such as in a name. See production 2 in the XML specification for the definition of a legal character, and production 5 for the definition of a legal name character.
NO_DATA_ALLOWED_ERROR	If data is specified for a node that does not support data.
NOT_FOUND_ERR	If an attempt is made to reference a node in a context where it does not exist.
NO_MODIFICATION_ALLOWED_ERR	If an attempt is made to modify an object where modifications are not allowed.
NOT_SUPPORTED_ERR	If the implementation does not support the requested type of object or operation.
WRONG_DOCUMENT_ERR	If a node is used in a different document than the one that created it (that doesn't support it).

196.6 DBMS_XMLDOM Subprogram Groups

DBMS_XMLDOM subprograms are divided into groups according to W3C Interfaces.

- [DOMNode Subprograms](#) (page 196-6)
- [DOMAttr Subprograms](#) (page 196-7)
- [DOMCDATASection Subprograms](#) (page 196-8)
- [DOMCharacterData Subprograms](#) (page 196-8)
- [DOMComment Subprograms](#) (page 196-9)
- [DOMDocument Subprograms](#) (page 196-9)
- [DOMDocumentFragment Subprograms](#) (page 196-10)
- [DOMDocumentType Subprograms](#) (page 196-11)
- [DOMElement Subprograms](#) (page 196-11)
- [DOMEntity Subprograms](#) (page 196-12)
- [DOMEntityReference Subprograms](#) (page 196-13)
- [DOMImplementation Subprograms](#) (page 196-13)
- [DOMNamedNodeMap Subprograms](#) (page 196-13)
- [DOMNodeList Subprograms](#) (page 196-14)
- [DOMNotation Subprograms](#) (page 196-14)
- [DOMProcessingInstruction Subprograms](#) (page 196-14)

- [DOMText Subprograms](#) (page 196-15)

196.6.1 DBMS_XMLDOM DOMNode Subprograms

This table lists and briefly describes the `DOMNode` subprograms of `DBMS_XMLDOM`.

Table 196-4 Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
ADOPTNODE Function (page 196-25)	Adopts a node from another document
APPENDCHILD Function (page 196-26)	Appends a new child to the node
CLONENODE Function (page 196-27)	Clones the node
FREENODE Procedure (page 196-36)	Frees all resources associated with the node
GETATTRIBUTES Function (page 196-39)	Retrieves the attributes of the node
GETCHILDNODES Function (page 196-40)	Retrieves the children of the node
GETEXPANDEDNAME Procedure and Functions (page 196-44)	Retrieves the expanded name of the node
GETFIRSTCHILD Function (page 196-44)	Retrieves the first child of the node
GETLASTCHILD Function (page 196-45)	Retrieves the last child of the node
GETLOCALNAME Procedure and Functions (page 196-47)	Retrieves the local part of the qualified name
GETNAMESPACE Procedure and Functions (page 196-49)	Retrieves the node's namespace URI
GETNEXTSIBLING Function (page 196-49)	Retrieves the next sibling of the node
GETNODENAME Function (page 196-50)	Retrieves the Name of the Node
GETNODETYPE Function (page 196-50)	Retrieves the Type of the node
GETNODEVALUE Function (page 196-51)	Retrieves the Value of the Node
GETNODEVALUEASBINARYSTREAM Function & Procedure (page 196-51)	Retrieves Node Value as binary stream
GETNODEVALUEASCHARACTERSTREAM Function & Procedure (page 196-52)	Retrieves Node Value as character stream
GETOWNERDOCUMENT Function (page 196-54)	Retrieves the owner document of the node
GETPARENTNODE Function (page 196-55)	Retrieves the parent of this node
GETPREFIX Function (page 196-56)	Retrieves the namespace prefix
GETPREVIOUSIBLING Function (page 196-56)	Retrieves the previous sibling of the node
GETSCHEMANODE Function (page 196-58)	Retrieves the associated schema URI
HASATTRIBUTES Function (page 196-63)	Tests if the node has attributes
HASCILDNODES Function (page 196-63)	Tests if the node has child nodes
IMPORTNODE Function (page 196-64)	Imports a node from another document
INSERTBEFORE Function (page 196-65)	Inserts a child before the reference child
ISNULL Functions (page 196-66)	Tests if the node is <code>NULL</code>
MAKEATTR Function (page 196-70)	Casts the node to an Attribute

Table 196-4 (Cont.) Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
MAKECDATASECTION Function (page 196-70)	Casts the node to a CData Section
MAKECHARACTERDATA Function (page 196-71)	Casts the node to Character Data
MAKECOMMENT Function (page 196-71)	Casts the node to a Comment
MAKEDOCUMENT Function (page 196-72)	Casts the node to a DOM Document
MAKEDOCUMENTFRAGMENT Function (page 196-72)	Casts the node to a DOM Document Fragment
MAKEDOCUMENTTYPE Function (page 196-73)	Casts the node to a DOM Document Type
MAKEELEMENT Function (page 196-73)	Casts the node to a DOM Element
MAKEENTITY Function (page 196-74)	Casts the node to a DOM Entity
MAKEENTITYREFERENCE Function (page 196-74)	Casts the node to a DOM Entity Reference
MAKENOTATION Function (page 196-77)	Casts the node to a DOM Notation
MAKEPROCESSINGINSTRUCTION Function (page 196-77)	Casts the node to a DOM Processing Instruction
MAKETEXT Function (page 196-78)	Casts the node to a DOM Text
REMOVECHILD Function (page 196-81)	Removes a specified child from a node
REPLACECHILD Function (page 196-82)	Replaces the old child with a new child
SETNODEVALUE Procedure (page 196-88)	Sets the Value of the node
SETNODEVALUEASBINARYSTREAM Function & Procedure (page 196-88)	Sets the Node Value as binary stream
SETNODEVALUEASCHARACTERSTREAM Function & Procedure (page 196-89)	Sets the Node Value as a character stream
SETPREFIX Procedure (page 196-90)	Sets the namespace prefix
USEBINARYSTREAM Function (page 196-93)	Establishes that the stream is valid
WRITETOBUFFER Procedures (page 196-94)	Writes the contents of the node to a buffer
WRITETOCLOB Procedures (page 196-94)	Writes the contents of the node to a CLOB
WRITETOFILE Procedures (page 196-95)	Writes the contents of the node to a file

196.6.2 DBMS_XMLDOM DOMAttr Subprograms

This table lists the DOMAttr subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 196-5 Summary of DOMAttr Subprograms; DBMS_XMLDOM

Method	Description
GETEXPANDEDNAME Procedure and Functions (page 196-44)	Retrieves the expanded name of the attribute
GETLOCALNAME Procedure and Functions (page 196-47)	Retrieves the local name of the attribute
GETNAME Functions (page 196-47)	Retrieves the name of the attribute
GETNAMESPACE Procedure and Functions (page 196-49)	Retrieves the NS URI of the attribute
GETOWNERELEMENT Function (page 196-55)	Retrieves the Element node, parent of the attribute
GETQUALIFIEDNAME Functions (page 196-57)	Retrieves the Qualified Name of the attribute
GETSPECIFIED Function (page 196-58)	Tests if attribute was specified in the element
GETVALUE Function (page 196-61)	Retrieves the value of the attribute
ISNULL Functions (page 196-66)	Tests if the Attribute node is NULL
MAKENODE Functions (page 196-75)	Casts the Attribute to a node
SETVALUE Procedure (page 196-91)	Sets the value of the attribute

196.6.3 DBMS_XMLDOM DOMCDataSection Subprograms

This table lists the DOMCdata subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 196-6 Summary of DOMCdata Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions (page 196-66)	Tests if the CDataSection is NULL
MAKENODE Functions (page 196-75)	Casts the CDataSection to a node

196.6.4 DBMS_XMLDOM DOMCharacterData Subprograms

This table lists the DOMCharacterData subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 196-7 Summary of DOMCharacterData Subprograms; DBMS_XMLDOM

Method	Description
APPENDDATA Procedure (page 196-27)	Appends the specified data to the node data
DELETEDATA Procedure (page 196-33)	Deletes the data from the specified offSets
GETDATA Functions (page 196-41)	Retrieves the data of the node
GETLENGTH Functions (page 196-46)	Retrieves the length of the data

**Table 196-7 (Cont.) Summary of DOMCharacterData Subprograms;
DBMS_XMLDOM**

Method	Description
INSERTDATA Procedure (page 196-66)	Inserts the data in the node at the specified offSets
ISNULL Functions (page 196-66)	Tests if the CharacterData is NULL
MAKENODE Functions (page 196-75)	Casts the CharacterData to a node
REPLACEDATA Procedure (page 196-83)	Changes a range of characters in the node
SETDATA Procedures (page 196-86)	Sets the data to the node
SUBSTRINGDATA Function (page 196-92)	Retrieves the substring of the data

196.6.5 DBMS_XMLDOM DOMComment Subprograms

The table lists the DOMComment subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 196-8 Summary of DOMComment Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions (page 196-66)	Tests if the comment is NULL
MAKENODE Functions (page 196-75)	Casts the Comment to a node

196.6.6 DBMS_XMLDOM DOMDocument Subprograms

This table lists the DOMDocument subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 196-9 Summary of DOMDocument Subprograms; DBMS_XMLDOM

Method	Description
CREATEATTRIBUTE Functions (page 196-28)	Creates an Attribute
CREATECDATASECTION Function (page 196-29)	Creates a CDataSection node
CREATECOMMENT Function (page 196-29)	Creates a Comment node
CREATEDOCUMENT Function (page 196-30)	Creates a new Document
CREATEDOCUMENTFRAGMENT Function (page 196-30)	Creates a new Document Fragment
CREATEELEMENT Functions (page 196-31)	Creates a new Element
CREATEENTITYREFERENCE Function (page 196-31)	Creates an Entity reference

**Table 196-9 (Cont.) Summary of DOMDocument Subprograms;
DBMS_XMLDOM**

Method	Description
CREATEPROCESSINGINSTRUCTION Function (page 196-32)	Creates a Processing Instruction
CREATETEXTNODE Function (page 196-32)	Creates a Text node
FREEDOCFRAG Procedure (page 196-35)	Frees the document fragment
FREEDOCUMENT Procedure (page 196-35)	Frees the document
GETCHARSET Function (page 196-39)	Retrieves the charset of the DOM document
GETDOCTYPE Function (page 196-41)	Retrieves the DTD of the document
GETDOCUMENTELEMENT Function (page 196-42)	Retrieves the root element of the document
GETELEMENTSBYTAGNAME Functions (page 196-42)	Retrieves <ul style="list-style-type: none"> the elements in the DOMNODELIST by tag name elements in the subtree of a DOMNODELIST by tagname
GETIMPLEMENTATION Function (page 196-45)	Retrieves the DOM implementation
GETSTANDALONE Function (page 196-59)	Retrieves the standalone property of the document
GETVERSION Function (page 196-61)	Retrieves the version of the document
GETXMLTYPE Function (page 196-62)	Retrieves the XMLType associated with the DOM Document
ISNULL Functions (page 196-66)	Tests if the document is NULL
MAKENODE Functions (page 196-75)	Casts the document to a node
NEWDOMDOCUMENT Functions (page 196-78)	Creates a new document
SETCHARSET Procedure (page 196-85)	Sets the charset of the DOM document
SETDOCTYPE Procedure (page 196-86)	Sets the DTD of the document
SETSTANDALONE Procedure (page 196-90)	Sets the standalone property of the document
SETVERSION Procedure (page 196-91)	Sets the version of the document
WRITETOBUFFER Procedures (page 196-94)	Writes the document to a buffer
WRITETOCLOB Procedures (page 196-94)	Writes the document to a CLOB
WRITETOFILE Procedures (page 196-95)	Writes the document to a file

196.6.7 DBMS_XMLDOM DOMDocumentFragment Subprograms

This table lists the DOMDocumentFragment subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 196-10 Summary of DOMDocumentFragment Subprograms; DBMS_XMLDOM

Method	Description
FREEDOCFRAG Procedure (page 196-35)	Frees the specified document fragment
ISNULL Functions (page 196-66)	Tests if the DocumentFragment is <code>NULL</code>
MAKENODE Functions (page 196-75)	Casts the Document Fragment to a node
WRITETOBUFFER Procedures (page 196-94)	Writes the contents of a document fragment into a buffer

196.6.8 DBMS_XMLDOM DOMDocumentType Subprograms

This table lists the DOMDocumentType subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 196-11 Summary of DOMDocumentType Subprograms; DBMS_XMLDOM

Method	Description
FINDENTITY Function (page 196-33)	Finds the specified entity in the document type
FINDNOTATION Function (page 196-34)	Finds the specified notation in the document type
GETENTITIES Function (page 196-43)	Retrieves the nodemap of entities in the Document type
GETNAME Functions (page 196-47)	Retrieves the name of the Document type
GETNOTATIONS Function (page 196-53)	Retrieves the nodemap of the notations in the Document type
GETPUBLICID Functions (page 196-57)	Retrieves the public ID of the document type
GETSYSTEMID Functions (page 196-59)	Retrieves the system ID of the document type
ISNULL Functions (page 196-66)	Tests if the Document Type is <code>NULL</code>
MAKENODE Functions (page 196-75)	Casts the document type to a node

196.6.9 DBMS_XMLDOM DOMEElement Subprograms

This table lists the DOMEElement subprograms of DBMS_XMLDOM in alphabetical order and briefly describes them.

Table 196-12 Summary of DOMEElement Subprograms; DBMS_XMLDOM

Method	Description
FREEELEMENT Procedure (page 196-36)	Frees memory allocated to a DOMEElement handle
GETATTRIBUTE Functions (page 196-37)	Retrieves the attribute node by name

Table 196-12 (Cont.) Summary of DOMElement Subprograms; DBMS_XMLDOM

Method	Description
GETATTRIBUTENODE Functions (page 196-38)	Retrieves the attribute node by name
GETCHILDRENBYTAGNAME Functions (page 196-40)	Retrieves children of the element by tag name
GETELEMENTSBYTAGNAME Functions (page 196-42)	Retrieves <ul style="list-style-type: none"> the elements in the DOMNODELIST by tag name elements in the subtree of a DOMNODELIST by tagname
GETEXPANDEDNAME Procedure and Functions (page 196-44)	Retrieves the expanded name of the element
GETLOCALNAME Procedure and Functions (page 196-47)	Retrieves the local name of the element
GETNAMESPACE Procedure and Functions (page 196-49)	Retrieves the NS URI of the element
GETQUALIFIEDNAME Functions (page 196-57)	Retrieves the qualified name of the element
GETTAGNAME Function (page 196-60)	Retrieves the Tag name of the element
HASATTRIBUTE Functions (page 196-62)	Tests if an attribute exists
ISNULL Functions (page 196-66)	Tests if the Element is <code>NULL</code>
MAKENODE Functions (page 196-75)	Casts the Element to a node
NORMALIZE Procedure (page 196-79)	Normalizes the text children of the element
REMOVEATTRIBUTE Procedures (page 196-79)	Removes the attribute specified by the name
REMOVEATTRIBUTENODE Function (page 196-80)	Removes the attribute node in the element
RESOLVENAMESPACEPREFIX Function (page 196-83)	Resolve the prefix to a namespace URI
SETATTRIBUTE Procedures (page 196-84)	Sets the attribute specified by the name
SETATTRIBUTENODE Functions (page 196-85)	Sets the attribute node in the element

196.6.10 DBMS_XMLDOM DOMEntity Subprograms

This table lists and briefly describes the `DOMEntity` subprograms of `DBMS_XMLDOM`.

Table 196-13 Summary of DOMEntity Subprograms; DBMS_XMLDOM

Method	Description
GETNOTATIONNAME Function (page 196-53)	Retrieves the notation name of the entity
GETPUBLICID Functions (page 196-57)	Retrieves the public Id of the entity

Table 196-13 (Cont.) Summary of DOMEntity Subprograms; DBMS_XMLDOM

Method	Description
GETSYSTEMID Functions (page 196-59)	Retrieves the system Id of the entity
ISNULL Functions (page 196-66)	Tests if the Entity is NULL
MAKENODE Functions (page 196-75)	Casts the Entity to a node

196.6.11 DBMS_XMLDOM DOMEntityReference Subprograms

This table lists and briefly describes the `DOMEntityReference` subprograms of `DBMS_XMLDOM`.

Table 196-14 Summary of DOMEntityReference Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions (page 196-66)	Tests if the <code>DOMEntityReference</code> is NULL
MAKENODE Functions (page 196-75)	Casts the <code>DOMEntityReference</code> to NULL

196.6.12 DBMS_XMLDOM DOMImplementation Subprograms

This table lists and briefly describes the `DOMImplementation` subprograms of `DBMS_XMLDOM`.

Table 196-15 Summary of DOMImplementation Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions (page 196-66)	Tests if the <code>DOMImplementation</code> node is NULL
HASFEATURE Function (page 196-64)	Tests if the <code>DOMImplementation</code> implements a feature

196.6.13 DBMS_XMLDOM DOMNamedNodeMap Subprograms

This table lists and briefly describes the `DOMNamedNodeMap` subprograms of `DBMS_XMLDOM`.

Table 196-16 Summary of DOMNamedNodeMap Subprograms; DBMS_XMLDOM

Method	Description
GETLENGTH Functions (page 196-46)	Retrieves the number of items in the map
GETNAMEDITEM Function (page 196-48)	Retrieves the item specified by the name
ISNULL Functions (page 196-66)	Tests if the <code>NamedNodeMap</code> is NULL
ITEM Functions (page 196-69)	Retrieves the item given the index in the map

**Table 196-16 (Cont.) Summary of DOMNamedNodeMap Subprograms;
DBMS_XMLDOM**

Method	Description
REMOVENAMEDITEM Function (page 196-81)	Removes the item specified by name
SETNAMEDITEM Function (page 196-87)	Sets the item in the map specified by the name

196.6.14 DBMS_XMLDOM DOMNodeList Subprograms

This table lists and briefly describes the `DOMNodeList` subprograms of `DBMS_XMLDOM`.

Table 196-17 Summary of DOMNodeList Subprograms; DBMS_XMLDOM

Method	Description
FREENODELIST Procedure (page 196-37)	Frees all resources associated with a nodelist
GETLENGTH Functions (page 196-46)	Retrieves the number of items in the list
ISNULL Functions (page 196-66)	Tests if the <code>NodeList</code> is <code>NULL</code>
ITEM Functions (page 196-69)	Retrieves the item given the index in the list

196.6.15 DBMS_XMLDOM DOMNotation Subprograms

This table lists and briefly describes the `DOMNotation` subprograms of `DBMS_XMLDOM`.

Table 196-18 Summary of DOMNotation Subprograms; DBMS_XMLDOM

Method	Description
GETPUBLICID Functions (page 196-57)	Retrieves the public Id of the notation
GETSYSTEMID Functions (page 196-59)	Retrieves the system Id of the notation
ISNULL Functions (page 196-66)	Tests if the Notation is <code>NULL</code>
MAKENODE Functions (page 196-75)	Casts the notation to a node

196.6.16 DBMS_XMLDOM DOMProcessingInstruction Subprograms

This table lists and briefly describes the `DOMProcessingInstruction` subprograms of `DBMS_XMLDOM`.

**Table 196-19 Summary of DOMProcessingInstruction Subprograms;
DBMS_XMLDOM**

Method	Description
GETDATA Functions (page 196-41)	Retrieves the data of the processing instruction

**Table 196-19 (Cont.) Summary of DOMProcessingInstruction Subprograms;
DBMS_XMLDOM**

Method	Description
GETTARGET Function (page 196-54)	Retrieves the target of the processing instruction
ISNULL Functions (page 196-66)	Tests if the Processing Instruction is NULL
MAKENODE Functions (page 196-75)	Casts the Processing Instruction to a node
SETDATA Procedures (page 196-86)	Sets the data of the processing instruction

196.6.17 DBMS_XMLDOM DOMText Subprograms

This table lists and briefly describes the `DOMText` subprograms of `DBMS_XMLDOM`.

Table 196-20 Summary of DOMText Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions (page 196-66)	Tests if the text is NULL
MAKENODE Functions (page 196-75)	Casts the text to a node
SPLITTEXT Function (page 196-92)	Splits the contents of the text node into 2 text nodes

196.7 Summary of DBMS_XMLDOM Subprograms

This table lists the `DBMS_XMLDOM` subprograms and briefly describes them.

Table 196-21 Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ADOPTNODE Function (page 196-25)	Adopts a node from another document	DOMNode Subprograms (page 196-6)
APPENDCHILD Function (page 196-26)	Appends a new child to the node	DOMNode Subprograms (page 196-6)
APPENDDATA Procedure (page 196-27)	Appends the specified data to the node data	DOMCharacterData Subprograms (page 196-8)
CLONENODE Function (page 196-27)	Clones the node	DOMNode Subprograms (page 196-6)
CREATEATTRIBUTE Functions (page 196-28)	Creates an Attribute	DOMDocument Subprograms (page 196-9)
CREATECDATASECTION Function (page 196-29)	Creates a <code>CDataSection</code> node	DOMDocument Subprograms (page 196-9)
CREATECOMMENT Function (page 196-29)	Creates a Comment node	DOMDocument Subprograms (page 196-9)

Table 196-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
CREATEDOCUMENT Function (page 196-30)	Creates a new Document	DOMDocument Subprograms (page 196-9)
CREATEDOCUMENTFRAGMENT Function (page 196-30)	Creates a new Document Fragment	DOMDocument Subprograms (page 196-9)
CREATEELEMENT Functions (page 196-31)	Creates a new Element	DOMDocument Subprograms (page 196-9)
CREATEENTITYREFERENCE Function (page 196-31)	Creates an Entity reference	DOMDocument Subprograms (page 196-9)
CREATEPROCESSINGINSTRUCTION Function (page 196-32)	Creates a Processing Instruction	DOMDocument Subprograms (page 196-9)
CREATETEXTNODE Function (page 196-32)	Creates a Text node	DOMDocument Subprograms (page 196-9)
DELETEDATA Procedure (page 196-33)	Deletes the data from the specified offSets	DOMCharacterData Subprograms (page 196-8)
FINDENTITY Function (page 196-33)	Finds the specified entity in the document type	DOMDocumentType Subprograms (page 196-11)
FINDNOTATION Function (page 196-34)	Finds the specified notation in the document type	DOMDocumentType Subprograms (page 196-11)
FREEDOCFRAG Procedure (page 196-35)	Frees the document fragment	DOMDocument Subprograms (page 196-9) and DOMDocumentFragment Subprograms (page 196-10)
FREEDOCUMENT Procedure (page 196-35)	Frees the document	DOMDocument Subprograms (page 196-9)
FREEELEMENT Procedure (page 196-36)	Frees memory allocated to a DOMELEMENT handle	DOMELEMENT Subprograms (page 196-11)
FREENODE Procedure (page 196-36)	Frees all resources associated with the node	DOMNode Subprograms (page 196-6)
FREENODELIST Procedure (page 196-37)	Frees all resources associated with a nodelist	DOMNodeList Subprograms (page 196-14)
GETATTRIBUTE Functions (page 196-37)	Retrieves the attribute node by name	DOMELEMENT Subprograms (page 196-11)

Table 196-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETATTRIBUTENODE Functions (page 196-38)	Retrieves the attribute node by name	DOMElement Subprograms (page 196-11)
GETATTRIBUTES Function (page 196-39)	Retrieves the attributes of the node	DOMNode Subprograms (page 196-6)
GETCHARSET Function (page 196-39)	Retrieves the character set of the DOM document	DOMDocument Subprograms (page 196-9)
GETCHILDNODES Function (page 196-40)	Retrieves the children of the node	DOMNode Subprograms (page 196-6)
GETCHILDRENBYTAGNAME Functions (page 196-40)	Retrieves children of the element by tag name	DOMCharacterData Subprograms (page 196-8)
GETDATA Functions (page 196-41)	Retrieves <ul style="list-style-type: none"> the data of the node the data of the processing instruction 	<ul style="list-style-type: none"> DOMCharacterData Subprograms (page 196-8) DOMProcessingInstruction Subprograms (page 196-14)
GETDOCTYPE Function (page 196-41)	Retrieves the DTD of the document	DOMDocument Subprograms (page 196-9)
GETDOCUMENTELEMENT Function (page 196-42)	Retrieves the root element of the document	DOMDocument Subprograms (page 196-9)
GETELEMENTSBYTAGNAME Functions (page 196-42)	Retrieves <ul style="list-style-type: none"> the elements in the DOMNODELIST by tag name elements in the subtree of a DOMNODELIST by tagname 	<ul style="list-style-type: none"> DOMDocument Subprograms (page 196-9) DOMElement Subprograms (page 196-11)
GETENTITIES Function (page 196-43)	Retrieves the nodemap of entities in the Document type	DOMDocumentType Subprograms (page 196-11)
GETEXPANDEDNAME Procedure and Functions (page 196-44)	Retrieves <ul style="list-style-type: none"> the expanded name of the node the expanded name of the attribute the expanded name of the element 	<ul style="list-style-type: none"> DOMNode Subprograms (page 196-6) DOMAttr Subprograms (page 196-7) DOMElement Subprograms (page 196-11)
GETFIRSTCHILD Function (page 196-44)	Retrieves the first child of the node	DOMNode Subprograms (page 196-6)
GETIMPLEMENTATION Function (page 196-45)	Retrieves the DOM implementation	DOMDocument Subprograms (page 196-9)

Table 196-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETLASTCHILD Function (page 196-45)	Retrieves the last child of the node	DOMNode Subprograms (page 196-6)
GETLENGTH Functions (page 196-46)	Retrieves <ul style="list-style-type: none"> the length of the data the number of items in the map the number of items in the list 	<ul style="list-style-type: none"> DOMCharacterData Subprograms (page 196-8) DOMNamedNodeMap Subprograms (page 196-13) DOMNodeList Subprograms (page 196-14)
GETLOCALNAME Procedure and Functions (page 196-47)	Retrieves <ul style="list-style-type: none"> the local part of the qualified name the local name of the attribute the local name of the element 	<ul style="list-style-type: none"> DOMNode Subprograms (page 196-6) DOMAttr Subprograms (page 196-7) DOMElement Subprograms (page 196-11)
GETNAME Functions (page 196-47)	Retrieves <ul style="list-style-type: none"> the name of the attribute the name of the Document type 	<ul style="list-style-type: none"> DOMAttr Subprograms (page 196-7) DOMDocumentType Subprograms (page 196-11)
GETNAMEDITEM Function (page 196-48)	Retrieves <ul style="list-style-type: none"> an item specified by name and namespace URI) 	<ul style="list-style-type: none"> DOMNamedNodeMap Subprograms (page 196-13) DOMNamedNodeMap Subprograms (page 196-13)
GETNAMESPACE Procedure and Functions (page 196-49)	Retrieves <ul style="list-style-type: none"> the node's namespace URI the NS URI of the attribute the NS URI of the element 	<ul style="list-style-type: none"> DOMNode Subprograms (page 196-6) DOMAttr Subprograms (page 196-7) DOMElement Subprograms (page 196-11)
GETNEXTSIBLING Function (page 196-49)	Retrieves the next sibling of the node	DOMNode Subprograms (page 196-6)
GETNODENAME Function (page 196-50)	Retrieves the Name of the Node	DOMNode Subprograms (page 196-6)
GETNODETYPE Function (page 196-50)	Retrieves the Type of the node	DOMNode Subprograms (page 196-6)
GETNODEVALUE Function (page 196-51)	Retrieves the Value of the Node	DOMNode Subprograms (page 196-6)

Table 196-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETNODEVALUEASBINARYSTREAM Function & Procedure (page 196-51)	Retrieves the Node Value as binary stream	DOMNode Subprograms (page 196-6)
GETNODEVALUEASCHARACTERSTREAM Function & Procedure (page 196-52)	Retrieves the Node Value as character stream	DOMNode Subprograms (page 196-6)
GETNOTATIONNAME Function (page 196-53)	Retrieves the notation name of the entity	DOMEntity Subprograms (page 196-12)
GETNOTATIONS Function (page 196-53)	Retrieves the nodemap of the notations in the Document type	DOMDocumentType Subprograms (page 196-11)
GETTARGET Function (page 196-54)	Retrieves the target of the processing instruction	DOMProcessingInstruction Subprograms (page 196-14)
GETOWNERDOCUMENT Function (page 196-54)	Retrieves the owner document of the node	DOMNode Subprograms (page 196-6)
GETOWNERELEMENT Function (page 196-55)	Retrieves the Element node, parent of the attribute	DOMAttr Subprograms (page 196-7)
GETPARENTNODE Function (page 196-55)	Retrieves the parent of this node	DOMNode Subprograms (page 196-6)
GETPREFIX Function (page 196-56)	Retrieves the namespace prefix)	DOMNode Subprograms (page 196-6)
GETPREVIOUS SIBLING Function (page 196-56)	Retrieves the previous sibling of the node	DOMNode Subprograms (page 196-6)
GETPUBLICID Functions (page 196-57)	Retrieves <ul style="list-style-type: none"> the public ID of the document type the public Id of the entity the public Id of the notation 	<ul style="list-style-type: none"> DOMDocumentType Subprograms (page 196-11) DOMEntity Subprograms (page 196-12) DOMNotation Subprograms (page 196-14)
GETQUALIFIEDNAME Functions (page 196-57)	Retrieves <ul style="list-style-type: none"> the Qualified Name of the attribute the qualified name of the element 	<ul style="list-style-type: none"> DOMAttr Subprograms (page 196-7) DOMElement Subprograms (page 196-11)
GETSCHEMANODE Function (page 196-58)	Retrieves the associated schema URI	DOMNode Subprograms (page 196-6)
GETSPECIFIED Function (page 196-58)	Tests if attribute was specified in the element.	DOMAttr Subprograms (page 196-7)
GETSTANDALONE Function (page 196-59)	Retrieves the standalone property of the document	DOMDocument Subprograms (page 196-9)

Table 196-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETSYSTEMID Functions (page 196-59)	Retrieves <ul style="list-style-type: none"> the system ID of the document type the system Id of the entity the system Id of the notation 	<ul style="list-style-type: none"> DOMDocumentType Subprograms (page 196-11) DOMEntity Subprograms (page 196-12) DOMNotation Subprograms (page 196-14)
GETTAGNAME Function (page 196-60)	Retrieves the Tag name of the element	DOMELEMENT Subprograms (page 196-11)
GETVALUE Function (page 196-61)	Retrieves the value of the attribute	DOMAttr Subprograms (page 196-7)
GETVERSION Function (page 196-61)	Retrieves the version of the document	DOMDocument Subprograms (page 196-9))
GETXMLTYPE Function (page 196-62)	Retrieves the XMLType associated with the DOM Document	DOMDocument Subprograms (page 196-9)
HASATTRIBUTES Function (page 196-63)	Tests if the node has attributes	DOMNode Subprograms (page 196-6)
HASATTRIBUTE Functions (page 196-62)	Tests if an attribute exists	DOMELEMENT Subprograms (page 196-11)
HASCHILDNODES Function (page 196-63)	Tests if the node has child nodes	DOMNode Subprograms (page 196-6)
HASFEATURE Function (page 196-64)	Tests if the DOMImplementation implements a feature	DOMImplementation Subprograms (page 196-13)
IMPORTNODE Function (page 196-64)	Imports a node from another document	DOMNode Subprograms (page 196-6)
INSERTBEFORE Function (page 196-65)	Inserts a child before the reference child	DOMNode Subprograms (page 196-6)
INSERTDATA Procedure (page 196-66)	Inserts the data in the node at the specified offSets	DOMCharacterData Subprograms (page 196-8)

Table 196-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ISNULL Functions (page 196-66)	Tests <ul style="list-style-type: none"> • if the node is NULL • if the Attribute node is NULL • if the CDataSection is NULL • if the CharacterData is NULL • if the comment is NULL • if the document is NULL • if the DocumentFragment is NULL • if the Document Type is NULL • if the Element is NULL • if the Entity is NULL • if the DOMEntityReference is NULL • if the DOMImplementation node is NULL • if the NamedNodeMap is NULL • if the NodeList is NULL • if the Notation is NULL • if the Processing Instruction is NULL • if the text is NULL 	<ul style="list-style-type: none"> • DOMNode Subprograms (page 196-6) • DOMAttr Subprograms (page 196-7) • DOMCDataSection Subprograms (page 196-8) • DOMCharacterData Subprograms (page 196-8) • DOMComment Subprograms (page 196-9) • DOMDocument Subprograms (page 196-9) • DOMDocumentFragment Subprograms (page 196-10) • DOMDocumentType Subprograms (page 196-11) • DOMElement Subprograms (page 196-11) • DOMEntity Subprograms (page 196-12) • DOMEntityReference Subprograms (page 196-13) • DOMImplementation Subprograms (page 196-13) • DOMNamedNodeMap Subprograms (page 196-13) • DOMNodeList Subprograms (page 196-14) • DOMNotation Subprograms (page 196-14) • DOMProcessingInstruction Subprograms (page 196-14) • DOMText Subprograms (page 196-15)

Table 196-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ITEM Functions (page 196-69)	Retrieves <ul style="list-style-type: none"> the item given the index in the map the item given the index in the <code>NodeList</code> 	<ul style="list-style-type: none"> DOMNamedNodeMap Subprograms (page 196-13) DOMNodeList Subprograms (page 196-14)
MAKEATTR Function (page 196-70)	Casts the node to an Attribute	DOMNode Subprograms (page 196-6)
MAKECDATASECTION Function (page 196-70)	Casts the node to a CData Section	DOMNode Subprograms (page 196-6)
MAKECHARACTERDATA Function (page 196-71)	Casts the node to Character Data	DOMNode Subprograms (page 196-6)
MAKECOMMENT Function (page 196-71)	Casts the node to a Comment	DOMNode Subprograms (page 196-6)
MAKEDOCUMENT Function (page 196-72)	Casts the node to a DOM Document	DOMNode Subprograms (page 196-6)
MAKEDOCUMENTFRAGMENT Function (page 196-72)	Casts the node to a DOM Document Fragment	DOMNode Subprograms (page 196-6))
MAKEDOCUMENTTYPE Function (page 196-73)	Casts the node to a DOM Document Type	DOMNode Subprograms (page 196-6)
MAKEELEMENT Function (page 196-73)	Casts the node to a DOM Element	DOMNode Subprograms (page 196-6)
MAKEENTITY Function (page 196-74)	Casts the node to a DOM Entity	DOMNode Subprograms (page 196-6)
MAKEENTITYREFERENCE Function (page 196-74)	Casts the node to a DOM Entity Reference	DOMNode Subprograms (page 196-6)

Table 196-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
MAKENODE Functions (page 196-75)	Casts <ul style="list-style-type: none"> • the Attribute to a node • the CDatasection to a node • the CharacterData to a node • the Comment to a node • the document to a node • the Document Fragment to a node • the document type to a node • the Element to a node • the Entity to a node • • the DOMEntityReference to NULL • the notation to a node • the Processing Instruction to a node • the text to a node 	<ul style="list-style-type: none"> • DOMAttr Subprograms (page 196-7) • DOMCDataSection Subprograms (page 196-8) • DOMCharacterData Subprograms (page 196-8) • DOMComment Subprograms (page 196-9) • DOMDocument Subprograms (page 196-9) • DOMDocumentFragment Subprograms (page 196-10) • DOMDocumentType Subprograms (page 196-11) • DOMElement Subprograms (page 196-11) • DOMEntity Subprograms (page 196-12) • DOMEntityReference Subprograms (page 196-13) • DOMNotation Subprograms (page 196-14) • DOMProcessingInstruction Subprograms (page 196-14) • DOMText Subprograms (page 196-15)
MAKENOTATION Function (page 196-77)	Casts the node to a DOM Notation	DOMNode Subprograms (page 196-6)
MAKEPROCESSINGINSTRUCTION Function (page 196-77)	Casts the node to a DOM Processing Instruction	DOMNode Subprograms (page 196-6)
MAKETEXT Function (page 196-78)	Casts the node to a DOM Text	DOMNode Subprograms (page 196-6)
NEWDOMDOCUMENT Functions (page 196-78)	Creates a new document	DOMDocument Subprograms (page 196-9)
NORMALIZE Procedure (page 196-79)	Normalizes the text children of the element	DOMElement Subprograms (page 196-11)

Table 196-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
REMOVEATTRIBUTE Procedures (page 196-79)	Removes the attribute specified by the name	DOMElement Subprograms (page 196-11)
REMOVEATTRIBUTENODE Function (page 196-80)	Removes the attribute node in the element	DOMElement Subprograms (page 196-11)
REMOVECHILD Function (page 196-81)	Removes a specified child from a node	DOMNode Subprograms (page 196-6)
REMOVENAMEDITEM Function (page 196-81)	Removes the item specified by name	DOMNamedNodeMap Subprograms (page 196-13)
REPLACECHILD Function (page 196-82)	Replaces the old child with a new child	DOMNode Subprograms (page 196-6)
REPLACEDATA Procedure (page 196-83)	Changes a range of characters in the node	DOMCharacterData Subprograms (page 196-8)
RESOLVENAMESPACEPREFIX Function (page 196-83)	Resolve the prefix to a namespace URI	DOMElement Subprograms (page 196-11)
SETATTRIBUTE Procedures (page 196-84)	Sets the attribute specified by the name	DOMElement Subprograms (page 196-11)
SETATTRIBUTENODE Functions (page 196-85)	Sets the attribute node in the element	DOMElement Subprograms (page 196-11)
SETCHARSET Procedure (page 196-85)	Sets the charset of the DOM document	DOMDocument Subprograms (page 196-9)
SETDATA Procedures (page 196-86)	Sets <ul style="list-style-type: none"> the data to the node the data of the processing instruction 	<ul style="list-style-type: none"> DOMCharacterData Subprograms (page 196-8) DOMProcessingInstruction Subprograms (page 196-14)
SETDOCTYPE Procedure (page 196-86)	Sets the DTD of the document.	DOMDocument Subprograms (page 196-9)
SETNAMEDITEM Function (page 196-87)	Sets the item in the map specified by the name	DOMNamedNodeMap Subprograms (page 196-13)
SETNODEVALUE Procedure (page 196-88)	Sets the Value of the node	DOMNode Subprograms (page 196-6)
SETNODEVALUEASBINARYSTREAM Function & Procedure (page 196-88)	Sets the Node Value as a binary stream	DOMNode Subprograms (page 196-6)
SETNODEVALUEASCHARACTERSTREAM Function & Procedure (page 196-89)	Sets the Node Value as a character stream	DOMNode Subprograms (page 196-6)

Table 196-21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
SETPREFIX Procedure (page 196-90)	Sets the namespace prefix	DOMNode Subprograms (page 196-6)
SETSTANDALONE Procedure (page 196-90)	Sets the standalone property of the document	DOMDocument Subprograms (page 196-9)
SETVALUE Procedure (page 196-91)	Sets the value of the attribute	DOMAttr Subprograms (page 196-7)
SETVERSION Procedure (page 196-91)	Sets the version of the document	DOMDocument Subprograms (page 196-9)
SPLITTEXT Function (page 196-92)	Splits the contents of the text node into 2 text nodes	DOMText Subprograms (page 196-15)
SUBSTRINGDATA Function (page 196-92)	Retrieves the substring of the data	DOMCharacterData Subprograms (page 196-8)
USEBINARYSTREAM Function (page 196-93)	Strabismus that the stream is valid for use	DOMNode Subprograms (page 196-6)
WRITETOBUFFER Procedures (page 196-94)	Writes <ul style="list-style-type: none"> the contents of the node to a buffer the document to a buffer the contents of a document fragment into a buffer 	<ul style="list-style-type: none"> DOMNode Subprograms (page 196-6) DOMDocument Subprograms (page 196-9) DOMDocumentFragment Subprograms (page 196-10)
WRITETOCLOB Procedures (page 196-94)	Writes <ul style="list-style-type: none"> the contents of the node to a CLOB the document to a CLOB 	<ul style="list-style-type: none"> DOMNode Subprograms (page 196-6) DOMDocument Subprograms (page 196-9)
WRITETOFILE Procedures (page 196-95)	Writes <ul style="list-style-type: none"> the contents of the node to a file the document to a file 	<ul style="list-style-type: none"> DOMNode Subprograms (page 196-6) DOMDocument Subprograms (page 196-9)

196.7.1 ADOPTNODE Function

This function adopts a node from another document, and returns this new node.

See Also:

[DOMNode Subprograms](#) (page 196-6) for other subprograms in this group

Syntax

```
DBMS_XMLDOM.ADOPTNODE(
  doc          IN  DOMDocument,
  importedNode IN  DOMNode)
RETURN DOMNODE;
```

Parameters

Table 196-22 ADOPTNODE Function Parameters

Parameter	Description
doc	Document that is adopting the node
importedNode	Node to adopt

Usage Notes

Note that the [ADOPTNODE Function](#) (page 196-25) removes the node from the source document while the [IMPORTNODE Function](#) (page 196-64) clones the node in the source document.

196.7.2 APPENDCHILD Function

This function adds the node `newchild` to the end of the list of children of this node, and returns the newly added node. If the `newchild` is already in the tree, it is first removed.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.APPENDCHILD(
  n          IN  DOMNode,
  newchild  IN  DOMNode)
RETURN DOMNODE;
```

Parameters

Table 196-23 APPENDCHILD Function Parameters

Parameter	Description
n	DOMNode
newchild	The child to be appended to the list of children of node <code>n</code>

196.7.3 APPENDDATA Procedure

This procedure appends the string to the end of the character data of the node. Upon success, data provides access to the concatenation of data and the specified string argument.

See Also:

[DOMCharacterData Subprograms](#) (page 196-8)

Syntax

```
DBMS_XMLDOM.APPENDDATA(
  cd      IN   DOMCHARACTERDATA,
  arg     IN   VARCHAR2);
```

Parameters

Table 196-24 APPENDDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
arg	The data to append to the existing data

196.7.4 CLONENODE Function

This function returns a duplicate of this node, and serves as a generic copy constructor for nodes. The duplicate node has no parent, its parent node is `NULL`.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.CLONENODE(
  n      IN   DOMNODE,
  deep  IN   BOOLEAN)
RETURN DOMNODE;
```

Parameters

Table 196-25 CLONENODE Function Parameters

Parameter	Description
n	DOMNODE

Table 196-25 (Cont.) CLONENODE Function Parameters

Parameter	Description
deep	Determines if children are to be cloned

Usage Notes

- Cloning an Element copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child Text node.
- Cloning an Attribute directly, as opposed to be cloned as part of an Element cloning operation, returns a specified attribute (specified is `TRUE`).
- Cloning any other type of node simply returns a copy of this node.

196.7.5 CREATEATTRIBUTE Functions

This function creates a `DOMATTR` node.

**See Also:**

[DOMDocument Subprograms \(page 196-9\)](#)

Syntax

Creates a `DOMATTR` with the specified name:

```
DBMS_XMLDOM.CREATEATTRIBUTE (
  doc      IN   DOMDOCUMENT,
  name     IN   VARCHAR2)
RETURN DOMATTR;
```

Creates a `DOMATTR` with the specified name and namespace URI:

```
DBMS_XMLDOM.CREATEATTRIBUTE (
  doc      IN   DOMDOCUMENT,
  qname    IN   VARCHAR2,
  ns       IN   VARCHAR2)
RETURN DOMATTR;
```

Parameters**Table 196-26 CREATEATTRIBUTE Function Parameters**

Parameter	Description
doc	DOMDOCUMENT
qname	New attribute qualified name
ns	Namespace

196.7.6 CREATECDATASECTION Function

This function creates a `DOMCDATASECTION` node.

See Also:

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.CREATECDATASECTION(  
    doc      IN      DOMDOCUMENT,  
    data     IN      VARCHAR2)  
RETURN DOMCDATASECTION;
```

Parameters

Table 196-27 CREATECDATASECTION Function Parameters

Parameter	Description
<code>doc</code>	<code>DOMDOCUMENT</code>
<code>data</code>	Content of the <code>DOMCDATASECTION</code> node

196.7.7 CREATECOMMENT Function

This function creates a `DOMCOMMENT` node.

See Also:

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.CREATECOMMENT(  
    doc      IN      DOMDOCUMENT,  
    data     IN      VARCHAR2)  
RETURN DOMCOMMENT;
```

Parameters

Table 196-28 CREATECOMMENT Function Parameters

Parameter	Description
<code>doc</code>	<code>DOMDOCUMENT</code>
<code>data</code>	Content of the <code>DOMComment</code> node

196.7.8 CREATEDOCUMENT Function

This function creates a `DOMDOCUMENT` with specified namespace URI, root element name, DTD.

See Also:

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENT(
  namespaceURI      IN   VARCHAR2,
  qualifiedName     IN   VARCHAR2,
  doctype           IN   DOMTYPE := NULL)
RETURN DOMDOCUMENT;
```

Parameters

Table 196-29 CREATEDOCUMENT Function Parameters

Parameter	Description
namespaceURI	Namespace URI
qualifiedName	Root element name
doctype	Document type

196.7.9 CREATEDOCUMENTFRAGMENT Function

This function creates a `DOMDOCUMENTFRAGMENT`.

See Also:

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENTFRAGMENT(
  doc      IN   DOMDOCUMENT)
RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 196-30 CREATEDOCUMENTFRAGMENT Function Parameters

Parameter	Description
doc	DOMDocument

196.7.10 CREATEELEMENT Functions

This function creates a `DOMELEMENT`.

See Also:

[DOMDocument Subprograms](#) (page 196-9)

Syntax

Creates a `DOMElement` with specified name:

```
DBMS_XMLDOM.CREATEELEMENT(  
  doc          IN      DOMDOCUMENT,  
  tagName     IN      VARCHAR2)  
RETURN DOMELEMENT;
```

Creates a `DOMElement` with specified name and namespace URI:

```
DBMS_XMLDOM.CREATEELEMENT(  
  doc          IN      DOMDOCUMENT,  
  tagName     IN      VARCHAR2,  
  ns          IN      VARCHAR2)  
RETURN DOMELEMENT;
```

Parameters

Table 196-31 CREATEELEMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT
tagName	Tagname for new DOMELEMENT
ns	Namespace

196.7.11 CREATEENTITYREFERENCE Function

This function creates a `DOMENTITYREFERENCE` node.

See Also:

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.CREATEENTITYREFERENCE(  
  doc          IN      DOMDOCUMENT,  
  name        IN      VARCHAR2)  
RETURN DOMENTITYREFERENCE;
```

Parameters

Table 196-32 CREATEENTITYREFERENCE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
name	New entity reference name

196.7.12 CREATEPROCESSINGINSTRUCTION Function

This function creates a `DOMPROCESSINGINSTRUCTION` node.

**See Also:**

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.CREATEPROCESSINGINSTRUCTION(
  doc      IN      DOMDocument,
  target   IN      VARCHAR2,
  data     IN      VARCHAR2)
RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 196-33 CREATEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
doc	DOMDOCUMENT
target	Target of the new processing instruction
data	Content data of the new processing instruction

196.7.13 CREATETEXTNODE Function

This function creates a `DOMTEXT` node.

**See Also:**

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.CREATETEXTNODE(
  doc      IN      DOMDocument,
```

```

    data    IN    VARCHAR2)
RETURN DOMTEXT;

```

Parameters

Table 196-34 CREATETEXTNODE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMText node

196.7.14 DELETEDATA Procedure

This procedure removes a range of characters from the node. Upon success, data and length reflect the change.

See Also:

[DOMCharacterData Subprograms](#) (page 196-8)

Syntax

```

DBMS_XMLDOM.DELETEDATA(
    cd        IN    DOMCHARACTERDATA,
    offset    IN    NUMBER,
    cnt       IN    NUMBER);

```

Parameters

Table 196-35 DELETEDATA PROCEDURE Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset from which to delete the data
cnt	The number of characters (starting from offset) to delete

196.7.15 FINDENTITY Function

This function finds an entity in the specified DTD, and returns that entity if found.

See Also:

[DOMDocumentType Subprograms](#) (page 196-11)

Syntax

```
DBMS_XMLDOM.FINDENTITY(
  dt      IN      DOMDOCUMENTTYPE,
  name    IN      VARCHAR2,
  par     IN      BOOLEAN)
RETURN  DUMENTITY;
```

Parameters**Table 196-36 FINDENTITY Function Parameters**

Parameter	Description
dt	The DTD
name	Entity to find
par	Flag to indicate type of entity; TRUE for parameter entity and FALSE for normal entity

196.7.16 FINDNOTATION Function

This function finds the notation in the specified DTD, and returns it, if found.

**See Also:**

[DOMDocumentType Subprograms](#) (page 196-11)

Syntax

```
DBMS_XMLDOM.FINDNOTATION(
  dt      IN      DOMDocumentType,
  name    IN      VARCHAR2)
RETURN  DOMNOTATION;
```

Parameters**Table 196-37 FINDNOTATION Function Parameters**

Parameter	Description
dt	The DTD
name	The notation to find

196.7.17 FREEDOCFRAG Procedure

This procedure frees the specified document fragment.

See Also:

[DOMDocument Subprograms](#) (page 196-9) and [DOMDocumentFragment Subprograms](#) (page 196-10)

Syntax

```
DBMS_XMLDOM.FREEDOCFRAG(  
    df    IN    DOMDOCUMENTFRAGMENT);
```

Parameters

Table 196-38 FREEDOCFRAG Procedure Parameters

Parameter	Description
df	DOM document fragment

196.7.18 FREEDOCUMENT Procedure

This procedure frees `DOMDOCUMENT` object.

See Also:

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.FREEDOCUMENT(  
    doc    IN    DOMDOCUMENT);
```

Parameters

Table 196-39 FREEDOCUMENT Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT

196.7.19 FREEELEMENT Procedure

This procedure frees memory allocated to a DOMELEMENT handle.

See Also:

[DBMS_XMLDOM DOMELEMENT Subprograms](#) (page 196-11)

Syntax

```
DBMS_XMLDOM.FREEELEMENT(  
    elem IN DOMELEMENT);
```

Parameters

Table 196-40 FREEELEMENT Procedure Parameters

Parameter	Description
elem	Of type DOMELEMENT

196.7.20 FREENODE Procedure

This procedure frees all resources associated with a DOMNODE.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.FREENODE(  
    n      IN      DOMNODE);
```

Parameters

Table 196-41 FREENODE Procedure Parameters

Parameter	Description
n	DOMNODE

196.7.21 FREENODELIST Procedure

This procedure frees all resources associated with a nodelist.

See Also:

[DBMS_XMLDOM DOMNodeList Subprograms](#) (page 196-14)

Syntax

```
DBMS_XMLDOM.FREENODELIST(  
  nl IN DOMNodeList);
```

Parameters

Table 196-42 FREENODELIST Procedure Parameters

Parameter	Description
nl	Of type DOMNODELIST

196.7.22 GETATTRIBUTE Functions

This function returns the value of an attribute of an `DOMELEMENT` by name.

See Also:

[DOMElement Subprograms](#) (page 196-11)

Syntax

Returns the value of a `DOMELEMENT`'s attribute by name:

```
DBMS_XMLDOM.GETATTRIBUTE(  
  elem      IN      DOMELEMENT,  
  name      IN      VARCHAR2)  
RETURN VARCHAR2;
```

Returns the value of a `DOMELEMENT`'s attribute by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTE(  
  elem      IN      DOMELEMENT,  
  name      IN      VARCHAR2,  
  ns        IN      VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 196-43 GETATTRIBUTE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
ns	Namespace

196.7.23 GETATTRIBUTENODE Functions

This function returns an attribute node from the DOMELEMENT by name. The function is overloaded. The specific forms of functionality are described along with the syntax declarations.

**See Also:**

[DOMELEMENT Subprograms](#) (page 196-11)

Syntax

Returns an attribute node from the DOMELEMENT by name:

```
DBMS_XMLDOM.GETATTRIBUTENODE(
  elem      IN      DOMELEMENT,
  name      IN      VARCHAR2)
RETURN DOMATTR;
```

Returns an attribute node from the DOMELEMENT by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTENODE(
  elem      IN      DOMELEMENT,
  name      IN      VARCHAR2,
  ns        IN      VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 196-44 GETATTRIBUTENODE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name; * matches any attribute
ns	Namespace

196.7.24 GETATTRIBUTES Function

This function retrieves a `NAMEDNODEMAP` containing the attributes of this node (if it is an Element) or `NULL` otherwise.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.GETATTRIBUTES(
  n      IN      DOMNode)
RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 196-45 GETATTRIBUTES Function Parameters

Parameter	Description
n	DOMNODE

196.7.25 GETCHARSET Function

This function retrieves the character set of the DOM document.

See Also:

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.GETCHARSET(
  doc IN  DOMDocument)
RETURN VARCHAR2;
```

Parameters

Table 196-46 GETCHARSET Function Parameters

Parameter	Description
doc	DOM document

Usage Notes

For a newly parsed document, we return the database character set. Once the `SETCHARSET` Procedure is called with a non-NULL value for `charset`, that `charset` is returned.

196.7.26 GETCHILDNODES Function

This function retrieves a `DOMNODELIST` that contains all children of this node. If there are no children, this is a `DOMNODELIST` containing no nodes.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.GETCHILDNODES(  
  n      IN      DOMNode)  
RETURN DOMNodeList;
```

Parameters

Table 196-47 GETCHILDNODES Function Parameters

Parameter	Description
n	DOMNODE

196.7.27 GETCHILDRENBYTAGNAME Functions

This function returns the children of the `DOMELEMENT`.

See Also:

[DOMElement Subprograms](#) (page 196-11)

Syntax

Returns children of the `DOMELEMENT` given the tag name:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(  
  elem      IN      DOMElement,  
  name      IN      VARCHAR2)  
RETURN DOMNODELIST;
```

Returns children of the `DOMELEMENT` given the tag name and namespace:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(  
  elem      IN      DOMElement,
```

```

    name      IN      VARCHAR2,
    ns        IN      VARCHAR2)
RETURN DOMNODELIST;

```

Parameters

Table 196-48 GETCHILDRENBYTAGNAME Function Parameters

Parameter	Description
elem	DOMELEMENT
name	Tag name
ns	Namespace

196.7.28 GETDATA Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the character data of the node that implements this interface (See Also: [DOMCharacterData Subprograms](#) (page 196-8)):

```

DBMS_XMLDOM.GETDATA(
    cd      IN      DOMCHARACTERDATA)
RETURN VARCHAR2;

```

Returns the content data of the `DOMProcessingInstruction` (See Also: [DOMProcessingInstruction Subprograms](#) (page 196-14)):

```

DBMS_XMLDOM.GETDATA(
    pi      IN      DOMPROCESSINGINSTRUCTION)
RETURN VARCHAR2;

```

Parameters

Table 196-49 GETDATA Function Parameters

Parameter	Description
cd	DOMCHARACTERDATA
pi	The DOMPROCESSINGINSTRUCTION

196.7.29 GETDOCTYPE Function

This function returns the DTD associated to the `DOMDOCUMENT`.

See Also:

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.GETDOCTYPE (
    doc      IN      DOMDOCUMENT)
RETURN DOMDOCUMENTTYPE;
```

Parameters**Table 196-50** GETDOCTYPE Function Parameters

Parameter	Description
doc	DOMDOCUMENT

196.7.30 GETDOCUMENTELEMENT Function

This function returns the root element of the `DOMDOCUMENT`.

**See Also:**

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.GETDOCUMENTELEMENT (
    doc      IN      DOMDOCUMENT)
RETURN DOMELEMENT;
```

Parameters**Table 196-51** GETDOCUMENTELEMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT

196.7.31 GETELEMENTSBYTAGNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns a `DOMNODELIST` of all the elements with a specified tagname (See Also: [DOMDocument Subprograms](#) (page 196-9)):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME (
    doc      IN      DOMDOCUMENT,
    tagname  IN      VARCHAR2)
RETURN DOMNODELIST;
```

Returns the element children of the `DOMELEMENT` given the tag name (See Also: [DOMElement Subprograms](#) (page 196-11)):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
    elem      IN      DOMELEMENT,
    name      IN      VARCHAR2)
RETURN DOMNODELIST;
```

Returns the element children of the `DOMELEMENT` given the tag name and namespace (See Also: [DOMElement Subprograms](#) (page 196-11)):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
    elem      IN      DOMELEMENT,
    name      IN      VARCHAR2,
    ns        IN      VARCHAR2)
RETURN DOMNODELIST;
```

Parameters

Table 196-52 GETELEMENTSBYTAGNAME Function Parameters

Parameter	Description
doc	DOMDOCUMENT
tagname	Name of the tag to match on
elem	The <code>DOMELEMENT</code>
name	Tag name; using a wildcard(*) would match any tag
ns	Namespace

196.7.32 GETENTITIES Function

This function retrieves a `DOMNAMEDNODEMAP` containing the general entities, both external and internal, declared in the DTD.

See Also:

[DOMDocumentType Subprograms](#) (page 196-11)

Syntax

```
DBMS_XMLDOM.GETENTITIES(
    dt      IN      DOMDocumentType)
RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 196-53 GETENTITIES Function Parameters

Parameter	Description
dt	DOMDOCUMENTTYPE

196.7.33 GETEXPANDEDNAME Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described along with the syntax declarations.

Syntax

Retrieves the expanded name of the `Node` if is in an `Element` or `Attribute` type; otherwise, returns `NULL` (See Also: [DOMNode Subprograms](#) (page 196-6))

```
DBMS_XMLDOM.GETEXPANDEDNAME(
    n          IN      DOMNODE
    data      OUT     VARCHAR);
```

Returns the expanded name of the `DOMAttr` (See Also: [DOMAttr Subprograms](#) (page 196-7)):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
    a          IN      DOMAttr)
RETURN VARCHAR2;
```

Returns the expanded name of the `DOMElement` (See Also: [DOMElement Subprograms](#) (page 196-11)):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
    elem      IN      DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 196-54 GETEXPANDEDNAME Procedure and Function Parameters

Parameter	Description
n	DOMNODE
data	Returned expanded name of the Node
a	DOMATTR
elem	DOMELEMENT

196.7.34 GETFIRSTCHILD Function

This function retrieves the first child of this node. If there is no such node, this returns `NULL`.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.GETFIRSTCHILD(
  n      IN      DOMNODE)
RETURN DOMNODE;
```

Parameters**Table 196-55** GETFIRSTCHILD Function Parameters

Parameter	Description
n	DOMNODE

196.7.35 GETIMPLEMENTATION Function

This function returns the `DOMIMPLEMENTATION` object that handles this `DOMDOCUMENT`.

**See Also:**

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.GETIMPLEMENTATION(
  doc    IN      DOMDOCUMENT)
RETURN DOMIMPLEMENTATION;
```

Parameters**Table 196-56** GETIMPLEMENTATION Function Parameters

Parameter	Description
doc	DOMDOCUMENT

196.7.36 GETLASTCHILD Function

This function retrieves the last child of this node. If there is no such node, this returns `NULL`.

**See Also:**

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.GETLASTCHILD(
  n      IN  DOMNODE)
RETURN DOMNODE;
```

Parameters**Table 196-57** GETLASTCHILD Function Parameters

Parameter	Description
n	DOMNODE

196.7.37 GETLENGTH Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the number of characters in the data. This may have the value zero, because CharacterData nodes may be empty (See Also: [DOMCharacterData Subprograms](#) (page 196-8)):

```
DBMS_XMLDOM.GETLENGTH(
  cd      IN  DOMCHARACTERDATA)
RETURN NUMBER;
```

Gets the number of nodes in this map. The range of valid child node indexes is 0 to length-1, inclusive (See Also: [DOMNamedNodeMap Subprograms](#) (page 196-13)):

```
DBMS_XMLDOM.GETLENGTH(
  nnm     IN  DOMNAMEDNODEMAP)
RETURN NUMBER;
```

Gets the number of nodes in the list. The range of valid child node indexes is 0 to length-1, inclusive (See Also: [DOMNodeList Subprograms](#) (page 196-14)):

```
DBMS_XMLDOM.GETLENGTH(
  nl      IN  DOMNODELIST)
RETURN NUMBER;
```

Parameters**Table 196-58** GETLENGTH Function Parameters

Parameter	Description
cd	DOMCHARACTERDATA
nnm	DOMNAMEDNODEMAP
nl	DOMNODELIST

196.7.38 GETLOCALNAME Procedure and Functions

This function is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the local part of the node's qualified name (See Also: [DOMNode Subprograms](#) (page 196-6)):

```
DBMS_XMLDOM.GETLOCALNAME(
  n      IN      DOMNODE,
  data   OUT     VARCHAR2);
```

Returns the local name of the `DOMAttr` (See Also: [DOMAttr Subprograms](#) (page 196-7)):

```
DBMS_XMLDOM.GETLOCALNAME(
  a      IN      DOMATTR)
RETURN VARCHAR2;
```

Returns the local name of the `DOMElement` (See Also: [DOMElement Subprograms](#) (page 196-11))

```
DBMS_XMLDOM.GETLOCALNAME(
  elem   IN      DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 196-59 GETLOCALNAME Procedure and Function Parameters

Parameter	Description
n	DOMNode
data	Returned local name.
a	DOMAttr.
elem	DOMElement.

196.7.39 GETNAME Functions

This function is overloaded. The specific forms of functionality are described with the syntax declarations.

Syntax

Returns the name of this attribute (See Also: [DOMAttr Subprograms](#) (page 196-7)):

```
DBMS_XMLDOM.GETNAME(
  a      IN      DOMATTR)
RETURN VARCHAR2;
```

Retrieves the name of DTD, or the name immediately following the `DOCTYPE` keyword (See Also: [DOMDocumentType Subprograms](#) (page 196-11)):

```
DBMS_XMLDOM.GETNAME(
    dt      IN      DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Parameters

Table 196-60 GETNAME Function Parameters

Parameter	Description
a	DOMATTR
dt	DOMDOCUMENTTYPE

196.7.40 GETNAMEDITEM Function

GETNAMEDITEM retrieves a node specified by name.

See Also:

[DOMNamedNodeMap Subprograms](#) (page 196-13)

Syntax

Retrieves a node specified by name:

```
DBMS_XMLDOM.GETNAMEDITEM(
    nnm     IN  DOMNAMEDNODEMAP,
    name    IN  VARCHAR2)
RETURN DOMNODE;
```

Retrieves a node specified by name and namespace URI:

```
DBMS_XMLDOM.GETNAMEDITEM(
    nnm     IN  DOMNAMEDNODEMAP,
    name    IN  VARCHAR2,
    ns      IN  VARCHAR2)
RETURN DOMNODE;
```

Parameters

Table 196-61 GETNAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNAMEDNODEMAP
name	Name of the item to be retrieved
ns	Namespace

196.7.41 GETNAMESPACE Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the namespace URI associated with the node (See Also: [DOMNode Subprograms](#) (page 196-6)):

```
DBMS_XMLDOM.GETNAMESPACE(
  n      IN      DOMNODE,
  data   OUT     VARCHAR2);
```

Retrieves the namespace of the DOMATTR (See Also: [DOMAttr Subprograms](#) (page 196-7)):

```
DBMS_XMLDOM.GETNAMESPACE(
  a      IN      DOMATTR)
RETURN VARCHAR2;
```

Retrieves the namespace of the DOMELEMENT (See Also: [DOMELEMENT Subprograms](#) (page 196-11)):

```
DBMS_XMLDOM.GETNAMESPACE(
  elem   IN      DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 196-62 GETNAMESPACE Procedure and Function Parameters

Parameter	Description
n	DOMNODE
data	Returned namespace URI
a	DOMATTR
elem	DOMELEMENT

196.7.42 GETNEXTSIBLING Function

This function retrieves the node immediately following this node. If there is no such node, this returns NULL.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.GETNEXTSIBLING(  
  n      IN      DOMNODE )  
RETURN DOMNode;
```

Parameters

Table 196-63 GETNEXTSIBLING Function Parameters

Parameter	Description
n	DOMNODE

196.7.43 GETNODETYPE Function

This function retrieves a code representing the type of the underlying object.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.GETNODETYPE(  
  n      IN      DOMNODE )  
RETURN NUMBER;
```

Parameters

Table 196-64 GETNODETYPE Function Parameters

Parameter	Description
n	DOMNODE

196.7.44 GETNODENAME Function

This function gets the name of the node depending on its type.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.GETNODENAME(  
  n      IN      DOMNODE )  
RETURN VARCHAR2;
```

Parameters

Table 196-65 GETNODENAME Function Parameters

Parameter	Description
n	DOMNODE

196.7.45 GETNODEVALUE Function

This function gets the value of this node, depending on its type.

**See Also:**

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.GETNODEVALUE(
    n          IN      DOMNODE)
RETURN VARCHAR2;*
```

Parameters

Table 196-66 GETNODEVALUE Function Parameters

Parameter	Description
n	DOMNODE

196.7.46 GETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

**See Also:**

[DOMNode Subprograms](#) (page 196-6)

Syntax

This function returns an instance of the PL/SQL `XMLBinaryInputStream`. The node datatype must be `RAW` or `BLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
    n          IN      DOMNODE)
RETURN SYS.UTL_BINARYINPUTSTREAM;
```

Using this procedure, the application passes an implementation of `SYS.UTL_BINARYOUTPUTSTREAM` into which XDB writes the contents of the node. The datatype of the node must be `RAW` or `CLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
    n          in  DOMNODE,
    value     in  SYS.UTL_BINARYOUTPUTSTREAM);
```

Parameters

Table 196-67 GETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	BINARYOUTPUTSTREAM

196.7.47 GETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

 **See Also:**
[DOMNode Subprograms](#) (page 196-6)

Syntax

This function returns an instance of the PL/SQL `XMLCharacterInputStream`. If the node data is character it is converted to the current session character set. If the node data is not character data, it is first converted to character data.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (
    n          IN    DOMNODE)
RETURN SYS.UTL_CHARACTERINPUTSTREAM;
```

Using this procedure, the node data is converted, as necessary, to the session character set and then "pushed" into the `SYS.UTL_CHARACTEROUTPUTSTREAM`.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (
    n          IN    DOMNODE,
    value     IN    SYS.UTL_CHARACTEROUTPUTSTREAM);
```

Parameters

Table 196-68 GETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE

Table 196-68 (Cont.) GETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

Parameter	Description
value	CHARACTEROUTPUTSTREAM

196.7.48 GETNOTATIONNAME Function

This function returns the notation name of the `DOMENTITY`.

See Also:

[DOMEntity Subprograms](#) (page 196-12)

Syntax

```
DBMS_XMLDOM.GETNOTATIONNAME(
    ent      IN      DOMENTITY)
RETURN VARCHAR2;
```

Parameters

Table 196-69 GETNOTATIONNAME Function Parameters

Parameter	Description
ent	DOMENTITY

196.7.49 GETNOTATIONS Function

This function retrieves a `DOMNAMEDNODEMAP` containing the notations declared in the DTD.

See Also:

[DOMDocumentType Subprograms](#) (page 196-11)

Syntax

```
DBMS_XMLDOM.GETNOTATIONS(
    dt      IN      DOMDOCUMENTTYPE)
RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 196-70 GETNOTATIONS Function Parameters

Parameter	Description
dt	DOMDOCUMENTTYPE

196.7.50 GETTARGET Function

This function returns the target of the `DOMPROCESSINGINSTRUCTION`.

**See Also:**

[DOMProcessingInstruction Subprograms](#) (page 196-14)

Syntax

```
DBMS_XMLDOM.GETTARGET(
    pi      IN      DOMPROCESSINGINSTRUCTION)
RETURN VARCHAR2;
```

Parameters

Table 196-71 GETTARGET Function Parameters

Parameter	Description
pi	DOMPROCESSINGINSTRUCTION

196.7.51 GETOWNERDOCUMENT Function

This function retrieves the Document object associated with this node. This is also the Document object used to create new nodes. When this node is a Document or a Document Type that is not used with any Document yet, this is `NULL`.

**See Also:**

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.GETOWNERDOCUMENT(
    n      IN      DOMNODE)
RETURN DOMDOCUMENT;
```

Parameters

Table 196-72 GETOWNERDOCUMENT Function Parameters

Parameter	Description
n	DOMNODE

196.7.52 GETOWNERELEMENT Function

This function retrieves the Element node to which the specified Attribute is attached.

**See Also:**

[DOMAttr Subprograms](#) (page 196-7)

Syntax

```
DBMS_XMLDOM.GETOWNERELEMENT(  
    a          IN      DOMATTR)  
RETURN DOMELEMENT;
```

Parameters

Table 196-73 GETOWNERELEMENT Function Parameters

Parameter	Description
a	Attribute

196.7.53 GETPARENTNODE Function

This function retrieves the parent of this node. All nodes, except `Attr`, `Document`, `DocumentFragment`, `Entity`, and `Notation` may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, this is `NULL`.

**See Also:**

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.GETPARENTNODE(  
    n          IN      DOMNODE)  
RETURN DOMNODE;
```

Parameters

Table 196-74 GETPARENTNODE Function Parameters

Parameter	Description
n	DOMNODE

196.7.54 GETPREFIX Function

This function retrieves the namespace prefix of the node.

**See Also:**

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.GETPREFIX(
  n          IN      DOMNODE)
RETURN VARCHAR2;
```

Parameters

Table 196-75 GETPREFIX Function Parameters

Parameter	Description
n	DOMNODE

196.7.55 GETPREVIOUSIBLING Function

This function retrieves the node immediately preceding this node. If there is no such node, this returns `NULL`.

**See Also:**

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.GETPREVIOUSIBLING(
  n          IN      DOMNODE)
RETURN DOMNODE;
```

Parameters

Table 196-76 GETPREVIOUSIBLING Function Parameters

Parameter	Description
n	DOMNODE

196.7.56 GETPUBLICID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the public identifier of the specified DTD (See Also: [DOMDocumentType Subprograms](#) (page 196-11)):

```
DBMS_XMLDOM.GETPUBLICID(
    dt          IN      DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Returns the public identifier of the `DOMENTITY` (See Also: [DOMEntity Subprograms](#) (page 196-12)):

```
DBMS_XMLDOM.GETPUBLICID(
    ent        IN      DOMENTITY)
RETURN VARCHAR2;
```

Returns the public identifier of the `DOMNOTATION` (See Also: [DOMNotation Subprograms](#) (page 196-14)):

```
DBMS_XMLDOM.GETPUBLICID(
    n          IN      DOMNOTATION)
RETURN VARCHAR2;
```

Parameters

Table 196-77 GETPUBLICID Function Parameters

Parameter	Description
dt	The DTD
ent	DOMENTITY
n	DOMNOTATION

196.7.57 GETQUALIFIEDNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the qualified name of the `DOMATTR` (See Also: [DOMAttr Subprograms](#) (page 196-7)):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(
    a          IN   DOMATTR)
RETURN VARCHAR2;
```

Returns the qualified name of the `DOMElement` (See Also: [DOMElement Subprograms](#) (page 196-11)):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(
    elem      IN   DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 196-78 GETQUALIFIEDNAME Functions Parameters

Parameter	Description
a	DOMATTR
elem	DOMELEMENT

196.7.58 GETSCHEMANODE Function

This function retrieves the schema URI associated with the node.

 **See Also:**
[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.GETSCHEMANODE(
    n          IN   DOMNODE)
RETURN DOMNODE;
```

Parameters

Table 196-79 GETSCHEMANODE Function Parameters

Parameter	Description
n	DOMNODE

196.7.59 GETSPECIFIED Function

If this attribute was explicitly specified, a value in the original document, this is true; otherwise, it is false.

 **See Also:**
[DOMAttr Subprograms](#) (page 196-7)

Syntax

```
DBMS_XMLDOM.GETSPECIFIED(
  a          IN      DOMATTR)
RETURN BOOLEAN;
```

Parameters**Table 196-80** GETSPECIFIED Function Parameters

Parameter	Description
a	DOMATTR

196.7.60 GETSTANDALONE Function

This function returns the standalone property associated with the `DOMDOCUMENT`.

**See Also:**

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.GETSTANDALONE(
  doc       IN      DOMDOCUMENT)
RETURN VARCHAR2;
```

Parameters**Table 196-81** GETSTANDALONE Function Parameters

Parameter	Description
doc	DOMDOCUMENT.

196.7.61 GETSYSTEMID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the system id of the specified DTD (See Also: [DOMDocumentType Subprograms](#) (page 196-11)):

```
DBMS_XMLDOM.GETSYSTEMID(
  dt       IN      DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Returns the system identifier of the `DOMENTITY` (See Also: [DOMEntity Subprograms](#) (page 196-12)):

```
DBMS_XMLDOM.GETSYSTEMID(
    ent      IN      DUMENTITY)
RETURN VARCHAR2;
```

Returns the system identifier of the DOMNOTATION (See Also: [DOMNotation Subprograms \(page 196-14\)](#)):

```
DBMS_XMLDOM.GETSYSTEMID(
    n        IN      DOMNOTATION)
RETURN VARCHAR2;
```

Parameters

Table 196-82 GETSYSTEMID Function Parameters

Parameter	Description
dt	The DTD.
ent	DOMEntity.
n	DOMNotation.

196.7.62 GETTAGNAME Function

This function returns the name of the DOMELEMENT.

See Also:

[DOMELEMENT Subprograms \(page 196-11\)](#)

Syntax

```
DBMS_XMLDOM.GETTAGNAME(
    elem     IN      DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 196-83 GETTAGNAME Function Parameters

Parameter	Description
elem	The DOMELEMENT

196.7.63 GETVALUE Function

This function retrieves the value of the attribute.

See Also:

[DOMAttr Subprograms](#) (page 196-7)

Syntax

```
DBMS_XMLDOM.GETVALUE(  
    a          IN      DOMATTR)  
RETURN VARCHAR2;
```

Parameters

Table 196-84 GETVALUE Function Parameters

Parameter	Description
a	DOMATTR

196.7.64 GETVERSION Function

This function returns the version of the DOMDOCUMENT.

See Also:

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.GETVERSION(  
    doc        IN      DOMDOCUMENT)  
RETURN VARCHAR2;
```

Parameters

Table 196-85 GETVERSION Function Parameters

Parameter	Description
doc	DOMDOCUMENT

196.7.65 GETXMLTYPE Function

This function returns the `XMLType` associated with the `DOMDOCUMENT`.

See Also:

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.GETXMLTYPE(  
    doc          IN      DOMDOCUMENT)  
RETURN SYS.XMLTYPE;
```

Parameters

Table 196-86 GETXMLTYPE Function Parameters

Parameter	Description
doc	DOMDOCUMENT

196.7.66 HASATTRIBUTE Functions

Verifies whether an attribute has been defined for `DOMELEMENT`, or has a default value.

See Also:

[DOMElement Subprograms](#) (page 196-11)

Syntax

Verifies whether an attribute with the specified name has been defined for `DOMElement`:

```
DBMS_XMLDOM.HASATTRIBUTE(  
    elem      IN  DOMELEMENT,  
    name     IN  VARCHAR2)  
RETURN VARCHAR2;
```

Verifies whether an attribute with specified name and namespace URI has been defined for `DOMELEMENT`; namespace enabled:

```
DBMS_XMLDOM.HASATTRIBUTE(  
    elem      IN  DOMELEMENT,  
    name     IN  VARCHAR2,  
    ns       IN  VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 196-87 HASATTRIBUTE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name; * matches any attribute
ns	Namespace

196.7.67 HASATTRIBUTES Function

This function returns whether this node has any attributes.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.HASATTRIBUTES(
    n          IN      DOMNODE)
RETURN BOOLEAN;
```

Parameters

Table 196-88 HASATTRIBUTES Function Parameters

Parameter	Description
n	DOMNODE

196.7.68 HASCHILDNODES Function

This function determines whether this node has any children.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.HASCHILDNODES(
    n          IN      DOMNODE)
RETURN BOOLEAN;
```

Parameters

Table 196-89 HASCHILDNODES Function Parameters

Parameter	Description
n	DOMNODE

196.7.69 HASFEATURE Function

This function tests if the `DOMIMPLEMENTATION` implements a specific feature.

**See Also:**

[DOMImplementation Subprograms](#) (page 196-13)

Syntax

```
DBMS_XMLDOM.HASFEATURE(
  di          IN      DOMIMPLEMENTATION,
  feature     IN      VARCHAR2,
  version     IN      VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 196-90 HASFEATURE Function Parameters

Parameter	Description
di	DOMIMPLEMENTATION
feature	The feature to check for
version	The version of the DOM to check in

196.7.70 IMPORTNODE Function

This function imports a node from an external document and returns this new node.

**See Also:**

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.IMPORTNODE(
  doc          IN      DOMDOCUMENT,
  importedNode IN      DOMNODE,
```

```

    deep          IN BOOLEAN)
RETURN DOMNODE;
```

Parameters

Table 196-91 IMPORTNODE Function Parameters

Parameter	Description
doc	Document from which the node is imported
importedNode	Node to import
deep	Setting for recursive import. <ul style="list-style-type: none"> If this value is <code>TRUE</code>, the entire subtree of the node will be imported with the node. If this value is <code>FALSE</code>, only the node itself will be imported.

Usage Notes

Note that the [ADOPTNODE Function](#) (page 196-25) removes the node from the source document while the [IMPORTNODE Function](#) (page 196-64) clones the node in the source document.

196.7.71 INSERTBEFORE Function

This function inserts the node `newchild` before the existing child node `refchild`. If `refchild` is `NULL`, insert `newchild` at the end of the list of children.

If `newchild` is a `DOCUMENTFRAGMENT` object, all of its children are inserted, in the same order, before `refchild`. If the `newchild` is already in the tree, it is first removed.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```

DBMS_XMLDOM.INSERTBEFORE(
    n          IN    DOMNODE,
    newchild  IN    DOMNODE,
    refchild  IN    DOMNODE)
RETURN DOMNode;
```

Parameters

Table 196-92 INSERTBEFORE Function Parameters

Parameter	Description
n	DOMNode
newChild	The child to be inserted in the DOMNODE
refChild	The reference node before which the <code>newchild</code> is to be inserted

196.7.72 INSERTDATA Procedure

This procedure inserts a string at the specified character offset.

See Also:

[DOMCharacterData Subprograms](#) (page 196-8)

Syntax

```
DBMS_XMLDOM.INSERTDATA(
  cd      IN      DOMCHARACTERDATA,
  offset  IN      NUMBER,
  arg     IN      VARCHAR2);
```

Parameters

Table 196-93 INSERTDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to insert the data
arg	The value to be inserted

196.7.73 ISNULL Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Checks if the specified `DOMNODE` is `NULL`. Returns `TRUE` if it is `NULL`, `FALSE` otherwise (See Also: [DOMNode Subprograms](#) (page 196-6)):

```
DBMS_XMLDOM.ISNULL(
  n      IN      DOMNODE)
RETURN BOOLEAN;
```

Checks that the specified `DOMATTR` is `NULL`; returns `TRUE` if it is `NULL`, `FALSE` otherwise (See Also: [DOMAttr Subprograms](#) (page 196-7)):

```
DBMS_XMLDOM.ISNULL(
  a      IN      DOMATTR)
RETURN BOOLEAN;
```

Checks that the specified `DOMCDATASECTION` is `NULL`; returns `TRUE` if it is `NULL`, `FALSE` otherwise (See Also: [DOMCDATASection Subprograms](#) (page 196-8)):

```
DBMS_XMLDOM.ISNULL(
  cds    IN      DOMCDATASECTION)
RETURN BOOLEAN;
```

Checks that the specified `DOMCHARACTERDATA` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMCharacterData Subprograms](#) (page 196-8)):

```
DBMS_XMLDOM.ISNULL(  
    cd      IN      DOMCHARACTERDATA)  
RETURN BOOLEAN;
```

Checks that the specified `DOMCOMMENT` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMComment Subprograms](#) (page 196-9)):

```
DBMS_XMLDOM.ISNULL(  
    com     IN      DOMCOMMENT)  
RETURN BOOLEAN;
```

Checks that the specified `DOMDOCUMENT` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocument Subprograms](#) (page 196-9)):

```
DBMS_XMLDOM.ISNULL(  
    doc     IN      DOMDOCUMENT)  
RETURN BOOLEAN;
```

Checks that the specified `DOMDOCUMENTFRAGMENT` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocumentFragment Subprograms](#) (page 196-10)):

```
DBMS_XMLDOM.ISNULL(  
    df      IN      DOMDOCUMENTFRAGMENT)  
RETURN BOOLEAN;
```

Checks that the specified `DOMDOCUMENTTYPE` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocumentType Subprograms](#) (page 196-11)):

```
DBMS_XMLDOM.ISNULL(  
    dt      IN      DOMDOCUMENTTYPE)  
RETURN BOOLEAN;
```

Checks that the specified `DOMELEMENT` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMElement Subprograms](#) (page 196-11)):

```
DBMS_XMLDOM.ISNULL(  
    elem   IN      DOMELEMENT)  
RETURN BOOLEAN;
```

Checks that the specified `DOMENTITY` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMEntity Subprograms](#) (page 196-12)):

```
DBMS_XMLDOM.ISNULL(  
    ent    IN      DOMENTITY)  
RETURN BOOLEAN;
```

Checks that the specified `DOMENTITYREFERENCE` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMEntityReference Subprograms](#) (page 196-13)):

```
DBMS_XMLDOM.ISNULL(  
    EREF   IN      DOMENTITYREFERENCE)  
RETURN BOOLEAN;
```

Checks that the specified `DOMIMPLEMENTATION` is NULL; returns TRUE if it is NULL (See Also: [DOMImplementation Subprograms](#) (page 196-13)):

```
DBMS_XMLDOM.ISNULL(
    di      IN      DOMIMPLEMENTATION)
RETURN BOOLEAN;
```

Checks that the specified `DOMNAMEDNODEMAP` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNamedNodeMap Subprograms](#) (page 196-13)):

```
DBMS_XMLDOM.ISNULL(
    nnm     IN      DOMNAMEDNODEMAP)
RETURN BOOLEAN;
```

Checks that the specified `DOMNODELIST` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNodeList Subprograms](#) (page 196-14)):

```
DBMS_XMLDOM.ISNULL(
    nl      IN      DOMNODELIST)
RETURN BOOLEAN;
```

Checks that the specified `DOMNOTATION` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNotation Subprograms](#) (page 196-14)):

```
DBMS_XMLDOM.ISNULL(
    n       IN      DOMNOTATION)
RETURN BOOLEAN;
```

Checks that the specified `DOMPROCESSINGINSTRUCTION` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMProcessingInstruction Subprograms](#) (page 196-14)):

```
DBMS_XMLDOM.ISNULL(
    pi      IN      DOMPROCESSINGINSTRUCTION)
RETURN BOOLEAN;
```

Checks that the specified `DOMTEXT` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMText Subprograms](#) (page 196-15)):

```
DBMS_XMLDOM.ISNULL(
    t       IN      DOMTEXT)
RETURN BOOLEAN;
```

Parameters

Table 196-94 ISNULL Function Parameters

Parameter	Description
n	DOMNODE to check
a	DOMATTR to check
cds	DOMCDATASECTION to check
cd	DOMCHARACTERDATA to check
com	DOMCOMMENT to check
doc	DOMDOCUMENT to check
dF	DOMDOCUMENTFRAGMENT to check
dt	DOMDOCUMENTTYPE to check
elem	DOMELEMENT to check
ent	DOMENTITY to check

Table 196-94 (Cont.) ISNULL Function Parameters

Parameter	Description
eref	DOMENTITYREFERENCE to check
di	DOMIMPLEMENTATION to check
nnm	DOMNAMENODEMAP to check
nl	DOMNODELIST to check
n	DOMNOTATION to check
pi	DOMPROCESSINGINSTRUCTION to check
t	DOMTEXT to check

196.7.74 ITEM Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the item in the map which corresponds to the `INDEX` parameter. If `INDEX` is greater than or equal to the number of nodes in this map, this returns `NULL` (See Also: [DOMNamedNodeMap Subprograms](#) (page 196-13)):

```
DBMS_XMLDOM.ITEM(
    nnm      IN      DOMNAMEDNODEMAP,
    index    IN      NUMBER)
RETURN DOMNODE;
```

Returns the item in the collection which corresponds to the `INDEX` parameter. If `index` is greater than or equal to the number of nodes in the list, this returns `NULL` (See Also: [DOMNodeList Subprograms](#) (page 196-14)):

```
DBMS_XMLDOM.ITEM(
    nl      IN      DOMNODELIST,
    index   IN      NUMBER)
RETURN DOMNODE;
```

Parameters

Table 196-95 ITEM Function Parameters

Parameter	Description
nnm	DOMNAMEDNODEMAP
index	The index in the node map at which the item is to be retrieved
nl	DOMNODELIST
index	The index in the <code>NodeList</code> used to retrieve the item

196.7.75 MAKEATTR Function

This function casts a specified `DOMNODE` to a `DOMATTR`, and returns the `DOMATTR`.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.MAKEATTR(  
    n          IN      DOMNODE)  
RETURN DOMATTR;
```

Parameters

Table 196-96 MAKEATTR Function Parameters

Parameter	Description
n	DOMNODE to cast

196.7.76 MAKECDATASECTION Function

This function casts a specified `DOMNODE` to a `DOMCDATASECTION`.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.MAKECDATASECTION(  
    n          IN      DOMNODE)  
RETURN DOMCDATASECTION;
```

Parameters

Table 196-97 MAKECDATASECTION Function Parameters

Parameter	Description
n	DOMNODE to cast

196.7.77 MAKECHARACTERDATA Function

This function casts a specified `DOMNODE` to a `DOMCHARACTERDATA`, and returns the `DOMCHARACTERDATA`.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.MAKECHARACTERDATA(  
    n          IN      DOMNode)  
RETURN DOMCharacterData;
```

Parameters

Table 196-98 MAKECHARACTERDATA Function Parameters

Parameter	Description
n	DOMNODE to cast

196.7.78 MAKECOMMENT Function

This function casts a specified `DOMNODE` to a `DOMCOMMENT`, and returns the `DOMCOMMENT`.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.MAKECOMMENT(  
    n          IN      DOMNODE)  
RETURN DOMCOMMENT;
```

Parameters

Table 196-99 MAKECOMMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

196.7.79 MAKEDOCUMENT Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENT`, and returns the `DOMDOCUMENT`.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENT(  
  n          IN      DOMNODE)  
RETURN DOMDocument;
```

Parameters

Table 196-100 MAKEDOCUMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

196.7.80 MAKEDOCUMENTFRAGMENT Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENTFRAGMENT`, and returns the `DOMDOCUMENTFRAGMENT`.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTFRAGMENT(  
  n          IN      DOMNODE)  
RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 196-101 MAKEDOCUMENTFRAGMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

196.7.81 MAKEDOCUMENTTYPE Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENTTYPE` and returns the `DOMDOCUMENTTYPE`.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTTYPE(  
    n          IN      DOMNODE)  
RETURN DOMDOCUMENTTYPE;
```

Parameters

Table 196-102 MAKEDOCUMENTTYPE Function Parameters

Parameter	Description
n	DOMNODE to cast.

196.7.82 MAKEELEMENT Function

This function casts a specified `DOMNODE` to a `DOMELEMENT`, and returns the `DOMELEMENT`.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.MAKEELEMENT(  
    n          IN      DOMNODE)  
RETURN DOMELEMENT;
```

Parameters

Table 196-103 MAKEELEMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

196.7.83 MAKEENTITY Function

This function casts a specified `DOMNODE` to a `DOMENTITY`, and returns the `DOMENTITY`.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.MAKEENTITY (
  n          IN      DOMNODE)
RETURN DOMENTITY;
```

Parameters

Table 196-104 MAKEENTITY Function Parameters

Parameter	Description
n	DOMNODE to cast

196.7.84 MAKEENTITYREFERENCE Function

This function casts a specified `DOMNODE` to a `DOMENTITYREFERENCE`, and returns the `DOMENTITYREFERENCE`.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.MAKEENTITYREFERENCE (
  n          IN      DOMNODE)
RETURN DOMENTITYREFERENCE;
```

Parameters

Table 196-105 MAKEENTITYREFERENCE Function Parameters

Parameter	Description
n	DOMNODE to cast

196.7.85 MAKENODE Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Casts specified `DOMATTR` to a `DOMNODE`, and returns the `DOMNODE` (See Also: [DOMAttr Subprograms \(page 196-7\)](#)):

```
DBMS_XMLDOM.MAKENODE(  
    a          IN    DOMATTR)  
RETURN DOMNODE;
```

Casts the `DOMCDATASECTION` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMCDATASection Subprograms \(page 196-8\)](#)):

```
DBMS_XMLDOM.MAKENODE(  
    cds        IN    DOMCDATASECTION)  
RETURN DOMNODE;
```

Casts the specified `DOMCHARACTERDATA` as a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMCharacterData Subprograms \(page 196-8\)](#)):

```
DBMS_XMLDOM.MAKENODE(  
    cd         IN    DOMCHARACTERDATA)  
RETURN DOMNODE;
```

Casts the specified `DOMCOMMENT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMComment Subprograms \(page 196-9\)](#)):

```
DBMS_XMLDOM.MAKENODE(  
    com        IN    DOMCOMMENT)  
RETURN DOMNODE;
```

Casts the `DOMDOCUMENT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMDocument Subprograms \(page 196-9\)](#)):

```
DBMS_XMLDOM.MAKENODE(  
    doc        IN    DOMDOCUMENT)  
RETURN DOMNODE;
```

Casts the specified `DOMDOCUMENTFRAGMENT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMDocumentFragment Subprograms \(page 196-10\)](#)):

```
DBMS_XMLDOM.MAKENODE(  
    df         IN    DOMDOCUMENTFRAGMENT)  
RETURN DOMNode;
```

Casts the specified `DOMDOCUMENTTYPE` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMDocumentType Subprograms \(page 196-11\)](#)):

```
DBMS_XMLDOM.MAKENODE(  
    dt         IN    DOMDOCUMENTTYPE)  
RETURN DOMNODE;
```

Casts the specified `DOMELEMENT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMElement Subprograms \(page 196-11\)](#)):

```
DBMS_XMLDOM.MAKENODE(
    elem      IN      DOMELEMENT)
RETURN DOMNODE;
```

Casts specified `DOMENTITY` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMEntity Subprograms](#) (page 196-12)):

```
DBMS_XMLDOM.MAKENODE(
    ent      IN      DOMENTITY)
RETURN DOMNODE;
```

Casts the `DOMENTITYREFERENCE` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMEntityReference Subprograms](#) (page 196-13)):

```
DBMS_XMLDOM.MAKENODE(
   eref     IN      DOMENTITYREFERENCE)
RETURN DOMNODE;
```

Casts the `DOMNOTATION` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMNotation Subprograms](#) (page 196-14)):

```
DBMS_XMLDOM.MAKENODE(
    n      IN      DOMNOTATION)
RETURN DOMNODE;
```

Casts the `DOMPROCESSINGINSTRUCTION` to a `DOMNODE`, and returns the `DOMNODE` (See Also: [DOMProcessingInstruction Subprograms](#) (page 196-14)):

```
DBMS_XMLDOM.MAKENODE(
    pi     IN      DOMPROCESSINGINSTRUCTION)
RETURN DOMNODE;
```

Casts the `DOMTEXT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMText Subprograms](#) (page 196-15)):

```
DBMS_XMLDOM.MAKENODE(
    t      IN      DOMTEXT)
RETURN DOMNODE;
```

Parameters

Table 196-106 MAKENODE Function Parameters

Parameter	Description
a	DOMATTR to cast
cds	DOMCDATASECTION to cast
cd	DOMCHARACTERDATA to cast
com	DOMCOMMENT to cast
doc	DOMDOCUMENT to cast
df	DOMDOCUMENTFRAGMENT to cast
dt	DOMDOCUMENTTYPE to cast
elem	DOMELEMENT to cast
ent	DOMENTITY to cast
eref	DOMENTITYREFERENCE to cast

Table 196-106 (Cont.) MAKENODE Function Parameters

Parameter	Description
n	DOMNOTATION to cast
pi	DOMPROCESSINGINSTRUCTION to cast
t	DOMTEXT to cast

196.7.86 MAKENOTATION Function

This function casts a specified DOMNODE to a DOMNOTATION, and returns the DOMNOTATION.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.MAKENOTATION(
    n      IN      DOMNODE)
RETURN DOMNOTATION;
```

Parameters

Table 196-107 MAKENOTATION Function Parameters

Parameter	Description
n	DOMNODE to cast

196.7.87 MAKEPROCESSINGINSTRUCTION Function

This function casts a specified DOMNODE to a DOMPROCESSINGINSTRUCTION, and returns the Domprocessinginstruction.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.MAKEPROCESSINGINSTRUCTION(
    n      IN      DOMNODE)
RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 196-108 MAKEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
n	DOMNODE to cast

196.7.88 MAKETEXT Function

This function casts a specified `DOMNODE` to a `DOMTEXT`, and returns the `DOMTEXT`.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.MAKETEXT(  
    n          IN      DOMNODE )  
    RETURN DOMTEXT;
```

Parameters

Table 196-109 MAKETEXT Function Parameters

Parameter	Description
n	DOMNODE to cast

196.7.89 NEWDOMDOCUMENT Functions

This function returns a new `DOMDOCUMENT` instance.

See Also:

[DOMDocument Subprograms](#) (page 196-9)

Syntax

Returns a new `DOMDOCUMENT` instance:

```
DBMS_XMLDOM.NEWDOMDOCUMENT  
    RETURN DOMDOCUMENT;
```

Returns a new `DOMDOCUMENT` instance created from the specified `XMLType` object:

```
DBMS_XMLDOM.NEWDOMDOCUMENT(
  xmlDoc   IN SYS.XMLTYPE)
RETURN DOMDOCUMENT;
```

Returns a new `DOMDOCUMENT` instance created from the specified `CLOB`:

```
DBMS_XMLDOM.NEWDOMDOCUMENT(
  clob     IN   CLOB)
RETURN DOMDOCUMENT;
```

Parameters

Table 196-110 NEWDOMDOCUMENT Function Parameters

Parameter	Description
<code>xmlDoc</code>	XMLType source for the <code>DOMDOCUMENT</code>
<code>clob</code>	CLOB source for the <code>DOMDOCUMENT</code>

196.7.90 NORMALIZE Procedure

This procedure normalizes the text children of the `DOMELEMENT`.

See Also:

[DOMElement Subprograms](#) (page 196-11)

Syntax

```
DBMS_XMLDOM.NORMALIZE(
  elem     IN   DOMELEMENT);
```

Parameters

Table 196-111 NORMALIZE Procedure Parameters

Parameter	Description
<code>elem</code>	The <code>DOMELEMENT</code>

196.7.91 REMOVEATTRIBUTE Procedures

This procedure removes an attribute from the `DOMELEMENT` by name.

See Also:

[DOMElement Subprograms](#) (page 196-11)

Syntax

Removes the value of a `DOMELEMENT`'s attribute by name:

```
DBMS_XMLDOM.REMOVEATTRIBUTE(  
  elem      IN      DOMELEMENT,  
  name      IN      VARCHAR2);
```

Removes the value of a `DOMELEMENT`'s attribute by name and namespace URI.

```
DBMS_XMLDOM.REMOVEATTRIBUTE(  
  elem      IN      DOMELEMENT,  
  name      IN      VARCHAR2,  
  ns        IN      VARCHAR2);
```

Parameters

Table 196-112 REMOVEATTRIBUTE Procedure Parameters

Parameter	Description
<code>elem</code>	The <code>DOMELEMENT</code>
<code>name</code>	Attribute name
<code>ns</code>	Namespace

196.7.92 REMOVEATTRIBUTENODE Function

This function removes the specified attribute node from the `DOMELEMENT`. The method returns the removed node.

See Also:

[DOMElement Subprograms](#) (page 196-11)

Syntax

```
DBMS_XMLDOM.REMOVEATTRIBUTENODE(  
  elem      IN      DOMELEMENT,  
  oldAttr   IN      DOMATTR)  
RETURN DOMAttr;
```

Parameters

Table 196-113 REMOVEATTRIBUTENODE Function Parameters

Parameter	Description
<code>elem</code>	The <code>DOMELEMENT</code> .
<code>oldAttr</code>	The old <code>DOMATTR</code> .

196.7.93 REMOVECHILD Function

This function removes the child node indicated by `oldchild` from the list of children, and returns it.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.REMOVECHILD(
  n          IN      DOMNode,
  oldchild  IN      DOMNode)
RETURN DOMNODE;
```

Parameters

Table 196-114 REMOVECHILD Function Parameters

Parameter	Description
<code>n</code>	DOMNode
<code>oldChild</code>	The child of the node <code>n</code> to be removed

196.7.94 REMOVENAMEDITEM Function

This function removes a node, specified by name, from the map and returns this node.

When this map contains the attributes attached to an element, if the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

See Also:

[DOMNamedNodeMap Subprograms](#) (page 196-13)

Syntax

Removes a node specified by name:

```
DBMS_XMLDOM.REMOVENAMEDITEM(
  nnm      IN      DOMNamedNodeMap,
  name     IN      VARCHAR2)
RETURN DOMNode;
```

Removes a node specified by name and namespace URI:

```
DBMS_XMLDOM.REMOVENAMEDITEM(
  nnm      IN      DOMNamedNodeMap,
  name     IN      VARCHAR2,
  ns       IN      VARCHAR2)
RETURN DOMNode;
```

Parameters

Table 196-115 REMOVENAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNamedNodeMap
name	The name of the item to be removed from the map
ns	Namespace

196.7.95 REPLACECHILD Function

This function replaces the child node `oldchild` with `newchild` in the list of children, and returns the `oldchild` node.

If `newchild` is a `DocumentFragment` object, `oldchild` is replaced by all of the `DocumentFragment` children, which are inserted in the same order. If the `newchild` is already in the tree, it is first removed.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.REPLACECHILD(
  n          IN      DOMNode,
  newchild   IN      DOMNode,
  oldchild   IN      DOMNode)
RETURN DOMNode;
```

Parameters

Table 196-116 REPLACECHILD Function Parameters

Parameter	Description
n	DOMNode
newchild	The new child which is to replace the old child
oldchild	The child of the node n which is to be replaced

196.7.96 REPLACEDATA Procedure

This procedure changes a range of characters in the node. Upon success, data and length reflect the change.

See Also:

[DOMCharacterData Subprograms](#) (page 196-8)

Syntax

```
DBMS_XMLDOM.REPLACEDATA(  
    cd          IN    DOMCHARACTERDATA,  
    offset      IN    NUMBER,  
    cnt         IN    NUMBER,  
    arg         IN    VARCHAR2);
```

Parameters

Table 196-117 REPLACEDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to replace
cnt	The number of characters to replace
arg	The value to replace with

196.7.97 RESOLVENAMESPACEPREFIX Function

This function resolves the specified namespace prefix, and returns the resolved namespace.

See Also:

[DOMElement Subprograms](#) (page 196-11)

Syntax

```
DBMS_XMLDOM.RESOLVENAMESPACEPREFIX(  
    elem        IN    DOMELEMENT,  
    prefix      IN    VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 196-118 RESOLVENAMESPACEPREFIX Function Parameters

Parameter	Description
elem	The DOMELEMENT
prefix	Namespace prefix

196.7.98 SETATTRIBUTE Procedures

This procedure sets the value of a DOMELEMENT's attribute by name.

**See Also:**

[DOMELEMENT Subprograms](#) (page 196-11)

Syntax

Sets the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.SETATTRIBUTE(
  elem      IN  DOMELEMENT,
  name      IN  VARCHAR2,
  newvalue  IN  VARCHAR2);
```

Sets the value of a DOMELEMENT's attribute by name and namespace URI:

```
DBMS_XMLDOM.SETATTRIBUTE(
  elem      IN  DOMELEMENT,
  name      IN  VARCHAR2,
  newvalue  IN  VARCHAR2,
  ns        IN  VARCHAR2);
```

Parameters

Table 196-119 SETATTRIBUTE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
newvalue	Attribute value
ns	Namespace

196.7.99 SETATTRIBUTENODE Functions

This function adds a new attribute node to the `DOMELEMENT`.

See Also:

[DOMElement Subprograms](#) (page 196-11)

Syntax

Adds a new attribute node to the `DOMELEMENT`:

```
DBMS_XMLDOM.SETATTRIBUTENODE(
  elem      IN  DOMELEMENT,
  newAttr   IN  DOMATTR)
RETURN DOMATTR;
```

Adds a new attribute node to the `DOMElement`; namespace enabled:

```
DBMS_XMLDOM.SETATTRIBUTENODE(
  elem      IN  DOMELEMENT,
  newAttr   IN  DOMATTR,
  ns        IN  VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 196-120 SETATTRIBUTENODE Function Parameters

Parameter	Description
<code>elem</code>	The <code>DOMELEMENT</code>
<code>newAttr</code>	The new <code>DOMATTR</code>
<code>ns</code>	The namespace

196.7.100 SETCHARSET Procedure

This function sets the charset of the DOM document.

See Also:

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.SETCHARSET(
  doc      IN  DOMDocument,
  charset  IN  VARCHAR2);
```

Parameters

Table 196-121 SETCHARSET Procedure Parameters

Parameter	Description
doc	DOM document
charset	Character set

Usage Notes

This is used for [WRITETOFILE Procedures](#) (page 196-95) if not explicitly specified at that time.

196.7.101 SETDATA Procedures

This overloaded procedure sets character data or `DOMPROCESSINGINSTRUCTION` content data. The specific functionality is described in the syntax declarations.

Syntax

Sets the character data of the node that implements this interface (See Also: [DOMCharacterData Subprograms](#) (page 196-8)):

```
DBMS_XMLDOM.SETDATA(
  cd      IN      DOMCHARACTERDATA,
  data    IN      VARCHAR2);
```

Sets the content data of the `DOMPROCESSINGINSTRUCTION` (See Also: [DOMProcessingInstruction Subprograms](#) (page 196-14)):

```
DBMS_XMLDOM.SETDATA(
  pi      IN      DOMPROCESSINGINSTRUCTION,
  data    IN      VARCHAR2);
```

Parameters

Table 196-122 SETDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
data	The data to which the node is set
pi	DOMPROCESSINGINSTRUCTION
data	New processing instruction content data

196.7.102 SETDOCTYPE Procedure

Given a DOM document, this procedure creates a new DTD with the specified name, system id and public id and sets it in the document.

This DTD can later be retrieved using the [GETDOCTYPE Function](#) (page 196-41).

Syntax

```
DBMS_XMLDOM.SETDOCTYPE(
  doc      IN  DOMDocument,
  name     IN  VARCHAR2,
  sysid    IN  VARCHAR2,
  pubid    IN  VARCHAR2);
```

Parameters

Table 196-123 SETDOCTYPE Procedure Parameters

Parameter	Description
doc	The document whose DTD has to be set
name	The name that the doctype needs to be initialized with
sysid	The system ID that the doctype needs to be initialized with
pubid	The public ID that the doctype needs to be initialized with

196.7.103 SETNAMEDITEM Function

This function adds a node using its `nodeName` attribute.

If a node with that name is already present in this map, it is replaced by the new one. The old node is returned on replacement; if no replacement is made, `NULL` is returned.

As the `nodeName` attribute is used to derive the name under which the node must be stored, multiple nodes of certain types, those that have a "special" string value, cannot be stored because the names would clash. This is seen as preferable to allowing nodes to be aliased.

See Also:

[DOMNamedNodeMap Subprograms](#) (page 196-13)

Syntax

Adds a node using its `nodeName` attribute:

```
DBMS_XMLDOM.SETNAMEDITEM(
  nnm      IN  DOMNAMEDNODEMAP,
  arg      IN  DOMNODE)
RETURN DOMNode;
```

Adds a node using its `nodeName` attribute and namespace URI:

```
DBMS_XMLDOM.SETNAMEDITEM(
  nnm      IN  DOMNAMEDNODEMAP,
  arg      IN  DOMNODE,
  ns       IN  VARCHAR2)
RETURN DOMNode;
```

Parameters

Table 196-124 SETNAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNAMEDNODEMAP
arg	The Node to be added using its nodeName attribute
ns	Namespace

196.7.104 SETNODEVALUE Procedure

This procedure sets the value of this node, depending on its type. When it is defined to be `NULL`, setting it has no effect.

**See Also:**

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.SETNODEVALUE (
  n          IN      DOMNODE,
  nodeValue IN      VARCHAR2);
```

Parameters

Table 196-125 SETNODEVALUE Procedure Parameters

Parameter	Description
n	DOMNode
nodeValue	The value to which node is set

196.7.105 SETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described in the syntax section.

**See Also:**

[DOMNode Subprograms](#) (page 196-6)

Syntax

This function returns an instance of the PL/SQL `XMLBINARYOUTPUTSTREAM` into which the caller can write the node value. The datatype of the node must be `RAW` or `BLOB` – if not, an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
  n      IN      DOMNODE)
RETURN SYS.UTL_BINARYOUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `sys.utl_BinaryInputStream` from which XDB reads data to populate the node. The datatype of the node must be `RAW` or `BLOB` – if not an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
  n      in      DOMNODE,
  value  in      SYS.UTL_BINARYINPUTSTREAM);
```

Parameters

Table 196-126 SETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	BINARYINPUTSTREAM

196.7.106 SETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described in the syntax section.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

This function returns an instance of the PL/SQL `XMLCHARACTEROUTPUTSTREAM` type into which the caller can write the node value. The datatype of the node can be any valid XDB datatype. If the type is not character or `CLOB`, the character data written to the stream is converted to the node datatype. If the datatype of the node is character or `CLOB`, then the character data written to the stream is converted from PL/SQL session character set to the character set of the node.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (
  n      IN      DOMNODE)
RETURN SYS.UTL_CHARACTEROUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `SYS.UTL_CHARACTERINPUTSTREAM` from which XDB reads to populate the node. The

datatype of the node may be any valid type supported by XDB. If a non-character datatype, the character data read from the stream is converted to the datatype of the node. If the datatype of the node is either character or CLOB, then no conversion occurs and the character set of the node becomes the character set of the PL/SQL session.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (
  n          IN  DOMNODE,
  value     IN  SYS.UTL_CHARACTERINPUTSTREAM);
```

Parameters

Table 196-127 SETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	CHARACTERINPUTSTREAM

196.7.107 SETPREFIX Procedure

This procedure sets the namespace prefix for this node to the specified value.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.SETPREFIX(
  n          IN  DOMNODE,
  prefix IN  VARCHAR2);
```

Parameters

Table 196-128 SETPREFIX Procedure Parameters

Parameter	Description
n	DOMNODE
prefix	The value for the namespace prefix of the node

196.7.108 SETSTANDALONE Procedure

This procedure sets the standalone property of the DOMDOCUMENT.

See Also:

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.SETSTANDALONE(
  doc          IN   DOMDOCUMENT,
  newvalue     IN   VARCHAR2);
```

Parameters**Table 196-129 SETSTANDALONE Procedure Parameters**

Parameter	Description
doc	DOMDOCUMENT
newvalue	Value of the standalone property of the document

196.7.109 SETVALUE Procedure

This procedure sets the value of the attribute.

**See Also:**

[DOMAttr Subprograms](#) (page 196-7)

Syntax

```
DBMS_XMLDOM.SETVALUE(
  a          IN   DOMATTR,
  value     IN   VARCHAR2);
```

Parameters**Table 196-130 SETVALUE Procedure Parameters**

Parameter	Description
a	DOMATTR
value	The value to which to set the attribute

196.7.110 SETVERSION Procedure

This procedure sets the version of the `DOMDOCUMENT`.

**See Also:**

[DOMDocument Subprograms](#) (page 196-9)

Syntax

```
DBMS_XMLDOM.SETVERSION(
  doc      IN   DOMDOCUMENT,
  version  IN   VARCHAR2);
```

Parameters**Table 196-131 SETVERSION Procedure Parameters**

Parameter	Description
doc	DOMDOCUMENT
version	The version of the document

196.7.111 SPLITTEXT Function

This function breaks this `DOMTEXT` node into two `DOMTEXT` nodes at the specified offset.

**See Also:**

[DBMS_XMLDOM DOMText Subprograms \(page 196-15\)](#)

Syntax

```
DBMS_XMLDOM.SPLITTEXT(
  t      IN   DOMTEXT,
  offset IN   NUMBER)
RETURN DOMText;
```

Parameters**Table 196-132 SPLITTEXT Function Parameters**

Parameter	Description
t	DOMTEXT
offset	Offset at which to split

196.7.112 SUBSTRINGDATA Function

This function extracts a range of data from the node.

**See Also:**

[DOMCharacterData Subprograms \(page 196-8\)](#)

Syntax

```
DBMS_XMLDOM.SUBSTRINGDATA(
    cd      IN      DOMCHARACTERDATA,
    offset  IN      NUMBER,
    cnt     IN      NUMBER)
RETURN VARCHAR2;
```

Parameters

Table 196-133 SUBSTRINGDATA Function Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The starting offset of the data from which to get the data
cnt	The number of characters (from the offset) of the data to get

196.7.113 USEBINARYSTREAM Function

This function returns `TRUE` if the datatype of the node is `RAW` or `BLOB`, so that the node value may be read or written using an `UTL_BINARYINPUTSTREAM` or `UTL_BINARYOUTPUTSTREAM`.

If a value of `FALSE` is returned, the node value may only be accessed through an `UTL_CHARACTERINPUTSTREAM` or `UTL_CHARACTEROUTPUTSTREAM`.

See Also:

[DOMNode Subprograms](#) (page 196-6)

Syntax

```
DBMS_XMLDOM.USEBINARYSTREAM (
    n      IN      DOMNODE)
RETURN BOOLEAN;
```

Parameters

Table 196-134 USEBINARYSTREAM Function Parameters

Parameter	Description
n	DOMNODE

196.7.114 WRITETOBUFFER Procedures

WRITETOBUFFER is an overloaded procedure that writes an XML node, XML document, or a document fragment to a specified buffer.

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified buffer using the database character set (See Also: [DOMNode Subprograms](#) (page 196-6)):

```
DBMS_XMLDOM.WRITETOBUFFER(
  n          IN      DOMNODE,
  buffer     IN OUT  VARCHAR2);
```

Writes XML document to a specified buffer using database character set (See Also: [DOMDocument Subprograms](#) (page 196-9)):

```
DBMS_XMLDOM.WRITETOBUFFER(
  doc        IN      DOMDOCUMENT,
  buffer     IN OUT  VARCHAR2);
```

Writes the contents of the specified document fragment into a buffer using the database character set (See Also: [DOMDocumentFragment Subprograms](#) (page 196-10)):

```
DBMS_XMLDOM.WRITETOBUFFER(
  df         IN      DOMDOCUMENTFRAGMENT,
  buffer     IN OUT  VARCHAR2);
```

Parameters

Table 196-135 WRITETOBUFFER Procedure Parameters

Parameter	Description
n	DOMNODE
buffer	Buffer to which to write
doc	DOMDOCUMENT
df	DOM document fragment

196.7.115 WRITETOCLOB Procedures

WRITETOCLOB is an overloaded procedure that writes an XML node or document to a specified CLOB.

The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified CLOB using the database character set (See Also: [DOMNode Subprograms](#) (page 196-6)):

```
DBMS_XMLDOM.WRITETOCLOB(
  n          IN          DOMNODE,
  cl         IN OUT     CLOB);
```

Writes XML document to a specified CLOB using database character set (See Also: [DOMDocument Subprograms](#) (page 196-9)):

```
DBMS_XMLDOM.WRITETOCLOB(
  doc        IN          DOMDOCUMENT,
  cl         IN OUT     CLOB);
```

Parameters

Table 196-136 WRITETOCLOB Procedure Parameters

Parameter	Description
n	DOMNODE
cl	CLOB to which to write
doc	DOMDOCUMENT

196.7.116 WRITETOFILE Procedures

This overloaded procedure writes an XML node or XML document to a specified node.

The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified file using the database character set (See Also: [DOMNode Subprograms](#) (page 196-6)):

```
DBMS_XMLDOM.WRITETOFILE(
  n          IN          DOMNODE,
  fileName   IN          VARCHAR2);
```

Writes XML node to specified file using the specified character set, which is passed in as a separate parameter (See Also: [DOMNode Subprograms](#) (page 196-6)):

```
DBMS_XMLDOM.WRITETOFILE(
  n          IN          DOMNODE,
  fileName   IN          VARCHAR2,
  charset    IN          VARCHAR2);
```

Writes an XML document to a specified file using database character set (See Also: [DOMDocument Subprograms](#) (page 196-9)):

```
DBMS_XMLDOM.WRITETOFILE(
  doc        IN          DOMDOCUMENT,
  filename   IN          VARCHAR2);
```

Writes an XML document to a specified file using specified character set (See Also: [DOMDocument Subprograms](#) (page 196-9)):

```
DBMS_XMLDOM.WRITETOFILE(
  doc        IN          DOMDOCUMENT,
  fileName   IN          VARCHAR2,
  charset    IN          VARCHAR2);
```

Parameters

Table 196-137 WRITETOFILE Procedure Parameters

Parameter	Description
n	DOMNODE
fileName	File to which to write. The filename should be in the format of database_directory_object_name/filename, for example mydir/filename (on windows, use \ instead of /).
charset	specified character set
doc	DOMDOCUMENT
charset	Character set

DBMS_XMLGEN

The `DBMS_XMLGEN` package converts the results of a SQL query to a canonical XML format.

The package takes an arbitrary SQL query as input, converts it to XML format, and returns the result as a `CLOB`. This package is similar to the `DBMS_XMLQUERY` package, except that it is written in C and compiled into the kernel. This package can only be run on the database.

This chapter contains the following topic:

- [Security Model](#) (page 197-1)
- [Summary of DBMS_XMLGEN Subprograms](#) (page 197-1)

See Also:

Oracle XML DB Developer's Guide, for more information on XML support and on examples of using `DBMS_XMLGEN`

197.1 DBMS_XMLGEN Security Model

Owned by `XDB`, the `DBMS_XMLGEN` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

197.2 Summary of DBMS_XMLGEN Subprograms

This table lists the `DBMS_XMLGEN` subprograms and briefly describes them.

Table 197-1 Summary of DBMS_XMLGEN Package Subprograms

Subprogram	Description
CLOSECONTEXT Procedure (page 197-2)	Closes the context and releases all resources
CONVERT Functions (page 197-3)	Converts the XML into the escaped or unescaped XML equivalent
GETNUMROWSPROCESSED Function (page 197-3)	Gets the number of SQL rows that were processed in the last call to GETXML Functions (page 197-4)
GETXML Functions (page 197-4)	Gets the XML document
GETXMLTYPE Functions (page 197-5)	Gets the XML document and returns it as <code>XMLType</code>

Table 197-1 (Cont.) Summary of DBMS_XMLGEN Package Subprograms

Subprogram	Description
NEWCONTEXT Functions (page 197-6)	Creates a new context handle
NEWCONTEXTFROMHIERARCHY Function (page 197-6)	Obtains a handle to use in the GETXML Functions (page 197-4) and other functions to get a hierarchical XML with recursive elements from the result
RESTARTQUERY Procedure (page 197-7)	Restarts the query to start fetching from the beginning
SETCONVERTSPECIALCHARS Procedure (page 197-7)	Sets whether special characters such as \$, which are non-XML characters, should be converted or not to their escaped representation
SETMAXROWS Procedure (page 197-8)	Sets the maximum number of rows to be fetched each time
SETNULLHANDLING Procedure (page 197-9)	Sets NULL handling options
SETROWSETTAG Procedure (page 197-9)	Sets the name of the element enclosing the entire result
SETROWTAG Procedure (page 197-10)	Sets the name of the element enclosing each row of the result
SETSKIPROWS Procedure (page 197-10)	Sets the number of rows to skip every time before generating the XML.
USEITEMTAGSFORCOLL Procedure (page 197-11)	Forces the use of the collection column name appended with the tag <code>_ITEM</code> for collection elements
USENULLATTRIBUTEINDICATOR Procedure (page 197-11)	Specifies whether to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document.

197.2.1 CLOSECONTEXT Procedure

This procedure closes a given context and releases all resources associated with it, including the SQL cursor and bind and define buffers. After this call, the handle cannot be used for a subsequent function call.

Syntax

```
DBMS_XMLGEN.CLOSECONTEXT (
    ctx IN ctxHandle);
```

Parameters

Table 197-2 CLOSECONTEXT Procedure Parameters

Parameter	Description
ctx	The context handle to close.

197.2.2 CONVERT Functions

This function converts the XML data into the escaped or unescapes XML equivalent, and returns XML CLOB data in encoded or decoded format. There are several version of the function.

Syntax

Uses XMLDATA in string form (VARCHAR2):

```
DBMS_XMLGEN.CONVERT (  
    xmlData IN VARCHAR2,  
    flag    IN NUMBER := ENTITY_ENCODE)  
RETURN VARCHAR2;
```

Uses XMLDATA in CLOB form:

```
DBMS_XMLGEN.CONVERT (  
    xmlData IN CLOB,  
    flag    IN NUMBER := ENTITY_ENCODE)  
RETURN CLOB;
```

Parameters

Table 197-3 CONVERT Function Parameters

Parameter	Description
xmlData	The XML CLOB data to be encoded or decoded.
flag	The flag setting; ENTITY_ENCODE (default) for encode, and ENTITY_DECODE for decode.

Usage Notes

This function escapes the XML data if the ENTITY_ENCODE is specified. For example, the escaped form of the character < is <. Unescaping is the reverse transformation.

197.2.3 GETNUMROWSPROCESSED Function

This function retrieves the number of SQL rows processed when generating the XML using the GETXML Functions call. This count does not include the number of rows skipped before generating the XML.

Note that GETXML Functions always generates an XML document, even if there are no rows present.

Syntax

```
DBMS_XMLGEN.GETNUMROWSPROCESSED (  
    ctx    IN    ctxHandle)  
RETURN NUMBER;
```

Parameters

Table 197-4 GETNUMROWSPROCESSED Function Parameters

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call.

Usage Notes

This function is used to determine the terminating condition if calling GETXML Functions in a loop.

Related Topics:

- [GETXML Functions](#) (page 197-4)
This function gets the XML document. The function is overloaded.

197.2.4 GETXML Functions

This function gets the XML document. The function is overloaded.

Syntax

Gets the XML document by fetching the maximum number of rows specified. It appends the XML document to the CLOB passed in. Use this version of [GETXML Functions](#) (page 197-4) to avoid any extra CLOB copies and to reuse the same CLOB for subsequent calls. Because of the CLOB reuse, this [GETXML Functions](#) (page 197-4) call is potentially more efficient:

```
DBMS_XMLGEN.GETXML (
  ctx          IN ctxHandle,
  tmpclob      IN OUT NCOPY CLOB,
  dtdOrSchema IN number := NONE)
RETURN BOOLEAN;
```

Generates the XML document and returns it as a temporary CLOB. The temporary CLOB obtained from this function must be freed using the DBMS_LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (
  ctx          IN ctxHandle,
  dtdOrSchema IN number := NONE)
RETURN CLOB;
```

Converts the results from the SQL query string to XML format, and returns the XML as a temporary CLOB, which must be subsequently freed using the DBMS_LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (
  sqlQuery     IN VARCHAR2,
  dtdOrSchema  IN number := NONE)
RETURN CLOB;
```

Parameters

Table 197-5 GETXML Function Parameters

Parameter	Description
ctx	The context handle obtained from the <code>newContext</code> call.
tmpClob	The CLOB to which the XML document is appended.
sqlQuery	The SQL query string.
dtdOrSchema	Generate a DTD or a schema? Only <code>NONE</code> is supported.

Usage Notes

When the rows indicated by the [SETSKIPROWS Procedure](#) (page 197-10) call are skipped, the maximum number of rows as specified by the [SETMAXROWS Procedure](#) (page 197-8) call (or the entire result if not specified) is fetched and converted to XML. Use the [GETNUMROWSPROCESSED Function](#) (page 197-3) to check if any rows were retrieved.

197.2.5 GETXMLTYPE Functions

This function gets the XML document and returns it as an `XMLTYPE`. `XMLTYPE` operations can be performed on the results. This function is overloaded.

Syntax

Generates the XML document and returns it as a `sys.XMLType`:

```
DBMS_XMLGEN.GETXMLTYPE (
  ctx          IN ctxhandle,
  dtdOrSchema  IN number := NONE)
RETURN sys.XMLType;
```

Converts the results from the SQL query string to XML format, and returns the XML as a `sys.XMLType`:

```
DBMS_XMLGEN.GETXMLTYPE (
  sqlQuery     IN VARCHAR2,
  dtdOrSchema  IN number := NONE)
RETURN sys.XMLType
```

Parameters

Table 197-6 GETXMLTYPE Function Parameters

Parameter	Description
ctx	The context handle obtained from the <code>newContext</code> call.
sqlQuery	The SQL query string.
dtdOrSchema	Generate a DTD or a schema? Only <code>NONE</code> is supported.

197.2.6 NEWCONTEXT Functions

This function generates and returns a new context handle.

This context handle is used in [GETXML Functions](#) (page 197-4) and other functions to get XML back from the result. There are several version of the function.

Syntax

Generates a new context handle from a query:

```
DBMS_XMLGEN.NEWCONTEXT (  
    query      IN VARCHAR2)  
RETURN ctxHandle;
```

Generates a new context handle from a query string in the form of a PL/SQL ref cursor:

```
DBMS_XMLGEN.NEWCONTEXT (  
    queryString IN SYS_REFCURSOR)  
RETURN ctxHandle;
```

Parameters

Table 197-7 NEWCONTEXT Function Parameters

Parameter	Description
query	The query, in the form of a VARCHAR, the result of which must be converted to XML.
queryString	The query string in the form of a PL/SQL ref cursor, the result of which must be converted to XML.

197.2.7 NEWCONTEXTFROMHIERARCHY Function

This function obtains a handle to use in the GETXML Functions and other functions to get a hierarchical XML with recursive elements from the result.

Syntax

```
DBMS_XMLGEN.NEWCONTEXTFROMHIERARCHY (  
    queryString IN VARCHAR2)  
RETURN ctxHandle;
```

Parameters

Table 197-8 NEWCONTEXTFROMHIERARCHY Function Parameters

Parameter	Description
queryString	The query string, the result of which must be converted to XML. The query is a hierarchical query typically formed using a <code>CONNECT BY</code> clause, and the result must have the same property as the result set generated by a <code>CONNECT BY</code> query. The result set must have only two columns, the level number and an XML value. The level number is used to determine the hierarchical position of the XML value within the result XML document.

Related Topics:

- [GETXML Functions](#) (page 197-4)
This function gets the XML document. The function is overloaded.

197.2.8 RESTARTQUERY Procedure

This procedure restarts the query and generates the XML from the first row.

It can be used to start executing the query again, without having to create a new context.

Syntax

```
DBMS_XMLGEN.RESTARTQUERY (
  ctx IN ctxHandle);
```

Parameters

Table 197-9 RESTARTQUERY Procedure Parameters

Parameter	Description
ctx	The context handle corresponding to the current query.

197.2.9 SETCONVERTSPECIALCHARS Procedure

This procedure sets whether or not special characters in the XML data must be converted into their escaped XML equivalent. For example, the `<` sign is converted to `<`.

The default is to perform conversions.

This function improves performance of XML processing when the input data cannot contain any special characters such as `<`, `>`, `"`, `'`, which must be escaped. It is expensive to scan the character data to replace the special characters, particularly if it involves a lot of data.

Syntax

```
DBMS_XMLGEN.SETCONVERTSPECIALCHARS (
  ctx   IN ctxHandle,
  conv  IN BOOLEAN);
```

Parameters**Table 197-10 SETCONVERTSPECIALCHARS Procedure Parameters**

Parameter	Description
ctx	The context handle obtained from one of the NEWCONTEXT Functions (page 197-6) call.
conv	TRUE indicates that conversion is needed.

197.2.10 SETMAXROWS Procedure

This procedure sets the maximum number of rows to fetch from the SQL query result for every invocation of the GETXML Functions call.

It is used when generating paginated results. For example, when generating a page of XML or HTML data, restrict the number of rows converted to XML or HTML by setting the `maxrows` parameter.

Syntax

```
DBMS_XMLGEN.SETMAXROWS (
  ctx      IN ctxHandle,
  maxRows  IN NUMBER);
```

Parameters**Table 197-11 SETMAXROWS Procedure Parameters**

Parameter	Description
ctx	The context handle corresponding to the query executed.
maxRows	The maximum number of rows to get for each call to GETXML Functions (page 197-4)

Related Topics:

- [GETXML Functions](#) (page 197-4)
This function gets the XML document. The function is overloaded.

197.2.11 SETNULLHANDLING Procedure

This procedure sets `NULL` handling options, handled through the `flag` parameter setting.

Syntax

```
DBMS_XMLGEN.SETNULLHANDLING(
  ctx IN ctx,
  flag IN NUMBER);
```

Parameters

Table 197-12 SETNULLHANDLING Procedure Parameters

Parameter	Description
<code>ctx</code>	The context handle corresponding to the query executed.
<code>flag</code>	The <code>NULL</code> handling option set. <ul style="list-style-type: none"> <code>DROP_NULLS CONSTANT NUMBER:= 0;</code> (Default) Leaves out the tag for <code>NULL</code> elements. <code>NULL_ATTR CONSTANT NUMBER:= 1;</code> Sets <code>xsi:nil="true"</code>. <code>EMPTY_TAG CONSTANT NUMBER:= 2;</code> Sets, for example, <code><foo/></code>.

197.2.12 SETROWSETTAG Procedure

This procedure sets the name of the root element of the document. The default name is `ROWSET`.

Syntax

```
DBMS_XMLGEN.SETROWSETTAG (
  ctx          IN ctxHandle,
  rowSetTagName IN VARCHAR2);
```

Parameters

Table 197-13 SETROWSETTAG Procedure Parameters

Parameter	Description
<code>ctx</code>	The context handle obtained from the NEWCONTEXT Functions (page 197-6) call.
<code>rowSetTagName</code>	The name of the document element. Passing <code>NULL</code> indicates that you do not want the <code>ROWSET</code> element present.

Usage Notes

The user can set the `rowSetTag` to `NULL` to suppress the printing of this element. However, an error is produced if both the row and the rowset are `NULL` and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

197.2.13 SETROWTAG Procedure

This procedure sets the name of the element separating all the rows. The default name is `ROW`.

Syntax

```
DBMS_XMLGEN.SETROWTAG (
  ctx          IN ctxHandle,
  rowTagName  IN VARCHAR2);
```

Parameters

Table 197-14 SETROWTAG Procedure Parameters

Parameter	Description
<code>ctx</code>	The context handle obtained from the NEWCONTEXT Functions (page 197-6) call.
<code>rowTagName</code>	The name of the <code>ROW</code> element. Passing <code>NULL</code> indicates that you do not want the <code>ROW</code> element present.

Usage Notes

The user can set the name of the element to `NULL` to suppress the `ROW` element itself. However, an error is produced if both the row and the rowset are `NULL` and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

197.2.14 SETSKIPROWS Procedure

This procedure skips a given number of rows before generating the XML output for every call to the `GETXML` Functions. It is used when generating paginated results for stateless Web pages using this utility.

For example, when generating the first page of XML or HTML data, set `skiprows` to zero. For the next set, set the `skiprows` to the number of rows obtained in the first case. See [GETNUMROWSPROCESSED Function](#) (page 197-3).

Syntax

```
DBMS_XMLGEN.SETSKIPROWS (
  ctx          IN ctxHandle,
  skipRows    IN NUMBER);
```

Parameters

Table 197-15 SETSKIPROWS Procedure Parameters

Parameter	Description
<code>ctx</code>	The context handle corresponding to the query executed.
<code>skipRows</code>	The number of rows to skip for each call to <code>getXML</code> .

Related Topics:

- [GETXML Functions](#) (page 197-4)
This function gets the XML document. The function is overloaded.

197.2.15 USEITEMTAGSFORCOLL Procedure

This procedure overrides the default name of the collection elements. The default name for collection elements is the type name itself.

Syntax

```
DBMS_XMLGEN.USEITEMTAGSFORCOLL (
    ctx IN ctxHandle);
```

Parameters**Table 197-16 USEITEMTAGSFORCOLL Procedure Parameters**

Parameter	Description
ctx	The context handle.

Usage Notes

Using this procedure, you can override the default to use the name of the column with the `_ITEM` tag appended to it. If there is a collection of `NUMBER`, the default tag name for the collection elements is `NUMBER`.

197.2.16 USENULLATTRIBUTEINDICATOR Procedure

This procedure specifies whether to use an XML attribute to indicate `NULL`, or to do it by omitting the inclusion of the particular entity in the XML document.

It is used as a shortcut for the [SETNULLHANDLING Procedure](#) (page 197-9).

Syntax

```
DBMS_XMLGEN.USENULLATTRIBUTEINDICATOR(
    ctx          IN   ctxType,
    attrind     IN   BOOLEAN := TRUE);
```

Parameters**Table 197-17 USENULLATTRIBUTEINDICATOR Procedure Parameters**

Parameter	Description
ctx	Context handle.
attrind	Use attribute to indicate <code>NULL</code> ?

DBMS_XMLINDEX

The `DBMS_XMLINDEX` package provides an interface to implement asynchronous indexing.

This chapter contains the following topics:

- [Overview](#) (page 198-1)
- [Security Model](#) (page 198-1)
- [Summary of DBMS_XMLINDEX Subprograms](#) (page 198-1)

See Also:

Oracle XML DB Developer's Guide for more information about "XMLIndex"

198.1 DBMS_XMLINDEX Overview

`DBMS_XMLINDEX` provides a mechanism for asynchronous index maintenance.

Asynchronous Index Maintenance

The basic XMLIndex is maintained on every DML operation. However, given the computing costs, in many cases the availability of stale result is adequate. In such situations, it is desirable to defer index updates to a more convenient time, for example when the load on the database is low. `DBMS_XMLINDEX` provides this mechanism.

198.2 DBMS_XMLINDEX Security Model

Owned by `XDB`, the `DBMS_XMLINDEX` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`.

Subprograms in this package are executed using the privileges of the current user.

198.3 Summary of DBMS_XMLINDEX Subprograms

This table lists the `DBMS_XMLINDEX` subprograms and briefly describes them.

Table 198-1 DBMS_XMLINDEX Package Subprograms

Subprogram	Description
CREATEDATEINDEX Procedure (page 198-2)	Creates a secondary index for date values in the <code>VALUE</code> column of a <code>PATH TABLE</code> which is the storage table of an XMLIndex

Table 198-1 (Cont.) DBMS_XMLINDEX Package Subprograms

Subprogram	Description
CREATENUMBERINDEX Procedure (page 198-3)	Creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex
DROPPARAMETER Procedure (page 198-4)	Drops the XMLIndex parameter string that is associated with a given parameter identifier.
MODIFYPARAMETER Procedure (page 198-4)	Modifies the XMLIndex parameter string that is associated with a given parameter name
PROCESS_PENDING Procedure (page 198-5)	Processes pending rows for a NONBLOCKING ALTER INDEX OPERATION on an XMLIndex
REGISTERPARAMETER Procedure (page 198-5)	Registers a parameter string and XMLIndex parameter string pair in XDB
SYNCINDEX Procedure (page 198-6)	Synchronizes the index manually

198.3.1 CREATEDATEINDEX Procedure

This procedure creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex. The second form of the procedure allows for the date_index_clause to be set to an empty string.

Syntax

```
DBMS_XMLINDEX.CREATEDATEINDEX (
  xml_index_schema IN VARCHAR2,
  xml_index_name   IN VARCHAR2,
  date_index_name  IN VARCHAR2,
  xmltypename     IN VARCHAR2,
  date_index_clause IN VARCHAR2);
```

```
DBMS_XMLINDEX.CREATEDATEINDEX (
  xml_index_schema IN VARCHAR2
  xml_index_name   IN VARCHAR2,
  date_index_name  IN VARCHAR2,
  xmltypename     IN VARCHAR2);
```

Parameters

Table 198-2 CREATEDATEINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex
date_index_name	Name of the secondary index to be created for date values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema

Table 198-2 (Cont.) CREATEDATEINDEX Procedure Parameters

Parameter	Description
xmltypename	The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: DATETIME, TIME, DATE, GDAY, GMONTH, GYEAR, GYEARMONTH, GMONTHDAY.
date_index_clause	Storage clause to be applied to the date index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the date index

198.3.2 CREATENUMBERINDEX Procedure

This procedure creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex.

Syntax

```
DBMS_XMLINDEX.CREATENUMBERINDEX (
  xml_index_schema IN VARCHAR2,
  xml_index_name   IN VARCHAR2,
  num_index_name   IN VARCHAR2,
  num_index_clause IN VARCHAR2,
  xmltypename      IN VARCHAR2);
```

Parameters

Table 198-3 CREATENUMBERINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex
num_index_name	Name of the secondary index to be created for number values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema
num_index_clause	Storage clause to be applied to the number index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the number index.
xmltypename	The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: FLOAT, DOUBLE, DECIMAL, INTEGER, NONPOSITIVEINTEGER, NEGATIVEINTEGER, LONG, INT, SHORT, BYTE, NONNEGATIVEINTEGER, UNSIGNEDLONG, UNSIGNEDINT, UNSIGNEDSHORT, UNSIGNEDBYTE, POSITIVEINTEGER.

198.3.3 DROPPARAMETER Procedure

This procedure drops the `XMLIndex` parameter string that is associated with a given parameter identifier.

Syntax

```
DBMS_XMLINDEX.DROPPARAMETER (
    name          IN          VARCHAR2);
```

Parameters

Table 198-4 DROPPARAMETER Procedure Parameters

Parameter	Description
name	Identifier for parameter string

Examples

```
DBMS_XMLINDEX.DROPPARAMETER (
    'myIndexParam');
```

198.3.4 MODIFYPARAMETER Procedure

This procedure modifies the `XMLIndex` parameter string that is associated with a given parameter identifier.

Syntax

```
DBMS_XMLINDEX.MODIFYPARAMETER (
    name          IN          VARCHAR2,
    parameter     IN          CLOB);
```

Parameters

Table 198-5 MODIFYPARAMETER Procedure Parameters

Parameter	Description
name	Identifier for parameter string
parameter	<code>XMLIndex</code> parameter clause that can appear in a <code>CREATE INDEX</code> or an <code>ALTER INDEX</code> statement

Examples

```
DBMS_XMLINDEX.MODIFYPARAMETER (
    'myIndexParam',
    'PATH TABLE po_ptab
    PATH ID INDEX po_pidx
    ORDER KEY INDEX po_oidx
    VALUE INDEX po_vidx');
```

198.3.5 PROCESS_PENDING Procedure

This procedure processes executes DMLs required to complete a `NONBLOCKING ALTER INDEX ADD_GROUP/ADD_COLUMN` operation on an XMLIndex.

Syntax

```
DBMS_XMLINDEX.PROCESS_PENDING (
  xml_index_schema  IN   VARCHAR2,
  xml_index_name    IN   VARCHAR2,
  pending_row_count OUT  BINARY_INTEGER,
  error_row_count   OUT  BINARY_INTEGER);
```

Parameters

Table 198-6 PROCESS_PENDING Procedure Parameters

Parameter	Description
<code>xml_index_schema</code>	Name of the owner of the XMLIndex
<code>xml_index_name</code>	Name of the XMLIndex to be altered using <code>NONBLOCKING ALTER INDEX OPERATION</code>
<code>pending_row_count</code>	Number of pending rows to be processed
<code>error_row_count</code>	Number of rows for which indexing may have failed because of an error

Usage Notes

- This procedure will iteratively attempt to index all necessary rows in small batches while skipping rows that are locked and rows for which index maintenance fails with an error. Therefore, it may have to be executed multiple times for an XMLIndex until all pending rows are processed. Once all pending rows are processed, user can complete the `NONBLOCKING ALTER INDEX OPERATION`.
- If it is not possible process all the pending rows after multiple trials, the user will have to manually triage the locking or error issues by examining unprocessed rows in `SYS_AIXSXI_#####_PENDINGTAB` and errors in `SYS_AIXSXI_#####_ERRORTAB`. Keeping track of rows and the errors is useful in triaging issues.

Examples

```
EXEC DBMS_XMLINDEX.PROCESS_PENDING(
  'SCOTT', 'PO_XMLINDEX_IX', out_param1, out_param2);
```

198.3.6 REGISTERPARAMETER Procedure

This procedure registers a parameter identifier and XMLIndex parameter string pair in XDB.

Syntax

```
DBMS_XMLINDEX.REGISTERPARAMETER (
  name      IN   VARCHAR2,
  parameter IN   CLOB);
```

Parameters

Table 198-7 REGISTERPARAMETER Procedure Parameters

Parameter	Description
name	Identifier for parameter string
parameter	XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement

Examples

```
DBMS_XMLINDEX.REGISTERPARAMETER (
    'myIndexParam',
    'PATH TABLE po_ptab
    PATH ID INDEX po_pidx
    ORDER KEY INDEX po_oidx
    VALUE INDEX po_vidx
    PATHS(NAMESPACE MAPPING(xmlns:p="http://www.example.com/IPO"))
    GROUP MASTERGROU XMLTABLE PO_TAB
    ('/p:PurchaseOrder'
     COLUMNS
        REFERENCE VARCHAR2(30) PATH 'p:Reference',
        REQUESTOR VARCHAR2(30) PATH 'p:Requestor' )
    GROUP ITEMGROUP XMLTABLE ITEMGROUP_TAB
    ('/p:PurchaseOrder/p:LineItems/p:LineItem'
     COLUMNS
        LINENUMBER NUMBER(38) PATH '@p:ItemNumber',
        QUANTITY NUMBER(38) PATH '@p:Quantity',
        DESCRIPTION VARCHAR2(256) PATH 'p:Description'));
```

198.3.7 SYNCINDEX Procedure

This function synchronizes an asynchronously maintained XMLIndex.

It applies to the XMLIndex changes that are logged in the pending table, and brings the path table up-to-date with the base XMLTYPE column.

Syntax

```
DBMS_XMLINDEX.SYNCINDEX (
    xml_index_schema    IN VARCHAR2,
    xml_index_name      IN VARCHAR2,
    partition_name      IN VARCHAR2 DEFAULT NULL,
    reindex              IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 198-8 SYNCINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_schema_name	Name of the XMLIndex
partition_name	[Currently not supported]

Table 198-8 (Cont.) SYNCINDEX Procedure Parameters

Parameter	Description
reindex	Default is <code>FALSE</code> . If set to <code>TRUE</code> , this drops the secondary indexes and recreates them later so that they can be bulk-loaded.

Examples

```
EXEC DBMS_XMLINDEX.SYNCINDEX('USER1', 'SS_TAB_XMLI', REINDEX=>TRUE);
```

DBMS_XMLPARSER

Using `DBMS_XMLPARSER`, you can access the contents and structure of XML documents. XML describes a class of data XML document objects. It partially describes the behavior of computer programs which process them. By construction, XML documents are conforming SGML documents.

XML documents are made up of storage units called entities, which contain either parsed or unparsed data. Parsed data is made up of characters, some of which form character data, and some of which form markup. Markup encodes a description of the document's storage layout and logical structure. XML provides a mechanism to impose constraints on the storage layout and logical structure.

A software module called an XML processor is used to read XML documents and provide access to their content and structure. It is assumed that an XML processor is doing its work on behalf of another module, called the application. This PL/SQL implementation of the XML processor (or parser) follows the W3C XML specification REC-xml-19980210 and includes the required behavior of an XML processor in terms of how it must read XML data and the information it must provide to the application.

The default behavior for this PL/SQL XML parser is to build a parse tree that can be accessed by DOM APIs, validate it if a DTD is found (otherwise, it is non-validating), and record errors if an error log is specified. If parsing fails, an application error is raised.

This chapter contains the following topics:

- [Security Model](#) (page 199-1)
- [Summary of DBMS_XMLPARSER Subprograms](#) (page 199-1)

Oracle XML DB Developer's Guide

199.1 DBMS_XMLPARSER Security Model

Owned by `XDB`, the `DBMS_XMLPARSER` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`.

Subprograms in this package are executed using the privileges of the current user.

199.2 Summary of DBMS_XMLPARSER Subprograms

This table lists the `DBMS_XMLPARSER` subprograms and briefly describes them.

Table 199-1 DBMS_XMLPARSER Package Subprograms

Method	Description
FREEPARSER (page 199-2)	Frees a parser object.
GETDOCTYPE (page 199-3)	Gets parsed DTD.
GETDOCUMENT (page 199-3)	Gets DOM document.
GETRELEASEVERSION (page 199-3)	Returns the release version of Oracle XML Parser for PL/SQL.
GETVALIDATIONMODE (page 199-4)	Returns validation mode.
NEWPARSER (page 199-4)	Returns a new parser instance
PARSE (page 199-4)	Parses XML stored in the given url/file.
PARSEBUFFER (page 199-5)	Parses XML stored in the given buffer
PARSECLOB (page 199-5)	Parses XML stored in the given clob
PARSEDTD (page 199-6)	Parses DTD stored in the given url/file
PARSEDTDBUFFER (page 199-6)	Parses DTD stored in the given buffer
PARSEDTDCLOB (page 199-7)	Parses DTD stored in the given clob
SETBASEDIR (page 199-7)	Sets base directory used to resolve relative URLs.
SETDOCTYPE (page 199-8)	Sets DTD.
SETERRORLOG (page 199-8)	Sets errors to be sent to the specified file
SETPRESERVEWHITESPACE (page 199-8)	Sets white space preserve mode
SETVALIDATIONMODE (page 199-9)	Sets validation mode.
SHOWWARNINGS (page 199-9)	Turns warnings on or off.

199.2.1 FREEPARSER

This procedure frees a parser object.

Syntax

```
PROCEDURE freeParser(
    p Parser);
```

Parameters

Table 199-2 FREEPARSER Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

199.2.2 GETDOCTYPE

The `GETDOCTYPE` function returns the parsed DTD. This function must be called only after a DTD is parsed.

Syntax

```
FUNCTION getDoctype(  
    p Parser)  
RETURN DOMDocumentType;
```

Parameters

Table 199-3 GETDOCTYPE Function Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

199.2.3 GETDOCUMENT

`GETDOCUMENT` returns the document node of a DOM tree document built by the parser. This function must be called only after a document is parsed.

Syntax

```
FUNCTION GETDOCUMENT(  
    p Parser)  
RETURN DOMDocument;
```

Parameters

Table 199-4 GETDOCUMENT Function Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

199.2.4 GETRELEASEVERSION

`GETRELEASEVERSION` returns the release version of the Oracle XML parser for PL/SQL.

Syntax

```
FUNCTION getReleaseVersion  
RETURN VARCHAR2;
```

199.2.5 GETVALIDATIONMODE

The `GETVALIDATIONMODE` function retrieves the validation mode: `TRUE` for validating, `FALSE` otherwise.

Syntax

```
FUNCTION GETVALIDATIONMODE(  
    p Parser)  
RETURN BOOLEAN;
```

Parameters

Table 199-5 GETVALIDATIONMODE Function Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

199.2.6 NEWPARSER

This function returns a new parser instance.

This function must be called before the default behavior of Parser can be changed and if other parse methods need to be used.

Syntax

```
FUNCTION newParser  
RETURN Parser;
```

199.2.7 PARSE

`PARSE` parses XML stored in the given URL or file. An application error is raised if parsing fails.

There are several versions of this method.

Syntax

Function. Use this when the default parser behavior is acceptable, and only a URL or file needs to be parsed. Returns the built DOM document.

```
FUNCTION parse(url VARCHAR2)  
RETURN DOMDocument;
```

Procedure. Any changes to the default parser behavior should be effected before calling this procedure.

```
PROCEDURE parse(  
    p Parser,  
    url VARCHAR2);
```

Parameters

Table 199-6 PARSE Subprogram Parameters

Parameter	IN / OUT	Description
url	(IN)	Complete path of the url/file to be parsed.
p	(IN)	Parser instance.

199.2.8 PARSEBUFFER

PARSEBUFFER parses XML stored in the given buffer.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEBUFFER(
  p  Parser,
  doc VARCHAR2);
```

Parameters

Table 199-7 PARSEBUFFER Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

199.2.9 PARSECLOB

PARSECLOB parses XML stored in the given clob.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSECLOB(
  p  Parser,
  doc CLOB);
```

Parameters

Table 199-8 PARSECLOB Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

199.2.10 PARSEDTD

PARSEDTD parses the DTD stored in the given URL or file.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTD(  
  p      Parser,  
  url   VARCHAR2,  
  root  VARCHAR2);
```

Parameters

Table 199-9 PARSEDTD Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
url	(IN)	Complete path of the URL or file to be parsed.
root	(IN)	Name of the root element.

199.2.11 PARSEDTDBUFFER

PARSEDTDBUFFER parses the DTD stored in the given buffer.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTDBUFFER(  
  p      Parser,  
  dtd   VARCHAR2,  
  root  VARCHAR2);
```

Parameters

Table 199-10 PARSEDTDBUFFER Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD buffer to parse.
root	(IN)	Name of the root element.

199.2.12 PARSEDTDCLOB

PARSEDTDCLOB parses the DTD stored in the given clob.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTDCLOB(  
  p    Parser,  
  dtd  CLOB,  
  root VARCHAR2);
```

Parameters

Table 199-11 PARSEDTDCLOB Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD Clob to parse.
root	(IN)	Name of the root element.

199.2.13 SETBASEDIR

This procedure sets the base directory used to resolve relative URLs. An application error is raised if parsing fails.

Syntax

```
PROCEDURE setBaseDir(  
  p    Parser,  
  dir  VARCHAR2);
```

Parameters

Table 199-12 SETBASEDIR Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dir	(IN)	Directory used as a base directory.

199.2.14 SETDOCTYPE Procedure

This procedure sets a DTD to be used by the parser for validation. This call should be made before the document is parsed.

Syntax

```
PROCEDURE setDoctype(  
    p Parser,  
    dtd DOMDocumentType);
```

Parameters

Table 199-13 SETDOCTYPE Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD to set.

199.2.15 SETERRORLOG Procedure

This procedure sets errors to be sent to the specified file.

Syntax

```
PROCEDURE setErrorLog(  
    p Parser,  
    fileName VARCHAR2);
```

Parameters

Table 199-14 SETERRORLOG Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
fileName	(IN)	Complete path of the file to use as the error log.

199.2.16 SETPRESERVEWHITESPACE

This procedure sets whitespace preserving mode.

Syntax

```
PROCEDURE setPreserveWhitespace(  
    p Parser,  
    yes BOOLEAN);
```

Parameters

Table 199-15 SETPRESERVEWHITESPACE Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - preserve, FALSE - don't preserve.

199.2.17 SETVALIDATIONMODE

This procedure sets the validation mode.

Syntax

```
PROCEDURE setValidationMode(
  p Parser,
  yes BOOLEAN);
```

Parameters

Table 199-16 SETVALIDATIONMODE Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - validate, FALSE - don't validate.

199.2.18 SHOWWARNINGS

This procedure turns warnings on or off.

Syntax

```
PROCEDURE showWarnings(
  p Parser,
  yes BOOLEAN);
```

Parameters

Table 199-17 SHOWWARNINGS Procedure Parameters

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - show warnings, FALSE - don't show warnings.

200

DBMS_XMLQUERY

DBMS_XMLQUERY provides database-to-XMLType functionality.

Whenever possible, use DBMS_XMLGEN, a built-in package in C, instead of DBMS_XMLQUERY.

This chapter contains the following topics:

- [Security Model](#) (page 200-1)
- [Constants](#) (page 200-1)
- [Types](#) (page 200-2)
- [Summary of DBMS_XMLQUERY Subprograms](#) (page 200-2)

200.1 DBMS_XMLQUERY Security Model

Owned by XDB, the DBMS_XMLQUERY package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

200.2 DBMS_XMLQUERY Constants

The DBMS_XMLQUERY package includes several constants to use when specifying parameter values.

These constants are defined in the following table.

Table 200-1 Constants of DBMS_XMLQUERY

Constant	Description
DB_ENCODING	Used to signal that the DB character encoding is to be used.
DEFAULT_ROWSETTAG	The tag name for the element enclosing the XML generated from the result set (that is, for most cases the root node tag name) -- ROWSET.
DEFAULT_ERRORTAG	The default tag to enclose raised errors -- ERROR.
DEFAULT_ROWIDATTR	The default name for the cardinality attribute of XML elements corresponding to db.records -- NUM
DEFAULT_ROWTAG	The default tag name for the element corresponding to db.records -- ROW
DEFAULT_DATE_FORMAT	Default date mask -- 'MM/dd/yyyy HH:mm:ss'
ALL_ROWS	Indicates that all rows are needed in the output.
NONE	Used to specify that the output should not contain any XML metadata (for example, no DTD).
DTD	Used to specify that the generation of the DTD is desired.
SCHEMA	Used to specify that the generation of the XML Schema is desired.

Table 200-1 (Cont.) Constants of DBMS_XMLQUERY

Constant	Description
LOWER_CASE	Use lower case tag names.
UPPER_CASE	Use upper case tag names.

200.3 Types

The `DBMS_XMLQUERY` subprograms use the `ctxType` type.

Table 200-2 Types of DBMS_XMLQUERY

Type	Description
<code>ctxType</code>	The type of the query context handle. This is the return type of NEWCONTEXT (page 200-6)

200.4 Summary of DBMS_XMLQUERY Subprograms

This table lists the `DBMS_XMLQUERY` subprograms and briefly describes them.

Table 200-3 DBMS_XMLQUERY Package Subprograms

Method	Description
CLOSECONTEXT (page 200-3)	Closes or deallocates a particular query context.
GETDTD (page 200-4)	Generates the DTD.
GETEXCEPTIONCONTENT (page 200-4)	Returns the thrown exception's error code and error message.
GETNUMROWSPROCESSED (page 200-5)	Returns the number of rows processed for the query.
GETVERSION (page 200-5)	Prints the version of the XSU in use.
GETXML (page 200-5)	Generates the XML document.
NEWCONTEXT (page 200-6)	Creates a query context and it returns the context handle.
PROPAGATEORIGINALEXCEPTION (page 200-7)	Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather than, wrapping it with an <code>OracleXMLSQLException</code> .
REMOVEXSLTPARAM (page 200-7)	Removes a particular top-level stylesheet parameter.
SETBINDVALUE (page 200-7)	Sets a value for a particular bind name.
SETCOLLIDATTRNAME (page 200-8)	Sets the name of the id attribute of the collection element's separator tag.
SETDATAHEADER (page 200-8)	Sets the XML data header.
SETDATEFORMAT (page 200-9)	Sets the format of the generated dates in the XML document.

Table 200-3 (Cont.) DBMS_XMLQUERY Package Subprograms

Method	Description
SETENCODINGTAG (page 200-9)	Sets the encoding processing instruction in the XML document.
SETERRORTAG (page 200-9)	Sets the tag to be used to enclose the XML error documents.
SETMAXROWS (page 200-10)	Sets the maximum number of rows to be converted to XML.
SETMETAHEADER (page 200-10)	Sets the XML meta header.
SETRAISEEXCEPTION (page 200-10)	Tells the XSU to throw the raised exceptions.
SETRAISENOROWSEXCEPTION (page 200-11)	Tells the XSU to throw or not to throw an <code>OracleXMLNoRowsException</code> in the case when for one reason or another, the XML document generated is empty.
SETROWIDATTRNAME (page 200-11)	Sets the name of the id attribute of the row enclosing tag.
SETROWIDATTRVALUE (page 200-12)	Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag.
SETROWSETTAG (page 200-12)	Sets the tag to be used to enclose the XML dataset.
SETROWTAG (page 200-12)	Sets the tag to be used to enclose the XML element.
SETSKIPROWS (page 200-13)	Sets the number of rows to skip.
SETSQLTOXMLNAMEESCAPING (page 200-13)	This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.
SETSTYLESHEETHEADER (page 200-13)	Sets the stylesheet header.
SETTAGCASE (page 200-14)	Specified the case of the generated XML tags.
SETXSLT (page 200-14)	Registers a stylesheet to be applied to generated XML.
SETXSLTPARAM (page 200-15)	Sets the value of a top-level stylesheet parameter.
USENULLATTRIBUTEINDICATOR (page 200-15)	Specifies weather to use an XML attribute to indicate NULLness.
USETYPEFORCOLLELEMTAG (page 200-16)	Tells the XSU to use the collection element's type name as the collection element tag name.

200.4.1 CLOSECONTEXT

This procedure closes or deallocates a particular query context

Syntax

```
PROCEDURE CLOSECONTEXT(
  ctxHdl IN ctxType);
```

Table 200-4 CLOSECONTEXT Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

200.4.2 GETDTD

Generates and returns the DTD based on the SQL query used to initialize the context. The options are described in the following table.

Syntax

Function that generates the DTD based on the SQL query that is used to initialize the context.

```
FUNCTION GETDTD(
  ctxHdl IN ctxType,
  withVer IN BOOLEAN := false)
RETURN CLOB;
```

Procedure that generates the DTD based on the SQL query that is used to initialize the context. Specifies the output CLOB for XML document result.

```
PROCEDURE GETDTD(
  ctxHdl IN ctxType,
  xDoc IN CLOB,
  withVer IN BOOLEAN := false);
```

Parameters

Table 200-5 GETDTD Subprogram Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
withVer	(IN)	Generate the version information? TRUE for yes.
xDoc	(IN)	CLOB into which to write the generated XML document.

200.4.3 GETEXCEPTIONCONTENT

GETEXCEPTIONCONTENT returns the thrown exception's SQL error code and error message through the procedure's OUT parameters.

This procedure is a work around the JVM functionality that obscures the original exception by its own exception, rendering PL/SQL unable to access the original exception content.

Syntax

```
PROCEDURE GETEXCEPTIONCONTENT(
  ctxHdl IN ctxType,
  errNo OUT NUMBER,
  errMsg OUT VARCHAR2);
```

Parameters

Table 200-6 GETEXCEPTIONCONTENT Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
errNo	(OUT)	Error number.
errMsg	(OUT)	Error message.

200.4.4 GETNUMROWSPROCESSED

Return the number of rows processed for the query.

Syntax

```
FUNCTION GETNUMROWSPROCESSED(
  ctxHdl IN ctxType)
RETURN NUMBER;
```

Table 200-7 GETNUMROWSPROCESSED Function Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

200.4.5 GETVERSION

The `GETVERSION` procedure prints the version of the XSU in use.

Syntax

```
PROCEDURE GETVERSION();
```

200.4.6 GETXML

`GETXML` creates the new context, executes the query, gets the XML back and closes the context. This is a convenience function. The context does not need to be explicitly opened or closed.

Syntax

This function uses a SQL query in string form.

```
FUNCTION GETXML(
  sqlQuery IN VARCHAR2,
  metaType IN NUMBER := NONE)
RETURN CLOB;
```

This function uses a SQL query in `CLOB` form.

```
FUNCTION GETXML(
  sqlQuery IN CLOB,
```

```
metaType IN NUMBER := NONE)
RETURN CLOB;
```

This function generates the XML document based on a SQL query used to initialize the context.

```
FUNCTION GETXML(
  ctxHdl IN ctxType,
  metaType IN NUMBER := NONE)
RETURN CLOB;
```

This procedure generates the XML document based on the SQL query used to initialize the context.

```
PROCEDURE GETXML(
  ctxHdl IN ctxType,
  xDoc IN CLOB,
  metaType IN NUMBER := NONE);
```

Parameters

Table 200-8 GETXML Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
metaType	(IN)	XML metadatatype (NONE, DTD, or SCHEMA).
sqlQuery	(IN)	SQL query.
xDoc	(IN)	CLOB into which to write the generated XML document.

200.4.7 NEWCONTEXT

NEWCONTEXT creates a save context and returns the context handle.

Syntax

```
FUNCTION NEWCONTEXT(
  sqlQuery IN VARCHAR2)
RETURN ctxType;
```

```
FUNCTION NEWCONTEXT(
  sqlQuery IN CLOB)
RETURN ctxType;
```

Parameters

Table 200-9 NEWCONTEXT Function Parameters

Parameter	IN / OUT	Description
sqlQuery	(IN)	SQL query, the results of which to convert to XML.

200.4.8 PROPAGATEORIGINALEXCEPTION

The `PROPAGATEORIGINALEXCEPTION` procedure specifies whether to throw every original exception raised or to wrap it in an `OracleXMLSQLException`.

Syntax

```
PROCEDURE PROPAGATEORIGINALEXCEPTION(
  ctxHdl IN ctxType,
  flag IN BOOLEAN);
```

Parameters

Table 200-10 PROPAGATEORIGINALEXCEPTION Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	TRUE if want to propagate original exception, FALSE to wrap in <code>OracleXMLException</code> .

200.4.9 REMOVEXSLTPARAM

This procedure removes the value of a top-level stylesheet parameter. If no stylesheet is registered, this method is not operational.

Syntax

```
PROCEDURE REMOVEXSLTPARAM(
  ctxHdl IN ctxType,
  name IN VARCHAR2);
```

Table 200-11 REMOVEXSLTPARAM Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Name of the top level stylesheet parameter.

200.4.10 SETBINDVALUE

This procedure sets a value for a particular bind name.

Syntax

```
PROCEDURE SETBINDVALUE(
  ctxHdl IN ctxType,
  bindName IN VARCHAR2,
  bindValue IN VARCHAR2);
```

Table 200-12 SETBINDVALUE Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
bindName	(IN)	Bind name.
bindValue	(IN)	Bind value.

200.4.11 SETCOLLIDATTRNAME

This procedure sets the name of the id attribute of the collection element's separator tag.

Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

Syntax

```
PROCEDURE SETCOLLIDATTRNAME(
  ctxHdl IN ctxType,
  attrName IN VARCHAR2);
```

Table 200-13 SETCOLLIDATTRNAME Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
attrName	(IN)	Attribute name.

200.4.12 SETDATAHEADER

This procedure sets the XML data header.

The data header is an XML entity that is appended at the beginning of the query-generated XML entity, the `rowset`. The two entities are enclosed by the `docTag` argument. The last data header specified is used. Passing in `NULL` for the `header` parameter unsets the data header.

Syntax

```
PROCEDURE SETDATAHEADER(
  ctxHdl IN ctxType,
  header IN CLOB := null,
  tag IN VARCHAR2 := null);
```

Table 200-14 SETDATAHEADER Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
header	(IN)	Header.
tag	(IN)	Tag used to enclose the data header and the rowset.

200.4.13 SETDATEFORMAT

This procedure sets the format of the generated dates in the XML document.

The syntax of the date format pattern, the date mask, should conform to the requirements of the `java.text.SimpleDateFormat` class. Setting the mask to `NULL` or an empty string sets the default mask `-- DEFAULT_DATE_FORMAT`.

Syntax

```
PROCEDURE SETDATEFORMAT(
  ctxHdl IN ctxType,
  mask IN VARCHAR2);
```

Table 200-15 SETDATEFORMAT Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
mask	(IN)	The date mask.

200.4.14 SETENCODINGTAG Procedure

This procedure sets the encoding processing instruction in the XML document.

Syntax

```
PROCEDURE SETENCODINGTAG(
  ctxHdl IN ctxType,
  enc IN VARCHAR2 := DB_ENCODING);
```

Table 200-16 SETENCODINGTAG Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
enc	(IN)	The encoding to use.

200.4.15 SETERRORTAG Procedure

This procedure sets the tag to be used to enclose the XML error documents.

Syntax

```
PROCEDURE SETERRORTAG(
  ctxHdl IN ctxType,
  tag IN VARCHAR2);
```

Table 200-17 SETERRORTAG Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

Table 200-17 (Cont.) SETERRORTAG Procedure Parameters

Parameter	IN / OUT	Description
tag	(IN)	Tag name.

200.4.16 SETMAXROWS Procedure

This procedure sets the maximum number of rows to be converted to XML. By default, there is no set maximum.

Syntax

```
PROCEDURE SETMAXROWS (
  ctxHdl IN ctxType,
  rows IN NUMBER);
```

Table 200-18 SETMAXROWS Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
rows	(IN)	Maximum number of rows to generate.

200.4.17 SETMETAHEADER Procedure

This procedure sets the XML meta header.

When set, the header is inserted at the beginning of the metadata part (DTD or XMLSchema) of each XML document generated by this object. The last meta header specified is used. Passing in `NULL` for the `header` parameter unsets the meta header.

Syntax

```
PROCEDURE SETMETAHEADER(
  ctxHdl IN ctxType,
  header IN CLOB := null);
```

Table 200-19 SETMETAHEADER Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
Header	(IN)	Header.

200.4.18 SETRAISEEXCEPTION

This procedure specifies whether to throw raised exceptions.

If this call isn't made or if `FALSE` is passed to the `flag` argument, the XSU catches the SQL exceptions and generates an XML document from the exception message.

Syntax

```
PROCEDURE SETRAISEEXCEPTION(
  ctxHdl IN ctxType,
  flag IN BOOLEAN:=true);
```

Table 200-20 SETRAISEEXCEPTION Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Throw raised exceptions? TRUE for yes, otherwise FALSE.

200.4.19 SETRAISENOROWSEXCEPTION

This procedure specifies whether to throw an `OracleXMLNoRowsException` when the generated XML document is empty. By default, the exception is not thrown.

Syntax

```
PROCEDURE SETRAISENOROWSEXCEPTION(
  ctxHdl IN ctxType,
  flag IN BOOLEAN:=false);
```

Table 200-21 SETRAISENOROWSEXCEPTION Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Throws an <code>OracleXMLNoRowsException</code> if set to TRUE.

200.4.20 SETROWIDATTRNAME

This procedure sets the name of the id attribute of the row enclosing tag. Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

Syntax

```
PROCEDURE SETROWIDATTRNAME(
  ctxHdl IN ctxType,
  attrName IN VARCHAR2);
```

Table 200-22 SETROWIDATTRNAME Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
attrName	(IN)	Attribute name.

200.4.21 SETROWIDATTRVALUE

This procedure specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag.

Passing `NULL` or an empty string for the `colName` assigns the row count value (0, 1, 2 and so on) to the row id attribute.

Syntax

```
PROCEDURE SETROWIDATTRVALUE(  
  ctxHdl IN ctxType,  
  colName IN VARCHAR2);
```

Table 200-23 SETROWIDATTRVALUE Procedure Parameters

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>colName</code>	(IN)	Column whose value is to be assigned to the row id attribute.

200.4.22 SETROWSETTAG

This procedure sets the tag to be used to enclose the XML dataset.

Syntax

```
PROCEDURE SETROWSETTAG(  
  ctxHdl IN ctxType,  
  tag IN VARCHAR2);
```

Table 200-24 SETROWSETTAG Procedure Parameters

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>tag</code>	(IN)	Tag name.

200.4.23 SETROWTAG

This procedure sets the tag to be used to enclose the XML element corresponding to a `db.record`.

Syntax

```
PROCEDURE SETROWTAG(  
  ctxHdl IN ctxType,  
  tag IN VARCHAR2);
```

Table 200-25 SETROWTAG Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

200.4.24 SETSKIPROWS

SETSKIPROWS sets the number of rows to skip. By default, 0 rows are skipped.

Syntax

```
PROCEDURE SETSKIPROWS(
  ctxHdl IN ctxType,
  rows IN NUMBER);
```

Table 200-26 SETSKIPROWS Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
rows	(IN)	Maximum number of rows to skip.

200.4.25 SETSQLTOXMLNAMEESCAPING

This procedure turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

Syntax

```
PROCEDURE SETSQLTOXMLNAMEESCAPING(
  ctxHdl IN ctxType,
  flag IN BOOLEAN := true);
```

Table 200-27 SETSQLTOXMLNAMEESCAPING Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Turn on escaping? TRUE for yes, otherwise FALSE.

200.4.26 SETSTYLESHEETHEADER

SETSTYLESHEETHEADER sets the stylesheet header (the stylesheet processing instructions) in the generated XML document.

Passing NULL for the uri argument will unset the stylesheet header and the stylesheet type.

Syntax

```
PROCEDURE SETSTYLESHEETHEADER(
  ctxHdl IN ctxType,
  uri IN VARCHAR2,
  type IN VARCHAR2 := 'text/xsl');
```

Table 200-28 SETSTYLESHEETHEADER Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
uri	(IN)	Stylesheet URI.
type	(IN)	Stylesheet type; defaults to "text/xsl".

200.4.27 SETTAGCASE

SETTAGCASE specifies the case of the generated XML tags.

Syntax

```
PROCEDURE SETTAGCASE(
  ctxHdl IN ctxType,
  tCase IN NUMBER);
```

Table 200-29 SETTAGCASE Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tCase	(IN)	The tag's case: <ul style="list-style-type: none"> • 0 for as are • 1 for lower case • 2 for upper case

200.4.28 SETXSLT

SETXSLT registers a stylesheet to be applied to generated XML. If a stylesheet was already registered, it is replaced by the new one. Passing `NULL` for the `uri` argument, or `NULL` or an empty string for the `stylesheet` argument, *unsets* the stylesheet header and `type`.

Syntax

To unregister the stylesheet, pass in `NULL` for the URI.

```
PROCEDURE SETXSLT(
  ctxHdl IN ctxType,
  uri IN VARCHAR2,
  ref IN VARCHAR2 := null);
```

To unregister the stylesheet pass in `NULL` or an empty string for the stylesheet.

```
PROCEDURE SETXSLT(
  ctxHdl IN ctxType,
  stylesheet CLOB,
  ref IN VARCHAR2 := null);
```

Parameters

Table 200-30 SETXSLT Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
uri	(IN)	Stylesheet URI.
stylesheet	(IN)	Stylesheet.
ref	(IN)	URL to include, imported and external entities.

200.4.29 SETXSLTPARAM

SETXSLTPARAM sets the value of a top-level stylesheet parameter.

The parameter value is expected to be a valid XPath expression; the string literal values would therefore have to be quoted explicitly. If no stylesheet is registered, this method is not operational.

Syntax

```
PROCEDURE SETXSLTPARAM(
  ctxHdl IN ctxType,
  name IN VARCHAR2,
  value IN VARCHAR2);
```

Table 200-31 SETXSLTPARAM Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Name of the top level stylesheet parameter.
value	(IN)	Value to be assigned to the stylesheet parameter.

200.4.30 USENULLATTRIBUTEINDICATOR

This procedure specifies whether to use an XML attribute to indicate NULLness, or to do this by omitting the particular entity in the XML document.

Syntax

```
PROCEDURE SETNULLATTRIBUTEINDICATOR(
  ctxHdl IN ctxType,
  flag IN BOOLEAN);
```

Table 200-32 USENULLATTRIBUTEINDICATOR Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Sets attribute to NULL if TRUE, omits from XML document if FALSE.

200.4.31 USETYPEFORCOLLELEMTAG

This procedure specifies whether to use the collection element's type name as its element tag name.

By default, the tag name for elements of a collection is the collection's tag name followed by `_item`.

Syntax

```
PROCEDURE USETYPEFORCOLLELEMTAG(
  ctxHdl IN ctxType,
  flag IN BOOLEAN := true);
```

Table 200-33 USETYPEFORCOLLELEMTAG Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Turn on use of the type name?

201

DBMS_XMLSAVE

DBMS_XMLSAVE provides XML to database-type functionality.

This chapter contains the following topics:

- [Security Model](#) (page 201-1)
- [Constants](#) (page 201-1)
- [Types](#) (page 201-1)
- [Summary of DBMS_XMLSAVE Subprograms](#) (page 201-2)

See Also:

Oracle XML DB Developer's Guide

201.1 DBMS_XMLSAVE Security Model

Owned by XDB, the DBMS_XMLSAVE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC

Subprograms in this package are executed using the privileges of the current user.

201.2 DBMS_XMLSAVE Constants

The DBMS_XMLSAVE includes constants to use when specifying parameter values.

These constants are defined in the following table.

Table 201-1 Constants of DBMS_XMLSAVE

Constant	Description
DEFAULT_ROWTAG	The default tag name for the element corresponding to database records -- ROW
DEFAULT_DATE_FORMAT	Default date mask: 'MM/dd/yyyy HH:mm:ss'
MATCH_CASE	Used to specify that when mapping XML elements to database entities; the XSU should be case sensitive.
IGNORE_CASE	Used to specify that when mapping XML elements to database entities the XSU should be case insensitive.

201.3 Types

The DBMS_XMLSAVE subprograms use the ctxType Type.

Table 201-2 *Types of DBMS_XMLSAVE*

Type	Description
ctxType	The type of the query context handle. The type of the query context handle. This the return type of NEWCONTEXT (page 201-5).

201.4 Summary of DBMS_XMLSAVE Subprograms

This table lists the DBMS_XMLSAVE subprograms and briefly describes them.

Table 201-3 **DBMS_XMLSAVE Package Subprograms**

Method	Description
CLEARKEYCOLUMNLIST (page 201-3)	Clears the key column list.
CLEARUPDATECOLUMNLIST (page 201-3)	Clears the update column list.
CLOSECONTEXT (page 201-3)	It closes/deallocates a particular save context.
DELETEXML (page 201-4)	Deletes records specified by data from the XML document, from the table specified at the context creation time.
GETEXCEPTIONCONTENT (page 201-4)	Returns the thrown exception's error code and error message.
INSERTXML (page 201-5)	Inserts the XML document into the table specified at the context creation time.
NEWCONTEXT (page 201-5)	Creates a save context, and returns the context handle.
PROPAGATEORIGINALEXCEPTION (page 201-6)	Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather than, wrapping it with an <code>OracleXMLSQLException</code> .
REMOVEXSLTPARAM (page 201-6)	Removes the value of a top-level stylesheet parameter
SETBATCHSIZE (page 201-7)	Changes the batch size used during DML operations.
SETCOMMITBATCH (page 201-7)	Sets the commit batch size.
SETDATEFORMAT (page 201-8)	Sets the format of the generated dates in the XML document.
SETIGNORECASE (page 201-8)	The XSU does mapping of XML elements to database.
SETKEYCOLUMN (page 201-8)	This methods adds a column to the key column list.
SETPRESERVEWHITESPACE (page 201-9)	Tells the XSU whether to preserve whitespace or not.
SETROWTAG (page 201-9)	Names the tag used in the XML document to enclose the XML elements corresponding to database.
SETSQLTOXMLNAMEESCAPING (page 201-10)	This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.
SETUPDATECOLUMN (page 201-10)	Adds a column to the update column list.

Table 201-3 (Cont.) DBMS_XMLSAVE Package Subprograms

Method	Description
SETXSLT (page 201-10)	Registers a XSL transform to be applied to the XML to be saved.
SETXSLTPARAM (page 201-11)	Sets the value of a top-level stylesheet parameter.
UPDATEXML (page 201-12)	Updates the table given the XML document.

201.4.1 CLEARKEYCOLUMNLIST

This procedure clears the key column list.

Syntax

```
PROCEDURE clearKeyColumnList(
    ctxHdl IN ctxType);
```

Parameters

Table 201-4 CLEARKEYCOLUMNLIST Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

201.4.2 CLEARUPDATECOLUMNLIST

This procedure clears the update column list.

Syntax

```
PROCEDURE clearUpdateColumnList(
    ctxHdl IN ctxType);
```

Parameters

Table 201-5 CLEARUPDATECOLUMNLIST Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

201.4.3 CLOSECONTEXT

This procedure closes/deallocates a particular save context.

Syntax

```
PROCEDURE closeContext(
    ctxHdl IN ctxType);
```

Parameters**Table 201-6 CLOSECONTEXT Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

201.4.4 DELETEXML

The `DELETEXML` function deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

The options are described in the following table.

Syntax

```
FUNCTION deleteXML(
  ctxHdl IN ctxPType,
  xDoc IN VARCHAR2)
RETURN NUMBER;
```

```
FUNCTION deleteXML(
  ctxHdl IN ctxType,
  xDoc IN CLOB)
RETURN NUMBER;
```

Parameters**Table 201-7 DELETEXML Function Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

201.4.5 GETEXCEPTIONCONTENT

Through its arguments, this method returns the thrown exception's error code and error message, SQL error code.

This is to get around the fact that the JVM throws an exception on top of whatever exception was raised, rendering PL/SQL unable to access the original exception.

Syntax

```
PROCEDURE getExceptionContent(
  ctxHdl IN ctxType,
  errNo OUT NUMBER,
  errMsg OUT VARCHAR2);
```

Parameters

Table 201-8 GETEXCEPTIONCONTENT Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
errNo	(IN)	Error number.
errMsg	(IN)	Error message.

201.4.6 INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted. The options are described in the following table.

Syntax

Table 201-9 INSERTXML Function Syntax

Syntax	Description
<pre>FUNCTION insertXML(ctxHdl IN ctxType, xDoc IN VARCHAR2) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a VARCHAR2.
<pre>FUNCTION insertXML(ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a CLOB.

Parameters

Table 201-10 INSERTXML Function Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

201.4.7 NEWCONTEXT

NEWCONTEXT creates a save context and returns the context handle.

Syntax

```
FUNCTION newContext(
  targetTable IN VARCHAR2)
RETURN ctxType;
```

Parameters

Table 201-11 NEWCONTEXT Function Parameters

Parameter	IN / OUT	Description
targetTable	(IN)	The target table into which to load the XML document.

201.4.8 PROPAGATEORIGINALEXCEPTION

The `PROPAGATEORIGINALEXCEPTION` procedure tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather than, wrapping it with an `OracleXMLSQLException`.

Syntax

```
PROCEDURE propagateOriginalException(
    ctxHdl IN ctxType,
    flag IN BOOLEAN);
```

Parameters

Table 201-12 PROPAGATEORIGINALEXCEPTION Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Propagate the original exception? 0=FALSE, 1=TRUE.

201.4.9 REMOVEXSLTPARAM

This procedure removes the value of a top-level stylesheet parameter.

Syntax

```
PROCEDURE removeXSLTParam(
    ctxHdl IN ctxType,
    name IN VARCHAR2);
```

Parameters

Table 201-13 REMOVEXSLTPARAM Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Parameter name.

201.4.10 SETBATCHSIZE

This procedure changes the batch size used during DML operations.

When performing inserts, updates or deletes, it is better to batch the operations so that they get executed in one shot rather than as separate statements. The flip side is that more memory is needed to buffer all the bind values. Note that when batching is used, a commit occurs only after a batch is executed. So if one of the statement inside a batch fails, the whole batch is rolled back. This is a small price to pay considering the performance gain; nevertheless, if this behavior is unacceptable, then set the batch size to 1.

Syntax

```
PROCEDURE setBatchSize(  
    ctxHdl IN ctxType,  
    batchSize IN NUMBER);
```

Parameters

Table 201-14 SETBATCHSIZE Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
batchSize	(IN)	Batch size.

201.4.11 SETCOMMITBATCH

This procedure sets the commit batch size.

The commit batch size refers to the number or records inserted after which a commit should follow. If `batchSize` is less than 1 or the session is in "auto-commit" mode, using the XSU does not make any explicit commits. By default, `commitBatch` is 0.

Syntax

```
PROCEDURE setCommitBatch(  
    ctxHdl IN ctxType,  
    batchSize IN NUMBER);
```

Parameters

Table 201-15 SETCOMMITBATCH Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
batchSize	(IN)	Commit batch size.

201.4.12 SETDATEFORMAT

This procedure sets the format of the generated dates in the XML document.

The syntax of the date format pattern, the date mask, should conform to the requirements of the class `java.text.SimpleDateFormat`. Setting the mask to `<code>null</code>` or an empty string unsets the date mask.

Syntax

```
PROCEDURE setDateFormat(
    ctxHdl IN ctxType,
    mask IN VARCHAR2);
```

Parameters

Table 201-16 SETDATEFORMAT Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
mask	(IN)	Syntax of the date format pattern.

201.4.13 SETIGNORECASE

This function tells the XSU whether to ignore case when the XSU maps XML elements to database columns/attributes. This matching is based on the element names (XML tags).

Syntax

```
PROCEDURE setIgnoreCase(
    ctxHdl IN ctxType,
    flag IN NUMBER);
```

Parameters

Table 201-17 SETIGNORECASE Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Ignore tag case in the XML doc? 0=FALSE, 1=TRUE.

201.4.14 SETKEYCOLUMN

This method adds a column to the "key column list".

The value for the column cannot be `NULL`. In case of update or delete, the columns in the key column list make up the `WHERE` clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations.

Syntax

```
PROCEDURE setKeyColumn(
  ctxHdl IN ctxType,
  colName IN VARCHAR2);
```

Parameters**Table 201-18 SETKEYCOLUMN Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the key column list; cannot be NULL.

201.4.15 SETPRESERVEWHITESPACE

This procedure tells the XSU whether or not to preserve whitespace.

Syntax

```
PROCEDURE setPreserveWhitespace(
  ctxHdl IN ctxType,
  flag IN BOOLEAN := true);
```

Parameters**Table 201-19 SETPRESERVEWHITESPACE Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Should XSU preserve whitespace?

201.4.16 SETROWTAG

This procedure names the tag used in the XML document to enclose the XML elements corresponding to db. records.

Syntax

```
PROCEDURE setRowTag(
  ctxHdl IN ctxType,
  tag IN VARCHAR2);
```

Parameters**Table 201-20 SETROWTAG Procedure Parameters**

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

201.4.17 SETSQLTOXMLNAMEESCAPING

SETSQLTOXMLNAMEESCAPING turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

Syntax

```
PROCEDURE setSQLToXMLNameEscaping(
    ctxHdl IN ctxType,
    flag IN BOOLEAN := true);
```

Parameters

Table 201-21 SETSQLTOXMLNAMEESCAPING Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Turn on escaping?

201.4.18 SETUPDATECOLUMN

SETUPDATECOLUMN adds a column to the update column list.

In case of insert, the default is to insert values to all the columns in the table. In case of updates, the default is to only update the columns corresponding to the tags present in the ROW element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Syntax

```
PROCEDURE setUpDateColumn(
    ctxHdl IN ctxType,
    colName IN VARCHAR2);
```

Parameters

Table 201-22 SETUPDATECOLUMN Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the update column list.

201.4.19 SETXSLT

SETXSLT registers an XSL transform to be applied to the XML to be saved.

If a stylesheet was already registered, it gets replaced by the new one. To un-register the stylesheet, pass in null for the URI. The options are described in the following table.

Syntax

Table 201-23 SETXSLT Procedure Syntax

Syntax	Description
<pre>PROCEDURE setXSLT(ctxHdl IN ctxType, uri IN VARCHAR2, ref IN VARCHAR2 := null);</pre>	Passes in the stylesheet through a URI.
<pre>PROCEDURE setXSLT(ctxHdl IN ctxType, stylesheet IN CLOB, ref IN VARCHAR2 := null);</pre>	Passes in the stylesheet through a CLOB.

Parameters

Table 201-24 SETXSLT Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
uri	(IN)	URI to the stylesheet to register.
ref	(IN)	URL for include, import, and external entities.
stylesheet	(IN)	CLOB containing the stylesheet to register.

201.4.20 SETXSLTPARAM

SETXSLTPARAM sets the value of a top-level stylesheet parameter.

The parameter is expected to be a valid XPath expression; literal values would therefore have to be explicitly quoted.

Syntax

```
PROCEDURE setXSLTParam(
  ctxHdl IN ctxType,
  name IN VARCHAR2,
  value IN VARCHAR2);
```

Parameters

Table 201-25 SETXSLTPARAM Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Parameter name.
value	(IN)	Parameter value as an XPath expression

201.4.21 UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated.

The options are described in the following table.

Syntax

```
FUNCTION updateXML(  
    ctxHdl IN ctxType,  
    xDoc IN VARCHAR2)  
RETURN NUMBER;
```

```
FUNCTION updateXML(  
    ctxHdl IN ctxType,  
    xDoc IN CLOB)  
RETURN NUMBER;
```

Parameters

Table 201-26 UPDATEXML Function Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

DBMS_XMLSCHEMA

DBMS_XMLSCHEMA package provides procedures to manage XML schemas.

It is created by script `dbmsxsch.sql` during Oracle database installation.

This chapter contains the following topics:

- [Overview](#) (page 202-1)
- [Deprecated Subprograms](#) (page 202-1)
- [Security Model](#) (page 202-2)
- [Constants](#) (page 202-2)
- [Views](#) (page 202-4)
- [Operational Notes](#) (page 202-4)
- [Summary of DBMS_XMLSCHEMA Subprograms](#) (page 202-5)

See Also:

Oracle XML DB Developer's Guide

202.1 DBMS_XMLSCHEMA Overview

The DBMS_XMLSCHEMA package uses subprograms to manage XML schemas.

These subprograms provide the following XML schema management::

- Register an XML schema
- Delete a previously registered XML schema
- Re-compile a previously registered XML schema
- Generate an XML schema
- Evolves an XML schema

202.2 DBMS_XMLSCHEMA Deprecated Subprograms

These subprograms are deprecated with release Oracle Database 12c.

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only

- [GENERATESCHEMA Function](#) (page 202-9)
- [GENERATESCHEMAS Function](#) (page 202-10)

202.3 DBMS_XMLSCHEMA Security Model

Owned by XDB, the DBMS_XMLSCHEMA package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

202.4 DBMS_XMLSCHEMA Constants

The DBMS_XMLSCHEMA package defines several constants to use when specifying parameter values.

These constants are shown in following tables.

- [Table 202-1](#) (page 202-2)
- [Table 202-2](#) (page 202-3)
- [Table 202-3](#) (page 202-3)

Table 202-1 DBMS_XMLSCHEMA Constants - Delete Option

Constant	Type	Value	Description
DELETE_RESTRICT	NUMBER	1	Deletion of an XML schema fails if there are any tables or XML schemas that depend on it
DELETE_INVALIDATE	NUMBER	2	Deletion of an XML schema does not fail if there are tables or XML schemas that depend on it. All dependent tables and schemas are invalidated.
DELETE_CASCADE	NUMBER	3	Deletion of an XML schema also drops all SQL types and default tables associated with it. SQL types are dropped only if <code>gentypes</code> argument was set to <code>TRUE</code> during registration of the XML schema. However, deletion of the XML schema fails if there are any instance documents conforming to the schema or any dependent XML schemas.
DELETE_CASCADE_FORCE	NUMBER	4	This option is similar to <code>DELETE_CASCADE</code> except that it does not check for any stored instance documents conforming to the schema or any dependent XML schemas. Also, it ignores any errors.

Table 202-2 *DBMS_XMLSCHEMA Constants - Enable Hierarchy*

Constant	Type	Value	Description
ENABLE_HIERARCHY_NONE	PLS_INTEGER	1	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will not be called on any tables created while registering that schema
ENABLE_HIERARCHY_CONTENTS	PLS_INTEGER	2	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called for all tables created during schema registration with <code>hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS</code>
ENABLE_HIERARCHY_RESMETADATA	PLS_INTEGER	3	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called on all tables created during schema registration with <code>hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA</code> . A. Users should pass in <code>DBMS_XMLSCHEMA.ENABLE_RESMETADATA</code> for schemas they intend to use as resource metadata tables.

Table 202-3 *DBMS_XMLSCHEMA Constants - Register CSID*

Constant	Type	Value	Description
REGISTER_NODOCID	NUMBER	1	If a schema is registered for metadata use (using the value <code>ENABLE_HIER_RESMETADATA</code> for parameter <code>enablehierarchy</code> during registration), a column named <code>DOCID</code> is added to all tables created during schema registration. This constant can be used in the options argument of <code>REGISTERSHEMA</code> to prevent the creation of this column if the user wishes to optimize on storage
REGISTER_CSID_NULL	NUMBER	-1	If user wishes to not specify the character set of the input schema document when invoking <code>REGISTERSHEMA</code> , this value can be used for the <code>csid</code> parameter

202.5 Views

This table lists the views used by the `DBMS_XMLSCHEMA` package

The columns of these views are described in detail in the *Oracle Database Reference*

Table 202-4 Summary of Views used by DBMS_XMLSCHEMA

Schema	Description
<code>USER_XML_SCHEMAS</code>	All registered XML Schemas owned by the user
<code>ALL_XML_SCHEMAS</code>	All registered XML Schemas usable by the current user
<code>DBA_XML_SCHEMAS</code>	All registered XML Schemas in the database
<code>DBA_XML_TABLES</code>	All XMLType tables in the system
<code>USER_XML_TABLES</code>	All XMLType tables owned by the current user
<code>ALL_XML_TABLES</code>	All XMLType tables usable by the current user
<code>DBA_XML_TAB_COLS</code>	All XMLType table columns in the system
<code>USER_XML_TAB_COLS</code>	All XMLType table columns in tables owned by the current user
<code>ALL_XML_TAB_COLS</code>	All XMLType table columns in tables usable by the current user
<code>DBA_XML_VIEWS</code>	All XMLType views in the system
<code>USER_XML_VIEWS</code>	All XMLType views owned by the current user
<code>ALL_XML_VIEWS</code>	All XMLType views usable by the current user
<code>DBA_XML_VIEW_COLS</code>	All XMLType view columns in the system
<code>USER_XML_VIEW_COLS</code>	All XMLType view columns in views owned by the current user
<code>ALL_XML_VIEW_COLS</code>	All XMLType view columns in views usable by the current user

202.6 DBMS_XMLSCHEMA Operational Notes

There are guidelines for using in-place XML schema evolution.

Before you perform an in-place XML-schema evolution, you should follow these preparatory steps:

1. Back up all existing data (instance documents) for the XML schema that will be evolved.
2. Perform a dry run using trace only, that is, without actually evolving the XML schema or updating any instance documents, to produce a trace of the update operations that would be performed during evolution. To do this, set the flag parameter value to only `INPLACE_TRACE`. Do not also use `INPLACE_EVOLVE`. After performing the dry run, examine the trace file, verifying that the listed DDL operations are in fact those that you intend.

202.7 Summary of DBMS_XMLSCHEMA Subprograms

This table lists the DBMS_XMLSCHEMA subprograms and briefly describes them.

Table 202-5 DBMS_XMLSCHEMA Package Subprograms

Method	Description
COMPILESCHEMA Procedure (page 202-5)	Used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state.
COPYEVOLVE Procedure (page 202-6)	Evolves registered schemas so that existing XML instances remain valid
DELETESCHEM Procedure (page 202-8)	Removes the schema from the database
GENERATESCHEM Function (page 202-9)	Generates an XML schema from an oracle type name
GENERATESCHEMAS Function (page 202-10)	Generates several XML schemas from an oracle type name
INPLACEEVOLVE Procedure (page 202-11)	Evolves registered schemas by propagating schema changes to object types and tables
PURGESCHEM Procedure (page 202-13)	Removes the XML schema
REGISTERSCHEM Procedures (page 202-13)	Registers the specified schema for use by Oracle. This schema can then be used to store documents conforming to this.
REGISTERURI Procedure (page 202-17)	Registers an XML schema specified by a URI name

202.7.1 COMPILESCHEMA Procedure

This procedure can be used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. Can result in a `ORA-31001` exception: invalid resource handle or path name.

Syntax

```
DBMS_XMLSCHEMA.COMPILESCHEMA(  
    schemaur1 IN VARCHAR2);
```

Parameters

Table 202-6 COMPILESCHEMA Procedure Parameters

Parameter	Description
schemaur1	URL identifying the schema

202.7.2 COPYEVOLVE Procedure

This procedure evolves registered schemas so that existing XML instances remain valid.

This procedure is accomplished in according to the following basic scenario (alternative actions are controlled by the procedure's parameters):

- copies data in schema based `XMLType` tables to temporary table storage
- drops old tables
- deletes old schemas
- registers new schemas
- creates new `XMLType` tables
- Populates new tables with data in temporary storage; auxiliary structures (constraints, triggers, indexes, and others) are not preserved
- drops temporary tables

See Also:

- "Schema Evolution" chapter of the *Oracle XML DB Developer's Guide* for examples on how to evolve existing schemas
- *Oracle Database Error Messages* for information on exceptions specific to schema evolution, ORA-30142 through ORA-30946.

Syntax

```
DBMS_XMLSCHEMA.COPYEVOLVE(
  schemaurls      IN  XDB$STRUBG_LIST_T,
  newschemas      IN  XMLSequenceType,
  transforms      IN  XMLSequenceType :=NULL,
  preserveolddocs IN  BOOLEAN :=FALSE,
  maptablename    IN  VARCHAR2 :=NULL,
  generatetables  IN  BOOLEAN :=TRUE,
  force           IN  BOOLEAN :=FALSE,
  schemaowners    IN  XDB$STRING_LIST_T :=NULL,
  parallelDegree  IN  PLS_INTEGER := 0,
  options         IN  PLS_INTEGER := 0);
```

Parameters

Table 202-7 COPYEVOLVE Procedure Parameters

Parameter	Description
<code>schemaurls</code>	VARRAY of URLs of all schemas to be evolved. Should include the dependent schemas. Unless the <code>FORCE</code> parameter is <code>TRUE</code> , URLs should be in the order of dependency.
<code>newschemas</code>	VARRAY of new schema documents. Should be specified in same order as the corresponding URLs.

Table 202-7 (Cont.) COPYEVOLVE Procedure Parameters

Parameter	Description
transforms	VARRAY of transforming XSL documents to be applied to schema-based documents. Should be specified in same order as the corresponding URLs. Optional if no transformations are required.
preserveolddocs	Default is FALSE, and temporary tables with old data are dropped. If TRUE, these table are still available after schema evolution is complete.
maptabname	Specifies the name of the table mapping permanent to temporary tables during the evolution process. Valid columns are: <ul style="list-style-type: none"> • SCHEMA_URL - VARCHAR2(700) - URL of schema to which this table conforms • SCHEMA_OWNER - VARCHAR2(30) - Owner of the schema • ELEMENT_NAME - VARCHAR2(256) - Element to which this table conforms • TAB_NAME - VARCHAR2(65) - Qualified table name: <owner_name>.<table_name> • COL_NAME - VARCHAR2(4000) - Name of the column (NULL for XMLType tables) • TEMP_TABNAME - VARCHAR2(30) - Name of temporary tables which holds data for this table.
generatetables	Default is TRUE, and new tables will be generated. If FALSE: <ul style="list-style-type: none"> • new tables will not be generated after registration of new schemas • preserveolddocs must be TRUE • maptablename must be non-NULL
force	Default is FALSE. If TRUE, ignores errors generated during schema evolution. Used when there are circular dependencies among schemas to ensure that all schemas are stored despite possible errors in registration.
schemaowners	VARRAY of names of schema owners. Should be specified in same order as the corresponding URLs. Default is NULL, assuming that all schemas are owned by the current user.
paralleldegree	Specifies the degree of parallelism to be used in a PARALLEL hint during the data copy stage of the evolution. If this is 0 (default), the PARALLEL hint will not be given in the data copy statements.
options	Currently, the only supported option is COPYEVOLVE_BINARY_XML which lets you register the new schemas for binary XML and create the new tables/columns with binary XML as the storage type.

Usage Notes

You should back up all schemas and documents prior to invocation because [COPYEVOLVE Procedure](#) (page 202-6) deletes all conforming documents prior to implementing the schema evolution.

202.7.3 DELETESCHEMA Procedure

This procedure deletes the XML Schema specified by the URL.

Syntax

```
DBMS_XMLSCHEMA.DELETESCHEMA(
    schemaur1      IN  VARCHAR2,
    delete_option IN  PLS_INTEGER := DELETE_RESTRICT);
```

See Also:

"XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Parameters

Table 202-8 DELETESCHEMA Procedure Parameters

Parameter	Description
schemaur1	URL identifying the schema to be deleted
delete_option	Delete options: <ul style="list-style-type: none"> DELETE_RESTRICT - Schema deletion fails if there are any tables or schemas that depend on this schema DELETE_INVALIDATE - Schema deletion does not fail if there are any dependencies. Instead, it simply invalidates all dependent objects. DELETE_CASCADE - Schema deletion will also drop all default SQL types and default tables. However the deletion fails if there are any stored instances conforming to this schema. DELETE_CASCADE_FORCE - Similar to DELETE_CASCADE except that it does not check for any stored instances conforming to this schema. Also, it ignores any errors.

Exceptions

Table 202-9 DELETESCHEMA Procedure Exceptions

Exception	Description
ORA-31001	Invalid resource handle or path name

202.7.4 GENERATESCHEMA Function

This **deprecated function** generates XML schema(s) from an Oracle type name. It inlines all in one schema (`XMLType`).

Note:

This subprogram is deprecated with Oracle Database 12c.

See Also:

"XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.GENERATESCHEMA(
  schemaname    IN  VARCHAR2,
  typename     IN  VARCHAR2,
  elementname  IN  VARCHAR2 := NULL,
  recurse      IN  BOOLEAN  := TRUE,
  annotate     IN  BOOLEAN  := TRUE,
  embedcoll   IN  BOOLEAN  := TRUE)
RETURN SYS.XMLTYPE;
```

Parameters

Table 202-10 GENERATESCHEMA Function Parameters

Parameter	Description
schemaname	Name of the database schema containing the type
typename	Name of the Oracle type
elementname	The name of the top level element in the XML Schema. Defaults to <code>typename</code> .
recurse	Whether or not to also generate schema for all types referred to by the type specified
annotate	Whether or not to put the SQL annotations in the XML Schema
embedcoll	Determines whether the collections should be embedded in the type which refers to them, or create a <code>complextyp</code> . Cannot be <code>FALSE</code> if annotations are turned on

Exceptions

Table 202-11 GENERATESCHEMA Function Exceptions

Exception	Description
ORA-31001	Invalid resource handle or path name

202.7.5 GENERATESCHEMAS Function

This **deprecated function** generates XML schema(s) from an Oracle type name. It returns a collection of `XMLTypeS`, one XML Schema document for each database schema.

 **Note:**

This subprogram is deprecated with Oracle Database 12c.

 **See Also:**

"XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.GENERATESCHEMAS(
  schemaname   IN  VARCHAR2,
  typename     IN  VARCHAR2,
  elementname  IN  VARCHAR2 := NULL,
  schemaurl    IN  VARCHAR2 := NULL,
  annotate     IN  BOOLEAN := TRUE,
  embedcoll   IN  BOOLEAN := TRUE )
RETURN SYS.XMLTYPE;
```

Parameters

Table 202-12 GENERATESCHEMAS Function Parameters

Parameter	Description
schemaname	Name of the database schema containing the type
typename	Name of the Oracle type
elementname	The name of the top level element in the XML Schema defaults to typeName
schemaurl	Specifies base URL where schemas will be stored, needed by top level schema for import statement
annotate	Whether or not to put the SQL annotations in the XML Schema

Table 202-12 (Cont.) GENERATESCHEMAS Function Parameters

Parameter	Description
embedcoll	Determines whether the collections be embedded in the type which refers to them, or create a <code>complextype</code> . Cannot be <code>FALSE</code> if annotations are turned on

Exceptions**Table 202-13 GENERATESCHEMAS Function Exceptions**

Exception	Description
ORA-31001	Invalid resource handle or path name

202.7.6 INPLACEEVOLVE Procedure

This procedure evolves registered schemas by propagating schema changes to object types and tables.

Syntax

```
DBMS_XMLSCHEMA.INPLACEEVOLVE(
  schemaURL  IN  VARCHAR2,
  diffXML    IN  XMLType,
  flags      IN  NUMBER);
```

Parameters**Table 202-14 INPLACEEVOLVE Procedure Parameters**

Parameter	Description
schemaurL	URL of the schema to evolve
diffXML	Changes to be applied to the schema. This is an XML document conforming to the <code>XDIFF</code> schema and specifies what changes need to be applied and the locations in the schema document where the changes are to be applied.

Table 202-14 (Cont.) INPLACEEVOLVE Procedure Parameters

Parameter	Description
flags	<p>The following bits may be set in this parameter to control the behavior of this procedure:</p> <ul style="list-style-type: none"> • <code>INPLACE_EVOLVE</code> (value 1, meaning that bit 1 is on) – Perform in-place XML schema evolution: construct a new XML schema and validate it (against the XML schema for XML schemas); construct the DDL statements needed to evolve the instance-document disk structures, execute the DDL statements, and replace the old XML schema with the new. • <code>INPLACE_TRACE</code> (value 2, meaning that bit 2 is on) – Perform all steps necessary for in-place evolution, except executing the DDL statements and overwriting the old XML schema with the new, then write both the DDL statements and the new XML schema to a trace file. <p>That is, each of the bits constructs the new XML schema, validates it, and determines the steps needed to evolve the disk structures underlying the instance documents. In addition:</p> <ul style="list-style-type: none"> • Bit <code>INPLACE_EVOLVE</code> carries out those evolution steps and replaces the old XML schema with the new. • Bit <code>INPLACE_TRACE</code> saves the evolution steps and the new XML schema in a trace file (it does not carry out the evolution steps)

Exceptions

The procedure raises exceptions in the following cases:

- An error will be raised for invalid `xPATH` expressions and for `xDIFF` documents that do not conform to the `xdiff` schema.
- Path expressions that are syntactically correct but result in an invalid node in the schema document will result in an error.
- If the schema change makes the schema an ill-formed XML document or an invalid XML schema, this will raise an error.
- Any errors resulting from `CREATE TYPE`, `ALTER TYPE` and like commands will generate error messages.

Usage Notes

- Users are required to backup all their data before attempting in-place evolution, as there is no rollback with this operation.
- A user must register their new XML schema with the database using the [REGISTERSCHEMA Procedures](#) (page 202-13) and the [REGISTERURI Procedure](#) (page 202-17) at a schema URL that is different from that of the one to be evolved. If the new schema registers successfully and is usable, only then should the user attempt to evolve the existing schema to the new schema by means of this subprogram. If the registration of the new schema is successful, then the user must delete this schema (and all its dependent objects) before attempting to evolve the schema at the old schema URL.

202.7.7 PURGESCHEMA Procedure

This procedure removes the XML schema.

See Also:

"XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.PURGESCHEMA(  
    schemaid IN RAW);
```

Parameters

Table 202-15 PURGESCHEMA Procedure Parameters

Parameter	Description
schemaid	ID of the schema to be purged

Usage Notes

- The schema should have been originally registered for binary encoding and should have been deleted in the `HIDE` mode.
- Once a schema has been deleted in `HIDE` mode, it continues to exist in the XML DB dictionary and is used for decoding already encoded documents. The user invokes this interface when there are no stored instances encoded with this schema.
- Once the schema is purged, any space used by that schema will be reclaimed and documents encoded using the schema will raise an error if an attempt is made to decode them.
- The Schema ID can be obtained from the catalog views.

202.7.8 REGISTERSCHEMA Procedures

This procedure registers the specified schema for use by the database.

The procedure is overloaded. The different functionality of each form of syntax is presented along with the definition.

Note:

As of Oracle Database 11g Release 2 (11.2) the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

 **See Also:**

"XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Syntax

Registers a schema specified as a VARCHAR2:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
  schemaurl      IN VARCHAR2,
  schemadoc      IN VARCHAR2,
  local          IN BOOLEAN := TRUE,
  gentypes       IN BOOLEAN := TRUE,
  genbean        IN BOOLEAN := FALSE,
  gentables      IN BOOLEAN := TRUE,
  force          IN BOOLEAN := FALSE,
  owner          IN VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN PLS_INTEGER := 0);
```

Registers the schema specified as a BFILE. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
  schemaurl      IN VARCHAR2,
  schemadoc      IN BFILE,
  local          IN BOOLEAN := TRUE,
  gentypes       IN BOOLEAN := TRUE,
  genbean        IN BOOLEAN := FALSE,
  force          IN BOOLEAN := FALSE,
  owner          IN VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN PLS_INTEGER := 0);
```

Registers the schema specified as a BFILE and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
  schemaurl      IN VARCHAR2,
  schemadoc      IN BFILE,
  local          IN BOOLEAN := TRUE,
  gentypes       IN BOOLEAN := TRUE,
  genbean        IN BOOLEAN := TRUE,
  gentables      IN BOOLEAN := TRUE,
  force          IN BOOLEAN := TRUE,
  owner          IN VARCHAR2 := '',
  csid           IN NUMBER,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  BLOB,
  local          IN  BOOLEAN := TRUE,
  genTypes      IN  BOOLEAN := TRUE,
  genBean       IN  BOOLEAN := FALSE,
  force         IN  BOOLEAN := FALSE,
  owner         IN  VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options       IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  BLOB,
  local          IN  BOOLEAN := TRUE,
  gentypes      IN  BOOLEAN := TRUE,
  genbean       IN  BOOLEAN := TRUE,
  gentables     IN  BOOLEAN := TRUE,
  force         IN  BOOLEAN := TRUE,
  owner         IN  VARCHAR2 := '',
  csid          IN  NUMBER,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options       IN  PLS_INTEGER := 0);
```

Registers the schema specified as a CLOB

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  CLOB,
  local          IN  BOOLEAN := TRUE,
  gentypes      IN  BOOLEAN := TRUE,
  genbean       IN  BOOLEAN := FALSE,
  force         IN  BOOLEAN := FALSE,
  owner         IN  VARCHAR2 := NULL,
  options       IN  PLS_INTEGER := 0);
```

Registers the schema specified as an XMLTYPE.

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  SYS.XMLTYPE,
  local          IN  BOOLEAN := TRUE,
  gentypes      IN  BOOLEAN := TRUE,
  genbean       IN  BOOLEAN := FALSE,
  force         IN  BOOLEAN := FALSE,
  owner         IN  VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options       IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
  schemaurl      IN  VARCHAR2,
```

```

schemadoc      IN SYS.URIType,
local          IN BOOLEAN := TRUE,
gentypes      IN BOOLEAN := TRUE,
genbean       IN BOOLEAN := FALSE,
force         IN BOOLEAN := FALSE,
owner         IN VARCHAR2 := NULL,
enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
options       IN PLS_INTEGER := 0);

```

Parameters

Table 202-16 REGISTERSHEMA Procedure Parameters

Parameter	Description
schemaur1	URL that uniquely identifies the schema document. This value is used to derive the path name of the schema document within the database hierarchy. Can be used inside <code>schemalocation</code> attribute of XML Schema import element.
schemadoc	A valid XML schema document
local	Is this a local or global schema? <ul style="list-style-type: none"> By default, all schemas are registered as local schemas, under <code>/sys/schemas/<username>/...</code> If a schema is registered as global, it is added under <code>/sys/schemas/PUBLIC/...</code> <p>You need write privileges on the directory to be able to register a schema as global.</p>
gentypes	Determines whether the schema compiler generates object types. By default, <code>TRUE</code> . If you use binary XML, you must be set <code>gentypes</code> to <code>FALSE</code> .
genbean	Determines whether the schema compiler generates Java beans. By default, <code>FALSE</code> . Oracle recommends that this parameter always be set to <code>FALSE</code> .
gentables	Determines whether the schema compiler generates default tables. By default, <code>TRUE</code>
force	If this parameter is set to <code>TRUE</code> , the schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is <code>FALSE</code> .
owner	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.
csid	Identifies the character set of the input schema document. If this value is 0, the schema document's encoding is determined by the current rule for "text/xml" MIME type.

Table 202-16 (Cont.) REGISTERSHEMA Procedure Parameters

Parameter	Description
enablehierarchy	<ul style="list-style-type: none"> ENABLE_HIERARCHY_NONE - enable hierarchy will not be called on any tables created while registering that schema ENABLE_HIERARCHY_CONTENTS - enable hierarchy will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS. This is the default. ENABLE_HIERARCHY_RESMETADATA - enable hierarchy will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables.
options	<p>Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a BITOR of the desired bits. Possible bits:</p> <ul style="list-style-type: none"> REGISTER_NODOCID - this will suppress the creation of the DOCID column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the DOCID column) REGISTER_BINARYXML - Register the schema for Binary XML REGISTER_NT_AS_IOT - Store nested tables created during schema registration as index organized tables. The default is to store nested tables as heap tables

202.7.9 REGISTERURI Procedure

This procedure registers an XML Schema specified by a URI name.

Note:

As of Oracle Database 11g Release 2 (11.2) the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

Syntax

```
DBMS_XMLSCHEMA.REGISTERURI(
  schemaurl      IN  VARCHAR2,
  schemadocuri   IN  VARCHAR2,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := FALSE,
  gentables      IN  BOOLEAN := TRUE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  options        IN  PLS_INTEGER := 0);
```

Parameters

Table 202-17 REGISTERURI Procedure Parameters

Parameter	Description
<code>schemaurl</code>	Uniquely identifies the schema document. Can be used inside <code>schemaLocation</code> attribute of XML Schema import element.
<code>schemadocuri</code>	Pathname (URI) corresponding to the physical location of the schema document. The URI path could be based on HTTP, FTP, DB or Oracle XML DB protocols. This function constructs a <code>URIType</code> instance using the <code>urifactory</code> , and invokes the REGISTERSCHEMA Procedures (page 202-13).
<code>local</code>	Determines whether this is a local or global schema. By default, all schemas are registered as local schemas, under <code>/sys/schemas/<username>/...</code> . If a schema is registered as global, it is added under <code>/sys/schemas/PUBLIC/...</code> . The user needs write privileges on the directory to register a global schema.
<code>gentypes</code>	Determines whether the compiler generate object types. By default, <code>TRUE</code> .
<code>genbean</code>	Determines whether the compiler generate Java beans. By default, <code>FALSE</code> .
<code>gentables</code>	Determines whether the compiler generate default tables. <code>TRUE</code> by default.
<code>force</code>	<code>TRUE</code> : schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is <code>FALSE</code> .
<code>owner</code>	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.
<code>options</code>	Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a <code>BITOR</code> of the desired bits. Possible bits: <ul style="list-style-type: none"> <code>REGISTER_NODOCID</code> - this will suppress the creation of the <code>DOCID</code> column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the <code>DOCID</code> column)

DBMS_XMLSCHEMA_ANNOTATE

The `DBMS_XMLSCHEMA_ANNOTATE` package provides an interface to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

This chapter contains the following topics:

- [Overview](#) (page 203-1)
- [Security Model](#) (page 203-1)
- [Summary of DBMS_XMLSCHEMA_ANNOTATE Subprograms](#) (page 203-1)

See Also:

Oracle XML DB Developer's Guide

203.1 DBMS_XMLSCHEMA_ANNOTATE Overview

The `DBMS_XMLSCHEMA_ANNOTATE` package contains procedures to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

Schema annotations influence the way the XML data is stored. For example, the default table annotation assigns a user-provided name to an XML element instead of allowing the database to generate a system name. Consequently, query plans are more readable and it is easier to create constraints on that table.

203.2 DBMS_XMLSCHEMA_ANNOTATE Security Model

Owned by `XDB`, the `DBMS_XMLSCHEMA_ANNOTATE` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

203.3 Summary of DBMS_XMLSCHEMA_ANNOTATE Subprograms

This table lists and describes the `DBMS_XMLSCHEMA_ANNOTATE` package subprograms.

Table 203-1 DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

Subprogram	Description
ADDXDBNAMESPACE Procedure (page 203-3)	Adds the XDB namespace required for XDB annotation
DISABLEDEFAULTTABLECREATION Procedure (page 203-3)	Prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element
DISABLEMAINTAINDOM Procedure (page 203-4)	Sets the DOM fidelity attribute to <code>FALSE</code>
ENABLEDEFAULTTABLECREATION Procedure (page 203-5)	Enables the creation of <code>ALL</code> top level tables by removing the empty default table name annotation
ENABLEMAINTAINDOM Procedure (page 203-5)	Sets the DOM fidelity attribute to <code>TRUE</code>
GETSCHEMAANNOTATIONS Function (page 203-6)	Creates a document containing the differences between the annotated XML schema and the original XML schema
GETSIDXDEFFROMVIEW Function (page 203-7)	Takes a <code>XMLTABLE</code> view definition on a <code>xmltype</code> column or table and it returns a <code>CLOB</code> which can be used as parameter to create a structured <code>xmlindex</code> that backs up the <code>XMLTABLE</code> view as relational table
PRINTWARNINGS Procedure (page 203-7)	Lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema
REMOVEANYSTORAGE Procedure (page 203-8)	Removes the setting of the SQL type from the <code>ANY</code> child of the complex type with the given name
REMOVEDEFAULTTABLE Procedure (page 203-8)	Removes any default table attribute given for the element. After calling this procedure, the system generates table names
REMOVEMAINTAINDOM Procedure (page 203-9)	Removes all annotations used to maintain DOM from the given schema
REMOVEOUTOFFLINE Procedure (page 203-9)	Removes any existing <code>SQLInline</code> attributes to prevent out-of-line storage
REMOVESQLCOLLTYPE Procedure (page 203-10)	Removes a SQL collection type.
REMOVESQLNAME Procedure (page 203-11)	Removes a <code>SQLNAME</code> from a global element
REMOVESQLTYPE Procedure (page 203-12)	Removes a SQL type
REMOVESQLTYPE MAPPING Procedure (page 203-12)	Removes the SQL type mapping for the given schema type.
REMOVETABLEPROPS Procedure (page 203-13)	Removes the table storage properties from the <code>CREATE TABLE</code> statement
REMOVETIMESTAMPWITHTIMEZONE Procedure (page 203-14)	Removes the setting of the <code>TimeStampWithTimeZone</code> datatype from all <code>dateTime</code> typed elements in the XML schema
SETANYSTORAGE Procedure (page 203-14)	Assigns a SQL datatype to the <code>ANY</code> child of the complex type with the given name
SETDEFAULTTABLE Procedure (page 203-15)	Sets the name of the table for the specified global element

Table 203-1 (Cont.) DBMS_XMLSCHEMA_ANNOTATE Package Subprograms

Subprogram	Description
SETOUOFFLINE Procedure (page 203-15)	Sets the <code>SQLInline</code> attribute to <code>FALSE</code>
SETSHEMAANNOTATIONS Procedure (page 203-17)	Takes the annotated differences resulting from a call to <code>DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS</code> and patches them into the provided XML schema
SETSQLCOLLTYPE Procedure (page 203-18)	Assigns a SQL type name for a collection
SETSQLNAME Procedure (page 203-19)	Assigns a name to the SQL attribute that corresponds to an element defined in the XML schema
SETSQLTYPE Procedure (page 203-20)	Assigns a SQL type to a global object
SETSQLTYPE MAPPING Procedure (page 203-21)	Defines a mapping of schema type and SQL type
SETTABLEPROPS Procedure (page 203-22)	Specifies properties in the <code>TABLE</code> storage clause that is appended to the default <code>CREATE TABLE</code> statement
SETTIMESTAMPWITH TIMEZONE E Procedure (page 203-23)	Sets the <code>TIMESTAMPWITH TIMEZONE</code> datatype to all <code>dateTime</code> typed elements in the XML schema

203.3.1 ADDXDBNAMESPACE Procedure

This procedure adds the XDB namespace required for XDB annotation.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ADDXDBNAMESPACE (
    xmlschema      IN OUT XMLTYPE);
```

Parameters

Table 203-2 ADDXDBNAMESPACE Procedure Parameters

Parameter	Description
<code>xmlschema</code>	Gets an XML Schema as <code>XMLTYPE</code> , performs the annotation and returns it

Usage Notes

This procedure is called implicitly by any other procedure that adds a schema annotation. Since there is no reason to add an XDB namespace without other annotations, this procedure is most likely called by other annotations procedures and not by the user directly.

203.3.2 DISABLEDEFAULTTABLECREATION Procedure

This procedure prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element. The first overload applies to a specified top-level element and the second applies to all top-level elements. The

procedure always overwrites. This is equivalent to using the schema annotation `xdb:defaultTable=""` for the top-level element or elements.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION (
    xmlschema          IN OUT XMLType,
    globalElementName IN VARCHAR2);
```

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION (
    xmlschema          IN OUT XMLType);
```

Parameters

Table 203-3 DISABLEDEFAULTTABLECREATION Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalElementName	Name of the global element in the schema

Example

The `purchaseOrder` element will have an annotation similar to `xdb:defaultTable=""`.

```
DECLARE
    xml_schema    XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION(xml_schema,
                                                         'purchaseOrder');
    UPDATE annotation_tab SET out = xml_schema;
END;
/
```

203.3.3 DISABLEMAINTAINDOM Procedure

This procedure sets the DOM fidelity attribute to `FALSE`.

There are two overloads. The first sets DOM fidelity attribute to `FALSE` for all complex types, and the second sets it to `FALSE` for the named complex type. This is equivalent to adding `xdb:maintainDOM="false"` on all or specified complex types respectively.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (
    xmlschema          IN OUT XMLType,
    overwrite          IN BOOLEAN default TRUE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (
    xmlschema          IN OUT XMLType,
    complexTypeName   IN VARCHAR2,
    overwrite          IN BOOLEAN default TRUE);
```

Parameters

Table 203-4 DISABLEMAINTAINDOM Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
complexTypeName	The name of the complex type
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code>

203.3.4 ENABLEDEFAULTTABLECREATION Procedure

This procedure enables the creation of ALL top level tables by removing the empty default table name annotation.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (
    xmlschema          IN OUT  XMLTYPE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (
    xmlschema          IN OUT  XMLTYPE,
    globalElementName IN      VARCHAR2);;
```

Parameters

Table 203-5 ENABLEDEFAULTTABLECREATION Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
globalElementName	Name of the global element in the schema

Usage Notes

This procedure does not affect elements that have a default table name.

203.3.5 ENABLEMAINTAINDOM Procedure

This overloaded procedure sets the DOM fidelity attribute to `TRUE`.

There are two overloads. The first sets DOM fidelity attribute to `TRUE` for all complex types, and the second sets it to `TRUE` for the named complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (
    xmlschema          IN OUT XMLType,
    overwrite          IN BOOLEAN default TRUE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (
    xmlschema          IN OUT XMLType,
```

```

complexTypeName IN VARCHAR2,
overwrite       IN BOOLEAN default TRUE);

```

Parameters

Table 203-6 ENABLEMAINTAINDOM Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
complexTypeName	The name of the complex type
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code>

203.3.6 GETSCHEMAANNOTATIONS Function

This function creates a document containing the differences between the annotated XML schema and the original XML schema.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS (
    xmlschema IN xmlType)
RETURN XMLType;

```

Parameters

Table 203-7 GETSCHEMAANNOTATIONS Function Parameters

Parameter	Description
xmlschema	The original XML schema

Return Values

This function returns the document `annotations.xml` as an `XMLType`.

Usage Notes

This function saves all annotations in one document, named `annotations`, and returns it. With this document, you can apply all annotations to a non-annotated schema, using `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS`.

`DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS` is not available on Oracle Database release 10.2 (only Oracle Database release 11.x).

See Also:

[SETSCHEMAANNOTATIONS Procedure](#) (page 203-17)

Example

For an example of `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS`, see the example in [SETSCHEMAANNOTATIONS Procedure](#) (page 203-17).

203.3.7 GETSIDXDEFFROMVIEW Function

This function takes a `XMLTABLE` view definition on a `xmltype` column or table and it returns a `CLOB` which can be used as parameter to create a structured `xmlindex` that backs up the `XMLTABLE` view as relational table.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.GETSIDXDEFFROMVIEW (  
    viewName    IN xmlType)  
    RETURN CLOB;
```

Parameters

Table 203-8 GETSIDXDEFFROMVIEW Function Parameters

Parameter	Description
viewName	The original XML schema

Return Values

This function returns a `CLOB` which can be used as parameter to create a structured `xmlindex` that backs up the `XMLTABLE` view as relational table.

203.3.8 PRINTWARNINGS Procedure

This procedure lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.PRINTWARNINGS (  
    value        IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 203-9 PRINTWARNINGS Procedure Parameters

Parameter	Description
val	For the <code>NO MATCHING ELEMENTS FOUND</code> error message to be raised <code>val</code> must be set to <code>TRUE</code> . In cases in which user wishes to suppress this warning, set to <code>FALSE</code> .

Usage Notes

If an annotation maps to more than one node in the XML schema, this raise the error `ANNOTATION MAPS TO MULTIPLE ELEMENTS`. In this case no annotation is performed, and the

user must correct the parameters to the procedure call to refer to a unique node in the XML schema.

203.3.9 REMOVEANYSTORAGE Procedure

This procedure removes the setting of the SQL type from the `ANY` child of the complex type with the given name.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEANYSTORAGE (
    xmlschema      IN OUT XMLType,
    complexTypeName IN VARCHAR2);
```

Parameters

Table 203-10 REMOVEANYSTORAGE Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated.
complexTypeName	The name of the complex type.

Usage Notes

This procedure reverses the [SETANYSTORAGE Procedure](#) (page 203-14).

203.3.10 REMOVEDEFAULTTABLE Procedure

This procedure removes any default table attribute given for the element.

After calling this procedure, the system generates table names. This procedure always overwrites.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE (
    xmlschema      IN OUT XMLTYPE,
    globalElementName IN VARCHAR2);
```

Parameters

Table 203-11 REMOVEDEFAULTTABLE Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalElementName	Name of the global element in the schema

Example

Annotations can be verified anytime using "select out from annotation_tab".

```
--The purchaseOrder element will have no annotation for defaultTable.
```

```

DECLARE
    xml_schema XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE(xml_schema,
                                                'purchaseOrder');
    UPDATE annotation_tab SET out = xml_schema;
END;
/

```

203.3.11 REMOVEMAINTAINDOM Procedure

This procedure removes all annotations used to maintain DOM from the given schema.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEMAINTAINDOM (
    xmlschema      IN OUT XMLType);

```

Parameters

Table 203-12 REMOVEMAINTAINDOM Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated

203.3.12 REMOVEOUTOFLINE Procedure

This procedure removes any existing `SQLInline` attributes to prevent out-of-line storage.

There are three overloads.

Syntax

Removes the `SQLInline` attribute for the named element.

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
    xmlschema      IN OUT XMLType,
    elementName    IN      VARCHAR2,
    elementType    IN      VARCHAR2,
    overwrite      IN      BOOLEAN default TRUE);

```

Removes the `SQLInline` attribute for the object specified by its global object and local element names.

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
    xmlschema      IN OUT XMLType,
    globalObject    IN      VARCHAR2,
    globalObjectName IN    VARCHAR2,
    localElementName IN    VARCHAR2);

```

Removes the `SQLInline` attribute for the referenced global element.

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
  xmlschema      IN OUT XMLType,
  reference      IN      VARCHAR2);
```

Parameters

Table 203-13 REMOVEOUTOFLINE Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
elementName	The element name
elementType	The element type
globalObject	The global object (global complex type or global element)
globalObjectName	The name of the global object
localElementName	The name of a local element that descends from the global element
reference	A reference to a global element
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> .

Usage Notes

This procedure reverses [SETOUTOFLINE Procedure](#) (page 203-15).

203.3.13 REMOVESQLCOLLTYPE Procedure

This procedure removes a SQL collection type.

The first overload removes the SQL collection type corresponding to the named element and the second overload removes the type from the XML element inside the complex type.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
  xmlschema      IN OUT XMLType,
  elementName    IN VARCHAR2);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (
  xmlschema      IN OUT XMLType,
  globalObject    IN VARCHAR2,
  globalName      IN VARCHAR2,
  localElementName IN VARCHAR2);
```

Parameters

Table 203-14 REMOVESQLCOLLTYPE Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
elementName	The element name

Table 203-14 (Cont.) REMOVESQLCOLLTYPE Procedure Parameters

Parameter	Description
globalObject	The global object (global complex type or global element)
globalName	The name of the global object
localElementName	The name of a local element that descends from the global element

Usage Notes

This procedure reverses the [SETSQLCOLLTYPE Procedure](#) (page 203-18).

203.3.14 REMOVESQLNAME Procedure

This procedure removes a `SQLNAME` from a global element.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLNAME (
  xmlschema      IN OUT  XMLType,
  globalObject   IN     VARCHAR2,
  globalObjectName IN    VARCHAR2,
  localObject    IN     VARCHAR2,
  localObjectName IN    VARCHAR2,
  sqlName        IN     VARCHAR2,
  overwrite      IN     BOOLEAN DEFAULT TRUE);
```

Parameters**Table 203-15 REMOVESQLNAME Procedure Parameters**

Parameter	Description
xmlschema	XML schema to be annotated
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localObject	Object descended from the global object
localObjectName	Name of the local object
sqlName	Name of the SQL attribute that corresponds to the element defined in the XML schema
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> .

Example

The `shipTo` element will have an annotation similar to `xdb:SQLName="SHIPTO_SQLNAME"`.

```
DECLARE
  xml_schema XMLTYPE;
BEGIN
  SELECT out INTO xml_schema FROM annotation_tab;
  DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
```

```

        'element', 'purchaseOrder',
        'element', 'shipTo',
        'SHIPTO_SQLNAME');
    UPDATE annotation_tab SET out = xml_schema;
END;
/

```

203.3.15 REMOVESQLTYPE Procedure

This procedure removes a SQL type.

The first overload removes a SQL type from a global element and the second overload removes the type from a global element inside the complex type.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (
    xmlschema in out XMLType,
    globalElementName IN VARCHAR2);

```

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (
    xmlschema          IN OUT XMLTYPE,
    globalObject       IN VARCHAR2,
    globalObjectName   IN VARCHAR2,
    localObject        IN VARCHAR2,
    localObjectName    IN VARCHAR2);

```

Parameters

Table 203-16 REMOVESQLTYPE Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated.
globalObject	Global object (global complex type or global element)
globalElementName	Name of the global element.
globalObjectName	Name of the global object
localObject	Object descended from the global object
localObjectName	Name of the local object

Usage Notes

This procedure reverses the [SETSQLTYPE Procedure](#) (page 203-20).

203.3.16 REMOVESQLTYPE MAPPING Procedure

This procedure removes the SQL type mapping for the given schema type.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE MAPPING (
    xmlschema          IN OUT XMLTYPE,
    schemaTypeName    IN VARCHAR2);

```

Parameters

Table 203-17 REMOVESQLTYPE MAPPING Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
schemaTypeName	Name of the schema type

Usage Notes

This procedure reverses the [SETSQLTYPE MAPPING Procedure](#) (page 203-21).

203.3.17 REMOVETABLEPROPS Procedure

This procedure removes the table storage properties from the `CREATE TABLE` statement.

This procedure is overloaded. Each overload has different parameter requirements as indicated.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (
  xmlschema          IN OUT XMLTYPE,
  globalElementName IN      VARCHAR2);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (
  xmlschema          IN OUT XMLTYPE,
  globalObject       IN      VARCHAR2,
  globalObjectName   IN      VARCHAR2,
  localElementName   IN      VARCHAR2);
```

Parameters

Table 203-18 REMOVETABLEPROPS Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalElementName	Name of the global element in the schema
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localElementName	Name of a local element that descends from the global element

Usage Notes

This procedure reverses the [SETTABLEPROPS Procedure](#) (page 203-22).

203.3.18 REMOVETIMESTAMPWITHTIMEZONE Procedure

This procedure removes the setting of the `TimeStampWithTimeZone` datatype from all `dateTime` typed elements in the XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (
    xmlschema          IN OUT  XMLTYPE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (
    xmlschema          IN OUT  XMLTYPE,
    schemaTypeName    IN      VARCHAR2);
```

Parameters

Table 203-19 REMOVETIMESTAMPWITHTIMEZONE Procedure Parameters

Parameter	Description
<code>xmlschema</code>	XML schema to be annotated
<code>schemaTypeName</code>	Name of the schema type

Usage Notes

This procedure reverses the [SETTIMESTAMPWITHTIMEZONE Procedure](#) (page 203-23).

203.3.19 SETANYSTORAGE Procedure

This procedure assigns a SQL datatype to the `ANY` child of the complex type with the given name.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETANYSTORAGE (
    xmlschema          IN OUT  XMLType,
    complexTypeName    IN      VARCHAR2,
    sqlTypeName        IN      VARCHAR2,
    overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 203-20 SETANYSTORAGE Procedure Parameters

Parameter	Description
<code>xmlschema</code>	XML schema to be annotated
<code>complexTypeName</code>	Name of the complex type
<code>sqlTypeName</code>	Name of the SQL type
<code>overwrite</code>	Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> .

Example

The `xsd:any` child of complex type `Items` is assigned an annotation similar to `xdb:SQLType="VARCHAR"`.

```
DECLARE xml_schema XMLTYPE;BEGIN SELECT out INTO xml_schema FROM
annotation_tab; DBMS_XMLSCHEMA_ANNOTATE.setAnyStorage
(xml_schema,
'Items',
'VARCHAR'); UPDATE annotation_tab
SET out = xml_schema;END;
/
```

203.3.20 SETDEFAULTTABLE Procedure

This procedure sets the name of the table for the specified global element. This is equivalent to using the schema annotation `xdb:defaultTable="<default_table_name>"` for the top-level element.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETDEFAULTTABLE (
xmlschema          IN OUT XMLTYPE,
globalElementName IN      VARCHAR2,
tableName          IN      VARCHAR2,
overwrite          IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 203-21 SETDEFAULTTABLE Procedure Parameters

Parameter	Description
<code>xmlschema</code>	XML schema to be annotated
<code>globalElementName</code>	Name of the global element in the schema
<code>tableName</code>	Name being assigned to the table
<code>overwrite</code>	Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> .

203.3.21 SETOUTOFFLINE Procedure

This procedure sets the `SQLInline` attribute to `FALSE`, that is, it sets `xdb:SQLInline=FALSE`.

This forces XDB to store the corresponding elements in the XML document out-of-line as rows in a separate `XMLType` table. XDB stores references to each row of the `XMLType` table in a link table that is maintained by the main table

This procedure can improve performance in some situations if the out-of-line table acts as the driver for the query. Storing elements in an out-of-line table also reduces the numbers of columns in the base table, thus avoiding '1000 column limit' errors during XML schema registration, when some elements have complex types with many elements.

Also See:

Oracle XML DB Developer's Guide

There are three overloads.

Syntax

Sets the `SQLInline` attribute to `FALSE`, forcing out-of-line storage for the named element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFFLINE (
  xmlschema          IN OUT XMLType,
  elementName        IN      VARCHAR2,
  elementType         IN      VARCHAR2,
  defaultTableName   IN      VARCHAR2,
  overwrite           IN      BOOLEAN DEFAULT TRUE);
```

Sets the `SQLInline` attribute to `FALSE`, forcing out-of-line storage for the element specified by its local and global name.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFFLINE (
  xmlschema          IN OUT XMLType,
  globalObject       IN      VARCHAR2,
  globalObjectName   IN      VARCHAR2,
  localElementName   IN      VARCHAR2,
  defaultTableName   IN      VARCHAR2,
  overwrite           IN      BOOLEAN DEFAULT TRUE);
```

Sets the `SQLInline` attribute to `FALSE` to force out-of-line storage and sets the default table name for all references to a particular global element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFFLINE (
  xmlschema          IN OUT XMLType,
  reference           IN      VARCHAR2,
  defaultTableName   IN      VARCHAR2,
  overwrite           IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 203-22 SETOUTOFFLINE Procedure Parameters

Parameter	Description
<code>xmlschema</code>	The XML schema to be annotated.
<code>elementName</code>	The element name
<code>elementType</code>	The element type
<code>defaultTableName</code>	The name of the default table.
<code>globalObject</code>	The global object (global complex type or global element)
<code>globalObjectName</code>	The name of the global object
<code>localElementName</code>	The name of a local element that descends from the global element.
<code>reference</code>	A reference to a global element

Table 203-22 (Cont.) SETOUTOFFLINE Procedure Parameters

Parameter	Description
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Usage Notes

After XML schema registration and before loading XML instance data, use DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES() to make these references scope to the out-of-line table only. This ensures better query performance later on.

Example

The following example illustrates the third overloaded method. The element comment will have an annotation similar to xdb:defaultTable="CMMNT_DEFAULT_TABLE"

```
DECLARE
    xml_schema xmltype;
BEGIN
    SELECT OUT INTO xml_schema FROM annotation_tab;

    DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFFLINE (xml_schema,
                                           'ipo:comment',
                                           'CMMNT_DEFAULT_TABLE');

    UPDATE annotation_tab SET OUT = xml_schema;
END;
/
```

203.3.22 SETSCHEMAANNOTATIONS Procedure

This procedure takes the annotated differences resulting from a call to DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS and patches them into the provided XML schema.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS (
    xmlschema      IN OUT xmlType,
    annotations    IN VARCHAR2);
```

Parameters

Table 203-23 SETSCHEMAANNOTATIONS Procedure Parameters

Parameter	Description
xmlschema	An XML schema to be patched.
annotations	The differences document produced by calling DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS on the original XML schema and an annotated XML schema.

Usage Notes

DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS is not available on Oracle Database release 10.2 (only Oracle Database release 11.x).

See Also:

[GETSCHEMAANNOTATIONS Function](#) (page 203-6)

Example

The following example illustrates DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS shown here and [GETSCHEMAANNOTATIONS Function](#) (page 203-6).

```

-- test getannotations and apply them
declare
  xml_schema xmltype;
  xml_schema2 xmltype;
  annotations xmltype;
begin
  select out into xml_schema from annotation_tab;

  -- get the annotations from the schema
  annotations := DBMS_XMLSCHEMA_ANNOTATE.getSchemaAnnotations (xml_schema);

  -- apply the annotations to the schema
  select inp into xml_schema2 from annotation_tab;

  DBMS_XMLSCHEMA_ANNOTATE.setSchemaAnnotations(xml_schema2, annotations);

  update annotation_tab t set t.out = xml_schema2;
end;
/

```

203.3.23 SETSQLCOLLTYPE Procedure

This procedure assigns a SQL type name for a collection. A collection is a global or local element with `maxOccurs>1`.

Using this procedure, XDB creates `SQLTypeS` with the user-defined names provided.

There are two overloads. The first sets the name of the SQL collection type corresponding to an XML element and the second to an XML element inside the specified complex type.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (
  xmlschema      IN OUT  XMLTYPE,
  elementName    IN      VARCHAR2,
  sqlCollType    IN      VARCHAR2,
  overwrite      IN      BOOLEAN DEFAULT TRUE);

```

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (
  xmlschema      IN OUT XMLType,
  globalObject   IN  VARCHAR2,

```

```

globalObjectName IN VARCHAR2,
localElementName IN VARCHAR2,
sqlCollType     IN VARCHAR2,
overwrite       IN BOOLEAN default TRUE );

```

Parameters

Table 203-24 SETSQLCOLLTYPE Procedure Parameters

Parameter	Description
xmlschema	The XML schema to be annotated
elementName	The element name
sqlCollType	The SQL collection type
globalObject	The global object (global complex type or global element)
globalObjectName	The name of the global object
localElementName	The name of a local element that descends from the global element
overwrite	A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The `item` element will have an annotation similar to

```
xdb:SQLCollType="ITEM_SQL_COL_TYPE".
```

```

declare
  xml_schema xmltype;
begin
  SELECT out INTO xml_schema FROM annotation_tab;
  DBMS_XMLSCHEMA_ANNOTATE.setSQLCollType (xml_schema,
                                          'item',
                                          'ITEM_SQL_COL_TYPE',TRUE);
  UPDATE annotation_tab SET out = xml_schema;
end;

```

203.3.24 SETSQLNAME Procedure

This procedure assigns a name to the SQL attribute that corresponds to an element defined in the XML schema.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (
  xmlschema      IN OUT XMLType,
  globalObject   IN   VARCHAR2,
  globalObjectName IN   VARCHAR2,
  localObject    IN   VARCHAR2,
  localObjectName IN   VARCHAR2,
  sqlName        IN   VARCHAR2,
  overwrite      IN   BOOLEAN DEFAULT TRUE);

```

Parameters

Table 203-25 SETSQLNAME Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localObject	Object descended from the global object
localObjectName	Name of the local object
sqlName	Name of the SQL attribute that corresponds to the element defined in the XML schema
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The `shipTo` element will have an annotation similar to `xdb:SQLName="SHIPTO_SQLNAME"`.

```

DECLARE
    xml_schema    XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
                                        'element', 'purchaseOrder',
                                        'element', 'shipTo',
                                        'SHIPTO_SQLNAME');
    UPDATE annotation_tab SET out = xml_schema;
END;
/

```

203.3.25 SETSQLTYPE Procedure

This procedure assigns a SQL type to a global object.

There are two overloads. The first overload assigns a SQL Type to a global object, such as a global element or global complex type and the second to a local object.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (
    xmlschema          IN OUT  XMLTYPE,
    globalElementName  IN      VARCHAR2,
    sqlType            IN      VARCHAR2,
    overwrite          IN      BOOLEAN DEFAULT TRUE);

```

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (
    xmlschema          IN OUT  XMLTYPE,
    globalObject       IN      VARCHAR2,
    globalObjectName   IN      VARCHAR2,
    localObject        IN      VARCHAR2,
    localObjectName    IN      VARCHAR2,
    sqlType            IN      VARCHAR2,
    overwrite          IN      BOOLEAN DEFAULT TRUE);

```

Parameters

Table 203-26 SETSQLTYPE Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
globalElementName	Name of the global element
localObject	Object descended from the global object
localObjectName	Name of the local object
sqlType	SQL type assigned to the named global element
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE.

Example

The `purchaseOrder` element will have an annotation similar to `xdb:SQLType="PO_SQLTYPE"` and the `shipTo` element has one similar to `xdb:SQLType="VARCHAR"`.

```

DECLARE
    xml_schema xmltype;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.setSQLType (xml_schema,
                                        'purchaseOrder',
                                        'PO_SQLTYPE');

    UPDATE annotation_tab SET out = xml_schema;
END;
/

DECLARE xml_schema xmltype;BEGIN SELECT out INTO xml_schema FROM
annotation_tab; DBMS_XMLSCHEMA_ANNOTATE.setSQLType
(xml_schema,
'element', 'purchaseOrder',
'element', 'shipTo',                                'VARCHAR'); UPDATE
annotation_tab SET out = xml_schema;END;
/

```

203.3.26 SETSQLTYPE MAPPING Procedure

This procedure defines a mapping of schema type and SQL type.

If you use this procedure, you do not need to call the `SETSQLTYPE` procedure on all instances of the schema type; instead the procedure traverses the schema and assigns the SQL type automatically.

Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE MAPPING (
    xmlschema          IN OUT XMLType,
    schemaTypeName    IN   VARCHAR2,
    sqlTypeName       IN   VARCHAR2,
    overwrite         IN   BOOLEAN DEFAULT TRUE);

```

Parameters

Table 203-27 SETSQLTYPEMAPPING Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
schemaTypeName	Schema type
sqlTypeName	Name of the SQL type
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE

Example

The attribute `orderDate` will have an annotation similar to `xdb:SQLType="DATE"`.

```
declare xml_schema xmltype;beginSELECT out INTO xml_schema FROM
annotation_tab;DBMS_XMLSCHEMA_ANNOTATE.setSQLTypeMapping
(xml_schema,
'date',
'DATE');UPDATE annotation_tab SET
out = xml_schema;end;
/
```

203.3.27 SETTABLEPROPS Procedure

This procedure specifies properties in the `TABLE` storage clause that is appended to the default `CREATE TABLE` statement.

There are two overloads with different parameter requirements, as indicated:

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (
xmlschema          IN OUT XMLType,
globalElementName IN    VARCHAR2,
tableProps         IN    VARCHAR2,
overwrite          IN    BOOLEAN DEFAULT TRUE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (
xmlschema          IN OUT XMLTYPE,
globalObject       IN    VARCHAR2,
globalObjectName   IN    VARCHAR2,
localElementName   IN    VARCHAR2,
tableProps         IN    VARCHAR2,
overwrite          IN    BOOLEAN DEFAULT TRUE);
```

Parameters

Table 203-28 SETTABLEPROPS Procedure Parameters

Parameter	Description
xmlschema	XML schema to be annotated
globalElementName	Name of the global element in the schema

Table 203-28 (Cont.) SETTABLEPROPS Procedure Parameters

Parameter	Description
tableProps	Table properties
globalObject	Global object (global complex type or global element)
globalObjectName	Name of the global object
localElementName	Name of a local element that descends from the global element
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> .

Example

The `purchaseOrder` element will have an annotation similar to `xdb:tableProps="CACHE"`.

```
DECLARE xml_schema XMLTYPE;BEGIN SELECT out INTO xml_schema FROM
annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS(xml_schema,
'purchaseOrder' , 'CACHE'); UPDATE annotation_tab SET out = xml_schema;END;
/
```

203.3.28 SETTIMESTAMPWITHTIMEZONE Procedure

This procedure sets the `TIMESTAMPWITHTIMEZONE` datatype to all `dateTime` typed elements in the XML schema.

This is equivalent to adding `xdb:SQLType="TIMESTAMP WITH TIME ZONE"` to all `dateTime` objects.

Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETTIMESTAMPWITHTIMEZONE (
xmlschema IN OUT XMLTYPE,
overwrite IN BOOLEAN DEFAULT TRUE);
```

Parameters**Table 203-29 SETTIMESTAMPWITHTIMEZONE Procedure Parameters**

Parameter	Description
xmlschema	XML schema to be annotated
overwrite	Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> .

DBMS_XMLSTORAGE_MANAGE

The `DBMS_XMLSTORAGE_MANAGE` package provides an interface to manage and modify XML storage after schema registration has been completed.

This chapter contains the following topics:

- [Overview](#) (page 204-1)
- [Security Model](#) (page 204-1)
- [Summary of DBMS_XMLSTORAGE_MANAGE Subprograms](#) (page 204-1)

See Also:

Oracle XML DB Developer's Guide

204.1 DBMS_XMLSTORAGE_MANAGE Overview

`DBMS_XMLSTORAGE_MANAGE` contains procedures to manage and modify XML storage after schema registration has been completed.

Use subprograms from this package to improve the performance of bulk load operations. You can disable indexes and constraints before doing a bulk load process and to enable them afterwards.

204.2 DBMS_XMLSTORAGE_MANAGE Security Model

Owned by XDB, the `DBMS_XMLSTORAGE_MANAGE` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`.

Subprograms in this package are executed using the privileges of the current user.

204.3 Summary of DBMS_XMLSTORAGE_MANAGE Subprograms

This table lists and describes the `DBMS_XML_STORAGE` package subprograms.

Table 204-1 DBMS_XMLSTORAGE_MANAGE Package Subprograms

Subprogram	Description
DISABLEINDEXESANDCONSTRAINTS Procedure (page 204-2)	Disables the indexes and constraints for <code>XMLType</code> tables and <code>XMLType</code> columns

Table 204-1 (Cont.) DBMS_XMLSTORAGE_MANAGE Package Subprograms

Subprogram	Description
ENABLEINDEXESANDCONSTRAINTS Procedure (page 204-4)	Rebuilds all indexes and enables the constraints on an XMLType table including its child tables and out-of-line tables
EXCHANGEPOSTPROC Procedure (page 204-5)	Enable constraints after exchange partition
EXCHANGEPREPROC Procedure (page 204-6)	Disable constraints before exchange partition
INDEXXMLREFERENCES Procedure (page 204-6)	Creates unique indexes on the REF columns of the given XML type table or the XML type column of a given table
REFPARTITIONEXCHANGEIN Procedure (page 204-7)	This is an auxiliary procedure to load data through exchange partition operation into a partitioned table and its reference-partitioned child table provided the child table has an xmltype column with a local xmlindex.
REFPARTITIONEXCHANGEOUT Procedure (page 204-8)	Auxiliary procedure to load data through exchange partition operation out of a partitioned table and its reference-partitioned child table provided that the child table has an xmltype column with a local xmlindex.
RENAMECOLLECTIONTABLE Procedure (page 204-9)	Renames a collection table to the given table name
SCOPEXMLREFERENCES Procedure (page 204-10)	Scopes all XML references. Scoped REF types require less storage space and allow more efficient access than unscoped REF types
XPATH2TABCOLMAPPING Function (page 204-11)	Maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name

204.3.1 DISABLEINDEXESANDCONSTRAINTS Procedure

This procedure disables the indexes and constraints for XMLType tables and XMLType columns.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS (
    owner_name    IN  VARCHAR2 DEFAULT USER,
    table_name    IN  VARCHAR2,
    column_name   IN  VARCHAR2 DEFAULT NULL,
    clear         IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 204-2 DISABLEINDEXESANDCONSTRAINTS Procedure Parameters

Parameter	Description
owner_name	Owner's name
table_name	Name of the XMLType table that the procedure is being performed on

Table 204-2 (Cont.) DISABLEINDEXESANDCONSTRAINTS Procedure Parameters

Parameter	Description
column_name	XMLType column name
clear	Boolean that when set to TRUE clears all stored index and constraint data for the table before the procedure executes. The default is FALSE, which does not clear them.

Usage Notes

Passing XMLTYPE tables

For XMLType tables, you must pass the XMLType table name on which the bulk load operation is to be performed. For XMLType columns, you must pass the relational table name and the corresponding XMLType column name.

Using clear to Enable and Disable Indexes and Constraints

 **Note:**

If the `DISABLEINDEXESANDCONSTRAINTS` procedure is called with `clear` set to `TRUE`, it removes any index or constraint information about the XMLTYPE table or column memorized during earlier executions of the procedure.

Therefore, you must ensure that all disabled indexes and constraints are re-enabled on the table or column before you call the `DISABLEINDEXESANDCONSTRAINTS` procedure with `clear` set to `TRUE`.

Ideally, it is recommended that you set `clear` set to `TRUE` for the first execution. For any subsequent executions (due to errors while disabling or enabling indexes) `clear` should be set to `FALSE`, the default value. Once you have successfully re-enabled all the indexes and constraints following the bulk load operation, you can call this procedure again with `clear` set to `TRUE` for the next bulk load operation.

Example

The following example illustrates the use of `clear` in the `DISABLEINDEXESANDCONSTRAINTS` procedure and the [ENABLEINDEXESANDCONSTRAINTS Procedure](#) (page 204-4).

First, add a not-NULL constraint on `comment` element of the `PURCHASEORDER_TAB` table:

```
ALTER TABLE PURCHASEORDER_TAB ADD CONSTRAINT c1 check
('XMLDATA"."comment" IS NOT NULL);
```

Then, disable all the indexes and constraints by passing the `clear` as `TRUE`, by calling the `DISABLEINDEXESANDCONSTRAINTS` procedure:

```
BEGIN
  XDB.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
    ( USER, 'PURCHASEORDER_TAB', NULL, TRUE );
END;
```

/

Next, perform a bulk load operation (such as datapump import) which violates constraint `c1` in the `ALTER` table statement. This does not raise an error because the constraint is disabled:

```
host impdp orexample/orexample directory=dir dumpfile=dmp.txt
  tables=OREXAMPLE.PURCHASEORDER_TAB content = DATA_ONLY;
```

NOTE: To view the disabled constraints and indexes use:

```
SELECT constraint_name,table_name,status FROM all_constraints
  WHERE owner = user;
```

Finally, try to enable the constraint using the `ENABLEINDEXESANDCONSTRAINTS` procedure. It raises an error because `c1`, the not null constraint, is violated by the bulk load operation:

```
BEGIN
  xdb.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
    ( USER, 'PURCHASEORDER_TAB' );
END;
```

To disable all the indexes and constraints, again use `DISABLEINDEXESANDCONSTRAINTS`, but set `clear= FALSE` (because the `ENABLEINDEXESANDCONSTRAINTS` failed to complete successfully). Note: `clear = FALSE` by default, so we do not need to pass it explicitly in the next call.

```
BEGIN
  xdb.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
    ( USER, 'PURCHASEORDER_TAB' );
END;
```

Then, delete the incorrect rows entered into the table

```
DELETE FROM purchaseorder_tab p
  WHERE p.xmldata."comment" IS NULL;
```

Re-enable the indexes and constraints using `ENABLEINDEXESANDCONSTRAINTS`, which completes successfully.

```
BEGIN
  xdb.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
    ( USER, 'PURCHASEORDER_TAB' );
END;
```

204.3.2 ENABLEINDEXESANDCONSTRAINTS Procedure

This procedure rebuilds all indexes and enables the constraints on an `XMLType` table including its child tables and out-of-line tables.

When `column_name` is passed, it does the same for this `XMLType` column.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS (  
  owner_name  IN VARCHAR2 DEFAULT USER,  
  table_name  IN VARCHAR2,  
  column_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 204-3 ENABLEINDEXESANDCONSTRAINTS Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the table that the indexes and constraints are being removed from
column_name	Column name

Usage Notes

This procedure reverses [DISABLEINDEXESANDCONSTRAINTS Procedure](#) (page 204-2).

Example

See [DISABLEINDEXESANDCONSTRAINTS Procedure](#) (page 204-2)

204.3.3 EXCHANGEPOSTPROC Procedure

This procedure enable constraints after exchange partition.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPOSTPROC (  
  owner_name  IN VARCHAR2 DEFAULT USER,  
  table_name  IN VARCHAR2);
```

Parameters

Table 204-4 EXCHANGEPOSTPROC Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the table that the indexes and constraints are being removed from

204.3.4 EXCHANGEPREPROC Procedure

This procedure disable constraints before exchange partition.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPREPROC (
  owner_name  IN VARCHAR2 DEFAULT USER,
  table_name  IN VARCHAR2);
```

Parameters

Table 204-5 EXCHANGEPREPROC Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the table that the indexes and constraints are being removed from

204.3.5 INDEXXMLREFERENCES Procedure

This procedure creates unique indexes on the REF columns of the given XML type table or the XML type column of a given table.

If the procedure creates multiple REF columns, it appends _1, _2, and so on to their names.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.INDEXXMLREFERENCES (
  owner_name  IN VARCHAR2 DEFAULT USER,
  table_name  IN VARCHAR2,
  column_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 204-6 INDEXXMLREFERENCES Procedure Parameters

Parameter	Description
owner_name	The owner's name
table_name	The table being indexed
column_name	A column name. Not needed for XML type tables.
index_name	The name of the newly created index

Usage Notes

This procedure is only used if the REFS are scoped. See [SCOPEXMLREFERENCES Procedure](#) (page 204-10).

Indexed REFS lead to better performance when joins between the base table and a child table occur in the query plan.

- If the base table has a higher selectivity than the child table, there is no need to index the `REFS`.
- If the selectivity of the child table is higher than that of the base table and if no indexes are present, then the join of one row in the child table with the base table leads to a full table scan of the base table.

`INDEXXMLREFERENCES` does not index `REFS` recursively in child tables of a table it is called on. To do this, Oracle recommends calling the procedure from within a loop over the `XML_OUT_OF_LINE_TABLES` or `XML_NESTED_TABLES` view. This creates the index names from the current value of a column in the view.

Note:

This procedure is limited to the structured storage model.

204.3.6 REFPARTITIONEXCHANGEIN Procedure

This is an auxiliary procedure to load data through exchange partition operation into a partitioned table and its reference-partitioned child table provided that the child table has an `xmltype` column with a local `xmlindex`.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.REFPARTITIONEXCHANGEIN (
  owner_name           IN VARCHAR2,
  parent_table_name    IN VARCHAR2,
  child_table_name     IN VARCHAR2,
  parent_exchange_table_name IN VARCHAR2,
  child_exchange_table_name IN VARCHAR2,
  parent_exchange_stmt IN CLOB,
  child_exchange_stmt  IN CLOB);
```

Parameters

Table 204-7 REFPARTITIONEXCHANGEIN Parameters

Parameter	Description
<code>owner_name</code>	owner's name
<code>parent_table_name</code>	the partitioned base table
<code>child_table_name</code>	a partitioned table with reference partitioning based on the table named <code>parent_table_name</code>
<code>parent_exchange_table_name</code>	an exchange table for the partitioned base table
<code>child_exchange_table_name</code>	an exchange table for the table named <code>child_table_name</code>
<code>parent_exchange_stmt</code>	SQL statement to execute exchange partition operation between the table named <code>parent_table_name</code> and the table named <code>parent_exchange_table_name</code>

Table 204-7 (Cont.) REFPARTITIONEXCHANGEIN Parameters

Parameter	Description
child_exchange_stmt	SQL statement to execute exchange partition operation between the table named <code>child_table_name</code> and the table named <code>child_exchange_table_name</code>

204.3.7 REFPARTITIONEXCHANGEOUT Procedure

This is an auxiliary procedure to load data through exchange partition operation out of a partitioned table and its reference-partitioned child table provided that the child table has an `xmltype` column with a local `xmlindex`.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.REFPARTITIONEXCHANGEOUT (
    owner_name          IN VARCHAR2,
    parent_table_name   IN VARCHAR2,
    child_table_name    IN VARCHAR2,
    parent_exchange_table_name IN VARCHAR2,
    child_exchange_table_name IN VARCHAR2,
    parent_exchange_stmt IN CLOB,
    child_exchange_stmt IN CLOB);
```

Parameters

Table 204-8 REFPARTITIONEXCHANGEOUT Parameters

Parameter	Description
owner_name	owner's name
parent_table_name	the partitioned base table
child_table_name	a partitioned table with reference partitioning based on the table named <code>parent_table_name</code>
parent_exchange_table_name	an exchange table for the partitioned base table
child_exchange_table_name	an exchange table for the table named <code>child_table_name</code>
parent_exchange_stmt	SQL statement to execute exchange partition operation between the table named <code>parent_table_name</code> and the table named <code>parent_exchange_table_name</code>
child_exchange_stmt	SQL statement to execute exchange partition operation between the table named <code>child_table_name</code> and the table named <code>child_exchange_table_name</code>

204.3.8 RENAMECOLLECTIONTABLE Procedure

This procedure renames a collection table to the given table name.

An XPath expression specifies the collection table, starting from the `XMLType` base table or an `XMLType` column of the base table.

This procedure provides the only way to derive a collection table name from the corresponding collection type name because there is no direct schema annotation for the purpose.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
  owner_name          IN VARCHAR2 DEFAULT USER,
  table_name          IN VARCHAR2,
  column_name         IN VARCHAR2 DEFAULT NULL,
  xpath               IN VARCHAR2,
  collection_table_name IN VARCHAR2
  namespaces          IN VARCHAR2 default NULL); // For release 11.2 only
```

Parameters

Table 204-9 RENAMECOLLECTIONTABLE Procedure Parameters

Parameter	Description
<code>owner_name</code>	The name of the owner
<code>table_name</code>	The name of a base table that can be used as the starting point for specifying the collection table
<code>column_name</code>	An <code>XMLType</code> column that can be the starting point for specifying the collection table
<code>xpath</code>	The XPath expression that specifies the collection table
<code>collection_table_name</code>	The name of the collection table
<code>namespaces</code>	For Oracle Database 11g Release 2 (11.2) and higher. The namespaces used in XPath.

Usage Notes

Call this procedure after registering the XML schema.

The table name serves as a prefix to the index names.

Oracle recommends using this function because it makes query execution plans more readable.

Report errors that occur while this procedure runs to the user that called the procedure.

Note:

This procedure is limited to the structured storage model.

For Oracle Database 11g Release 2 (11.2) and higher, only, this function accepts XPath notation as well as DOT notation. If XPath notation is used, a `namespaces` parameter may also be required.

Example

The collection table name will be `EMP_TAB_NAMELIST`. You can verify this using `SELECT * FROM user_nested_tables`.

Using DOT Notation:

```
call XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
    USER,
    'EMP_TAB',
    NULL,
    '"XMLDATA"."EMPLOYEE"."NAME"',
    'EMP_TAB_NAMELIST');
```

Using XPath Notation:

XPath notation is available with Oracle Database 11g Release 2 (11.2) and higher.

```
call XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
    USER,
    'EMP_TAB',
    NULL,
    '/e:Employee/Name',
    'EMP_TAB_NAMELIST',
    '''http://www.oracle.com/emp.xsd''' as "e");
```

204.3.9 SCOPEXMLREFERENCES Procedure

This procedure scopes all XML references. Scoped `REF` types require less storage space and allow more efficient access than unscoped `REF` types.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES;
```

Usage Notes

- If you have used [SETOUTOFFLINE Procedure](#) (page 203-15) in the [DBMS_XMLSTORAGE_MANAGE](#) (page 204-1) package to avoid raising '1000 column limit' errors during XML schema registration, you should also use [SCOPEXMLREFERENCES Procedure](#) (page 204-10).
- Using `SCOPEXMLREFERENCES` after XML schema registration and before loading XML instance data, makes these reference scoped to the out-of-line table only.

Note:

This procedure is limited to the structured storage model.

204.3.10 XPATH2TABCOLMAPPING Function

This function maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name. This is necessary in cases in which the user wants to create an index on this table, or to add a constraint, or to rename a table to make query execution plans more readable.

Syntax

```
DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
  owner_name  IN  VARCHAR2 DEFAULT USER,
  table_name  IN  VARCHAR2,
  column_name IN  VARCHAR2 DEFAULT NULL,
  xpath       IN  VARCHAR2,
  namespaces  IN  VARCHAR2 DEFAULT NULL)
RETURN XMLTYPE;
```

Parameters

Table 204-10 XPATH2TABCOLMAPPING Procedure Parameters

Parameter	Description
owner_user	Owner's name
table_name	Name of the base table
column_name	Optional name of the XML type column if table_name is not an XMLtype table. If table_name refers to XMLType table then column_name should be NULL.
xpath	Path expression in DOT notation or XPath notation (see examples below)
namespaces	Optional namespace definitions for path expression

Examples

XPath2TabColMapping evaluated on XMLType table with Xpath Notation, namespaces provided

```
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
  USER, 'XML_TAB', '', '//nl:item/nl:location','xdbXmark' as "nl")
FROM DUAL;
```

This produces a result, for example:

```
<Result>
<Mapping TableName="SYS_NT12345" ColumnName="location"/>
</Result>
```

This allows us to define an index or constraint on table SYS_NT12345 and column location.

XPath2TabColMapping evaluated on table not of XMLType but with XMLType column by means of DOT notation

```
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
  USER, 'PurchaseOrderTab', 'XMLCOL', 'xmldata.LineItems.LineItem', '')
FROM DUAL;
```

205

DBMS_XMLSTORE

DBMS_XMLSTORE provides the ability to store XML data in relational tables.

This chapter contains the following sections:

- [Security Model](#) (page 205-1)
- [Types](#) (page 205-1)
- [Summary of DBMS_XMLSTORE Subprograms](#) (page 205-1)

See Also:

Oracle XML DB Developer's Guide

205.1 DBMS_XMLSTORE Security Model

Owned by XDB, the DBMS_XMLSTORE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

205.2 Types

The DBMS_XMLSTORE subprograms use the ctxType Type.

Table 205-1 *Types of DBMS_XMLSTORE*

Type	Description
ctxType	The type of the query context handle. This is the return type of NEWCONTEXT (page 205-4).

205.3 Summary of DBMS_XMLSTORE Subprograms

This table lists the DBMS_XMLSTORE subprograms and briefly describes them.

Table 205-2 *DBMS_XMLSTORE Package Subprograms*

Method	Description
CLEARKEYCOLUMNLIST (page 205-2)	Clears the key column list.
CLEARUPDATECOLUMNLIST (page 205-2)	Clears the update column list.

Table 205-2 (Cont.) DBMS_XMLSTORE Package Subprograms

Method	Description
CLOSECONTEXT (page 205-3)	It closes/deallocates a particular save context.
DELETEXML (page 205-3)	Deletes records specified by data from the XML document, from the table specified at the context creation time.
INSERTXML (page 205-4)	Inserts the XML document into the table specified at the context creation time.
NEWCONTEXT (page 205-4)	Creates a save context, and returns the context handle.
SETKEYCOLUMN (page 205-5)	This method adds a column to the key column list.
SETROWTAG (page 205-5)	Names the tag used in the XML document., to enclose the XML elements corresponding to the database.
SETUPDATECOLUMN (page 205-5)	Adds a column to the "update column list".
UPDATEXML (page 205-6)	Updates the table given the XML document.

205.3.1 CLEARKEYCOLUMNLIST

This procedure clears the key column list.

Syntax

```
PROCEDURE clearKeyColumnList(
    ctxHdl IN ctxType);
```

Table 205-3 CLEARKEYCOLUMNLIST Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

205.3.2 CLEARUPDATECOLUMNLIST

This procedure clears the update column list.

Syntax

```
PROCEDURE clearUpdateColumnList(
    ctxHdl IN ctxType);
```

Table 205-4 CLEARUPDATECOLUMNLIST Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

205.3.3 CLOSECONTEXT

This procedure closes/deallocates a particular save context.

Syntax

```
PROCEDURE closeContext(ctxHdl IN ctxType);
```

Table 205-5 CLOSECONTEXT Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

205.3.4 DELETEXML

DELETEXML deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

Syntax

The following syntax uses a VARCHAR2 type for the xDoc parameter.

```
FUNCTION deleteXML(
  ctxHdl IN ctxPType,
  xDoc IN VARCHAR2)
RETURN NUMBER;
```

The following syntax uses a CLOB type for the xDoc parameter.

```
FUNCTION deleteXML(
  ctxHdl IN ctxType,
  xDoc IN CLOB)
RETURN NUMBER;
```

The following syntax uses an XMLType type for the xDoc parameter.

```
FUNCTION deleteXML(
  ctxHdl IN ctxType,
  xDoc IN XMLType)
RETURN NUMBER;
```

Parameters

Table 205-6 DELETEXML Function Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

205.3.5 INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted.

Note that if a user passes an XML file for `insertXML` to `DBMS_XMLSTORE` that contains extra elements (elements that do not match any columns in the table), Oracle tries to insert into those columns unless [SETUPDATECOLUMN](#) (page 205-5) is used. The use of `setUpdateColumn` is optional only if the elements in the XML file match up to the columns in the table.

Syntax

```
FUNCTION insertXML(
  ctxHdl IN ctxType,
  xDoc IN VARCHAR2)
RETURN NUMBER;
```

```
FUNCTION insertXML(
  ctxHdl IN ctxType,
  xDoc IN CLOB)
RETURN NUMBER;
```

```
FUNCTION insertXML(
  ctxHdl IN ctxType,
  xDoc IN XMLType)
RETURN NUMBER;
```

Parameters

Table 205-7 INSERTXML Function Parameters

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>xDoc</code>	(IN)	String containing the XML document.

205.3.6 NEWCONTEXT

`NEWCONTEXT` creates a save context and returns the context handle.

Syntax

```
FUNCTION newContext(
  targetTable IN VARCHAR2)
RETURN ctxType;
```

Table 205-8 NEWCONTEXT Function Parameters

Parameter	IN / OUT	Description
<code>targetTable</code>	(IN)	The target table into which to load the XML document.

205.3.7 SETKEYCOLUMN

This method adds a column to the "key column list".

The value for the column cannot be `NULL`. In case of update or delete, the columns in the key column list make up the `WHERE` clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations

Syntax

```
PROCEDURE setKeyColumn(
    ctxHdl IN ctxType,
    colName IN VARCHAR2);
```

Table 205-9 SETKEYCOLUMN Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the key column list; cannot be <code>NULL</code> .

205.3.8 SETROWTAG

This procedure names the tag used in the XML document, to enclose the XML elements corresponding to database records.

Syntax

```
PROCEDURE setRowTag(
    ctxHdl IN ctxType,
    tag IN VARCHAR2);
```

Table 205-10 SETROWTAG Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

205.3.9 SETUPDATECOLUMN

`SETUPDATECOLUMN` adds a column to the update column list.

In case of insert, the default is to insert values to all the columns in the table. In case of updates, the default is to only update the columns corresponding to the tags present in the `ROW` element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Note that if a user passes an XML file for [INSERTXML](#) (page 205-4) to `DBMS_XMLSTORE` which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless `setUpdateColumn` is used. The use of `setUpdateColumn` is optional only if the elements in the XML file match up to the columns in the table.

Syntax

```
PROCEDURE setUpdateColumn(
    ctxHdl IN ctxType,
    colName IN VARCHAR2);
```

Table 205-11 SETUPUPDATECOLUMN Procedure Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the update column list.

205.3.10 UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated.

The options are described in the following table.

Syntax

The following syntax passes the `xDoc` parameter as a `VARCHAR2`.

```
FUNCTION updateXML(
    ctxHdl IN ctxType,
    xDoc IN VARCHAR2)
RETURN NUMBER;
```

The following syntax passes the `xDoc` parameter as a `CLOB`.

```
FUNCTION updateXML(
    ctxHdl IN ctxType,
    xDoc IN CLOB)
RETURN NUMBER;
```

The following syntax passes the `xDoc` parameter as a `XMLType`.

```
FUNCTION updateXML(
    ctxHdl IN ctxType,
    xDoc IN XMLType)
RETURN NUMBER;
```

Parameters

Table 205-12 UPDATEXML Function Parameters

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

DBMS_XMLTRANSLATIONS

The deprecated `DBMS_XMLTRANSLATIONS` package provides an interface to perform translations so that strings can be searched or displayed in various languages.

Note:

The `DBMS_XMLTRANSLATIONS` package is deprecated with Oracle Database 12c.

This chapter contains the following sections:

- [Security Model](#) (page 206-1)
- [Summary of DBMS_XMLTRANSLATIONS Subprograms](#) (page 206-1)

See Also:

For more information, see the *Oracle XML DB Developer's Guide*

206.1 DBMS_XMLTRANSLATIONS Security Model

Owned by `XDB`, the `DBMS_XMLTRANSLATIONS` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

206.2 Summary of DBMS_XMLTRANSLATIONS Subprograms

This table lists the `DBMS_XMLTRANSLATIONS` subprograms and briefly describes them.

Table 206-1 DBMS_XMLTranslations Package Subprograms

Method	Description
DISABLETRANSLATION Procedure (page 206-2)	Disables translations in the current session so that query or retrieval will take place on the base document ignoring session language values
ENABLETRANSLATION Procedure (page 206-2)	Enables translations in the current session
EXTRACTXLIFF Function & Procedure (page 206-3)	Extracts the translations in <code>XLIFF</code> format from either an <code>XMLTYPE</code> or a resource in the <code>XDB</code> Repository

Table 206-1 (Cont.) DBMS_XMLTranslations Package Subprograms

Method	Description
GETBASEDOCUMENT Function (page 206-5)	Returns the base document with all the translations
MERGEXLIFF Functions (page 206-7)	Merges the translations in XLIFF format into either an XMLTYPE or a resource in the XDB Repository
SETSOURCELANG Function (page 206-9)	Sets the source language to a particular language at the specified XPATH
TRANSLATEXML Function (page 206-11)	Returns the document in the specified language
UPDATETRANSLATION Function (page 206-12)	Updates the translation in a particular language at the specified XPATH

206.2.1 DISABLETRANSLATION Procedure

This deprecated procedure disables translations in the current session so that query or retrieval will take place on the base document ignoring session language values.

Note:

The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12c.

Syntax

```
DBMS_XMLTRANSLATIONS.DISABLETRANSLATION;
```

206.2.2 ENABLETRANSLATION Procedure

This deprecated procedure enables translations in the current session. This is the default behavior.

Note:

The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12c.

Syntax

```
DBMS_XMLTRANSLATIONS.ENABLETRANSLATION;
```

206.2.3 EXTRACTXLIFF Function & Procedure

This deprecated function and procedure extracts the translations in `XLIFF` format from either an `XMLTYPE` or a resource in the XDB Repository.

Note:

The `DBMS_XMLTRANSLATIONS` package is deprecated in its entirety with Oracle Database 12c.

Syntax

```
DBMS_XMLTRANSLATIONS.EXTRACTXLIFF(
  doc      IN  XMLTYPE,
  xpath    IN  VARCHAR2,
  namespace IN VARCHAR2 := NULL)
RETURN XMLTYPE;
```

```
DBMS_XMLTRANSLATIONS.EXTRACTXLIFF(
  abspath  IN  XMLTYPE,
  xpath    IN  VARCHAR2,
  namespace IN VARCHAR2 := NULL)
RETURN XMLTYPE;
```

Parameters

Table 206-2 EXTRACTXLIFF Function Parameters

Parameter	Description
<code>doc</code>	<code>XMLTYPE</code> from which the <code>XLIFF</code> is to be extracted
<code>xpath</code>	<code>XPATH</code> at which specifies the location of the element that needs to be translated. If no <code>XPATH</code> is specified, the entire document is processed.
<code>namespace</code>	Namespace
<code>abspath</code>	Absolute path of the resource from which the <code>XLIFF</code> is to be extracted

Return Values

The translations in the `XLIFF` format

Examples

Extracting the Translation from an `XMLTYPE`

Let `doc` =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
```

```

        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <title xml:lang="es">
        Security Class Example - ES
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>

```

Let the xpath = '/securityClass/title'. The output of EXTRACTXLIFF will be as follows:

```

<xliff version='1.1'>
  <file original='' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example - FR</target>
          <target xml:lang='es'>Security Class Example - ES</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
</xliff>

```

Extracting the Translation from a Resource

Let the resource '/public/security.xml' =

```

<securityClass xmlns="http://xmlns.oracle.com/xdm/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="es">
    Security Class Example - ES
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
  <privlist>
    <privilege name="privilege1"/>
    <aggregatePrivilege name="iStorePOApprover">
      <title>
        iStore Purchase Order Approver
      </title>
      <privilegeRef name="is:privilege1"/>
      <privilegeRef name="oa:submitPO"/>
      <privilegeRef name="oa:privilege3"/>
    </aggregatePrivilege>
  </privlist>

```

```

<privilege name="privilege2">
  <title xml:lang="en">
    secondary privilege
  </title>
  <title xml:lang="fr" xdb:srclang="true">
    secondary privilege - FR
  </title>
  <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
  <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
</privilege>
</privlist>
</securityClass>

```

And let `XPATH = "`, then the extracted `XLIFF` is

```

<xliff version='1.1'>
  <file original='/public/security.xml' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example - FR</target>
          <target xml:lang='es'>Security Class Example - ES</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
  <file original='/public/security.xml' source-language='fr' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/privilege[@name="privilege2"]/title'>
        <source>secondary privilege - FR</source>
        <alt-trans>
          <target xml:lang='en'>secondary privilege</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
</xliff>

```

206.2.4 GETBASEDOCUMENT Function

This function in the deprecated `DBMS_XMLTRANSLATIONS` package returns the base document with all the translations.

Note:

The `DBMS_XMLTRANSLATIONS` package is deprecated in its entirety with Oracle Database 12c.

Syntax

```

DBMS_XMLTRANSLATIONS.GETBASEDOCUMENT(
  doc    IN XMLTYPE)
RETURN XMLTYPE;

```

Parameters

Table 206-3 GETBASEDOCUMENT Function Parameters

Parameter	Description
doc	Input XMLTYPE

Return Values

The XMLTYPE which contains the base document with all the translations

Examples

For example, for doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

For the above document, this subprogram will return:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

206.2.5 MERGEXLIFF Functions

This deprecated function merges the translations in `XLIFF` format into either an `XMLTYPE` or a resource in the XDB Repository.

Note:

The `DBMS_XMLTRANSLATIONS` package is deprecated in its entirety with Oracle Database 12c.

Syntax

```
DBMS_XMLTRANSLATIONS.MERGEXLIFF(
  doc      IN XMLTYPE,
  xliiff   IN XMLTYPE)
RETURN XMLTYPE;
```

```
DBMS_XMLTRANSLATIONS.MERGEXLIFF(
  xliiff   IN XMLTYPE);
```

Parameters

Table 206-4 MERGEXLIFF Function & Procedure Parameters

Parameter	Description
<code>doc</code>	<code>XMLTYPE</code> from which the <code>XLIFF</code> is to be merged
<code>xliiff</code>	Translations in the <code>XLIFF</code> format

Return Values

The result of merging 'xliiff' into 'doc' at 'xpath'

Examples

Merge Translations into an XMLTYPE

Consider the following input `XMLTYPE`:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="es">
    Security Class Example - ES
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
```

```

</title>
<inherits-from>is:iStorePurchaseOrder</inherits-from>
<privlist>
<privilege name="privilege1"/>
<aggregatePrivilege name="iStorePOApprover">
  <title>
    iStore Purchase Order Approver
  </title>
  <privilegeRef name="is:privilege1"/>
  <privilegeRef name="oa:submitPO"/>
  <privilegeRef name="oa:privilege3"/>
</aggregatePrivilege>
<privilege name="privilege2">
  <title xml:lang="en">
    secondary privilege
  </title>
  <title xml:lang="fr" xdb:srclang="true">
    secondary privilege - FR
  </title>
  <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
  <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
</privilege>
</privlist>
</securityClass>

```

Let the input XLIFF be as follows:

```

<xliff version='1.1'>
  <file original='/public/security.xml' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example Modified</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example Mod - FR</target>
          <target xml:lang='es'>Security Class Example Mod - ES</target>
        </alt-trans>
      </trans-unit>
      <trans-unit id='/securityClass/privilege[@name="privilege2"]/title'>
        <source>secondary privilege modified</source>
        <alt-trans>
          <target xml:lang='fr'>secondary privilege mod - FR</target>
        </alt-trans>
      </trans-unit>
    </body>
  </xliff>

```

The output of merge will be as follows:

```

<securityClass xmlns="http://xmlns.oracle.com/xdm/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example Modified
  </title>
  <title xml:lang="es">
    Security Class Example Mod - ES
  </title>

```

```

<title xml:lang="fr">
  Security Class Example Mod - FR
</title>
<inherits-from>is:iStorePurchaseOrder</inherits-from>
<privlist>
<privilege name="privilege1"/>
<aggregatePrivilege name="iStorePOApprover">
  <title>
    iStore Purchase Order Approver
  </title>
  <privilegeRef name="is:privilege1"/>
  <privilegeRef name="oa:submitPO"/>
  <privilegeRef name="oa:privilege3"/>
</aggregatePrivilege>
<privilege name="privilege2">
  <title xml:lang="en" xdb:srclang="true">
    secondary privilege modified
  </title>
  <title xml:lang="fr">
    secondary privilege mod - FR
  </title>
  <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
  <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
</privilege>
</privlist>
</securityClass>

```

Merge XLIFF Translations into a Resource

If the input document in the above example were to be stored in the repository at '/public/security.xml', then merging the above XLIFF will have the same effect.

206.2.6 SETSOURCELANG Function

This deprecated function sets the source language to a particular language at the specified XPATH.

Note:

The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12c.

Syntax

```

DBMS_XMLTRANSLATIONS.SETSOURCELANG (
  doc      IN  XMLTYPE,
  xpath    IN  VARCHAR2,
  lang     IN  VARCHAR2,
  namespace IN VARCHAR2 := NULL)
RETURN XMLTYPE;

```

Parameters

Table 206-5 SETSOURCELANG Function Parameters

Parameter	Description
doc	XMLTYPE for which the source language is to be set
xpath	XPATHT at which the source language is to be set
lang	Source language
namespace	Namespace

Return Values

The updated document.

Examples

For example, if doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

then the statement

```
setSourceLang ( doc, '/securityClass/title', 'fr' )
```

produces

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en">
    Security Class Example
  </title>
  <title xml:lang="fr" xdb:srclang="true">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

206.2.7 TRANSLATEXML Function

This deprecated function returns the document in the specified language.

Note:

The DBMS_XMLTRANSLATIONS package is deprecated in its entirety with Oracle Database 12c.

Syntax

```
DBMS_XMLTRANSLATIONS.TRANSLATEXML(
  doc      IN  XMLTYPE,
  lang     IN  VARCHAR2)
RETURN XMLTYPE;
```

Parameters

Table 206-6 TRANSLATEXML Function Parameters

Parameter	Description
doc	Input XMLTYPE
lang	Language

Return Values

The XMLTYPE which contains the document in the specified language

Examples

For example, for doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

TRANSLATEXML (doc, 'fr') will return:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
```

```

        targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>

```

206.2.8 UPDATETRANSLATION Function

This deprecated function updates the translation in a particular language at the specified `XPATH`.

Note:

The `DBMS_XMLTRANSLATIONS` package is deprecated in its entirety with Oracle Database 12c.

Syntax

```

DBMS_XMLTRANSLATIONS.UPDATETRANSLATION(
    doc          IN  XMLTYPE,
    xpath       IN  VARCHAR2,
    lang        IN  VARCHAR2,
    value       IN  VARCHAR2,
    namespace   IN  VARCHAR2 := NULL)
RETURN XMLTYPE;

```

Parameters

Table 206-7 UPDATETRANSLATION Function Parameters

Parameter	Description
<code>doc</code>	XMLTYPE for which the translation is to be updated
<code>xpath</code>	XPATH at which the translation is to be updated
<code>lang</code>	Language for which the translation is to be updated
<code>value</code>	New translation
<code>namespace</code>	Namespace

Return Values

The updated document

Examples

For example,

```
updateTranslation ( doc, '/securityClass/title/text()', 'fr', 'Oracle' );
```

produces

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Oracle
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

DBMS_XPLAN

The `DBMS_XPLAN` package provides an easy way to display the output of the `EXPLAIN PLAN` command in several, predefined formats.

You can also use the `DBMS_XPLAN` package to display the plan of a statement stored in the Automatic Workload Repository (AWR) or stored in a SQL tuning set. It further provides a way to display the SQL execution plan and SQL execution runtime statistics for cached SQL cursors based on the information stored in the `V$SQL_PLAN` and `V$SQL_PLAN_STATISTICS_ALL` fixed views. Finally, it displays plans from a SQL plan baseline.

See Also:

- For more information on the `EXPLAIN PLAN` command, the AWR, and SQL tuning set, see *Oracle Database SQL Tuning Guide*.

- For more information on the `V$SQL_PLAN_STATISTICS` fixed view, see *Oracle Database Reference*

This chapter contains the following topics:

- [Overview](#) (page 207-1)
- [Security Model](#) (page 207-2)
- [Examples](#) (page 207-2)
- [Summary of DBMS_XPLAN Subprograms](#) (page 207-5)

207.1 DBMS_XPLAN Overview

The `DBMS_XPLAN` package supplies five table functions.

These functions are listed below:

- `DISPLAY` - to format and display the contents of a plan table.
- `DISPLAY_AWR` - to format and display the contents of the execution plan of a stored SQL statement in the AWR.
- `DISPLAY_CURSOR` - to format and display the contents of the execution plan of any loaded cursor.
- `DISPLAY_SQL_PLAN_BASELINE` - to display one or more execution plans for the SQL statement identified by SQL handle

- `DISPLAY_SQLSET` - to format and display the contents of the execution plan of statements stored in a SQL tuning set.

207.2 DBMS_XPLAN Security Model

This package runs with the privileges of the calling user, not the package owner (`sys`). The table function `DISPLAY_CURSOR` requires `SELECT` or `READ` privileges on the following fixed views: `V$SQL_PLAN`, `V$SESSION` and `V$SQL_PLAN_STATISTICS_ALL`.

Using the [DISPLAY_AWR Function](#) (page 207-10) requires the user to have `SELECT` or `READ` privileges on `DBA_HIST_SQL_PLAN`, `DBA_HIST_SQLTEXT`, and `V$DATABASE`.

Using the [DISPLAY_SQLSET Function](#) (page 207-18) requires the user to have the `SELECT` or `READ` privilege on `ALL_SQLSET_STATEMENTS` and `ALL_SQLSET_PLANS`.

Using [DISPLAY_SQL_PLAN_BASELINE Function](#) (page 207-17) requires the user to have the `SELECT` or `READ` privilege on `DBA_SQL_PLAN_BASELINES` as well as the privileges to execute the SQL statement for which the user is trying to get the plan.

All these privileges are automatically granted as part of the `SELECT_CATALOG` role.

207.3 Examples

These examples show sample uses of `DBMS_XPLAN`.

Displaying a Plan Table Using `DBMS_XPLAN.DISPLAY`

Execute an explain plan command on a `SELECT` statement:

```
EXPLAIN PLAN FOR
SELECT * FROM emp e, dept d
  WHERE e.deptno = d.deptno
  AND e.ename='benoit';
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);
```

This query produces the following output:

Plan hash value: 3693697075

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	Time
0	SELECT STATEMENT		1	57	6 (34)	00:00:01
* 1	HASH JOIN		1	57	6 (34)	00:00:01
* 2	TABLE ACCESS FULL	EMP	1	37	3 (34)	00:00:01
3	TABLE ACCESS FULL	DEPT	4	80	3 (34)	00:00:01

Predicate Information (identified by operation id):

- ```
1 - access("E"."DEPTNO"="D"."DEPTNO")
2 - filter("E"."ENAME"='benoit')
```

15 rows selected.

## Displaying a Cursor Execution Plan Using DBMS\_XPLAN.DISPLAY\_CURSOR

By default, the table function `DISPLAY_CURSOR` formats the execution plan for the last SQL statement executed by the session. For example:

```
SELECT ename FROM emp e, dept d
 WHERE e.deptno = d.deptno
 AND e.empno=7369;
```

```
ENAME

SMITH
```

To display the execution plan of the last executed statement for that session:

```
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR);
```

This query produces the following output:

```
Plan hash value: 3693697075, SQL hash value: 2096952573, child number: 0
```

```

SELECT ename FROM emp e, dept d WHERE e.deptno = d.deptno
AND e.empno=7369
```

| Id  | Operation         | Name | Rows | Bytes | Cost (%CPU) | Time     |
|-----|-------------------|------|------|-------|-------------|----------|
| 0   | SELECT STATEMENT  |      |      |       |             |          |
| * 1 | HASH JOIN         |      | 1    | 16    | 6 (34)      | 00:00:01 |
| * 2 | TABLE ACCESS FULL | EMP  | 1    | 13    | 3 (34)      | 00:00:01 |
| 3   | TABLE ACCESS FULL | DEPT | 4    | 12    | 3 (34)      | 00:00:01 |

```
Predicate Information (identified by operation id):
```

```

1 - access("E"."DEPTNO"="D"."DEPTNO")
2 - filter("E"."EMPNO"=7369)
```

```
21 rows selected.
```

You can also use the table function `DISPLAY_CURSOR` to display the execution plan for any loaded cursor stored in the cursor cache. In that case, you must supply a reference to the child cursor to the table function. This includes the SQL ID of the statement and optionally the child number.

Run a query with a distinctive comment:

```
SELECT /* TOTO */ ename, dname
FROM dept d join emp e USING (deptno);
```

Get `sql_id` and `child_number` for the preceding statement:

```
SELECT sql_id, child_number
FROM v$sql
WHERE sql_text LIKE '%TOTO%';
```

```
SQL_ID CHILD_NUMBER

gwp663cq5qbf 0
```

Display the execution plan for the cursor:

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR('gwp663cqh5qbf',0));
```

```
Plan hash value: 3693697075, SQL ID: gwp663cqh5qbf, child number: 0
```

```

SELECT /* TOTO */ ename, dname
FROM dept d JOIN emp e USING (deptno);
```

```

```

| Id  | Operation         | Name | Rows | Bytes | Cost (%CPU) | Time     |
|-----|-------------------|------|------|-------|-------------|----------|
| 0   | SELECT STATEMENT  |      |      |       | 7 (100)     |          |
| 1   | SORT GROUP BY     |      | 4    | 64    | 7 (43)      | 00:00:01 |
| * 2 | HASH JOIN         |      | 14   | 224   | 6 (34)      | 00:00:01 |
| 3   | TABLE ACCESS FULL | DEPT | 4    | 44    | 3 (34)      | 00:00:01 |
| 4   | TABLE ACCESS FULL | EMP  | 14   | 70    | 3 (34)      | 00:00:01 |

```

```

```
Predicate Information (identified by operation id):
```

```

2 - access("E"."DEPTNO"="D"."DEPTNO")
```

Instead of issuing two queries, one to get the `sql_id` and `child_number` pair and one to display the plan, you can combine these in a single query:

Display the execution plan of all cursors matching the string 'TOTO':

```
SELECT t.*
FROM v$sql s, table(DBMS_XPLAN.DISPLAY_CURSOR(s.sql_id, s.child_number)) t WHERE
sql_text LIKE '%TOTO%';
```

### Displaying a Plan Table with Parallel Information

By default, only relevant information is reported by the `display` and `display_cursor` table functions. In [Displaying a Plan Table Using DBMS\\_XPLAN.DISPLAY](#) (page 207-2), the query does not execute in parallel. Hence, information related to the parallelization of the plan is not reported. As shown in the following example, parallel information is reported only if the query executes in parallel.

```
ALTER TABLE emp PARALLEL;
EXPLAIN PLAN for
SELECT * FROM emp e, dept d
WHERE e.deptno = d.deptno
AND e.ename = 'hermann'
ORDER BY e.empno;
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);
Plan hash value: 3693697345
```

```

```

| Id | Operation          | Name     | Rows | Bytes | Cost (%CPU) | Time     | TQ    | INOUT | PQ Distrib |
|----|--------------------|----------|------|-------|-------------|----------|-------|-------|------------|
| 0  | SELECT STATEMENT   |          | 1    | 117   | 6 (50)      | 00:00:01 |       |       |            |
| 1  | PX COORDINATOR     |          |      |       |             |          |       |       |            |
| 2  | PX SEND QC (ORDER) | :TQ10003 | 1    | 117   | 6 (50)      | 00:00:01 | Q1,03 | P->S  | QC (ORDER) |
| 3  | SORT ORDER BY      |          | 1    | 117   | 6 (50)      | 00:00:01 | Q1,03 | PCWP  |            |
| 4  | PX RECEIVE         |          | 1    | 117   | 5 (40)      | 00:00:01 | Q1,03 | PCWP  |            |

```

```

|      |                   |          |   |     |        |          |       |      |       |
|------|-------------------|----------|---|-----|--------|----------|-------|------|-------|
| 5    | PX SEND RANGE     | :TQ10002 | 1 | 117 | 5 (40) | 00:00:01 | Q1,02 | P->P | RANGE |
| * 6  | HASH JOIN         |          | 1 | 117 | 5 (40) | 00:00:01 | Q1,02 | PCWP |       |
| 7    | PX RECEIVE        |          | 1 | 87  | 2 (50) | 00:00:01 | Q1,02 | PCWP |       |
| 8    | PX SEND HASH      | :TQ10001 | 1 | 87  | 2 (50) | 00:00:01 | Q1,01 | P->P | HASH  |
| 9    | PX BLOCK ITERATOR |          | 1 | 87  | 2 (50) | 00:00:01 | Q1,01 | PCWC |       |
| * 10 | TABLE ACCESS FULL | EMP      | 1 | 87  | 2 (50) | 00:00:01 | Q1,01 | PCWP |       |
| 11   | BUFFER SORT       |          |   |     |        |          | Q1,02 | PCWC |       |
| 12   | PX RECEIVE        |          | 4 | 120 | 3 (34) | 00:00:01 | Q1,02 | PCWP |       |
| 13   | PX SEND HASH      | :TQ10000 | 4 | 120 | 3 (34) | 00:00:01 |       | S->P | HASH  |
| 14   | TABLE ACCESS FULL | DEPT     | 4 | 120 | 3 (34) | 00:00:01 |       |      |       |

-----

Predicate Information (identified by operation id):

-----

```
6 - access("E"."DEPTNO"="D"."DEPTNO")
10 - filter("E"."ENAME"='hermann')
```

-----

When the query is parallel, information related to parallelism is reported: table queue number (TQ column), table queue type (INOUT) and table queue distribution method (PQ Distrib).

By default, if several plans in the plan table match the `statement_id` parameter passed to the display table function (default value is `NULL`), only the plan corresponding to the last `EXPLAIN PLAN` command is displayed. Hence, there is no need to purge the plan table after each `EXPLAIN PLAN`. However, you should purge the plan table regularly to ensure good performance in the execution of the `DISPLAY` table function. If no plan table is created, Oracle uses a global temporary table to store any plan information for individual users and preserves its content throughout the lifespan of a session. Note that you cannot truncate the content of a global temporary table.

For ease of use, you can define a view on top of the display table function and then use that view to display the output of the `EXPLAIN PLAN` command:

### Using a View to Display Last Explain Plan

```
define plan view
CREATE VIEW PLAN AS SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);

display the output of the last explain plan command
SELECT * FROM PLAN;
```

## 207.4 Summary of DBMS\_XPLAN Subprograms

This table lists the DBMS\_XPLAN subprograms and briefly describes them.

**Table 207-1 DBMS\_XPLAN Package Subprograms**

| Subprogram                                               | Description                                                   |
|----------------------------------------------------------|---------------------------------------------------------------|
| <a href="#">DIFF_PLAN Function</a><br>(page 207-6)       | Compares plans                                                |
| <a href="#">DISPLAY Function</a><br>(page 207-6)         | Displays the contents of the plan table                       |

| <a href="#">DISPLAY_SQLSET Function</a><br>(page 207-18)             | Displays the execution plan of a given statement stored in a SQL tuning set              |

## 207.4.1 DIFF\_PLAN Function

This function compares plans.

### Syntax

```
DBMS_XPLAN.DIFF_PLAN(
 plan1 IN SPC_SRC,
 plan2 IN SPC_SRC)
RETURN VARCHAR2;
```

### Parameters

**Table 207-2 DIFF\_PLAN Function Parameters**

| Parameter | Description |
|-----------|-------------|
| plan_1    | First plan  |
| plan_2    | Second plan |

## 207.4.2 DISPLAY Function

This table function displays the contents of the plan table.

In addition, you can use this table function to display any plan (with or without statistics) stored in a table as long as the columns of this table are named the same as columns of the plan table (or `V$SQL_PLAN_STATISTICS_ALL` if statistics are included). You can apply a predicate on the specified table to select rows of the plan to display.

### Syntax

```
DBMS_XPLAN.DISPLAY(
 table_name IN VARCHAR2 DEFAULT 'PLAN_TABLE',
 statement_id IN VARCHAR2 DEFAULT NULL,
 format IN VARCHAR2 DEFAULT 'TYPICAL',
 filter_preds IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 207-3 DISPLAY Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                           |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name   | Specifies the table name where the plan is stored. This parameter defaults to <code>PLAN_TABLE</code> , which is the default plan table for the <code>EXPLAIN PLAN</code> command. If <code>NULL</code> is specified it also defaults to <code>PLAN_TABLE</code> .                                                                                                    |
| statement_id | Specifies the <code>statement_id</code> of the plan to be displayed. This parameter defaults to <code>NULL</code> , which is the default when the <code>EXPLAIN PLAN</code> command is executed without a <code>set statement_id</code> clause. If no <code>statement_id</code> is specified, the function shows you the plan of the most recent explained statement. |

**Table 207-3 (Cont.) DISPLAY Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| format    | <p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> <li>• <b>BASIC:</b> Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li>• <b>TYPICAL:</b> This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</li> <li>• <b>SERIAL:</b> Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li>• <b>ALL:</b> Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> </ul> <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li>• <b>ROWS</b> - if relevant, shows the number of rows estimated by the optimizer</li> <li>• <b>BYTES</b> - if relevant, shows the number of bytes estimated by the optimizer</li> <li>• <b>COST</b> - if relevant, shows optimizer cost information</li> <li>• <b>PARTITION</b> - if relevant, shows partition pruning information</li> <li>• <b>PARALLEL</b> - if relevant, shows PX information (distribution method and table queue information)</li> <li>• <b>PREDICATE</b> - if relevant, shows the predicate section</li> <li>• <b>PROJECTION</b> -if relevant, shows the projection section</li> <li>• <b>ALIAS</b> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li>• <b>REMOTE</b> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li>• <b>NOTE</b> - if relevant, shows the note section of the explain plan</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> <p>If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V\$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the <a href="#">DISPLAY Function</a> (page 207-6). These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the <a href="#">DISPLAY_CURSOR Function</a> (page 207-12) or the <a href="#">DISPLAY_SQLSET Function</a> (page 207-18) for a full description of these four keywords).</p> |

**Table 207-3 (Cont.) DISPLAY Function Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>filter_preds</code> | SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is <code>NULL</code> (the default), the plan displayed corresponds to the last executed explain plan. For example: <code>filter_preds=&gt;'plan_id = 10'</code><br><br>Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see <b>WARNING</b> under Usage Notes) |

### Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use `'ALL -PROJECTION -NOTE'` to display everything except the projection and note sections.
- Use `'TYPICAL PROJECTION'` to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply `'PROJECTION'` is equivalent.
- Use `'-BYTES -COST -PREDICATE'` to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use `'BASIC ROWS'` to display basic information with the additional number of rows estimated by the optimizer.

#### **WARNING:**

Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

### Examples

To display the result of the last `EXPLAIN PLAN` command stored in the plan table:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY);
```

To display from other than the default plan table, "my\_plan\_table":

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('my_plan_table'));
```

To display the minimum plan information:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', null, 'basic'));
```

To display the plan for a statement identified by 'foo', such as `statement_id='foo'`:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', 'foo'));
```

## 207.4.3 DISPLAY\_AWR Function

This table function displays the contents of an execution plan stored in the AWR.

### Syntax

```
DBMS_XPLAN.DISPLAY_AWR(
 sql_id IN VARCHAR2,
 plan_hash_value IN NUMBER DEFAULT NULL,
 db_id IN NUMBER DEFAULT NULL,
 format IN VARCHAR2 DEFAULT TYPICAL);
```

### Parameters

**Table 207-4 DISPLAY\_AWR Table Function Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id          | Specifies the <code>SQL_ID</code> of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column <code>SQL_ID</code> in <code>DBA_HIST_SQLTEXT</code> .                                             |
| plan_hash_value | Specifies the <code>PLAN_HASH_VALUE</code> of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given <code>SQL_ID</code> .                                                             |
| db_id           | Specifies the <code>database_id</code> for which the plan of the SQL statement, identified by <code>SQL_ID</code> should be displayed. If not supplied, the <code>database_id</code> of the local database is used, as shown in <code>V\$DATABASE</code> . |

Table 207-4 (Cont.) DISPLAY\_AWR Table Function Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| format    | <p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> <li>BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li>TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</li> <li>SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li>ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> </ul> <p>For finer control on the display output, the following keywords can be added to the above four standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li>ROWS - if relevant, shows the number of rows estimated by the optimizer</li> <li>BYTES - if relevant, shows the number of bytes estimated by the optimizer</li> <li>COST - if relevant, shows optimizer cost information</li> <li>PARTITION - if relevant, shows partition pruning information</li> <li>PARALLEL - if relevant, shows PX information (distribution method and table queue information)</li> <li>PREDICATE - if relevant, shows the predicate section</li> <li>PROJECTION -if relevant, shows the projection section</li> <li>ALIAS - if relevant, shows the "Query Block Name / Object Alias" section</li> <li>REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li>NOTE - if relevant, shows the note section of the explain plan</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> |

### Usage Notes

- To use the DISPLAY\_AWR functionality, the calling user must have SELECT or READ privilege on DBA\_HIST\_SQL\_PLAN, DBA\_HIST\_SQLTEXT, and V\$DATABASE, otherwise it shows an appropriate error message.
- Here are some ways you might use variations on the format parameter:
  - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
  - Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.

- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

### Examples

To display the different execution plans associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_AWR('atfwcg8anrykp'));
```

To display all execution plans of all stored SQL statements containing the string 'TOTO':

```
SELECT tf.* FROM DBA_HIST_SQLTEXT ht, table
(DBMS_XPLAN.DISPLAY_AWR(ht.sql_id,null, null, 'ALL')) tf
WHERE ht.sql_text like '%TOTO%';
```

## 207.4.4 DISPLAY\_CURSOR Function

This table function displays the explain plan of any cursor loaded in the cursor cache. In addition to the explain plan, various plan statistics (such as I/O, memory and timing) can be reported (based on the V\$SQL\_PLAN\_STATISTICS\_ALL VIEWS).

### Syntax

```
DBMS_XPLAN.DISPLAY_CURSOR(
 sql_id IN VARCHAR2 DEFAULT NULL,
 cursor_child_no IN NUMBER DEFAULT 0,
 format IN VARCHAR2 DEFAULT 'TYPICAL');
```

### Parameters

**Table 207-5** DISPLAY\_CURSOR Function Parameters

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id          | Specifies the SQL_ID of the SQL statement in the cursor cache. You can retrieve the appropriate value by querying the column SQL_ID in V\$SQL or V\$SQLAREA. Alternatively, you could choose the column PREV_SQL_ID for a specific session out of V\$SESSION. This parameter defaults to NULL in which case the plan of the last cursor executed by the session is displayed. |
| cursor_child_no | Child number of the cursor to display. If not supplied, the execution plan of all cursors matching the supplied sql_id parameter are displayed. The child_number can be specified only if sql_id is specified.                                                                                                                                                                |

Table 207-5 (Cont.) DISPLAY\_CURSOR Function Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| format    | <p>Controls the level of details for the plan. It accepts five values:</p> <ul style="list-style-type: none"> <li>• <b>BASIC:</b> Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li>• <b>TYPICAL:</b> This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</li> <li>• <b>SERIAL:</b> Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li>• <b>ALL:</b> Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> <li>• <b>ADAPTIVE:</b> <ul style="list-style-type: none"> <li>- Displays the final plan, or the current plan if the execution has not completed. This section includes notes about runtime optimizations that affect the plan, such as switching from a Nested Loops join to a Hash join.</li> <li>- Plan lineage. This section shows the plans that were run previously due to automatic reoptimization. It also shows the default plan, if the plan changed due to dynamic plans.</li> <li>- Recommended plan. In reporting mode, the plan is chosen based on execution statistics displayed. Note that displaying the recommended plan for automatic reoptimization requires re-compiling the query with the optimizer adjustments collected in the child cursor. Displaying the recommended plan for a dynamic plan does not require this.</li> <li>- Dynamic plans. This summarizes the portions of the plan that differ from the default plan chosen by the optimizer.</li> </ul> </li> </ul> <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE).</p> <p>Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li>• <b>ROWS</b> - if relevant, shows the number of rows estimated by the optimizer</li> <li>• <b>BYTES</b> - if relevant, shows the number of bytes estimated by the optimizer</li> <li>• <b>COST</b> - if relevant, shows optimizer cost information</li> <li>• <b>PARTITION</b> - if relevant, shows partition pruning information</li> <li>• <b>PARALLEL</b> - if relevant, shows PX information (distribution method and table queue information)</li> <li>• <b>PREDICATE</b> - if relevant, shows the predicate section</li> <li>• <b>PROJECTION</b> -if relevant, shows the projection section</li> <li>• <b>ALIAS</b> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li>• <b>REMOTE</b> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li>• <b>NOTE</b> - if relevant, shows the note section of the explain plan</li> <li>• <b>IOSTATS</b> - assuming that basic plan statistics are collected when SQL statements are executed (either by using the gather_plan_statistics hint or by setting the parameter statistics_level to ALL), this format</li> </ul> |

**Table 207-5 (Cont.) DISPLAY\_CURSOR Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | <p>shows IO statistics for ALL (or only for the LAST as shown below) executions of the cursor.</p> <ul style="list-style-type: none"> <li>MEMSTATS - Assuming that PGA memory management is enabled (that is, pga_aggregate_target parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators.</li> <li>ALLSTATS - A shortcut for 'IOSTATS MEMSTATS'</li> <li>LAST - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution.</li> </ul> <p>The following two formats are deprecated but supported for backward compatibility:</p> <ul style="list-style-type: none"> <li>RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor.</li> <li>RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> |

### Usage Notes

- To use the DISPLAY\_CURSOR functionality, the calling user must have SELECT or READ privilege on the fixed views V\$SQL\_PLAN\_STATISTICS\_ALL, V\$SQL and V\$SQL\_PLAN, otherwise it shows an appropriate error message.
- Here are some ways you might use variations on the format parameter:
  - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
  - Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
  - Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
  - Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

### Examples

To display the execution plan of the last SQL statement executed by the current session:

```
SELECT * FROM table (
 DBMS_XPLAN.DISPLAY_CURSOR);
```

To display the execution plan of all children associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table (
 DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp'));
```

To display runtime statistics for the cursor included in the preceding statement:

```
SELECT * FROM table (
 DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp', NULL, 'ALLSTATS LAST');
```

## 207.4.5 DISPLAY\_PLAN Function

This table function displays the contents of the plan table in a variety of formats with CLOB output type.

### Syntax

```
DBMS_XPLAN.DISPLAY_PLAN (
 table_name IN VARCHAR2 DEFAULT 'PLAN_TABLE',
 statement_id IN VARCHAR2 DEFAULT NULL,
 format IN VARCHAR2 DEFAULT 'TYPICAL',
 filter_preds IN VARCHAR2 DEFAULT NULL,
 type IN VARCHAR2 DEFAULT 'TEXT')
RETURN CLOB;
```

### Parameters

**Table 207-6** DISPLAY\_PLAN Function Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name   | Specifies the table name where the plan is stored. This parameter defaults to <code>PLAN_TABLE</code> , which is the default plan table for the <code>EXPLAIN PLAN</code> command. If <code>NULL</code> is specified it also defaults to <code>PLAN_TABLE</code> .                                                                                                                                                                                                      |
| statement_id | Specifies the <code>statement_id</code> of the plan to be displayed. This parameter defaults to <code>NULL</code> , which is the default when the <code>EXPLAIN PLAN</code> command is executed without a <code>set statement_id</code> clause. If no <code>statement_id</code> is specified, the function shows you the plan of the most recent explained statement.                                                                                                   |
| filter_preds | SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is <code>NULL</code> (the default), the plan displayed corresponds to the last executed explain plan. For example: <code>filter_preds=&gt;'plan_id = 10'</code><br><br>Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see <b>WARNING</b> under Usage Notes) |

**Table 207-6 (Cont.) DISPLAY\_PLAN Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| format    | <p>Controls the level of details for the plan. It accepts five values:</p> <ul style="list-style-type: none"> <li>• <b>BASIC</b>: Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li>• <b>TYPICAL</b>: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</li> <li>• <b>SERIAL</b>: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li>• <b>ALL</b>: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> <li>• <b>ADAPTIVE</b>: Displays the default plan, and for each dynamic subplan (if stipulated): <ul style="list-style-type: none"> <li>- A list of the rowsources from the original which may be replaced, and the rowsources to replace them</li> <li>- If outline display is specified in the format argument, the hints for each option in the dynamic subplan are displayed</li> </ul> </li> </ul> <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li>• <b>ROWS</b> - if relevant, shows the number of rows estimated by the optimizer</li> <li>• <b>BYTES</b> - if relevant, shows the number of bytes estimated by the optimizer</li> <li>• <b>COST</b> - if relevant, shows optimizer cost information</li> <li>• <b>PARTITION</b> - if relevant, shows partition pruning information</li> <li>• <b>PARALLEL</b> - if relevant, shows PX information (distribution method and table queue information)</li> <li>• <b>PREDICATE</b> - if relevant, shows the predicate section</li> <li>• <b>PROJECTION</b> -if relevant, shows the projection section</li> <li>• <b>ALIAS</b> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li>• <b>REMOTE</b> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li>• <b>NOTE</b> - if relevant, shows the note section of the explain plan</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> <p>If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V\$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the <a href="#">DISPLAY Function</a> (page 207-6). These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the <a href="#">DISPLAY_CURSOR Function</a> (page 207-12) or the</p> |

**Table 207-6 (Cont.) DISPLAY\_PLAN Function Parameters**

| Parameter | Description                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------|
|           | <a href="#">DISPLAY_SQLSET Function</a> (page 207-18) for a full description of these four keywords). |
| type      | Output type, one of: 'TEXT', 'ACTIVE', 'HTML', or 'XML' (see Usage Notes regarding type ACTIVE).      |

### Return Values

Returns the requested report as CLOB

### Usage Notes

Active reports have a rich, interactive user interface akin to that found in Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

#### **WARNING:**

Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

## 207.4.6 DISPLAY\_SQL\_PLAN\_BASELINE Function

This table function displays one or more execution plans for the specified SQL handle of a SQL plan baseline.

### Syntax

```
DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE (
 sql_handle IN VARCHAR2 := NULL,
 plan_name IN VARCHAR2 := NULL,
 format IN VARCHAR2 := 'TYPICAL')
RETURN dbms_xplan_type_table;
```

### Parameters

**Table 207-7 DISPLAY\_SQL\_PLAN\_BASELINE Function Parameters**

| Parameter  | Description                                                                            |
|------------|----------------------------------------------------------------------------------------|
| sql_handle | SQL statement handle. It identifies a SQL statement whose plan(s) are to be displayed. |

**Table 207-7 (Cont.) DISPLAY\_SQL\_PLAN\_BASELINE Function Parameters**

| Parameter | Description                                                                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plan_name | Plan name. It identifies a specific plan. Default NULL means all plans associated with identified SQL statement are explained and displayed.                                     |
| format    | Format string determines what information stored in the plan displayed. One of three format values ('BASIC', 'TYPICAL', 'ALL') can be used, each representing a common use case. |

**Return Values**

A PL/SQL type table

**Usage Notes**

This procedure uses plan information stored in the plan baseline to explain and display the plans. It is possible that the `plan_id` stored in the SQL management base may not match with the `plan_id` of the generated plan. A mismatch between stored `plan_id` and generated `plan_id` means that it is a non-reproducible plan. Such a plan is deemed invalid and is bypassed by the optimizer during SQL compilation.

**Examples**

Display all plans of a SQL statement identified by the SQL handle 'SYS\_SQL\_b1d49f6074ab95af' using TYPICAL format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
 FROM TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(
 'SYS_SQL_b1d49f6074ab95af')) t;
```

Display all plans of one or more SQL statements containing the string 'HR2' using BASIC format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
 FROM (SELECT DISTINCT sql_handle FROM dba_sql_plan_baselines
 WHERE sql_text like '%HR2%') pb,
 TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(pb.sql_handle, NULL,
 'BASIC')) t;
```

## 207.4.7 DISPLAY\_SQLSET Function

This table function displays the execution plan of a given statement stored in a SQL tuning set.

**Syntax**

```
DBMS_XPLAN.DISPLAY_SQLSET(
 sqlset_name IN VARCHAR2,
 sql_id IN VARCHAR2,
 plan_hash_value IN NUMBER := NULL,
 format IN VARCHAR2 := 'TYPICAL',
```

```
sqlset_owner IN VARCHAR2 := NULL)
RETURN DBMS_XPLAN_TYPE_TABLE PIPELINED;
```

## Parameters

**Table 207-8** DISPLAY\_SQLSET Function Parameters

| Parameter       | Description                                                                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name     | Name of the SQL Tuning Set                                                                                                                                                                   |
| sql_id          | Specifies the sql_id value for a SQL statement having its plan stored in the SQL tuning set. You can find all stored SQL statements by querying table function<br>DBMS_SQLTUNE.SELECT_SQLSET |
| plan_hash_value | Optional parameter. Identifies a specific stored execution plan for a SQL statement. If suppressed, all stored execution plans are shown.                                                    |

Table 207-8 (Cont.) DISPLAY\_SQLSET Function Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| format    | <p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> <li>• <b>BASIC</b>: Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li>• <b>TYPICAL</b>: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only <b>PROJECTION</b>, <b>ALIAS</b> and <b>REMOTE SQL</b> information (see below).</li> <li>• <b>SERIAL</b>: Like <b>TYPICAL</b> except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li>• <b>ALL</b>: Maximum user level. Includes information displayed with the <b>TYPICAL</b> level with additional information (<b>PROJECTION</b>, <b>ALIAS</b> and information about <b>REMOTE SQL</b> if the operation is distributed).</li> </ul> <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as <b>PARTITION</b>) or logical additions to the base plan table output (such as <b>PREDICATE</b>). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li>• <b>ROWS</b> - if relevant, shows the number of rows estimated by the optimizer</li> <li>• <b>BYTES</b> - if relevant, shows the number of bytes estimated by the optimizer</li> <li>• <b>COST</b> - if relevant, shows optimizer cost information</li> <li>• <b>PARTITION</b> - if relevant, shows partition pruning information</li> <li>• <b>PARALLEL</b> - if relevant, shows PX information (distribution method and table queue information)</li> <li>• <b>PREDICATE</b> - if relevant, shows the predicate section</li> <li>• <b>PROJECTION</b> -if relevant, shows the projection section</li> <li>• <b>ALIAS</b> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li>• <b>REMOTE</b> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li>• <b>NOTE</b> - if relevant, shows the note section of the explain plan</li> <li>• <b>IOSTATS</b> - assuming that basic plan statistics are collected when SQL statements are executed (either by using the <code>gather_plan_statistics</code> hint or by setting the parameter <code>statistics_level</code> to <b>ALL</b>), this format shows IO statistics for <b>ALL</b> (or only for the <b>LAST</b> as shown below) executions of the cursor.</li> <li>• <b>MEMSTATS</b> - Assuming that PGA memory management is enabled (that is, <code>pga_aggregate_target</code> parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used,</li> </ul> |

**Table 207-8 (Cont.) DISPLAY\_SQLSET Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <p>number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators.</p> <ul style="list-style-type: none"> <li>• ALLSTATS - A shortcut for 'IOSTATS MEMSTATS'</li> <li>• LAST - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution.</li> </ul> <p>The following two formats are deprecated but supported for backward compatibility:</p> <ul style="list-style-type: none"> <li>• RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor.</li> <li>• RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> |
| sqlset_owner | The owner of the SQL tuning set. The default is the current user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

### Examples

To display the execution plan for the SQL statement associated with SQL ID 'gwp663cqh5qbf' and PLAN HASH 3693697075 in the SQL Tuning Set called 'OLTP\_optimization\_0405':

```
SELECT * FROM table (
 DBMS_XPLAN.DISPLAY_SQLSET(
 'OLTP_optimization_0405', 'gwp663cqh5qbf', 3693697075));
```

To display all execution plans of the SQL ID 'atfwcg8anrykp' stored in the SQL tuning set:

```
SELECT * FROM table (
 DBMS_XPLAN.DISPLAY_SQLSET(
 'OLTP_optimization_0405', 'gwp663cqh5qbf'));
```

To display runtime statistics for the SQL statement included in the preceding statement:

```
SELECT * FROM table (
 DBMS_XPLAN.DISPLAY_SQLSET(
 'OLTP_optimization_0405', 'gwp663cqh5qbf', NULL, 'ALLSTATS LAST');
```

# DBMS\_XSLPROCESSOR

The `DBMS_XSLPROCESSOR` package provides an interface to manage the contents and structure of XML documents.

This chapter contains the following topics:

- [DBMS\\_XSLPROCESSOR Overview](#) (page 208-1)
- [DBMS\\_XSLPROCESSOR Deprecated Subprograms](#) (page 208-2)
- [DBMS\\_XSLPROCESSOR Security Model](#) (page 208-2)
- [Summary of DBMS\\_XSLPROCESSOR Subprograms](#) (page 208-2)

## 208.1 DBMS\_XSLPROCESSOR Overview

The `DBMS_XSLPROCESSOR` package provides an interface to manage the contents and structure of XML documents.

### Standards

This PL/SQL implementation of the XSL processor follows the W3C XSLT working draft rev WD-xslt-19990813 and includes the required behavior of an XSL processor in terms of how it must read XSLT stylesheets and the transformation it must effect.

### Concepts

The Extensible Stylesheet Language Transformation (XSLT) describes rules for transforming a source tree into a result tree. A transformation expressed in XSLT is called a stylesheet. The transformation specified is achieved by associating patterns with templates defined in the stylesheet. A template is instantiated to create part of the result tree.

### Implementation

The following is the default behavior for this PL/SQL XSL Processor:

- A result tree which can be accessed by DOM programmatic interface
- Errors are not recorded unless an error log is specified; however, an application error will be raised if parsing fails

## 208.2 DBMS\_XSLPROCESSOR Deprecated Subprograms

These subprograms are deprecated from the `DBMS_XSLPROCESSOR` package in Oracle Database 12c release 12.2.

### Note:

Oracle recommends that do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

Starting in this release, these subprograms are available in the `DBMS_LOB` package.

- [CLOB2FILE Procedure](#) (page 208-3)
- [READ2CLOB Function](#) (page 208-7)

### See Also:

[Summary of DBMS\\_LOB Subprograms](#) (page 93-12)

## 208.3 DBMS\_XSLPROCESSOR Security Model

Owned by `XDB`, the `DBMS_XSLPROCESSOR` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

## 208.4 Summary of DBMS\_XSLPROCESSOR Subprograms

This table lists the `DBMS_XSLPROCESSOR` subprograms and briefly describes them.

**Table 208-1** *DBMS\_XSLPROCESSOR Package Subprograms*

| Method                                                   | Description                                                                                                                           |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CLOB2FILE Procedure</a><br>(page 208-3)      | Writes content of a <code>CLOB</code> into a file<br>This procedure has been deprecated starting in Oracle Database 12c release 12.2. |

## 208.4.1 CLOB2FILE Procedure

This procedure writes content of a CLOB into a file. This procedure has moved to the DBMS\_LOB package, starting in Oracle Database 12c release 12.2.

### Syntax

```
DBMS_XSLPROCESSOR.CLOB2FILE(
 cl IN CLOB;
 floccation IN VARCHAR2,
 fname IN VARCHAR2,
 csid IN NUMBER:=0);
```

### Parameters

**Table 208-2 CLOB2FILE Procedure Parameters**

| Parameter | Description    |
|-----------|----------------|
| CLOB      | File directory |
| flocation | File directory |
| fname     | File name      |

**Table 208-2 (Cont.) CLOB2FILE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| csid      | Character set id of the file <ul style="list-style-type: none"> <li>• Must be a valid Oracle id; otherwise returns an error</li> <li>• If 0, content of the output file will be in the database character set</li> </ul> |

## 208.4.2 FREEPROCESSOR Procedure

This procedure frees a `Processor` object.

### Syntax

```
DBMS_XSLPROCESSOR.FREEPROCESSOR(
 p IN Processor);
```

### Parameters

**Table 208-3 FREEPROCESSOR Procedure Parameters**

| Parameter | Description |
|-----------|-------------|
| p         | Processor   |

## 208.4.3 FREESTYLESHEET Procedure

This procedure frees a `Stylesheet` object.

### Syntax

```
DBMS_XSLPROCESSOR.FREESTYLESHEET(
 ss IN Stylesheet);
```

### Parameters

**Table 208-4 FREESTYLESHEET Procedure Parameters**

| Parameter | Description |
|-----------|-------------|
| ss        | Stylesheet  |

## 208.4.4 NEWPROCESSOR Function

This function returns a new `Processor` instance.

The function must be called before the default behavior of `Processor` can be changed and if other processor methods need to be used.

### Syntax

```
DBMS_XSLPROCESSOR.NEWPROCESSOR
 RETURN Processor;
```

## 208.4.5 NEWSTYLE SHEET Functions

This function creates and returns a new `Stylesheet` instance.

The options are described in the following table.

### Syntax

Creates and returns a new stylesheet instance using the given `DOMDOCUMENT` and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLE SHEET(
 xml doc IN DOMDOCUMENT,
 ref IN VARCHAR2)
RETURN Stylesheet;
```

Creates and returns a new `Stylesheet` instance using the given input and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLE SHEET(
 inp IN VARCHAR2,
 ref IN VARCHAR2)
RETURN Stylesheet;
```

### Parameters

**Table 208-5 NEWSTYLE SHEET Function Parameters**

| Parameter            | Description                         |
|----------------------|-------------------------------------|
| <code>xml doc</code> | DOMDocument to use for construction |
| <code>inp</code>     | Input URL to use for construction   |
| <code>ref</code>     | Reference URL                       |

## 208.4.6 PROCESSXSL Functions and Procedures

This function transforms input `XMLDocument`.

Any changes to the default processor behavior should be effected before calling this procedure. An application error is raised if processing fails.

### Syntax

Transforms input `XMLDocument` using given `DOMDocument` and `stylesheet`, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
 xml doc IN DOMDOCUMENT),
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given document as URL and the `Stylesheet`, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
 url IN VARCHAR2,
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given document as `CLOB` and the `Stylesheet`, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
 clb IN CLOB)
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given `DOMDOCUMENT` and the `stylesheet`, and writes the output to the specified file:

```
DBMS_XSLPROCESSOR.DBMS_XSLPROCESSOR.(
 p IN Processor,
 ss IN Stylesheet,
 xmldoc IN DOMDOCUMENT,
 dir IN VARCHAR2,
 fileName IN VARCHAR2);
```

Transforms input `XMLDocument` using given `URL` and the `stylesheet`, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
 url IN VARCHAR2,
 dir IN VARCHAR2,
 fileName IN VARCHAR2);
```

Transforms input `XMLDocument` using given `DOMDOCUMENT` and the `stylesheet`, and writes the output to a `CLOB`:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
 xmldoc IN DOMDOCUMENT,
 cl IN OUT CLOB);
```

Transforms input `XMLDocument` using given `DOMDOCUMENTFRAGMENT` and the `stylesheet`, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
 xmldf IN DOMDOCUMENTFRAGMENT)
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocumentFragment` using given `DOMDocumentFragment` and the `stylesheet`, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
 xmldf IN DOMDOCUMENTFRAGMENT,
```

```
dir IN VARCHAR2,
filename IN VARCHAR2);
```

Transforms input XMLDocumentFragment using given DOMDOCUMENTFRAGMENT and the stylesheet, and writes the output to a buffer:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
 xmldf IN DOMDOCUMENTFRAGMENT,
 buf IN OUT VARCHAR2);
```

Transforms input XMLDocumentFragment using given DOMDOCUMENTFRAGMENT and the stylesheet, and writes the output to a CLOB:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
 p IN Processor,
 ss IN Stylesheet,
 xmldf IN DOMDOCUMENTFRAGMENT,
 cl IN OUT CLOB);
```

### Parameters

**Table 208-6** PROCESSXSL Function and Procedure Parameters

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| p         | Processor instance                              |
| ss        | Stylesheet instance                             |
| xmldoc    | XML document being transformed                  |
| url       | URL for the information being transformed       |
| clb       | CLOB containing information to be transformed   |
| dir       | Directory where processing output file is saved |
| filename  | Processing output file                          |
| cl        | CLOB to which the processing output is saved    |
| xmldf     | XMLDocumentFragment being transformed           |

## 208.4.7 READ2CLOB Function

This function reads content of a file into a CLOB.

### Note:

This procedure has moved to the DBMS\_LOB package, starting in Oracle Database 12c release 12.2.

### Syntax

```
DBMS_XSLPROCESSOR.READ2CLOB(
 flocation IN VARCHAR2,
 fname IN VARCHAR2,
```

```

 csid IN NUMBER:=0)
 RETURN CLOB;

```

### Parameters

**Table 208-7 READ2CLOB Function Parameters**

| Parameter | Description                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flocation | File directory                                                                                                                                                                                                    |
| fname     | File name                                                                                                                                                                                                         |
| csid      | Character set id of the file <ul style="list-style-type: none"> <li>• Must be a valid Oracle id; otherwise returns an error</li> <li>• If 0, input file is assumed to be in the database character set</li> </ul> |

## 208.4.8 REMOVEPARAM Procedure

This procedure removes a top level stylesheet parameter.

### Syntax

```

DBMS_XSLPROCESSOR.REMOVEPARAM(
 ss IN Stylesheet,
 name IN VARCHAR2);

```

### Parameters

**Table 208-8 REMOVEPARAM Procedure Parameters**

| Parameter | Description           |
|-----------|-----------------------|
| ss        | Stylesheet instance   |
| name      | Name of the parameter |

## 208.4.9 RESETPARAMS Procedure

This procedure resets the top-level stylesheet parameters.

### Syntax

```

DBMS_XSLPROCESSOR.RESETPARAMS(
 ss IN Stylesheet);

```

### Parameters

**Table 208-9 RESETPARAMS Procedure Parameters**

| Parameter | Description         |
|-----------|---------------------|
| ss        | Stylesheet instance |

## 208.4.10 SELECTNODES Function

This function selects nodes which match the supplied path expression from a DOM tree, and returns the result of the selection.

### Syntax

```
DBMS_XSLPROCESSOR.SELECTNODES(
 n IN DBMS_XMLDOM.DOMNODE,
 pattern IN VARCHAR2,
 namespace IN VARCHAR2 := NULL)
RETURN DBMS_XMLDOM.DOMNODELIST;
```

### Parameters

**Table 208-10** SELECTNODES Function Parameters

| Parameter | Description              |
|-----------|--------------------------|
| n         | Root DOMNode of the tree |
| pattern   | Pattern to use           |
| namespace | Namespace declared       |

## 208.4.11 SELECTSINGLENODE Function

This function selects the first node from the tree that match the supplied path expression, and returns that node.

### Syntax

```
DBMS_XSLPROCESSOR.SELECTSINGLENODE(
 n IN DBMS_XMLDOM.DOMNODE,
 pattern IN VARCHAR2,
 namespace IN VARCHAR2 := NULL)
RETURN DBMS_XMLDOM.DOMNODE;
```

### Parameters

**Table 208-11** SELECTSINGLENODE Function Parameters

| Parameter | Description              |
|-----------|--------------------------|
| n         | Root DOMNode of the tree |
| pattern   | Pattern to use           |
| namespace | Namespace declared       |

## 208.4.12 SETERRORLOG Procedure

This deprecated procedure sets errors to be sent to the specified file.

### Note:

This subprogram has been deprecated, and is included only for reasons of backward compatibility.

### Syntax

```
DBMS_XSLPROCESSOR.SETERRORLOG(
 p IN Processor,
 fileName IN VARCHAR2);
```

### Parameters

**Table 208-12 SETERRORLOG Procedure Parameters**

| Parameter | Description                                       |
|-----------|---------------------------------------------------|
| p         | Processor instance                                |
| fileName  | Complete path of the file to use as the error log |

## 208.4.13 SETPARAM Procedure

This procedure sets a top level parameter in the stylesheet.

The parameter value must be a valid `xPath` expression. Literal string values must be quoted.

### Syntax

```
DBMS_XSLPROCESSOR.SETPARAM(
 ss IN Stylesheet,
 name IN VARCHAR2,
 value IN VARCHAR2);
```

### Parameters

**Table 208-13 SETPARAM Procedure Parameters**

| Parameter | Description            |
|-----------|------------------------|
| ss        | Stylesheet instance    |
| name      | Name of the parameter  |
| value     | Value of the parameter |

## 208.4.14 SHOWWARNINGS Procedure

This procedure turns warnings on (`TRUE`) or off (`FALSE`).

### Syntax

```
DBMS_XSLPROCESSOR.SHOWWARNINGS(
 p IN Processor,
 yes IN BOOLEAN);
```

### Parameters

**Table 208-14** SHOWWARNINGS Procedure Parameters

| Parameter | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| p         | Processor instance                                                            |
| yes       | Mode to set: <code>TRUE</code> to show warnings, <code>FALSE</code> otherwise |

## 208.4.15 TRANSFORMNODE Function

This function transforms a node in a DOM tree using the given stylesheet, and returns the result of the transformation as a `DOMDocumentFragment`.

### Syntax

```
DBMS_XSLPROCESSOR.TRANSFORMNODE(
 n IN DOMNODE,
 ss IN Stylesheet)
RETURN DOMDocumentFragment;
```

### Parameters

**Table 208-15** TRANSFORMNODE Function Parameters

| Parameter | Description          |
|-----------|----------------------|
| n         | DOMNode to transform |
| ss        | Stylesheet to use    |

## 208.4.16 VALUEOF Function and Procedure

This subprogram retrieves the value of the first node from the tree that matches the given pattern. You can use either a function or a procedure.

### Syntax

```
DBMS_XSLPROCESSOR.VALUEOF(
 n IN DBMS_XMLDOM.DOMNODE,
 pattern IN VARCHAR2,
 namespace IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

```
DBMS_XSLPROCESSOR.VALUEOF(
 n IN DBMS_XMLDOM.DOMNODE,
 pattern IN VARCHAR2,
 val OUT VARCHAR2,
 namespace IN VARCHAR2 := NULL);
```

### Parameters

**Table 208-16 VALUEOF Function and Procedure Parameters**

| Parameter | Description                         |
|-----------|-------------------------------------|
| n         | Node whose value is being retrieved |
| pattern   | Pattern to use                      |
| val       | Retrieved value                     |
| namespace | Namespace to use                    |

# DBMS\_XSTREAM\_ADM

This `DBMS_XSTREAM_ADM` package provides interfaces for streaming database changes between an Oracle database and other systems. XStream enables applications to stream out or stream in database changes.

This chapter contains the following topic:

- [Overview](#) (page 209-1)
- [Security Model](#) (page 209-2)
- [Operational Notes](#) (page 209-3)
- [Summary of DBMS\\_XSTREAM\\_ADM Subprograms](#) (page 209-3)

## See Also:

- *Oracle Database XStream Guide*
- *Oracle Call Interface Programmer's Guide*
- *Oracle Database XStream Java API Reference*

## 209.1 DBMS\_XSTREAM\_ADM Overview

The package provides interfaces for configuring outbound servers that stream database changes from an Oracle database to other systems. The package also provides interfaces for configuring inbound servers that stream database changes from other systems to an Oracle database.

In both cases, the database changes are encapsulated in logical change records (LCRs). Also, the other systems can be Oracle systems or a non-Oracle systems, such as non-Oracle databases or file systems.

XStream outbound servers can stream out LCRs from an Oracle database programmatically using C or Java. After receiving the LCRs, the other system can process them in any customized way. For example, the other system can save the contents of the LCRs to a file, send the LCRs to an Oracle database through an XStream inbound server, or generate SQL statements and execute them on any Oracle or non-Oracle databases.

XStream inbound servers accept LCRs from another system and either apply them to an Oracle database or process them in a customized way using apply handlers.

XStream can be used in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

 **See Also:**

- *Oracle Database XStream Guide*
- *Oracle Database Concepts* for more information about CDBs and PDBs

## 209.2 DBMS\_XSTREAM\_ADM Security Model

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an XStream administrator and connect as the XStream administrator when using this package.

An administrator must be granted the `DBA` role when the administrator is performing any of the following actions:

- Running the `ADD_OUTBOUND` procedure while connected as a user that is different from the configured connect user for an outbound server
- Running the `ALTER_OUTBOUND` procedure to change the capture user for a capture process or the connect user for an outbound server
- Running the `CREATE_OUTBOUND` procedure, because this procedure creates a capture process
- Running the `ALTER_INBOUND` procedure to change the apply user for an inbound server
- Running the `ADD_INBOUND` procedure while connected as a user that is different from the configured apply user for an inbound server

When the administrator does not need to perform the preceding tasks, the `DBA` role is not required.

 **See Also:**

- [GRANT\\_ADMIN\\_PRIVILEGE Procedure](#) (page 210-2)
- *Oracle Database XStream Guide, Chapter 4, "XStream Out and Security"* for more information about XStream and security.

## 209.3 DBMS\_XSTREAM\_ADM Operational Notes

Some subprograms in the `DBMS_APPLY_ADM` package can manage XStream outbound servers, and some subprograms in the `DBMS_APPLY_ADM` package can manage XStream inbound servers.

### See Also:

[DBMS\\_APPLY\\_ADM](#) (page 20-1) for details about which subprograms can manage outbound servers and inbound servers

## 209.4 Summary of DBMS\_XSTREAM\_ADM Subprograms

This table lists the `DBMS_XSTREAM_ADM` subprograms and briefly describes them.

**Table 209-1 DBMS\_XSTREAM\_ADM Package Subprograms**

| Subprogram                                                              | Description                                                                                                                                                                                      |
|-------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD_COLUMN Procedure</a><br>(page 209-6)                    | Either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule                                    |
| <a href="#">ADD_GLOBAL_PROPAGATION_RULES Procedure</a><br>(page 209-8)  | Either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist |
| <a href="#">ADD_GLOBAL_RULES Procedure</a><br>(page 209-12)             | Adds global rules to either the positive or negative rule set of a capture process or apply process, and creates the specified capture process or apply process if it does not exist             |
| <a href="#">ADD_OUTBOUND Procedure</a><br>(page 209-17)                 | Creates an XStream outbound server that dequeues LCRs from the specified queue                                                                                                                   |
| <a href="#">ADD_SCHEMA_PROPAGATION_RULES Procedure</a><br>(page 209-22) | Either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist |
| <a href="#">ADD_SCHEMA_RULES Procedure</a><br>(page 209-26)             | Adds rules to a rule set of XStream clients.                                                                                                                                                     |
| <a href="#">ADD_SUBSET_OUTBOUND_RULES Procedure</a><br>(page 209-31)    | Adds subset rules to an outbound server configuration                                                                                                                                            |
| <a href="#">ADD_SUBSET_PROPAGATION_RULES Procedure</a><br>(page 209-33) | Adds subset rules to the positive rule set for a propagation, and creates the specified propagation if it does not exist                                                                         |
| <a href="#">ADD_SUBSET_RULES Procedure</a><br>(page 209-37)             | Adds subset rules to the positive rule set of a capture process or apply process, and creates the specified capture process or apply process if it does not exist                                |

**Table 209-1 (Cont.) DBMS\_XSTREAM\_ADM Package Subprograms**

| Subprogram                                                            | Description                                                                                                                                                                                                             |
|-----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD_TABLE_PROPAGATION_RULES Procedure</a> (page 209-42)   | Either adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist                          |
| <a href="#">ADD_TABLE_RULES Procedure</a> (page 209-46)               | This procedure adds rules to a rule set of an XStream client.                                                                                                                                                           |
| <a href="#">ALTER_INBOUND Procedure</a> (page 209-52)                 | Modifies an XStream inbound server                                                                                                                                                                                      |
| <a href="#">ALTER_OUTBOUND Procedure</a> (page 209-53)                | Modifies an XStream outbound server                                                                                                                                                                                     |
| <a href="#">CREATE_INBOUND Procedure</a> (page 209-58)                | Creates an XStream inbound server and its queue                                                                                                                                                                         |
| <a href="#">CREATE_OUTBOUND Procedure</a> (page 209-60)               | Creates an XStream outbound server, queue, and capture process to enable XStream client applications to stream out Oracle database changes encapsulated in LCRs                                                         |
| <a href="#">DELETE_COLUMN Procedure</a> (page 209-65)                 | Either adds or removes a declarative rule-based transformation which deletes a column from a row LCR that satisfies the specified rule                                                                                  |
| <a href="#">DROP_INBOUND Procedure</a> (page 209-68)                  | Removes an inbound server configuration                                                                                                                                                                                 |
| <a href="#">DROP_OUTBOUND Procedure</a> (page 209-68)                 | Removes an outbound server configuration                                                                                                                                                                                |
| <a href="#">ENABLE_GG_XSTREAM_FOR_STREAMS Procedure</a> (page 209-69) | Enables XStream performance optimizations for Oracle Streams components                                                                                                                                                 |
| <a href="#">GET_MESSAGE_TRACKING Function</a> (page 209-70)           | Returns the tracking label for the current session                                                                                                                                                                      |
| <a href="#">GET_TAG Function</a> (page 209-71)                        | Gets the binary tag for all redo entries generated by the current session                                                                                                                                               |
| <a href="#">IS_GG_XSTREAM_FOR_STREAMS Function</a> (page 209-71)      | Returns <code>TRUE</code> if XStream performance optimizations are enabled for Oracle Streams components, or returns <code>FALSE</code> if XStream performance optimizations are disabled for Oracle Streams components |
| <a href="#">KEEP_COLUMNS Procedure</a> (page 209-72)                  | Either adds or removes a declarative rule-based transformation which keeps a list of columns in a row LCR that satisfies the specified rule                                                                             |
| <a href="#">MERGE_STREAMS Procedure</a> (page 209-74)                 | Merges a stream flowing from one capture process with a stream flowing from another capture process                                                                                                                     |
| <a href="#">MERGE_STREAMS_JOB Procedure</a> (page 209-77)             | Determines whether the original capture process and the cloned capture are within the specified merge threshold and, if they are, runs the <code>MERGE_STREAMS</code> procedure to merge the two streams                |
| <a href="#">PURGE_SOURCE_CATALOG Procedure</a> (page 209-80)          | Removes all Oracle Streams data dictionary information at the local database for the specified object                                                                                                                   |

**Table 209-1 (Cont.) DBMS\_XSTREAM\_ADM Package Subprograms**

| Subprogram                                                              | Description                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">RECOVER_OPERATION Procedure</a><br>(page 209-81)            | Provides options for a split and merge operation that stopped because it encountered an error. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation. |
| <a href="#">REMOVE_QUEUE Procedure</a><br>(page 209-83)                 | Removes the specified ANYDATA queue                                                                                                                                                                                            |
| <a href="#">REMOVE_RULE Procedure</a><br>(page 209-84)                  | Removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation.                                                                                        |
| <a href="#">REMOVE_SUBSET_OUTBOUND_RULES Procedure</a><br>(page 209-85) | Removes subset rules from an outbound server configuration                                                                                                                                                                     |
| <a href="#">REMOVE_XSTREAM_CONFIGURATION Procedure</a><br>(page 209-86) | Removes the XStream configuration at the local database                                                                                                                                                                        |
| <a href="#">RENAME_COLUMN Procedure</a><br>(page 209-88)                | Either adds or removes a declarative rule-based transformation which renames a column in a row LCR that satisfies the specified rule                                                                                           |
| <a href="#">RENAME_SCHEMA Procedure</a><br>(page 209-91)                | Either adds or removes a declarative rule-based transformation which renames a schema in a row LCR that satisfies the specified rule                                                                                           |
| <a href="#">RENAME_TABLE Procedure</a><br>(page 209-93)                 | Either adds or removes a declarative rule-based transformation which renames a table in a row LCR that satisfies the specified rule                                                                                            |
| <a href="#">SET_MESSAGE_TRACKING Procedure</a><br>(page 209-95)         | Sets the tracking label for logical change records (LCRs) produced by the current session                                                                                                                                      |
| <a href="#">SET_PARAMETER Procedure</a><br>(page 209-96)                | Sets a parameter for an outbound server, an inbound server, or an outbound server's capture process                                                                                                                            |
| <a href="#">SET_TAG Procedure</a><br>(page 209-97)                      | Sets the binary tag for all redo entries subsequently generated by the current session                                                                                                                                         |
| <a href="#">SET_UP_QUEUE Procedure</a><br>(page 209-98)                 | Creates a queue table and a queue for use with the capture, propagate, and apply functionality of XStream                                                                                                                      |
| <a href="#">SPLIT_STREAMS Procedure</a><br>(page 209-100)               | Splits one stream flowing from a capture process off from all of the other streams flowing from the capture process                                                                                                            |
| <a href="#">START_OUTBOUND Procedure</a><br>(page 209-104)              | Starts an XStream outbound server                                                                                                                                                                                              |
| <a href="#">STOP_OUTBOUND Procedure</a><br>(page 209-105)               | Stops an XStream outbound server                                                                                                                                                                                               |

 **Note:**

All subprograms commit unless specified otherwise.

## 209.4.1 ADD\_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The `column_value` and `column_function` parameters are mutually exclusive.

### Note:

- `ADD_COLUMN` transformations cannot add columns of the following data types: `BLOB`, `CLOB`, `NCLOB`, `BFILE`, `LONG`, `LONG RAW`, `ROWID`, user-defined types (including object types, `REFS`, `varrays`, nested tables), and Oracle-supplied types (including any types, XML types, spatial types, and media types).
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

### See Also:

*Oracle Database XStream Guide* for more information about declarative rule-based transformations

### Syntax

```
DBMS_XSTREAM_ADM.ADD_COLUMN(
 rule_name IN VARCHAR2,
 table_name IN VARCHAR2,
 column_name IN VARCHAR2,
 column_value IN ANYDATA,
 value_type IN VARCHAR2 DEFAULT 'NEW',
 step_number IN NUMBER DEFAULT 0,
 operation IN VARCHAR2 DEFAULT 'ADD');
```

```
DBMS_XSTREAM_ADM.ADD_COLUMN(
 rule_name IN VARCHAR2,
 table_name IN VARCHAR2,
 column_name IN VARCHAR2,
 column_function IN VARCHAR2,
 value_type IN VARCHAR2 DEFAULT 'NEW',
 step_number IN NUMBER DEFAULT 0,
 operation IN VARCHAR2 DEFAULT 'ADD');
```

## Parameters

Table 209-2 ADD\_COLUMN Procedure Parameters

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_name       | The name of the rule, specified as [ <i>schema_name</i> .] <i>rule_name</i> . If NULL, then the procedure raises an error.<br><br>For example, to specify a rule in the <i>hr</i> schema named <i>employees12</i> , enter <i>hr.employees12</i> . If the schema is not specified, then the current user is the default.                                                                                                                                                                                                                                                                                                                                                                     |
| table_name      | The name of the table to which the column is added in the row LCR, specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, <i>hr.employees</i> . If the schema is not specified, then the current user is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| column_name     | The name of the column added to each row LCR that satisfies the rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| column_value    | The value of the added column. Specify the appropriate ANYDATA function for the column datatype and the column value. For example, if the datatype of the column being added is NUMBER and the value is NULL, then specify the ANYDATA.ConvertNumber(NULL) function.<br><br>This parameter cannot be specified if the column_function parameter is specified.                                                                                                                                                                                                                                                                                                                               |
| column_function | Either the 'SYSDATE' or the 'SYSTIMESTAMP' SQL function.<br><br>The 'SYSDATE' SQL function places the current date and time set for the operating system on which the database resides. The datatype of the returned value is DATE, and the format returned depends on the value of the NLS_DATE_FORMAT initialization parameter.<br><br>The 'SYSTIMESTAMP' SQL function returns the system date, including fractional seconds and time zone, of the system on which the database resides. The return type is TIMESTAMP WITH TIME ZONE.<br><br>The function executes when the rule evaluates to TRUE.<br><br>This parameter cannot be specified if the column_value parameter is specified. |
| value_type      | Specify 'NEW' to add the column to the new values in the row LCR.<br><br>Specify 'OLD' to add the column to the old values in the row LCR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| step_number     | The order of execution of the transformation.<br><br><b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| operation       | Specify 'ADD' to add the transformation to the rule.<br><br>Specify 'REMOVE' to remove the transformation from the rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified table\_name, column\_name, and step\_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the ADD\_COLUMN procedures when one or more of these parameters is NULL:

| table_name | column_name | step_number | Result                                                                                                                    |
|------------|-------------|-------------|---------------------------------------------------------------------------------------------------------------------------|
| NULL       | NULL        | NULL        | Remove all add column transformations for the specified rule.                                                             |
| NULL       | NULL        | non-NULL    | Remove all add column transformations with the specified step_number for the specified rule.                              |
| NULL       | non-NULL    | non-NULL    | Remove all add column transformations with the specified column_name and step_number for the specified rule.              |
| non-NULL   | NULL        | non-NULL    | Remove all add column transformations with the specified table_name and step_number for the specified rule.               |
| NULL       | non-NULL    | NULL        | Remove all add column transformations with the specified column_name for the specified rule.                              |
| non-NULL   | non-NULL    | NULL        | Remove all add column transformations with the specified table_name and column_name for the specified rule.               |
| non-NULL   | NULL        | NULL        | Remove all add column transformations with the specified table_name for the specified rule.                               |
| non-NULL   | non-NULL    | non-NULL    | Remove all add column transformations with the specified table_name, column_name, and step_number for the specified rule. |

## 209.4.2 ADD\_GLOBAL\_PROPAGATION\_RULES Procedure

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES(
 streams_name IN VARCHAR2 DEFAULT NULL,
 source_queue_name IN VARCHAR2,
 destination_queue_name IN VARCHAR2,
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 dml_rule_name OUT VARCHAR2,
 ddl_rule_name OUT VARCHAR2,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
 and_condition IN VARCHAR2 DEFAULT NULL,
 queue_to_queue IN BOOLEAN DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES(
 streams_name IN VARCHAR2 DEFAULT NULL,
 source_queue_name IN VARCHAR2,
```

```

destination_queue_name IN VARCHAR2,
include_dml IN BOOLEAN DEFAULT TRUE,
include_ddl IN BOOLEAN DEFAULT FALSE,
include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
source_database IN VARCHAR2 DEFAULT NULL,
inclusion_rule IN BOOLEAN DEFAULT TRUE,
and_condition IN VARCHAR2 DEFAULT NULL,
queue_to_queue IN BOOLEAN DEFAULT NULL);

```

## Parameters

**Table 209-3 ADD\_GLOBAL\_PROPAGATION\_RULES Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| streams_name           | <p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p>                                                                                                                                                                                                                                                                      |
| source_queue_name      | <p>The name of the source queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>                                                                                                                                                                                                                                                                                                                                                        |
| destination_queue_name | <p>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p><b>Note:</b> Connection qualifiers are not allowed.</p> |
| include_dml            | <p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| include_ddl            | <p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 209-3 (Cont.) ADD\_GLOBAL\_PROPAGATION\_RULES Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| include_tagged_lcr | <p>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a logical change record (LCR) has a non-<code>NULL</code> tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-<code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if an LCR has a <code>NULL</code> Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a <code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a <code>NULL</code> tag.</p> <p>Usually, specify <code>TRUE</code> for this parameter if the <code>inclusion_rule</code> parameter is set to <code>FALSE</code>.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p> |
| source_database    | <p>The global name of the source database. The source database is where the changes originated. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| dml_rule_name      | <p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| inclusion_rule     | <p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 209-3 (Cont.) ADD\_GLOBAL\_PROPAGATION\_RULES Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| and_condition  | <p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.</p> <p><b>See Also:</b> <a href="#">Logical Change Record TYPES</a> (page 286-1)</p>                                                                                                                              |
| queue_to_queue | <p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>The procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> <li>• If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</li> <li>• If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.</li> <li>• If NULL, then the procedure does not change the queue to queue property of the propagation.</li> </ul> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p> |

## Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

## Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET')
```

## 209.4.3 ADD\_GLOBAL\_RULES Procedure

This procedure adds rules to an XStream clients rule set.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to an entire database.

This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying all logical change records (LCRs) it receives. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

### Note:

If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not support by Oracle Streams. Query the `DBA_STREAMS_UNUNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

## Syntax

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES(
 streams_type IN VARCHAR2,
```

```

streams_name IN VARCHAR2 DEFAULT NULL,
queue_name IN VARCHAR2 DEFAULT 'streams_queue',
include_dml IN BOOLEAN DEFAULT TRUE,
include_ddl IN BOOLEAN DEFAULT FALSE,
include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
source_database IN VARCHAR2 DEFAULT NULL,
dml_rule_name OUT VARCHAR2,
ddl_rule_name OUT VARCHAR2,
inclusion_rule IN BOOLEAN DEFAULT TRUE,
and_condition IN VARCHAR2 DEFAULT NULL,
source_root_name IN VARCHAR2 DEFAULT NULL,
source_container_name IN VARCHAR2 DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES(
streams_type IN VARCHAR2,
streams_name IN VARCHAR2 DEFAULT NULL,
queue_name IN VARCHAR2 DEFAULT 'streams_queue',
include_dml IN BOOLEAN DEFAULT TRUE,
include_ddl IN BOOLEAN DEFAULT FALSE,
include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
source_database IN VARCHAR2 DEFAULT NULL,
inclusion_rule IN BOOLEAN DEFAULT TRUE,
and_condition IN VARCHAR2 DEFAULT NULL,
source_root_name IN VARCHAR2 DEFAULT NULL,
source_container_name IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 209-4 ADD\_GLOBAL\_RULES Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                 |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| streams_type | The type of XStream client: <ul style="list-style-type: none"> <li>Specify <code>capture</code> for a capture process.</li> <li>Specify <code>apply</code> for an apply process.</li> </ul> |

**Table 209-4 (Cont.) ADD\_GLOBAL\_RULES Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| streams_name | <p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If <code>NULL</code>, if <code>streams_type</code> is <code>capture</code>, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If <code>NULL</code> and multiple XStream clients of the specified <code>streams_type</code> for the queue exist, then the procedure raises an error.</p> <p>If <code>NULL</code>, if <code>streams_type</code> is <code>apply</code>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> <li>• If one existing apply process has the source database specified in <code>source_database</code> and uses the queue specified in <code>queue_name</code>, then the procedure uses this apply process.</li> <li>• If <code>source_database</code> is <code>NULL</code> and one existing apply process is using the queue specified in <code>queue_name</code>, then the procedure uses this apply process.</li> </ul> <p>If <code>NULL</code> and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If <code>NULL</code> and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p> |
| queue_name   | <p>The name of the local queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be <code>ANYDATA</code> type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| include_dml  | <p>If <code>TRUE</code>, then the procedure creates a rule for DML changes. If <code>FALSE</code>, then the procedure does not create a DML rule. <code>NULL</code> is not permitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| include_ddl  | <p>If <code>TRUE</code>, then the procedure creates a rule for DDL changes. If <code>FALSE</code>, then the procedure does not create a DDL rule. <code>NULL</code> is not permitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| include_tagged_lcr | <p>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a redo entry or LCR has a non-<code>NULL</code> tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-<code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.</p> <p>If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if a redo entry or LCR has a <code>NULL</code> Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a <code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a <code>NULL</code> tag.</p> <p>Usually, specify <code>TRUE</code> for this parameter if the <code>inclusion_rule</code> parameter is set to <code>FALSE</code>.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p> |
| source_database    | <p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| dml_rule_name      | <p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 209-4 (Cont.) ADD\_GLOBAL\_RULES Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| ddl_rule_name         | <p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| inclusion_rule        | <p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the XStream client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the XStream client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| and_condition         | <p>If non-<code>NULL</code>, appends the specified condition to the system-generated rule condition using an <code>AND</code> clause in the following way:</p> <p><code>(system_condition) AND (and_condition)</code></p> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the global rules generated by the procedure evaluate to <code>TRUE</code> only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify <code>TRUE</code> for the <code>include_dml</code> parameter and <code>FALSE</code> for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify <code>FALSE</code> for the <code>include_dml</code> parameter and <code>TRUE</code> for the <code>include_ddl</code> parameter.</p> <p><b>See Also:</b> <a href="#">Logical Change Record TYPES</a> (page 286-1)</p> |
| source_root_name      | <p>The global name of the root in the source CDB. For example, <code>mycdb.example.com</code>.</p> <p>If this parameter is <code>NULL</code>, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-<code>NULL</code> value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| source_container_name | <p>The short name of the source container. The container can be the root or a PDB. For example, <code>CDB\$ROOT</code> or <code>hrpdb</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Usage Notes

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A capture process or apply process uses the rules for filtering.

## Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET')
```

## 209.4.4 ADD\_OUTBOUND Procedure

This procedure creates an XStream outbound server that dequeues LCRs from the specified queue. The outbound server streams out the LCRs to an XStream client application.

This procedure creates neither a capture process nor a queue. To create an outbound server, a capture process, and a queue with one procedure call, use the [CREATE\\_OUTBOUND Procedure \(page 209-60\)](#).

To create the capture process individually, use one of the following packages:

- DBMS\_XSTREAM\_ADM
- DBMS\_CAPTURE\_ADM

To create a queue individually, use the `SET_UP_QUEUE` procedure in the `DBMS_XSTREAM_ADM` package.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the lists of tables and schemas in different ways and are mutually exclusive.

 **Note:**

- A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an outbound server.
- This procedure enables the outbound server that it creates.
- Starting with Oracle Database 11g Release 2 (11.2.0.2), the `capture_name`, `start_scn`, and `start_time` parameters are included in this procedure.

**Syntax**

```
DBMS_XSTREAM_ADM.ADD_OUTBOUND(
 server_name IN VARCHAR2,
 queue_name IN VARCHAR2 DEFAULT NULL,
 source_database IN VARCHAR2 DEFAULT NULL,
 table_names IN DBMS_UTILITY.UNCL_ARRAY,
 schema_names IN DBMS_UTILITY.UNCL_ARRAY,
 connect_user IN VARCHAR2 DEFAULT NULL,
 comment IN VARCHAR2 DEFAULT NULL,
 capture_name IN VARCHAR2 DEFAULT NULL,
 start_scn IN NUMBER DEFAULT NULL,
 start_time IN TIMESTAMP DEFAULT NULL,
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 source_root_name IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL,
 lcrld_version IN NUMBER DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_OUTBOUND(
 server_name IN VARCHAR2,
 queue_name IN VARCHAR2 DEFAULT NULL,
 source_database IN VARCHAR2 DEFAULT NULL,
 table_names IN VARCHAR2 DEFAULT NULL,
 schema_names IN VARCHAR2 DEFAULT NULL,
 connect_user IN VARCHAR2 DEFAULT NULL,
 comment IN VARCHAR2 DEFAULT NULL,
 capture_name IN VARCHAR2 DEFAULT NULL,
 start_scn IN NUMBER DEFAULT NULL,
 start_time IN TIMESTAMP DEFAULT NULL,
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 source_root_name IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL,
 lcrld_version IN NUMBER DEFAULT NULL);
```

## Parameters

Table 209-5 ADD\_OUTBOUND Procedure Parameters

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| server_name     | <p>The name of the outbound server being created. A NULL specification is not allowed. Do not specify an owner.</p> <p>The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client.</p> <p><b>Note:</b> The <code>server_name</code> setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| queue_name      | <p>The name of the local queue from which the outbound server dequeues LCRs, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <code>xstream_queue</code> in the <code>xstrmadmin</code> schema, enter <code>xstrmadmin.xstream_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>If NULL, the procedure raises an error.</p>                                                                                                                                                                                                                                                                                                                                |
| source_database | <p>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p>                                                                                                         |
| table_names     | <p>The tables for which data manipulation language (DML) and data definition language (DDL) changes are streamed out to the XStream client application. The tables can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>• Comma-delimited list of type <code>VARCHAR2</code>.</li> <li>• A PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL.</li> </ul> <p>Each table should be specified as <code>[schema_name.]table_name</code>. For example, you can specify <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a> (page 209-21)" for more information about this parameter</p> |

**Table 209-5 (Cont.) ADD\_OUTBOUND Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema_names | <p>The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>Comma-delimited list of type VARCHAR2.</li> <li>A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL.</li> </ul> <p><b>Note:</b> This procedure does not concatenate the <code>schema_names</code> parameter with the <code>table_names</code> parameter. To specify tables, enter fully qualified table names in the <code>table_names</code> parameter (<code>schema_name.table_name</code>).</p> <p><b>See Also:</b> "Usage Notes (page 209-21)" for more information about this parameter</p> |
| connect_user | <p>The user who can attach to the specified outbound server to retrieve the LCR stream. The client application must attach to the outbound server as the specified connect user. See "CREATE_OUTBOUND Procedure (page 209-60)" for information about the privileges required by a connect user.</p> <p>If NULL, then the current user is the default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| comment      | An optional comment associated with the outbound server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| capture_name | <p>The name of the capture process configured to capture changes for the outbound server. Do not specify an owner.</p> <p>If the specified name matches the name of an existing capture process for another outbound server, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set.</p> <p>If the specified name matches the name of an existing capture process for an apply process, then an error is raised.</p> <p>If the specified name does not match the name of an existing capture process, then an error is raised.</p> <p>If NULL, then the outbound server is created without a capture process.</p>                                                                                                           |
| start_scn    | <p>A valid system change number (SCN) for the database from which the capture process starts capturing changes.</p> <p>If the <code>capture_name</code> parameter is NULL, then this parameter is ignored.</p> <p>If NULL and the <code>capture_name</code> parameter is non-NULL, then the start SCN of the capture process is not changed.</p> <p>An error is returned if an invalid SCN is specified.</p> <p>The <code>start_scn</code> and <code>start_time</code> parameters are mutually exclusive.</p>                                                                                                                                                                                                                                                                                                               |
| start_time   | <p>A valid time from which the capture process starts capturing changes.</p> <p>If the <code>capture_name</code> parameter is NULL, then this parameter is ignored.</p> <p>If NULL and the <code>capture_name</code> parameter is non-NULL, then the start SCN of the capture process is not changed.</p> <p>The <code>start_scn</code> and <code>start_time</code> parameters are mutually exclusive.</p>                                                                                                                                                                                                                                                                                                                                                                                                                  |
| include_dml  | If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| include_ddl  | If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 209-5 (Cont.) ADD\_OUTBOUND Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_root_name      | <p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p> |
| source_container_name | <p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| lcrld_version         | <p>The LCRID version for captured LCRs, either 1 or 2.</p> <p>If 2, then the LCRs are compatible with a database with its compatibility level at 12.2.0 or higher.</p> <p>If 1, then the LCRs are compatible with a database with its compatibility level at 12.1.0 or lower.</p> <p>If NULL, the default, and the database compatibility level is 12.2.0 or higher, then the lcrld_version is set to 2 internally. If the database compatibility level is 12.1.0 or lower, then the lcrld_version is set to 1 internally.</p>                                                                                                                                                                                                                                    |

### Usage Notes

The following list describes the behavior of the outbound server for various combinations of the `table_names` and `schema_names` parameters:

- If both the `table_names` and `schema_names` parameters are NULL or empty, then the outbound server streams all DML and DDL changes to the client application.  
This procedure is overloaded. The `table_names` and `schema_names` parameters are defaulted to NULL. Do not specify NULL for both `table_names` and `schema_names` in the same call; otherwise, error PLS-00307 is returned.
- If both the `table_names` and `schema_names` parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.
- If the `table_names` parameter is specified and the `schema_names` parameter is NULL or empty, then the outbound server streams DML and DDL changes for the specified tables.
- If the `table_names` parameter is NULL or empty and the `schema_names` parameter is specified, then the outbound server streams DML and DDL changes for the specified schemas.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the `schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

**Note:**

An empty array includes one `NULL` entry.

## 209.4.5 ADD\_SCHEMA\_PROPAGATION\_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES(
 schema_name IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 source_queue_name IN VARCHAR2,
 destination_queue_name IN VARCHAR2,
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 dml_rule_name OUT VARCHAR2,
 ddl_rule_name OUT VARCHAR2,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
 and_condition IN VARCHAR2 DEFAULT NULL,
 queue_to_queue IN BOOLEAN DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES(
 schema_name IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 source_queue_name IN VARCHAR2,
 destination_queue_name IN VARCHAR2,
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
 and_condition IN VARCHAR2 DEFAULT NULL,
 queue_to_queue IN BOOLEAN DEFAULT NULL);
```

### Parameters

**Table 209-6 ADD\_SCHEMA\_PROPAGATION\_RULES Procedure Parameters**

| Parameter                | Description                                            |
|--------------------------|--------------------------------------------------------|
| <code>schema_name</code> | The name of the schema. For example, <code>hr</code> . |

**Table 209-6 (Cont.) ADD\_SCHEMA\_PROPAGATION\_RULES Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| streams_name           | <p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p>                                                                                                                                                                                                                                                                      |
| source_queue_name      | <p>The name of the source queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>                                                                                                                                                                                                                                                                                                                                                        |
| destination_queue_name | <p>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p><b>Note:</b> Connection qualifiers are not allowed.</p> |
| include_dml            | <p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| include_ddl            | <p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 209-6 (Cont.) ADD\_SCHEMA\_PROPAGATION\_RULES Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| include_tagged_lcr | <p>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a logical change record (LCR) has a non-<code>NULL</code> tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-<code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if an LCR has a <code>NULL</code> Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a <code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a <code>NULL</code> tag.</p> <p>Usually, specify <code>TRUE</code> for this parameter if the <code>inclusion_rule</code> parameter is set to <code>FALSE</code>.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p> |
| source_database    | <p>The global name of the source database. The source database is where the change originated. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| inclusion_rule     | <p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 209-6 (Cont.) ADD\_SCHEMA\_PROPAGATION\_RULES Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| and_condition  | <p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.</p> <p><b>See Also:</b> <a href="#">Logical Change Record TYPES</a> (page 286-1)</p>                                                                                                                              |
| queue_to_queue | <p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> <li>• If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</li> <li>• If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.</li> <li>• If NULL, then the procedure does not change the queue to queue property of the propagation.</li> </ul> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p> |

## Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules for filtering.

## Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET')
```

## 209.4.6 ADD\_SCHEMA\_RULES Procedure

This procedure adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified schema.

This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

### Note:

If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not supported by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

## Syntax

```

DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES(
 schema_name IN VARCHAR2,
 streams_type IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 queue_name IN VARCHAR2 DEFAULT 'streams_queue',
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 dml_rule_name OUT VARCHAR2,
 ddl_rule_name OUT VARCHAR2,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
 and_condition IN VARCHAR2 DEFAULT NULL,
 source_root_name IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL);

```

```

DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES(
 schema_name IN VARCHAR2,
 streams_type IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 queue_name IN VARCHAR2 DEFAULT 'streams_queue',
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
 and_condition IN VARCHAR2 DEFAULT NULL,
 source_root_name IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 209-7 ADD\_SCHEMA\_RULES Procedure Parameters**

| Parameter    | Description                                                                                                                                                         |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema_name  | The name of the schema. For example, hr.<br>You can specify a schema that does not yet exist, because Oracle Streams does not validate the existence of the schema. |
| streams_type | The type of XStream client: <ul style="list-style-type: none"> <li>Specify capture for a capture process.</li> <li>Specify apply for an apply process.</li> </ul>   |

**Table 209-7 (Cont.) ADD\_SCHEMA\_RULES Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| streams_name | <p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If <code>NULL</code>, if <code>streams_type</code> is <code>capture</code>, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If <code>NULL</code> and multiple XStream clients of the specified <code>streams_type</code> for the queue exist, then the procedure raises an error.</p> <p>If <code>NULL</code>, if <code>streams_type</code> is <code>apply</code>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> <li>• If one existing apply process has the source database specified in <code>source_database</code> and uses the queue specified in <code>queue_name</code>, then the procedure uses this apply process.</li> <li>• If <code>source_database</code> is <code>NULL</code> and one existing apply process is using the queue specified in <code>queue_name</code>, then the procedure uses this apply process.</li> </ul> <p>If <code>NULL</code> and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If <code>NULL</code> and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p> |
| queue_name   | <p>The name of the local queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be <code>ANYDATA</code> type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| include_dml  | <p>If <code>TRUE</code>, then the procedure creates a rule for DML changes. If <code>FALSE</code>, then the procedure does not create a DML rule. <code>NULL</code> is not permitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| include_ddl  | <p>If <code>TRUE</code>, then the procedure creates a rule for DDL changes. If <code>FALSE</code>, then the procedure does not create a DDL rule. <code>NULL</code> is not permitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 209-7 (Cont.) ADD\_SCHEMA\_RULES Procedure Parameters

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| include_tagged_lcr | <p>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a redo entry or LCR has a non-<code>NULL</code> tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-<code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.</p> <p>If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if a redo entry or LCR has a <code>NULL</code> Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a <code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a <code>NULL</code> tag.</p> <p>Usually, specify <code>TRUE</code> for this parameter if the <code>inclusion_rule</code> parameter is set to <code>FALSE</code>.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p> |
| source_database    | <p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| dml_rule_name      | <p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 209-7 (Cont.) ADD\_SCHEMA\_RULES Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| ddl_rule_name         | <p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| inclusion_rule        | <p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the XStream client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the XStream client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| and_condition         | <p>If non-<code>NULL</code>, appends the specified condition to the system-generated rule condition using an <code>AND</code> clause in the following way:</p> <p><code>(system_condition) AND (and_condition)</code></p> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the schema rules generated by the procedure evaluate to <code>TRUE</code> only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify <code>TRUE</code> for the <code>include_dml</code> parameter and <code>FALSE</code> for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify <code>FALSE</code> for the <code>include_dml</code> parameter and <code>TRUE</code> for the <code>include_ddl</code> parameter.</p> <p><b>See Also:</b> <a href="#">Logical Change Record TYPES</a> (page 286-1)</p> |
| source_root_name      | <p>The global name of the root in the source CDB. For example, <code>mycdb.example.com</code>.</p> <p>If this parameter is <code>NULL</code>, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-<code>NULL</code> value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| source_container_name | <p>The short name of the source container. The container can be the root or a PDB. For example, <code>CDB\$ROOT</code> or <code>hrpdb</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Usage Notes

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A capture process or apply process uses the rules for filtering.

 **See Also:**

- ["Security Model \(page 209-2\)"](#)

## Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET')
```

## 209.4.7 ADD\_SUBSET\_OUTBOUND\_RULES Procedure

This procedure adds subset rules to an outbound server configuration. Subset rules instruct the outbound server to stream out a subset of the changes to the specified tables. Outbound servers can stream out a subset of both rows and columns.

This procedure is overloaded. One `column_list` parameter is type `VARCHAR2` and the other `column_list` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

 **Note:**

This procedure does not add rules to the outbound server's capture process.

## Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES(
 server_name IN VARCHAR2,
 table_name IN VARCHAR2,
 condition IN VARCHAR2 DEFAULT NULL,
 column_list IN DBMS_UTILITY.LNAME_ARRAY,
 keep IN BOOLEAN DEFAULT TRUE,
 source_database IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES(
 server_name IN VARCHAR2,
 table_name IN VARCHAR2,
 condition IN VARCHAR2 DEFAULT NULL,
 column_list IN VARCHAR2 DEFAULT NULL,
```

```
keep IN BOOLEAN DEFAULT TRUE,
source_database IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 209-8 ADD\_SUBSET\_OUTBOUND\_RULES Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| server_name | The name of the outbound server to which rules are being added. Specify an existing outbound server. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| table_name  | The name of the table specified as <code>[schema_name.]object_name</code> . For example, you can specify <code>hr.employees</code> . If the schema is not specified, then the current user is the default.<br><br>If the outbound server configuration uses a local capture process, then the table must exist at the local source database. If the outbound server configuration uses a downstream capture process, then the table must exist at both the source database and at the downstream capture database.<br><br>The specified table cannot have any LOB, LONG, or LONG RAW columns currently or in the future.                                                                                                                                                          |
| condition   | The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL.<br><br>For example, to specify rows in the <code>hr.employees</code> table where the <code>salary</code> is greater than 4000 and the <code>job_id</code> is <code>SA_MAN</code> , enter the following as the condition:<br><br><code>' salary &gt; 4000 and job_id = 'SA_MAN' '</code><br><br>If NULL, then the procedure raises an error.<br><br><b>Note:</b> The quotation marks in the preceding example are all single quotation marks.                                                                                                                                                                                                                     |
| column_list | The list of columns either to include in the outbound server configuration or to exclude from the outbound server configuration. Whether the columns are included or excluded depends on the setting for the <code>keep</code> parameter.<br><br>The columns can be specified in the following ways: <ul style="list-style-type: none"> <li>Comma-delimited list of type <code>VARCHAR2</code>.</li> <li>A PL/SQL associative array of type <code>DBMS_UTILITY.LNAME_ARRAY</code>, where each element is the name of a column. Specify the first column in position 1. The last position must be NULL.</li> </ul> To include or exclude all of the columns in a table, specify each column in the table in the list or array.<br><br>If NULL, then the procedure raises an error. |
| keep        | If TRUE, then the columns specified in the <code>column_list</code> parameter are kept as part of the outbound server configuration. Therefore, changes to these columns that satisfy the condition in the <code>condition</code> parameter are streamed to the outbound server's client application.<br><br>If FALSE, then the columns specified in the <code>column_list</code> parameter are excluded from the outbound server configuration. Therefore, changes to these columns are not streamed to the outbound server's client application.<br><br><b>See Also:</b> "Usage Notes (page 209-33)"                                                                                                                                                                            |

**Table 209-8 (Cont.) ADD\_SUBSET\_OUTBOUND\_RULES Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_database | <p>The global name of the container where the specified <code>table_names</code> and <code>schema_names</code> are located.</p> <p>If non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> |

### Usage Notes

When the `keep` parameter is set to `TRUE`, this procedure creates a keep columns declarative rule-based transformation for the columns listed in `column_list`.

When the `keep` parameter is set to `FALSE`, this procedure creates a delete column declarative rule-based transformation for each column listed in `column_list`.

 **See Also:**

*Oracle Database XStream Guide* for information about declarative rule-based transformations

## 209.4.8 ADD\_SUBSET\_PROPAGATION\_RULES Procedure

This procedure adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES(
 table_name IN VARCHAR2,
 dml_condition IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 source_queue_name IN VARCHAR2,
 destination_queue_name IN VARCHAR2,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 insert_rule_name OUT VARCHAR2,
 update_rule_name OUT VARCHAR2,
```

```

delete_rule_name OUT VARCHAR2,
queue_to_queue IN BOOLEAN DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES(
 table_name IN VARCHAR2,
 dml_condition IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 source_queue_name IN VARCHAR2,
 destination_queue_name IN VARCHAR2,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 queue_to_queue IN BOOLEAN DEFAULT NULL);

```

## Parameters

**Table 209-9 ADD\_SUBSET\_PROPAGATION\_RULES Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name        | <p>The name of the table specified as <code>[schema_name.]object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p> <p>The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.</p>                                                                                                                                                                  |
| dml_condition     | <p>The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL.</p> <p>For example, to specify rows in the <code>hr.employees</code> table where the salary is greater than 4000 and the <code>job_id</code> is <code>SA_MAN</code>, enter the following as the condition:</p> <pre>' salary &gt; 4000 and job_id = 'SA_MAN' '</pre> <p><b>Note:</b> The quotation marks in the preceding example are all single quotation marks.</p>                                                                     |
| streams_name      | <p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If <code>NULL</code> and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If <code>NULL</code> and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p> |
| source_queue_name | <p>The name of the source queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>                                                                                                             |

**Table 209-9 (Cont.) ADD\_SUBSET\_PROPAGATION\_RULES Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| destination_queue_name | <p>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p><b>Note:</b> Connection qualifiers are not allowed.</p> |
| include_tagged_lcr     | <p>If <code>TRUE</code>, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. This setting is appropriate for a full (for example, standby) copy of a database.</p> <p>If <code>FALSE</code>, then an LCR is considered for propagation only when the LCR contains a NULL tag. A setting of <code>FALSE</code> is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>                                                                                                                                                                                                                 |
| source_database        | <p>The global name of the source database. The source database is where the change originated. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>                                                                                                                                                                                                                       |
| insert_rule_name       | Contains the system-generated <code>INSERT</code> rule name. This rule handles inserts and updates that must be converted into inserts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| update_rule_name       | Contains the system-generated <code>UPDATE</code> rule name. This rule handles updates that remain updates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| delete_rule_name       | Contains the system-generated <code>DELETE</code> rule name. This rule handles deletes and updates that must be converted into deletes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 209-9 (Cont.) ADD\_SUBSET\_PROPAGATION\_RULES Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_to_queue | <p>If <code>TRUE</code> or <code>NULL</code>, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If <code>FALSE</code>, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> <li>• If <code>TRUE</code> and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</li> <li>• If <code>FALSE</code> and the specified propagation is a queue to queue propagation, then the procedure raises an error.</li> <li>• If <code>NULL</code>, then the procedure does not change the queue to queue property of the propagation.</li> </ul> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p> |

### Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for `INSERT` statements, one for `UPDATE` statements, and one for `DELETE` statements. For `INSERT` and `DELETE` statements, only row LCRs that satisfy the condition specified for the `dml_condition` parameter are propagated. For `UPDATE` statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified `dml_condition`, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified `dml_condition`, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified `dml_condition`, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified `dml_condition`, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

A propagation uses the rules for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing

positive rule set for the propagation are not affected. Additional rules can be added using either the `DBMS_XSTREAM_ADM` package or the `DBMS_RULE_ADM` package.

Rules for `INSERT`, `UPDATE`, and `DELETE` statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The `ADD_SUBSET_RULES` procedure is overloaded, and the system-generated rule names for `INSERT`, `UPDATE`, and `DELETE` statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

#### Note:

Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

### Examples

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `dbs1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID').AccessNumber()=2)
AND (:dml.get_value('NEW','REGION_ID').AccessNumber()=2)
```

## 209.4.9 ADD\_SUBSET\_RULES Procedure

This procedure adds rules to an XStream client.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a subset of rows in a specified table.  
This procedure creates the specified capture process if it does not exist.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_RULES(
 table_name IN VARCHAR2,
 dml_condition IN VARCHAR2,
 streams_type IN VARCHAR2 DEFAULT 'apply',
 streams_name IN VARCHAR2 DEFAULT NULL,
 queue_name IN VARCHAR2 DEFAULT 'streams_queue',
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 insert_rule_name OUT VARCHAR2,
 update_rule_name OUT VARCHAR2,
 delete_rule_name OUT VARCHAR2,
 source_root_name IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SUBSET_RULES(
 table_name IN VARCHAR2,
 dml_condition IN VARCHAR2,
 streams_type IN VARCHAR2 DEFAULT 'apply',
 streams_name IN VARCHAR2 DEFAULT NULL,
 queue_name IN VARCHAR2 DEFAULT 'streams_queue',
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 source_root_name IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 209-10 ADD\_SUBSET\_RULES Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>table_name</code>    | The name of the table specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.<br><br>The specified table must exist in the same database as the capture process or apply process. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.                                                                                            |
| <code>dml_condition</code> | The subset condition. Specify this condition similar to the way you specify conditions in a <code>WHERE</code> clause in SQL.<br><br>For example, to specify rows in the <code>hr.employees</code> table where the salary is greater than 4000 and the <code>job_id</code> is <code>SA_MAN</code> , enter the following as the condition:<br><br><code>' salary &gt; 4000 and job_id = 'SA_MAN' ' '</code><br><br><b>Note:</b> The quotation marks in the preceding example are all single quotation marks. |

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| streams_type | <p>The type of XStream client:</p> <ul style="list-style-type: none"> <li>Specify <code>capture</code> for a capture process.</li> <li>Specify <code>apply</code> for an apply process.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| streams_name | <p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If <code>NULL</code>, if <code>streams_type</code> is <code>capture</code>, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If <code>NULL</code> and multiple XStream clients of the specified <code>streams_type</code> for the queue exist, then the procedure raises an error.</p> <p>If <code>NULL</code>, if <code>streams_type</code> is <code>apply</code>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> <li>If one existing apply process has the source database specified in <code>source_database</code> and uses the queue specified in <code>queue_name</code>, then the procedure uses this apply process.</li> <li>If <code>source_database</code> is <code>NULL</code> and one existing apply process is using the queue specified in <code>queue_name</code>, then the procedure uses this apply process.</li> </ul> <p>If <code>NULL</code> and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If <code>NULL</code> and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p> |
| queue_name   | <p>The name of the local queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be <code>ANYDATA</code> type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 209-10 (Cont.) ADD\_SUBSET\_RULES Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| include_tagged_lcr | <p>If <code>TRUE</code>, then the XStream client performs its action regardless of the tag:</p> <ul style="list-style-type: none"> <li>A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag.</li> <li>An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-NULL tag.</li> </ul> <p>If <code>FALSE</code>, then an XStream client performs its action only when the tag is <code>NULL</code>:</p> <ul style="list-style-type: none"> <li>A redo entry is considered for capture by a capture process only when the redo entry contains a <code>NULL</code> tag.</li> <li>An LCR is considered for apply by an apply process only if the LCR contains a <code>NULL</code> tag.</li> </ul> <p>A setting of <code>FALSE</code> is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>                                                                                                                                                                                                                                                                                                                                                 |
| source_database    | <p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> |
| insert_rule_name   | Contains the system-generated <code>INSERT</code> rule name. This rule handles inserts and updates that must be converted into inserts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| update_rule_name   | Contains the system-generated <code>UPDATE</code> rule name. This rule handles updates that remain updates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| delete_rule_name   | Contains the system-generated <code>DELETE</code> rule name. This rule handles deletes and updates that must be converted into deletes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 209-10 (Cont.) ADD\_SUBSET\_RULES Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_root_name      | <p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is <code>NULL</code>, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-<code>NULL</code> value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p> |
| source_container_name | <p>The short name of the source container. The container can be the root or a PDB. For example, <code>CDB\$ROOT</code> or <code>hrpdb</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Usage Notes

Running this procedure generates three rules for the specified capture process or apply process: one for `INSERT` statements, one for `UPDATE` statements, and one for `DELETE` statements. For `INSERT` and `DELETE` statements, only DML changes that satisfy the condition specified for the `dml_condition` parameter are captured or applied. For `UPDATE` statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified `dml_condition`, then the DML change is captured or applied without any changes.
- If neither the new or old values in a DML change satisfy the specified `dml_condition`, then the DML change is not captured or applied.
- If the old values for a DML change satisfy the specified `dml_condition`, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified `dml_condition`, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process or apply process uses the rules for filtering. If the XStream client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the `DBMS_XSTREAM_ADM` package or the `DBMS_RULE_ADM` package.

Rules for `INSERT`, `UPDATE`, and `DELETE` statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name

is truncated. The `ADD_SUBSET_RULES` procedure is overloaded, and the system-generated rule names for `INSERT`, `UPDATE`, and `DELETE` statements are returned.

 **Note:**

Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

### Examples

The following is an example of a rule condition created for filtering DML changes containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `dbs1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID').AccessNumber()=2)
AND (:dml.get_value('NEW','REGION_ID').AccessNumber()=2)
```

## 209.4.10 ADD\_TABLE\_PROPAGATION\_RULES Procedure

This procedure adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES(
 table_name IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 source_queue_name IN VARCHAR2,
 destination_queue_name IN VARCHAR2,
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 dml_rule_name OUT VARCHAR2,
 ddl_rule_name OUT VARCHAR2,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
 and_condition IN VARCHAR2 DEFAULT NULL,
 queue_to_queue IN BOOLEAN DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES(
 table_name IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 source_queue_name IN VARCHAR2,
 destination_queue_name IN VARCHAR2,
 include_dml IN BOOLEAN DEFAULT TRUE,
```

```

include_ddl IN BOOLEAN DEFAULT FALSE,
include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
source_database IN VARCHAR2 DEFAULT NULL,
inclusion_rule IN BOOLEAN DEFAULT TRUE,
and_condition IN VARCHAR2 DEFAULT NULL,
queue_to_queue IN BOOLEAN DEFAULT NULL);

```

## Parameters

**Table 209-11 ADD\_TABLE\_PROPAGATION\_RULES Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name             | The name of the table specified as <code>[schema_name.]table_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| streams_name           | The name of the propagation. Do not specify an owner.<br>If the specified propagation does not exist, then the procedure creates it automatically.<br>If <code>NULL</code> and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.<br>If <code>NULL</code> and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.                                                                                                                                                                                                                                                     |
| source_queue_name      | The name of the source queue, specified as <code>[schema_name.]queue_name</code> . The current database must contain the source queue, and the queue must be <code>ANYDATA</code> type.<br>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.<br>If the schema is not specified, then the current user is the default.                                                                                                                                                                                                                                                                                                                                               |
| destination_queue_name | The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code> , if the destination queue is in a remote database. The queue must be <code>ANYDATA</code> type.<br>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>db2.net</code> , enter <code>strmadmin.streams_queue@db2.net</code> for this parameter.<br>If the schema is not specified, then the current user is the default.<br>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.<br><b>Note:</b> Connection qualifiers are not allowed. |
| include_dml            | If <code>TRUE</code> , then the procedure creates a rule for DML changes. If <code>FALSE</code> , then the procedure does not create a DML rule. <code>NULL</code> is not permitted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 209-11 (Cont.) ADD\_TABLE\_PROPAGATION\_RULES Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| include_ddl        | <p>If <code>TRUE</code>, then the procedure creates a rule for DDL changes. If <code>FALSE</code>, then the procedure does not create a DDL rule. <code>NULL</code> is not permitted.</p> <p>The generated rule evaluates to <code>TRUE</code> for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to <code>FALSE</code> for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to <code>FALSE</code> for changes that create synonyms or views based on the table. The rule also evaluates to <code>FALSE</code> for a change to a PL/SQL subprogram that refers to the table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| include_tagged_lcr | <p>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a logical change record (LCR) has a non-<code>NULL</code> tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-<code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if an LCR has a <code>NULL</code> Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a <code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a <code>NULL</code> tag.</p> <p>Usually, specify <code>TRUE</code> for this parameter if the <code>inclusion_rule</code> parameter is set to <code>FALSE</code>.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p> |
| source_database    | <p>The global name of the source database. The source database is where the change originated. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_to_queue | <p>If <code>TRUE</code> or <code>NULL</code>, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If <code>FALSE</code>, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> <li>• If <code>TRUE</code> and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</li> <li>• If <code>FALSE</code> and the specified propagation is a queue to queue propagation, then the procedure raises an error.</li> <li>• If <code>NULL</code>, then the procedure does not change the queue to queue property of the propagation.</li> </ul> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p> |

### Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A propagation uses the rules for filtering.

### Examples

The following is an example of a table rule condition created for filtering DML statements:

```
(((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET')
```

## 209.4.11 ADD\_TABLE\_RULES Procedure

This procedure adds rules to an XStream client rule set.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified table.

This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_TABLE_RULES(
 table_name IN VARCHAR2,
 streams_type IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 queue_name IN VARCHAR2 DEFAULT 'streams_queue',
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 dml_rule_name OUT VARCHAR2,
 ddl_rule_name OUT VARCHAR2,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
 and_condition IN VARCHAR2 DEFAULT NULL,
 source_root_name IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_TABLE_RULES(
 table_name IN VARCHAR2,
 streams_type IN VARCHAR2,
 streams_name IN VARCHAR2 DEFAULT NULL,
 queue_name IN VARCHAR2 DEFAULT 'streams_queue',
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
 and_condition IN VARCHAR2 DEFAULT NULL,
 source_root_name IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 209-12 ADD\_TABLE\_RULES Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>table_name</code> | The name of the table specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.<br><br>You can specify a table that does not yet exist, because Oracle Streams does not validate the existence of the table. |

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| streams_type | <p>The type of XStream client:</p> <ul style="list-style-type: none"> <li>Specify <code>capture</code> for a capture process.</li> <li>Specify <code>apply</code> for an apply process.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| streams_name | <p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If <code>NULL</code>, if <code>streams_type</code> is <code>capture</code>, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If <code>NULL</code> and multiple XStream clients of the specified <code>streams_type</code> for the queue exist, then the procedure raises an error.</p> <p>If <code>NULL</code>, if <code>streams_type</code> is <code>apply</code>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> <li>If one existing apply process has the source database specified in <code>source_database</code> and uses the queue specified in <code>queue_name</code>, then the procedure uses this apply process.</li> <li>If <code>source_database</code> is <code>NULL</code> and one existing apply process is using the queue specified in <code>queue_name</code>, then the procedure uses this apply process.</li> </ul> <p>If <code>NULL</code> and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If <code>NULL</code> and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p> |
| queue_name   | <p>The name of the local queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be <code>ANYDATA</code> type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| include_dml  | <p>If <code>TRUE</code>, then the procedure creates a DML rule for DML changes. Table 209-12 (Cont.) ADD\_TABLE\_RULES Procedure Parameters

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| include_ddl        | <p>If <code>TRUE</code>, then the procedure creates a DDL rule for DDL changes. If <code>FALSE</code>, then the procedure does not create a DDL rule. <code>NULL</code> is not permitted.</p> <p>The generated rule evaluates to <code>TRUE</code> for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to <code>FALSE</code> for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to <code>FALSE</code> for changes that create synonyms or views based on the table. The rule also evaluates to <code>FALSE</code> for a change to a PL/SQL subprogram that refers to the table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| include_tagged_lcr | <p>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a redo entry, session, or LCR has a non-<code>NULL</code> tag. If the rules are added to the positive rule set for the XStream client, then the XStream client performs its action regardless of the tag:</p> <ul style="list-style-type: none"> <li>• A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-<code>NULL</code> tag.</li> <li>• An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-<code>NULL</code> tag.</li> </ul> <p>If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the XStream client, then whether a database change is discarded does not depend on the tag.</p> <p>If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if a redo entry, session, or LCR has a <code>NULL</code> Oracle Streams tag. If the rules are added to the positive rule set for an XStream client, then the XStream client performs its action only when the tag is <code>NULL</code>:</p> <ul style="list-style-type: none"> <li>• A redo entry is considered for capture by a capture process only when the redo entry contains a <code>NULL</code> tag.</li> <li>• An LCR is considered for apply by an apply process only if the LCR contains a <code>NULL</code> tag.</li> </ul> <p>If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the XStream client, then a database change can be discarded only if it has a <code>NULL</code> tag.</p> <p>A setting of <code>FALSE</code> is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p> <p>Usually, specify <code>TRUE</code> for this parameter if the <code>inclusion_rule</code> parameter is set to <code>FALSE</code>.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p> |

**Table 209-12 (Cont.) ADD\_TABLE\_RULES Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_database | <p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> |
| dml_rule_name   | <p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| ddl_rule_name   | <p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| inclusion_rule  | <p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the XStream client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the XStream client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Table 209-12 (Cont.) ADD\_TABLE\_RULES Procedure Parameters

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| and_condition         | <p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.</p> <p><b>See Also:</b> <a href="#">Logical Change Record TYPES</a> (page 286-1)</p> |
| source_root_name      | <p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| source_container_name | <p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### Usage Notes

This procedure creates DML and DDL rules automatically based on include\_dml and include\_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process or apply process uses the rules for filtering.

 **See Also:**

- ["Operational Notes" \(page 209-3\)](#)
- ["Security Model" \(page 209-2\)](#)

**Examples**

The following is an example of a table rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET')
```

## 209.4.12 ALTER\_INBOUND Procedure

This procedure modifies an XStream inbound server.

**Syntax**

```
DBMS_XSTREAM_ADM.ALTER_INBOUND(
 server_name IN VARCHAR2,
 apply_user IN VARCHAR2 DEFAULT NULL,
 comment IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 209-13 ALTER\_INBOUND Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| server_name | The name of the inbound server being altered. Specify an existing inbound server. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| apply_user  | The user who applies all DML and DDL changes that satisfy the inbound server rule sets, who runs user-defined apply handlers, and who runs custom rule-based transformations configured for inbound server rules.<br>The client application must attach to the inbound server as the apply user. Specify a user to change the apply user. In this case, the user who invokes the ALTER_INBOUND procedure must be granted the DBA role. Only the SYS user can set the apply_user to SYS.<br>If NULL, then the apply user is not changed.<br>See <a href="#">"CREATE_INBOUND Procedure" (page 209-58)</a> for information about the required privileges for an apply user. |
| comment     | An optional comment associated with the inbound server.<br>If non-NULL, then the specified comment replaces the existing comment.<br>If NULL, then the existing comment is not changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## 209.4.13 ALTER\_OUTBOUND Procedure

This procedure modifies an XStream outbound server configuration.

This procedure always alters the specified outbound server. This procedure can also alter the outbound server's capture process when either of the following conditions is met:

- The capture process was created by the `CREATE_OUTBOUND` procedure in this package.
- The queue used by the capture process was created by the `CREATE_OUTBOUND` procedure.

To check whether this procedure can alter the outbound server's capture process, query the `CAPTURE_NAME` column in the `ALL_XSTREAM_OUTBOUND` view. When the name of the capture process appears in the `CAPTURE_NAME` column of this view, the `ALTER_OUTBOUND` procedure can manage the capture process's rules or change the capture user for the capture process. When the `CAPTURE_NAME` column of this view is `NULL`, the `ALTER_OUTBOUND` procedure cannot manage the capture process.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

### Note:

Starting with Oracle Database 11g Release 2 (11.2.0.2), the `start_scn` and `start_time` parameters are included in this procedure.

### Syntax

```
DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
 server_name IN VARCHAR2,
 table_names IN DBMS_UTILITY.UNCL_ARRAY,
 schema_names IN DBMS_UTILITY.UNCL_ARRAY,
 add IN BOOLEAN DEFAULT TRUE,
 capture_user IN VARCHAR2 DEFAULT NULL,
 connect_user IN VARCHAR2 DEFAULT NULL,
 comment IN VARCHAR2 DEFAULT NULL,
 inclusion_rule IN BOOLEAN DEFAULT TRUE,
 start_scn IN NUMBER DEFAULT NULL,
 start_time IN TIMESTAMP DEFAULT NULL,
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ALTER_OUTBOUND(
 server_name IN VARCHAR2,
 table_names IN VARCHAR2 DEFAULT NULL,
 schema_names IN VARCHAR2 DEFAULT NULL,
 add IN BOOLEAN DEFAULT TRUE,
```

```

capture_user IN VARCHAR2 DEFAULT NULL,
connect_user IN VARCHAR2 DEFAULT NULL,
comment IN VARCHAR2 DEFAULT NULL,
inclusion_rule IN BOOLEAN DEFAULT TRUE,
start_scn IN NUMBER DEFAULT NULL,
start_time IN TIMESTAMP DEFAULT NULL,
include_dml IN BOOLEAN DEFAULT TRUE,
include_ddl IN BOOLEAN DEFAULT FALSE,
source_database IN VARCHAR2 DEFAULT NULL,
source_container_name IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 209-14 ALTER\_OUTBOUND Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| server_name  | The name of the outbound server being altered. Specify an existing outbound server. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| table_names  | <p>The tables that are either added to or removed from the XStream Out configuration. Whether the tables are added or removed depends on the setting for the <code>add</code> parameter.</p> <p>The tables can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>Comma-delimited list of type <code>VARCHAR2</code>.</li> <li>A PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a table. Specify the first table in position 1. The last position must be <code>NULL</code>.</li> </ul> <p>Each table should be specified as <code>[schema_name.]table_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a> (page 209-57)" for more information about this parameter</p>                                                                                           |
| schema_names | <p>The schemas that are either added to or removed from the XStream Out configuration. Whether the schemas are added or removed depends on the setting for the <code>add</code> parameter.</p> <p>The schemas can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>Comma-delimited list of type <code>VARCHAR2</code>.</li> <li>A PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a schema. Specify the first schema in position 1. The last position must be <code>NULL</code>.</li> </ul> <p><b>Note:</b> This procedure does not concatenate the <code>schema_names</code> parameter with the <code>table_names</code> parameter. To specify tables, enter fully qualified table names in the <code>table_names</code> parameter (<code>schema_name.table_name</code>).</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a> (page 209-57)" for more information about this parameter</p> |
| add          | <p>If <code>TRUE</code>, then the procedure adds to the XStream Out configuration the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter.</p> <p>If <code>FALSE</code>, then the procedure removes from the XStream Out configuration the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 209-14 (Cont.) ALTER\_OUTBOUND Procedure Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| capture_user | <p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules.</p> <p>Specify a user to change the capture user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS.</p> <p>If NULL, then the capture user is not changed.</p> <p>If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user.</p> <p>Ensure that the capture user is granted the other required privileges. See "CREATE_OUTBOUND Procedure (page 209-60)" for information about the privileges required by a capture user.</p> <p>The capture process is stopped and restarted automatically when you change the value of this parameter.</p> <p><b>Note:</b> If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically.</p> |
| connect_user | <p>The user who can attach to the specified outbound server to retrieve the change stream. The XStream client application must attach to the outbound server as the specified connect user.</p> <p>Specify a user to change the connect user. In this case, the user who invokes the ALTER_OUTBOUND procedure must be granted the DBA role. Only the SYS user can set the connect_user to SYS.</p> <p>If NULL, then the connect user is not changed.</p> <p>If you change the connect user, then this procedure grants the new connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user.</p> <p>Ensure that the connect user is granted the other required privileges. See "CREATE_OUTBOUND Procedure (page 209-60)" for information about the privileges required by a connect user.</p>                                                                                                                                                                                                                                                                       |
| comment      | <p>An optional comment associated with the outbound server.</p> <p>If non-NULL, then the specified comment replaces the existing comment.</p> <p>If NULL, then the existing comment is not changed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 209-14 (Cont.) ALTER\_OUTBOUND Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inclusion_rule | <p>If TRUE and the add parameter is set to TRUE, then the procedure adds rules for the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter to the positive rule sets in the XStream Out configuration. When rules for tables and schemas are in positive rule sets, the XStream Out configuration streams DML and DDL changes to the tables and schemas out to the client application.</p> <p>If TRUE and the add parameter is set to FALSE, then the procedure removes rules for the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter from the positive rule sets in the XStream Out configuration.</p> <p>If FALSE and the add parameter is set to TRUE, then the procedure adds rules for the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter to the negative rule sets in the XStream Out configuration. When rules for tables and schemas are in negative rule sets, the XStream Out configuration does not stream changes to the tables and schemas out to the client application.</p> <p>If FALSE and the add parameter is set to FALSE, then the procedure removes rules for the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter from the negative rule sets in the XStream Out configuration.</p> |
| start_scn      | <p>A valid SCN for the database from which the capture process starts capturing changes. To be valid, the SCN value must be greater than or equal to the first SCN for the capture process.</p> <p>If a valid SCN is specified, then the capture process captures changes from the specified SCN when it is restarted.</p> <p>An error is returned if an invalid SCN is specified.</p> <p>If NULL and the <code>start_time</code> parameter is NULL, then the start SCN is not changed.</p> <p>If NULL and the <code>start_time</code> parameter is non-NULL, then the start SCN is changed to match the specified start time.</p> <p>The <code>start_scn</code> and <code>start_time</code> parameters are mutually exclusive.</p> <p><b>Note:</b> If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the <code>start_scn</code> parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the <code>start_scn</code> parameter is non-NULL.</p>                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 209-14 (Cont.) ALTER\_OUTBOUND Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_time            | <p>A valid time from which the capture process starts capturing changes. To be valid, the time must correspond to an SCN value that is greater than or equal to the first SCN for the capture process.</p> <p>If a valid time is specified, then the capture process captures changes from the specified time when it is restarted.</p> <p>An error is returned if an invalid time is specified.</p> <p>If NULL and the start_scn parameter is NULL, then the start time is not changed.</p> <p>If NULL and the start_scn parameter is non-NULL, then the start time is changed to match the specified start SCN.</p> <p>The start_scn and start_time parameters are mutually exclusive.</p> <p><b>Note:</b> If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the start_time parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the start_time parameter is non-NULL.</p> |
| include_dml           | <p>If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. ### Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table\_names and schema\_names parameters:

- If both the table\_names and schema\_names parameters are NULL or empty, then no rules are changed for the XStream Out configuration.
 

This procedure is overloaded. The table\_names and schema\_names parameters are defaulted to NULL. Do not specify NULL for both table\_names and schema\_names in the same call; otherwise, error PLS-00307 is returned.
- If both the table\_names and schema\_names parameters are specified, then the rules for the tables and schemas are added to or removed from the XStream Out configuration, depending on the setting of the add parameter.
- If the table\_names parameter is specified and the schema\_names parameter is NULL or empty, then the rules for the tables are added to or removed from the XStream

Out configuration, depending on the setting of the `add` parameter. The existing rules for schemas are not changed for the XStream Out configuration.

- If the `table_names` parameter is `NULL` or empty and the `schema_names` parameter is specified, then the rules for the schemas are added to or removed from the XStream Out configuration, depending on the setting of the `add` parameter. The existing rules for tables are not changed for the XStream Out configuration.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the `schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

 **Note:**

An empty array includes one `NULL` entry.

## 209.4.14 CREATE\_INBOUND Procedure

This procedure creates an XStream inbound server and its queue.

 **Note:**

A client application can create multiple sessions. Each session can attach to only one inbound server, and each inbound server can serve only one session at a time. However, different client application sessions can connect to different inbound servers. See *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an inbound server.

### Syntax

```
DBMS_XSTREAM_ADM.CREATE_INBOUND(
 server_name IN VARCHAR2,
 queue_name IN VARCHAR2,
 apply_user IN VARCHAR2 DEFAULT NULL,
 comment IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 209-15 CREATE\_INBOUND Procedure Parameters**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>server_name</code> | <p>The name of the inbound server being created. A <code>NULL</code> specification is not allowed. Do not specify an owner.</p> <p>The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client.</p> <p><b>Note:</b> The <code>server_name</code> setting cannot exceed 30 bytes, and it cannot be altered after the inbound server is created.</p> |

**Table 209-15 (Cont.) CREATE\_INBOUND Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name | <p>The name of the local queue used by the inbound server, specified as <code>[schema_name.]queue_name</code>.</p> <p>If the specified queue exists, then it is used. If the specified queue does not exist, then the procedure creates it.</p> <p>For example, to specify a queue named <code>xstream_queue</code> in the <code>xstrmadmin</code> schema, enter <code>xstrmadmin.xstream_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p><b>Note:</b> An inbound server's queue is used only to store error transactions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| apply_user | <p>The apply user. If <code>NULL</code>, then the current user is the default.</p> <p>The client application must attach to the inbound server as the apply user.</p> <p>The apply user is the user in whose security domain an inbound server evaluates whether LCRs satisfy its rule sets, applies DML and DDL changes directly to database objects, runs custom rule-based transformations configured for inbound server rules, and runs apply handlers configured for the inbound server. This user must have the necessary privileges to perform these actions. This procedure grants the apply user <code>dequeue</code> privileges on the queue used by the inbound server and configures the user as a secure queue user.</p> <p>In addition to the privileges granted by this procedure, you must grant the following privileges to the apply user:</p> <ul style="list-style-type: none"> <li>• The necessary privileges to perform DML and DDL changes on the apply objects</li> <li>• <code>EXECUTE</code> privilege on the rule sets used by the inbound server</li> <li>• <code>EXECUTE</code> privilege on all rule-based transformation functions used in the rule set</li> <li>• <code>EXECUTE</code> privilege on all apply handler procedures</li> </ul> <p>You can grant these privileges directly to the apply user, or you can grant them through roles.</p> <p>In addition, the apply user must be granted <code>EXECUTE</code> privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the inbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles.</p> <p><b>Note:</b> If the apply user for an inbound server is dropped using <code>DROP USER . . . CASCADE</code>, then the inbound server is also dropped automatically.</p> |
| comment    | An optional comment associated with the inbound server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Usage Notes

By default, an inbound server does not use rules or rule sets. Therefore, an inbound server applies all of the LCRs sent to it by an XStream client application. However, to filter the LCRs sent to an inbound server, you can add rules and rule sets to an inbound server using the `DBMS_XSTREAM_ADM` and `DBMS_RULE_ADM` packages.

In a CDB, you can execute the `CREATE_INBOUND` procedure from either the root or a PDB. The inbound server is restricted to receiving LCRs from one source database and only applying the changes to its local container. If the inbound server is at the root level, then the apply user must be a common user.

 **See Also:**

*Oracle Database XStream Guide*

## 209.4.15 CREATE\_OUTBOUND Procedure

This procedure creates an XStream outbound server, queue, and capture process to enable client applications to stream out Oracle database changes.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

 **Note:**

- A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See "OCIXStreamOutAttach()" in the *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an outbound server.
- If the `capture_name` parameter is `NULL`, then this procedure automatically generates a name for the capture process that it creates.
- This procedure automatically generates a name for the queue that it creates.
- This procedure enables both the capture process and outbound server that it creates.
- Starting with Oracle Database 11g Release 2 (11.2.0.2), the `capture_name` parameter is included in this procedure.

### Syntax

```
DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
 server_name IN VARCHAR2,
 source_database IN VARCHAR2 DEFAULT NULL,
 table_names IN DBMS_UTILITY.UNCL_ARRAY,
 schema_names IN DBMS_UTILITY.UNCL_ARRAY,
 capture_user IN VARCHAR2 DEFAULT NULL,
 connect_user IN VARCHAR2 DEFAULT NULL,
 comment IN VARCHAR2 DEFAULT NULL,
 capture_name IN VARCHAR2 DEFAULT NULL,
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 source_root_name IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL,
 lcr_id_version IN NUMBER DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.CREATE_OUTBOUND(
 server_name IN VARCHAR2,
 source_database IN VARCHAR2 DEFAULT NULL,
 table_names IN VARCHAR2 DEFAULT NULL,
 schema_names IN VARCHAR2 DEFAULT NULL,
 capture_user IN VARCHAR2 DEFAULT NULL,
 connect_user IN VARCHAR2 DEFAULT NULL,
 comment IN VARCHAR2 DEFAULT NULL,
 capture_name IN VARCHAR2 DEFAULT NULL,
 include_dml IN BOOLEAN DEFAULT TRUE,
 include_ddl IN BOOLEAN DEFAULT FALSE,
 source_root_name IN VARCHAR2 DEFAULT NULL,
 source_container_name IN VARCHAR2 DEFAULT NULL,
 lcrid_version IN NUMBER DEFAULT NULL);
```

## Parameters

**Table 209-16 CREATE\_OUTBOUND Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| server_name     | <p>The name of the outbound server being created. A NULL specification is not allowed. Do not specify an owner.</p> <p>The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client.</p> <p><b>Note:</b> The <code>server_name</code> setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| source_database | <p>The global name of the source database. The source database is where the changes to be captured originated.</p> <p>If non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>In a non-CDB, if non-NULL and the specified name is different from the global name of the current database, then downstream capture is assumed. In this case, configure the transmission of redo data from the source database to the downstream database before running the <code>CREATE_OUTBOUND</code> procedure. See <i>Oracle Database XStream Guide</i> for instructions.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> |

**Table 209-16 (Cont.) CREATE\_OUTBOUND Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_names  | <p>The tables for which DML and DDL changes are streamed out to the XStream client application. The tables can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>• Comma-delimited list of type VARCHAR2.</li> <li>• A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL.</li> </ul> <p>Each table should be specified as [<i>schema_name</i>.]<i>table_name</i>. For example, <i>hr.employees</i>. If the schema is not specified, then the current user is the default.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a> (page 209-65)" for more information about this parameter</p>                                                                       |
| schema_names | <p>The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>• Comma-delimited list of type VARCHAR2.</li> <li>• A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL.</li> </ul> <p><b>Note:</b> This procedure does not concatenate the <i>schema_names</i> parameter with the <i>table_names</i> parameter. To specify tables, enter fully qualified table names in the <i>table_names</i> parameter (<i>schema_name.table_name</i>).</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a> (page 209-65)" for more information about this parameter</p> |

Table 209-16 (Cont.) CREATE\_OUTBOUND Procedure Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| capture_user | <p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If <code>NULL</code>, then the current user is the default.</p> <p>This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user.</p> <p>In addition, ensure that the capture user has the following privileges:</p> <ul style="list-style-type: none"> <li>• <code>EXECUTE</code> privilege on the rule sets used by the capture process</li> <li>• <code>EXECUTE</code> privilege on all rule-based transformation functions used in the positive rule set</li> </ul> <p>You can grant these privileges directly to the apply user, or you can grant them through roles.</p> <p>In addition, the capture user must be granted <code>EXECUTE</code> privilege on all packages, including Oracle supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.</p> <p>Only a user who is granted the <code>DBA</code> role can set a capture user. Only the <code>SYS</code> user can set the <code>capture_user</code> to <code>SYS</code>.</p> <p>A capture user does not require privileges on a database object to capture changes made to it. The capture process can pass these changes to a custom rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.</p> |
| connect_user | <p>The user who can attach to the specified outbound server to retrieve the change stream. The client application must attach to the outbound server as the specified connect user.</p> <p>If <code>NULL</code>, then the current user is the default.</p> <p>The connect user is the user in whose security domain an outbound server evaluates LCRs against its rule sets and runs custom rule-based transformations configured for outbound server rules. This user must have the necessary privileges to perform these actions. This procedure grants the connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user.</p> <p>In addition to the privileges granted by this procedure, grant the following privileges to the connect user:</p> <ul style="list-style-type: none"> <li>• <code>EXECUTE</code> privilege on the rule sets used by the outbound server</li> <li>• <code>EXECUTE</code> privilege on all rule-based transformation functions used in the rule set</li> </ul> <p>You can grant these privileges directly to the connect user, or you can grant them through roles.</p> <p>In addition, the connect user must be granted <code>EXECUTE</code> privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the outbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles.</p>                                                                                                                                                                                     |

**Table 209-16 (Cont.) CREATE\_OUTBOUND Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| comment               | An optional comment associated with the outbound server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| capture_name          | <p>The name of the capture process configured to capture changes for the outbound server. Do not specify an owner. The capture process must not exist. If the specified name matches the name of an existing capture process, then an error is raised.</p> <p>If the name does not match the name of an existing capture process, then the procedure creates a new capture process with the specified name.</p> <p>If NULL, then the system creates a new capture process with a system-generated name.</p> <p><b>Note:</b> The capture process name cannot be altered after the capture process is created.</p>                                                                                                                                                  |
| include_dml           | If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| include_ddl           | If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| source_root_name      | <p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p> |
| source_container_name | <p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| lcrld_version         | <p>The LCRID version for captured LCRs, either 1 or 2.</p> <p>If 2, then the LCRs are compatible with a database with its compatibility level at 12.2.0 or higher.</p> <p>If 1, then the LCRs are compatible with a database with its compatibility level at 12.1.0 or lower.</p> <p>If NULL, the default, and the database compatibility level is 12.2.0 or higher, then the lcrld_version is set to 2 internally. If the database compatibility level is 12.1.0 or lower, then the lcrld_version is set to 1 internally.</p>                                                                                                                                                                                                                                    |

## Usage Notes

The following list describes the behavior of the outbound server for various combinations of the `table_names` and `schema_names` parameters:

- If both the `table_names` and `schema_names` parameters are `NULL` or empty, then the outbound server streams all DML and DDL changes to the client application.  
This procedure is overloaded. The `table_names` and `schema_names` parameters are defaulted to `NULL`. Do not specify `NULL` for both `table_names` and `schema_names` in the same call; otherwise, error `PLS-00307` is returned.
- If both the `table_names` and `schema_names` parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.
- If the `table_names` parameter is specified and the `schema_names` parameter is `NULL` or empty, then the outbound server streams DML and DDL changes for the specified tables.
- If the `table_names` parameter is `NULL` or empty and the `schema_names` parameter is specified, then the outbound server streams DML and DDL changes for the specified schema.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the `schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

### Note:

An empty array includes one `NULL` entry.

## 209.4.16 DELETE\_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which deletes a column from a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

 **Note:**

- The `DELETE_COLUMN` procedure supports the same data types supported by Oracle Streams capture processes.
- The `DELETE_COLUMN` procedure is useful when you want to delete a relatively small number of columns in a row LCR. To delete most of the columns in a row LCR and keep a relatively small number of columns, consider using the `KEEP_COLUMNS` procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

 **See Also:**

- *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by capture processes
- [KEEP\\_COLUMNS Procedure](#) (page 209-72)

## Syntax

```
DBMS_XSTREAM_ADM.DELETE_COLUMN(
 rule_name IN VARCHAR2,
 table_name IN VARCHAR2,
 column_name IN VARCHAR2,
 value_type IN VARCHAR2 DEFAULT '*',
 step_number IN NUMBER DEFAULT 0,
 operation IN VARCHAR2 DEFAULT 'ADD');
```

## Parameters

**Table 209-17 DELETE\_COLUMN Procedure Parameters**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>rule_name</code>   | The name of the rule, specified as <code>[schema_name.]rule_name</code> . If NULL, then the procedure raises an error.<br><br>For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default. |
| <code>table_name</code>  | The name of the table from which the column is deleted in the row LCR, specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.                                                                                           |
| <code>column_name</code> | The name of the column deleted from each row LCR that satisfies the rule.                                                                                                                                                                                                                                                             |

**Table 209-17 (Cont.) DELETE\_COLUMN Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                           |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value_type  | Specify 'NEW' to delete the column from the new values in the row LCR.<br>Specify 'OLD' to delete the column from the old values in the row LCR.<br>Specify '*' to delete the column from both the old and new values in the row LCR. |
| step_number | The order of execution of the transformation.<br><b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering                                                                             |
| operation   | Specify 'ADD' to add the transformation to the rule.<br>Specify 'REMOVE' to remove the transformation from the rule.                                                                                                                  |

**Usage Notes**

When 'REMOVE' is specified for the `operation` parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `DELETE_COLUMN` procedure when one or more of these parameters is `NULL`:

| table_name | column_name | step_number | Result                                                                                                                                                                |
|------------|-------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NULL       | NULL        | NULL        | Remove all delete column transformations for the specified rule.                                                                                                      |
| NULL       | NULL        | non-NULL    | Remove all delete column transformations with the specified <code>step_number</code> for the specified rule.                                                          |
| NULL       | non-NULL    | non-NULL    | Remove all delete column transformations with the specified <code>column_name</code> and <code>step_number</code> for the specified rule.                             |
| non-NULL   | NULL        | non-NULL    | Remove all delete column transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule.                              |
| NULL       | non-NULL    | NULL        | Remove all delete column transformations with the specified <code>column_name</code> for the specified rule.                                                          |
| non-NULL   | non-NULL    | NULL        | Remove all delete column transformations with the specified <code>table_name</code> and <code>column_name</code> for the specified rule.                              |
| non-NULL   | NULL        | NULL        | Remove all delete column transformations with the specified <code>table_name</code> for the specified rule.                                                           |
| non-NULL   | non-NULL    | non-NULL    | Remove all delete column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule. |

## 209.4.17 DROP\_INBOUND Procedure

This procedure removes an inbound server configuration.

This procedure always removes the specified inbound server. This procedure also removes the queue for the inbound server if all of the following conditions are met:

- One call to the `CREATE_INBOUND` procedure created the queue.
- The inbound server is the only subscriber to the queue.

### See Also:

["CREATE\\_INBOUND Procedure \(page 209-58\)"](#)

### Syntax

```
DBMS_XSTREAM_ADM.DROP_INBOUND(
 server_name IN VARCHAR2);
```

### Parameters

**Table 209-18 DROP\_INBOUND Procedure Parameters**

| Parameter                | Description                                                                                                |
|--------------------------|------------------------------------------------------------------------------------------------------------|
| <code>server_name</code> | The name of the inbound server being removed. Specify an existing inbound server. Do not specify an owner. |

## 209.4.18 DROP\_OUTBOUND Procedure

This procedure removes an outbound server configuration.

This procedure always drops the specified outbound server. This procedure also drops the queue used by the outbound server if both of the following conditions are met:

- The queue was created by the `CREATE_OUTBOUND` procedure in this package.
- The outbound server is the only subscriber to the queue.

If either one of the preceding conditions is not met, then the `DROP_OUTBOUND` procedure only drops the outbound server. It does not drop the queue.

This procedure also drops the capture process for the outbound server if both of the following conditions are met:

- The procedure can drop the outbound server's queue.
- The capture process was created by the `CREATE_OUTBOUND` procedure.

If the procedure can drop the queue but cannot manage the capture process, then it drops the queue without dropping the capture process.

 **See Also:**

- ["ADD\\_OUTBOUND Procedure \(page 209-17\)"](#)
- ["CREATE\\_OUTBOUND Procedure \(page 209-60\)"](#)

**Syntax**

```
DBMS_XSTREAM_ADM.DROP_OUTBOUND(
 server_name IN VARCHAR2);
```

**Parameters****Table 209-19 DROP\_OUTBOUND Procedure Parameters**

| Parameter   | Description                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------|
| server_name | The name of the outbound server being removed. Specify an existing outbound server. Do not specify an owner. |

## 209.4.19 ENABLE\_GG\_XSTREAM\_FOR\_STREAMS Procedure

This procedure enables XStream optimizations and performance optimizations for Oracle Streams components.

This procedure is intended for users of Oracle Streams who want to enable XStream optimizations and optimizations. For example, you can enable the optimizations for an Oracle Streams replication configuration that uses capture processes and apply processes to replicate changes between Oracle databases.

These capabilities and optimizations are enabled automatically for XStream components, such as outbound servers, inbound servers, and capture processes that send changes to outbound servers. It is not necessary to run this procedure for XStream components.

When XStream optimizations are enabled, Oracle Streams components can stream ID key LCRs and sequence LCRs. The XStream performance optimizations improve efficiency in various areas, including:

- LCR processing
- Handling large transactions
- DML execution during apply
- Dependency computation and scheduling
- Capture process parallelism

**Syntax**

```
DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS(
 enable IN BOOLEAN TRUE);
```

## Parameters

**Table 209-20 ENABLE\_GG\_XSTREAM\_FOR\_STREAMS Procedure Parameters**

| Parameter | Description                                                                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | If TRUE, then enable XStream performance optimizations for Oracle Streams components.<br>If FALSE, then disable XStream performance optimizations for Oracle Streams components. |

## Usage Notes

The following usage notes apply to this procedure:

- When you run this procedure, all capture processes and apply processes are restarted.
- After you run this procedure, the `PURPOSE` column in the following views displays XStream Streams:
  - `ALL_APPLY`
  - `DBA_APPLY`
  - `ALL_CAPTURE`
  - `DBA_CAPTURE`
- A license for the Oracle GoldenGate product is required to enable XStream performance optimizations for Oracle Streams components.

- [IS\\_GG\\_XSTREAM\\_FOR\\_STREAMS Function](#) (page 209-71)
- *Oracle Database XStream Guide, Chapter 1, Prerequisites for XStream*

## 209.4.20 GET\_MESSAGE\_TRACKING Function

The `GET_MESSAGE_TRACKING` Function returns the tracking label for the current session.

### See Also:

- [SET\\_MESSAGE\\_TRACKING Procedure](#) (page 209-95)

## Syntax

```
DBMS_STREAMS_ADM.GET_MESSAGE_TRACKING
RETURN VARCHAR2;
```

## 209.4.21 GET\_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

### See Also:

- ["SET\\_TAG Procedure \(page 209-97\)"](#)
- *Oracle Streams Replication Administrator's Guide* for more information about tags

### Syntax

```
DBMS_STREAMS_ADM.GET_TAG
RETURN RAW;
```

### Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON
DECLARE
 raw_tag RAW(2000);
BEGIN
 raw_tag := DBMS_STREAMS_ADM.GET_TAG();
 DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/
```

You can also display the value by querying the `DUAL` view:

```
SELECT DBMS_STREAMS_ADM.GET_TAG FROM DUAL;
```

## 209.4.22 IS\_GG\_XSTREAM\_FOR\_STREAMS Function

This function returns `TRUE` if XStream performance optimizations are enabled for Oracle Streams components, or this function returns `FALSE` if XStream performance optimizations are disabled for Oracle Streams components.

### See Also:

- ["ENABLE\\_GG\\_XSTREAM\\_FOR\\_STREAMS Procedure \(page 209-69\)"](#)

### Syntax

```
DBMS_XSTREAM_ADM.IS_GG_XSTREAM_FOR_STREAMS
RETURN BOOLEAN;
```

## 209.4.23 KEEP\_COLUMNS Procedure

This procedure either adds or removes a declarative rule-based transformation which keeps a list of columns in a row logical change record (LCR) that satisfies the specified rule. The transformation deletes columns that are not in the list from the row LCR.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The `column_list` parameter is type `VARCHAR2` and the `column_table` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

### Note:

- The `KEEP_COLUMNS` procedure supports the same data types supported by Oracle Streams capture processes.
- The `KEEP_COLUMNS` procedure is useful when you want to keep a relatively small number of columns in a row LCR. To keep most of the columns in a row LCR and delete a relatively small number of columns, consider using the `DELETE_COLUMN` procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

### See Also:

- *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes
- [DELETE\\_COLUMN Procedure](#) (page 209-65)

### Syntax

```
DBMS_XSTREAM_ADM.KEEP_COLUMNS(
 rule_name IN VARCHAR2,
 table_name IN VARCHAR2,
 column_list IN VARCHAR2,
 value_type IN VARCHAR2 DEFAULT '*',
 step_number IN NUMBER DEFAULT 0,
 operation IN VARCHAR2 DEFAULT 'ADD');
```

```
DBMS_XSTREAM_ADM.KEEP_COLUMNS(
 rule_name IN VARCHAR2,
 table_name IN VARCHAR2,
 column_table IN DBMS_UTILITY.LNAME_ARRAY,
 value_type IN VARCHAR2 DEFAULT '*',
```

```

step_number IN NUMBER DEFAULT 0,
operation IN VARCHAR2 DEFAULT 'ADD';

```

## Parameters

**Table 209-21 KEEP\_COLUMNS Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_name    | The name of the rule, specified as <code>[schema_name.]rule_name</code> . If NULL, then the procedure raises an error.<br><br>For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.                                                                                                                                                                               |
| table_name   | The name of the table for which the columns are kept in the row LCR, specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.                                                                                                                                                                                                                                                                           |
| column_list  | The names of the columns kept for each row LCR that satisfies the rule. Specify a comma-delimited list of type <code>VARCHAR2</code> . The transformation removes columns that are not in the list from the row LCR.<br><br>If this parameter is set to NULL, and the <code>column_table</code> parameter is also set to NULL, then the procedure raises an error.                                                                                                                                                  |
| column_table | The names of the columns kept for each row LCR that satisfies the rule. Specify a PL/SQL associative array of type <code>DBMS_UTILITY.LNAME_ARRAY</code> , where each element is the name of a column. The first schema should be in position 1. The last position must be NULL.<br><br>The transformation removes columns that are not in the table from the row LCR.<br><br>If this parameter is set to NULL, and the <code>column_list</code> parameter is also set to NULL, then the procedure raises an error. |
| value_type   | Specify 'NEW' to keep the columns in the new values in the row LCR.<br>Specify 'OLD' to keep the columns in the old values in the row LCR.<br>Specify '*' to keep the columns in both the old and new values in the row LCR.                                                                                                                                                                                                                                                                                        |
| step_number  | The order of execution of the transformation.<br><b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering                                                                                                                                                                                                                                                                                                                                                           |
| operation    | Specify 'ADD' to add the transformation to the rule.<br>Specify 'REMOVE' to remove the transformation from the rule.                                                                                                                                                                                                                                                                                                                                                                                                |

## Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the keep columns declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_list`, `column_table`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `KEEP_COLUMNS` procedure when one or more of these parameters is NULL:

| table_name | column_list/<br>column_table | step_number | Result                                                          |
|------------|------------------------------|-------------|-----------------------------------------------------------------|
| NULL       | NULL                         | NULL        | Remove all keep columns transformations for the specified rule. |

| <b>table_name</b> | <b>column_list/<br/>column_table</b> | <b>step_number</b> | <b>Result</b>                                                                                                                                                                     |
|-------------------|--------------------------------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NULL              | NULL                                 | non-NULL           | Remove all keep columns transformations with the specified <code>step_number</code> for the specified rule.                                                                       |
| NULL              | non-NULL                             | non-NULL           | Remove all keep columns transformations with the specified <code>column_list/column_table</code> and <code>step_number</code> for the specified rule.                             |

## 209.4.24 MERGE\_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process.

Typically, this procedure is used to merge two streams that were split using the `SPLIT_STREAMS` procedure in this package. The `SPLIT_STREAMS` procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the `SPLIT_STREAMS` procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the `MERGE_STREAMS_JOB` procedure. The `MERGE_STREAMS_JOB` procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the `MERGE_STREAMS_JOB` procedure does nothing. Typically, it is best to run the `MERGE_STREAMS_JOB` procedure instead of running the `MERGE_STREAMS` procedure directly.

However, you can choose to run the `MERGE_STREAMS` procedure directly when the following conditions are met:

- The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.
- The cloned capture process used by the split stream is started and is capturing changes.
- The apply process at the destination database is applying the changes captured by the cloned capture process.
- The `CAPTURE_MESSAGE_CREATE_TIME` in the `GV$STREAMS_CAPTURE` view of the cloned capture process has caught up to, or nearly caught up to, the `CAPTURE_MESSAGE_CREATE_TIME` of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The `MERGE_STREAMS` procedure performs the following actions:

1. Stops the cloned capture process.
  2. Stops the original capture process.
  3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
  4. Starts the original capture process from the lower SCN value of these two SCN values:
    - The acknowledged SCN of the cloned propagation.
    - The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.
- When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.
5. Drops the cloned propagation.
  6. Drops the cloned capture process.
  7. Drops the cloned queue.

| <code>script_directory_object</code> | <p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the <code>script_name</code> parameter is NULL, then the procedure ignores this parameter and does not generate a script.</p> <p>If NULL and the <code>script_name</code> parameter is non-NULL, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Usage Notes

You can use the `MERGE_STREAMS` procedure to merge two streams that were not split using the `SPLIT_STREAMS` procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

The `DBA_STREAMS_SPLIT_MERGE` view contains information about split and merge operations.

## 209.4.25 MERGE\_STREAMS\_JOB Procedure

This procedure determines whether the original capture process and the cloned capture process are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the `MERGE_STREAMS` procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the `SPLIT_STREAMS` procedure in this package. The `SPLIT_STREAMS` procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the `SPLIT_STREAMS` procedure has a cloned queue, cloned capture process, and cloned propagation.

If the `auto_merge_threshold` parameter was set to a positive number in the `SPLIT_STREAMS` procedure that split the streams, then a merge job runs the `MERGE_STREAMS_JOB` procedure automatically according to its schedule. The schedule name is specified for the `schedule_name` parameter, and the merge job name is specified for the `merge_job_name` parameter when the `MERGE_STREAMS_JOB` procedure is run automatically. The merge job and its schedule were created by the `SPLIT_STREAMS` procedure.

If the `auto_merge_threshold` parameter was set to `NULL` or 0 (zero) in the `SPLIT_STREAMS` procedure that split the streams, then you can run the `MERGE_STREAMS_JOB` procedure manually. In this case, it is not run automatically.

**Table 209-23 (Cont.) MERGE\_STREAMS\_JOB Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| propagation_name | <p>The name of the propagation that is merged back to the original stream.</p> <p>If <code>NULL</code>, then the name of the original propagation in the original stream is used. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure.</p> <p>If a non-<code>NULL</code> value is specified, then an error is raised under either of the following conditions:</p> <ul style="list-style-type: none"> <li>The queue specified in the <code>queue_name</code> parameter does not exist.</li> <li>The queue specified in the <code>queue_name</code> parameter exists but is not used by a capture process.</li> </ul> |
| queue_name       | <p>The name of the queue that is the source queue for the propagation that is merged back.</p> <p>If <code>NULL</code>, then the existing, original queue is the source queue for the propagation that is merged back. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream.</p>                                                                                                                                                                                                                                                                                         |
| merge_threshold  | <p>The merge threshold in seconds.</p> <p>The value of the <code>CAPTURE_MESSAGE_CREATE_TIME</code> column for each capture process in the <code>GV\$STREAMS_CAPTURE</code> dynamic performance view determines whether the streams are merged.</p> <p>Specifically, if the difference, in seconds, between the <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then this procedure runs the <code>MERGE_STREAMS</code> procedure to merge the streams. If the difference is greater than the value specified by this parameter, then this procedure does nothing.</p>                                                                                                                                                                                             |
| schedule_name    | <p>The name of the schedule for the merge job.</p> <p>If <code>NULL</code>, then no schedule name is specified. Typically, you set this parameter to <code>NULL</code> when the <code>auto_merge_threshold</code> parameter was set to <code>NULL</code> or 0 (zero) in the <code>SPLIT_STREAMS</code> procedure that split the streams.</p> <p>Specify <code>NULL</code> if you run this procedure manually.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| merge_job_name   | <p>The name of the job that merges the streams.</p> <p>If <code>NULL</code>, then no merge job name is specified. Typically, you set this parameter to <code>NULL</code> when the <code>auto_merge_threshold</code> parameter was set to <code>NULL</code> or 0 (zero) in the <code>SPLIT_STREAMS</code> procedure that split the streams.</p> <p>Specify <code>NULL</code> if you run this procedure manually.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Usage Notes

You can use the `MERGE_STREAMS_JOB` procedure to merge two streams that were not split using the `SPLIT_STREAMS` procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

After the `MERGE_STREAMS_JOB` procedure completes, you can query the `DBA_CAPTURE` and `DBA_PROPAGATION` views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the `schedule_name` and `merge_job_name` parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

The `DBA_STREAMS_SPLIT_MERGE` view contains information about split and merge operations.

## 209.4.26 PURGE\_SOURCE\_CATALOG Procedure

This procedure removes all Oracle Streams data dictionary information at the local database for the specified object.

You can use this procedure to remove Oracle Streams metadata that is not needed currently and will not be needed in the future.

### Syntax

```
DBMS_XSTREAM_ADM.PURGE_SOURCE_CATALOG(
 source_database IN VARCHAR2,
 source_object_name IN VARCHAR2,
 source_object_type IN VARCHAR2,
 source_root_name IN VARCHAR2);
```

### Parameters

**Table 209-24** PURGE\_SOURCE\_CATALOG Procedure Parameters

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>source_database</code>    | In a non-CDB, specify the global name of the source database containing the database object.<br>In a CDB, specify the global name of the container containing the database object. The container can be the root or a PDB.<br>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code> , then the procedure specifies <code>DBS1.NET</code> automatically. |
| <code>source_object_name</code> | The name of the object specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.                                                                                                                                                                                                                                                                                                  |
| <code>source_object_type</code> | Type of the object. Currently, <code>TABLE</code> is the only possible object type.                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 209-24 (Cont.) PURGE\_SOURCE\_CATALOG Procedure Parameters**

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>source_root_name</code> | <p>The global name of the source root containing the object in a CDB. The source root is where the changes being captured originated in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> <p>If the <code>source_root_name</code> parameter is <code>NULL</code>, then the global name of the local root is the default.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p> |

### Usage Notes

The global name of the source database containing the object must be specified for the `source_database` parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.

For example, suppose changes to the `hr.employees` table at the `dbs1.net` source database are being applied to the `hr.employees` table at the `dbs2.net` destination database. Also, suppose `hr.employees` at `dbs2.net` is not a source at all. In this case, specifying `dbs2.net` as the `source_database` for this table results in an error. However, specifying `dbs1.net` as the `source_database` for this table while running the `PURGE_SOURCE_CATALOG` procedure at the `dbs2.net` database removes data dictionary information about the table at `dbs2.net`.

Do not run this procedure at a database if either of the following conditions is true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstantiating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstantiating the object.

 **Note:**

These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.

## 209.4.27 RECOVER\_OPERATION Procedure

This procedure provides options for split and merge operations that stopped because they encountered an errors.

This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation. Split and merge operations might be run in an XStream Out environment in which multiple outbound servers use the same capture process.

This procedure only can perform these actions for split and merge operations using the `split_threshold` and `merge_threshold` capture process parameters set to non-NULL values to enable automatic split and merge.

Information about the operation is stored in the following data dictionary views when the operation is in process:

- `DBA_RECOVERABLE_SCRIPT`
- `DBA_RECOVERABLE_SCRIPT_PARAMS`
- `DBA_RECOVERABLE_SCRIPT_BLOCKS`
- `DBA_RECOVERABLE_SCRIPT_ERRORS`

The data dictionary views are populated at the database that contains the capture process.

When the operation completes successfully, metadata about the operation is moved from the `DBA_RECOVERABLE_SCRIPT` view to the `DBA_RECOVERABLE_SCRIPT_HIST` view. The other views, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`, retain information about the operation until it is purged automatically after 30 days.

When one of these operations encounters an error and stops, metadata about the operation remains in these views. In this case, you can either roll forward, roll back, or purge the metadata about the operation using the `RECOVER_OPERATION` procedure. If you choose to roll forward the operation, then correct conditions that caused the errors reported in `DBA_RECOVERABLE_SCRIPT_ERRORS` before proceeding.

Run the `RECOVER_OPERATION` procedure at the database that contains the capture process.

 **Note:**

To run the `RECOVER_OPERATION` procedure, both databases must be Oracle Database 10g Release 2 or later databases.

## Syntax

```
DBMS_XSTREAM_ADM.RECOVER_OPERATION(
 script_id IN RAW,
 operation_mode IN VARCHAR2 DEFAULT 'FORWARD');
```

## Parameters

**Table 209-25 RECOVER\_OPERATION Procedure Parameters**

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>script_id</code>      | The operation id of the operation that is being rolled forward, rolled back, or purged. Query the <code>SCRIPT_ID</code> column of the <code>DBA_RECOVERABLE_SCRIPT</code> data dictionary view to determine the operation id.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>operation_mode</code> | <p>If <code>FORWARD</code>, then the procedure rolls forward the operation. Specify <code>FORWARD</code> to try to complete the operation.</p> <p>If <code>ROLLBACK</code>, then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then this option also moves the metadata about the operation from the <code>DBA_RECOVERABLE_SCRIPT</code> view to the <code>DBA_RECOVERABLE_SCRIPT_HIST</code> view. The other views retain information about the operation for 30 days.</p> <p>If <code>PURGE</code>, then the procedure moves the metadata about the operation from the <code>DBA_RECOVERABLE_SCRIPT</code> view to the <code>DBA_RECOVERABLE_SCRIPT_HIST</code> view without rolling the operation back. The other views retain information about the operation for 30 days.</p> |

## 209.4.28 REMOVE\_QUEUE Procedure

This procedure removes the specified `ANYDATA` queue.

Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the `drop_unused_queue_table` parameter is set to `TRUE`, then drops the queue table if it is empty and no other queues are using it.
5. If the `cascade` parameter is set to `TRUE`, then drops all of the XStream clients that are using the queue.

 **Note:**

The specified queue must be a `ANYDATA` queue.

### Syntax

```
DBMS_XSTREAM_ADM.REMOVE_QUEUE(
 queue_name IN VARCHAR2,
 cascade IN BOOLEAN DEFAULT FALSE,
 drop_unused_queue_table IN BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 209-26 REMOVE\_QUEUE Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name              | The name of the queue to remove, specified as [ <i>schema_name</i> .] <i>queue_name</i> . For example, <i>strmadmin.streams_queue</i> . If the schema is not specified, then the current user is the default.                                                                                                                                        |
| cascade                 | If <b>TRUE</b> , then the procedure drops any XStream clients that use the queue.<br><br>If <b>FALSE</b> , then the procedure raises an error if there are any XStream clients that use the queue. Before you run this procedure with the <i>cascade</i> parameter set to <b>FALSE</b> , make sure no XStream clients are using the queue currently. |
| drop_unused_queue_table | If <b>TRUE</b> and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue.<br><br>If <b>FALSE</b> , then the procedure does not drop the queue table.                                                                        |

## 209.4.29 REMOVE\_RULE Procedure

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation.

**Note:**

If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the `DBMS_RULE_ADM.DROP_RULE` procedure. If you use the `DBMS_RULE_ADM.DROP_RULE` procedure, then some metadata about the rule might remain.

### Syntax

```
DBMS_XSTREAM_ADM.REMOVE_RULE(
 rule_name IN VARCHAR2,
 streams_type IN VARCHAR2,
 streams_name IN VARCHAR2,
 drop_unused_rule IN BOOLEAN DEFAULT TRUE,
 inclusion_rule IN BOOLEAN DEFAULT TRUE);
```

## Parameters

Table 209-27 REMOVE\_RULE Procedure Parameters

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>rule_name</code>        | <p>The name of the rule to remove, specified as <code>[schema_name.]rule_name</code>. If <code>NULL</code>, then the procedure removes all rules from the specified capture process, apply process, or propagation rule set.</p> <p>For example, to specify a rule in the <code>hr</code> schema named <code>prop_rule1</code>, enter <code>hr.prop_rule1</code>. If the schema is not specified, then the current user is the default.</p>                                                                  |
| <code>streams_type</code>     | <p>The type of XStream client:</p> <ul style="list-style-type: none"> <li>Specify <code>capture</code> for a capture process.</li> <li>Specify <code>propagation</code> for a propagation.</li> <li>Specify <code>apply</code> for an apply process.</li> </ul>                                                                                                                                                                                                                                              |
| <code>streams_name</code>     | <p>The name of the XStream client, which can be a capture process, propagation, or apply process. Do not specify an owner.</p> <p>If the specified XStream client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata.</p> <p>If the specified XStream client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error.</p> |
| <code>drop_unused_rule</code> | <p>If <code>TRUE</code> and the rule is not in any rule set, then the procedure drops the rule from the database.</p> <p>If <code>TRUE</code> and the rule exists in any rule set, then the procedure does not drop the rule from the database.</p> <p>If <code>FALSE</code>, then the procedure does not drop the rule from the database.</p>                                                                                                                                                               |
| <code>inclusion_rule</code>   | <p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure removes the rule from the positive rule set for the XStream client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure removes the rule from the negative rule set for the XStream client.</p>                                                                                                                                                                                                       |

## 209.4.30 REMOVE\_SUBSET\_OUTBOUND\_RULES Procedure

This procedure removes subset rules from an outbound server configuration.

The names of the specified insert, update, and delete rules must match those generated by the `ADD_SUBSET_OUTBOUND_RULES` procedure. To view the rule names for subset rules, run the following query:

```
SELECT RULE_OWNER, SUBSETTING_OPERATION, RULE_NAME
 FROM ALL_XSTREAM_RULES
 WHERE SUBSETTING_OPERATION IS NOT NULL;
```

 **Note:**

- This procedure removes the declarative rule-based transformation associated with each rule it removes.
- This procedure does not remove rules from the outbound server's capture process.

 **See Also:**

"[ADD\\_SUBSET\\_OUTBOUND\\_RULES Procedure](#) (page 209-31)"

**Syntax**

```
DBMS_XSTREAM_ADM.REMOVE_SUBSET_OUTBOUND_RULES(
 server_name IN VARCHAR2,
 insert_rule_name IN VARCHAR2,
 update_rule_name IN VARCHAR2,
 delete_rule_name IN VARCHAR2);
```

## 209.4.31 REMOVE\_XSTREAM\_CONFIGURATION Procedure

This procedure removes the XStream configuration at the local database.

**Syntax**

```
DBMS_XSTREAM_ADM.REMOVE_XSTREAM_CONFIGURATION(
 container IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

**Table 209-28 REMOVE\_XSTREAM\_CONFIGURATION Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| container | <p>If <b>CURRENT</b>, then the XStream configuration is removed from the current container. <b>CURRENT</b> can be specified while connected to the root or to a PDB in a CDB.</p> <p>If <b>ALL</b>, then the XStream configuration is removed from all of the containers in the CDB. To specify <b>ALL</b>, the procedure must be invoked in the root.</p> <p>If a container name, then the XStream configuration is removed from the specified container. To specify root, use <b>CDB\$ROOT</b> while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p> |

**Usage Notes**

Specifically, this procedure performs the following actions at the local database:

- Drops all capture processes

- If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the `ABORT_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the `ABORT_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the `ABORT_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- Drops propagations that were created using either the `DBMS_XSTREAM_ADM` package or the `DBMS_PROPAGATION_ADM` package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the `DBMS_AQADM` package.
- Disables all propagation jobs used by propagations
- Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.
- Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database
- Removes messaging clients
- Unsets message notification specifications that were set using the `SET_MESSAGE_NOTIFICATION` procedure in the `DBMS_XSTREAM_ADM` package
- Removes specifications for procedure DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers
- Removes update conflict handlers
- Removes specifications for substitute key columns for apply tables
- Drops rule sets and rules that were created using the `DBMS_XSTREAM_ADM` package.
- Drops unused rule sets that were used by capture processes, propagations, apply processes, and messaging clients, and removes the rules in these rule sets. These rules and rule sets are removed regardless of whether they were created using the `DBMS_XSTREAM_ADM` package or the `DBMS_RULE_ADM` package.

This procedure stops capture processes and apply processes before it drops them.

This procedure does not drop rule sets or rules if they meet both of the following conditions:

- The rule sets or rules were created using the `DBMS_RULE_ADM` package.
- The rule sets or rules were not used by a capture process, propagation, apply process, or messaging client.

 **Note:**

Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire XStream configuration at a database. If an Oracle Streams configuration exists at the database, then this procedure also removes the entire Oracle Streams configuration.

 **Note:**

- Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.
- This procedure commits multiple times.

## 209.4.32 RENAME\_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

 **Note:**

- The `RENAME_COLUMN` procedure supports the same data types supported by Oracle Streams capture processes.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

 **See Also:**

*Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes

### Syntax

```
DBMS_XSTREAM_ADM.RENAME_COLUMN(
 rule_name IN VARCHAR2,
 table_name IN VARCHAR2,
 from_column_name IN VARCHAR2,
 to_column_name IN VARCHAR2,
```

```
value_type IN VARCHAR2 DEFAULT '*',
step_number IN NUMBER DEFAULT 0,
operation IN VARCHAR2 DEFAULT 'ADD');
```

## Parameters

**Table 209-29 RENAME\_COLUMN Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                      |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_name        | The name of the rule, specified as [ <i>schema_name</i> .] <i>rule_name</i> . If NULL, then the procedure raises an error.<br><br>For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default. |
| table_name       | The name of the table in which the column is renamed in the row LCR, specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.                                                                  |
| from_column_name | The name of the column to be renamed in each row LCR that satisfies the rule.                                                                                                                                                                                                                    |
| to_column_name   | The new name of the column in each row LCR that satisfies the rule.                                                                                                                                                                                                                              |
| value_type       | Specify 'NEW' to rename the column in the new values in the row LCR.<br><br>Specify 'OLD' to rename the column in the old values in the row LCR.<br><br>Specify '*' to rename the column in both the old and new values in the row LCR.                                                          |
| step_number      | The order of execution of the transformation.<br><br><b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering                                                                                                                                    |
| operation        | Specify 'ADD' to add the transformation to the rule.<br><br>Specify 'REMOVE' to remove the transformation from the rule.                                                                                                                                                                         |

## Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the rename column declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_COLUMN` procedure when one or more of these parameters is NULL:

| table_name | from_column_name | to_column_name | step_number | Result                                                                                                       |
|------------|------------------|----------------|-------------|--------------------------------------------------------------------------------------------------------------|
| NULL       | NULL             | NULL           | NULL        | Remove all rename column transformations for the specified rule.                                             |
| NULL       | NULL             | NULL           | non-NULL    | Remove all rename column transformations with the specified <code>step_number</code> for the specified rule. |

| <b>table_name</b> | <b>from_column_name</b> | <b>to_column_name</b> | <b>step_number</b> | <b>Result</b>                                                                                                                                                         |
|-------------------|-------------------------|-----------------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NULL              | NULL                    | non-NULL              | non-NULL           | Remove all rename column transformations with the specified <code>to_column_name</code> and <code>step_number</code> for the specified rule.                          |

| non-NULL          | non-NULL                | non-NULL              | NULL               | Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule. |
| non-NULL          | non-NULL                | non-NULL              | non-NULL           | Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule. |

## 209.4.33 RENAME\_SCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

### Note:

Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

### See Also:

*Oracle Database XStream Guide* for more information about declarative rule-based transformations

### Syntax

```
DBMS_XSTREAM_ADM.RENAME_SCHEMA(
 rule_name IN VARCHAR2,
 from_schema_name IN VARCHAR2,
 to_schema_name IN VARCHAR2,
 step_number IN NUMBER DEFAULT 0,
 operation IN VARCHAR2 DEFAULT 'ADD');
```

### Parameters

**Table 209-30 RENAME\_SCHEMA Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_name        | The name of the rule, specified as <code>[schema_name.]rule_name</code> . If <code>NULL</code> , then the procedure raises an error.<br><br>For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default. |
| from_schema_name | The name of the schema to be renamed in each row LCR that satisfies the rule.                                                                                                                                                                                                                                                                       |
| to_schema_name   | The new name of the schema in each row LCR that satisfies the rule.                                                                                                                                                                                                                                                                                 |
| step_number      | The order of execution of the transformation.<br><br><b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering                                                                                                                                                                                       |

**Table 209-30 (Cont.) RENAME\_SCHEMA Procedure Parameters**

| Parameter | Description                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------|
| operation | Specify 'ADD' to add the transformation to the rule.<br>Specify 'REMOVE' to remove the transformation from the rule. |

### Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the rename schema declarative rule-based transformations for the specified rule are removed that match the specified `from_schema_name`, `to_schema_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_SCHEMA` procedure when one or more of these parameters is `NULL`:

| from_schema_name | to_schema_name | step_number | Result                                                                                                                                                                         |
|------------------|----------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NULL             | NULL           | NULL        | Remove all rename schema transformations for the specified rule.                                                                                                               |
| NULL             | NULL           | non-NULL    | Remove all rename schema transformations with the specified <code>step_number</code> for the specified rule.                                                                   |
| NULL             | non-NULL       | non-NULL    | Remove all rename schema transformations with the specified <code>to_schema_name</code> and <code>step_number</code> for the specified rule.                                   |
| non-NULL         | NULL           | non-NULL    | Remove all rename schema transformations with the specified <code>from_schema_name</code> and <code>step_number</code> for the specified rule.                                 |
| NULL             | non-NULL       | NULL        | Remove all rename schema transformations with the specified <code>to_schema_name</code> for the specified rule.                                                                |
| non-NULL         | non-NULL       | NULL        | Remove all rename schema transformations with the specified <code>from_schema_name</code> and <code>to_schema_name</code> for the specified rule.                              |
| non-NULL         | NULL           | NULL        | Remove all rename schema transformations with the specified <code>from_schema_name</code> for the specified rule.                                                              |
| non-NULL         | non-NULL       | non-NULL    | Remove all rename schema transformations with the specified <code>from_schema_name</code> , <code>to_schema_name</code> , and <code>step_number</code> for the specified rule. |

## 209.4.34 RENAME\_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

### Note:

Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

### See Also:

*Oracle Database XStream Guide* for more information about declarative rule-based transformations

### Syntax

```
DBMS_XSTREAM_ADM.RENAME_TABLE(
 rule_name IN VARCHAR2,
 from_table_name IN VARCHAR2,
 to_table_name IN VARCHAR2,
 step_number IN NUMBER DEFAULT 0,
 operation IN VARCHAR2 DEFAULT 'ADD');
```

### Parameters

**Table 209-31 RENAME\_TABLE Procedure Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                         |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>rule_name</code>       | The name of the rule, specified as <code>[schema_name.]rule_name</code> . If <code>NULL</code> , then the procedure raises an error.<br><br>For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default. |
| <code>from_table_name</code> | The name of the table to be renamed in each row LCR that satisfies the rule, specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.                                                                                                   |

**Table 209-31 (Cont.) RENAME\_TABLE Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| to_table_name | The new name of the table in each row LCR that satisfies the rule, specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, humres.staff.<br><br>The transformation can rename the table only, the schema only, or the table and the schema. If the schema is not specified, then the current user is the default. |
| step_number   | The order of execution of the transformation.<br><br><b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering                                                                                                                                                                    |
| operation     | Specify 'ADD' to add the transformation to the rule.<br><br>Specify 'REMOVE' to remove the transformation from the rule.                                                                                                                                                                                                         |

### Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the rename table declarative rule-based transformations for the specified rule are removed that match the specified `from_table_name`, `to_table_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_TABLE` procedure when one or more of these parameters is `NULL`:

| from_table_name | to_table_name | step_number | Result                                                                                                                                         |
|-----------------|---------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| NULL            | NULL          | NULL        | Remove all rename table transformations for the specified rule.                                                                                |
| NULL            | NULL          | non-NULL    | Remove all rename table transformations with the specified <code>step_number</code> for the specified rule.                                    |
| NULL            | non-NULL      | non-NULL    | Remove all rename table transformations with the specified <code>to_table_name</code> and <code>step_number</code> for the specified rule.     |
| non-NULL        | NULL          | non-NULL    | Remove all rename table transformations with the specified <code>from_table_name</code> and <code>step_number</code> for the specified rule.   |
| NULL            | non-NULL      | NULL        | Remove all rename table transformations with the specified <code>to_table_name</code> for the specified rule.                                  |
| non-NULL        | non-NULL      | NULL        | Remove all rename table transformations with the specified <code>from_table_name</code> and <code>to_table_name</code> for the specified rule. |

| from_table_name | to_table_name | step_number | Result                                                                                                                                                                      |
|-----------------|---------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| non-NULL        | NULL          | NULL        | Remove all rename table transformations with the specified <code>from_table_name</code> for the specified rule.                                                             |
| non-NULL        | non-NULL      | non-NULL    | Remove all rename table transformations with the specified <code>from_table_name</code> , <code>to_table_name</code> , and <code>step_number</code> for the specified rule. |

## 209.4.35 SET\_MESSAGE\_TRACKING Procedure

This procedure sets the tracking label for logical change records (LCRs) produced by the current session.

This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

### Note:

The tracking label set by this procedure does not track non-LCR messages.

### See Also:

KAWGET\_MESSAGE\_TRACKING

### Syntax

```
DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING(
 tracking_label IN VARCHAR2 DEFAULT 'Streams_tracking',
 actions IN NUMBER DEFAULT DBMS_XSTREAM_ADM.ACTION_MEMORY);
```

### Parameters

**Table 209-32 SET\_MESSAGE\_TRACKING Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tracking_label | The label used to track the LCRs produced by the session.<br>Set this parameter to <code>NULL</code> to stop message tracking in the current session.<br>The size limit for a label is 4,000 bytes. |

**Table 209-32 (Cont.) SET\_MESSAGE\_TRACKING Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| actions   | <p>When DBMS_XSTREAM_ADM.ACTION_MEMORY is specified, the LCRs are tracked in memory, and the V\$STREAMS_MESSAGE_TRACKING dynamic performance view is populated with information about the LCRs.</p> <p>Currently, DBMS_XSTREAM_ADM.ACTION_MEMORY is the only valid setting for this parameter.</p> <p>The value specified for this parameter is an enumerated constant. Enumerated constants must be prefixed with the package name.</p> |

## 209.4.36 SET\_PARAMETER Procedure

This procedure sets a parameter for an outbound server, an inbound server, or an outbound server's capture process.

### Syntax

```
DBMS_XSTREAM_ADM.SET_PARAMETER(
 streams_name IN VARCHAR2,
 streams_type IN VARCHAR2,
 parameter IN VARCHAR2,
 value IN VARCHAR2 DEFAULT NULL,
 no_wait IN BOOLEAN DEFAULT FALSE,
 source_database IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 209-33 SET\_PARAMETER Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                        |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| streams_type | <p>The type of XStream client:</p> <ul style="list-style-type: none"> <li>Specify <code>capture</code> for a capture process.</li> <li>Specify <code>apply</code> for an outbound server or inbound server.</li> </ul>                                                                                             |
| streams_name | The name of the capture process, outbound server, or inbound server. Do not specify an owner.                                                                                                                                                                                                                      |
| parameter    | <p>The name of the parameter you are setting.</p> <p>See "<a href="#">Capture Process Parameters</a> (page 32-35)" for information about capture process parameters.</p> <p>See "<a href="#">Apply Component Parameters</a> (page 20-58)" for information about outbound server and inbound server parameters.</p> |
| value        | <p>The value to which the parameter is set.</p> <p>If <code>NULL</code>, then the parameter is set to its default value.</p>                                                                                                                                                                                       |

Table 209-33 (Cont.) SET\_PARAMETER Procedure Parameters

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no_wait         | <p>If <code>TRUE</code>, then the parameter is set immediately.</p> <p>If <code>FALSE</code>, then the parameter is set after synchronizing with the running capture process, inbound server, or outbound server.</p> <p>When you modify multiple parameters for the same process consecutively, setting this parameter to <code>TRUE</code> speeds up each call. However, if the process is currently running, you must set this parameter to <code>FALSE</code> in the last to the procedure to ensure that the process uses the modified parameter values. If the no_wait parameter is set to <code>TRUE</code> for the last call to the procedure, the running process might not detect the parameter changes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| source_database | <p>If <code>CURRENT</code>, then the parameter is set only in the container where the procedure is invoked. <code>CURRENT</code> can be specified while connected to the root or to a PDB.</p> <p>If <code>ALL</code>, then the parameter is set in all containers in the CDB and all PDBs created after the procedure is invoked. To specify <code>ALL</code>, the procedure must be invoked in the root.</p> <p>If a container name, then the parameter is set in the specified container. To specify root, use <code>CDB\$ROOT</code> while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p><b>Note:</b> This parameter only applies to CDBs. Also, a non-null value can be specified only for the following parameters:</p> <ul style="list-style-type: none"> <li>• <code>include_objects</code> capture parameter</li> <li>• <code>excludetag</code> capture or apply parameter</li> <li>• <code>excludetrans</code> capture or apply parameter</li> <li>• <code>excludeuser</code> capture or apply parameter</li> <li>• <code>excludeuserid</code> capture or apply parameter</li> <li>• <code>getreplicates</code> capture or apply parameter</li> <li>• <code>getapplops</code> capture or apply parameter</li> </ul> |

## 209.4.37 SET\_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session.

Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

### See Also:

*Oracle Streams Replication Administrator's Guide* for more information about tags

## Syntax

```
DBMS_XSTREAM_ADM.SET_TAG(
 tag IN RAW DEFAULT NULL);
```

## Parameters

**Table 209-34 SET\_TAG Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag       | The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is <code>NULL</code> .<br>The size limit for a tag value is 2000 bytes. |

## Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```
EXEC DBMS_XSTREAM_ADM.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the `SET_TAG` procedure:

- This procedure is not transactional. That is, the effects of `SET_TAG` cannot be rolled back.
- If the `SET_TAG` procedure is run to set a non-`NULL` session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the `SET_TAG` procedure in a session. A data dictionary build happens when the `DBMS_CAPTURE_ADM.BUILD` procedure is run. The `BUILD` procedure can be run automatically when a capture process is created.

## 209.4.38 SET\_UP\_QUEUE Procedure

This procedure creates a queue table and a `ANYDATA` queue.

## Syntax

```
DBMS_XSTREAM_ADM.SET_UP_QUEUE(
 queue_table IN VARCHAR2 DEFAULT 'streams_queue_table',
 storage_clause IN VARCHAR2 DEFAULT NULL,
 queue_name IN VARCHAR2 DEFAULT 'streams_queue',
 queue_user IN VARCHAR2 DEFAULT NULL,
 comment IN VARCHAR2 DEFAULT NULL);
```

## Parameters

Table 209-35 SET\_UP\_QUEUE Procedure Parameters

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_table    | <p>The name of the queue table specified as <code>[schema_name.]queue_table_name</code>. For example, <code>strmadmin.streams_queue_table</code>. If the schema is not specified, then the current user is the default.</p> <p>If the queue table owner is not specified, then the procedure specifies the user who runs this procedure automatically as the queue table owner.</p> <p>Queue table names can be a maximum of 24 bytes.</p>                                                                                                                                                                                                                                                                                                                                                                                    |
| storage_clause | <p>The storage clause for queue table</p> <p>The storage parameter is included in the <code>CREATE TABLE</code> statement when the queue table is created. You can specify any valid table storage clause.</p> <p>If a tablespace is not specified here, then the procedure creates the queue table and all its related objects in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the procedure creates the queue table and all its related objects in the tablespace specified in the storage clause.</p> <p>If <code>NULL</code>, then the procedure uses the storage characteristics of the tablespace in which the queue table is created.</p> <p><b>See Also:</b> <i>Oracle Database SQL Language Reference</i> for more information about storage clauses</p> |
| queue_name     | <p>The name of the queue that will function as the <code>ANYDATA</code> queue, specified as <code>[schema_name.]queue_name</code>. For example, <code>strmadmin.streams_queue</code>.</p> <p>If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue.</p> <p>If the schema is not specified for this parameter, and the queue table owner is not specified in <code>queue_table</code>, then the current user is the default.</p> <p>Queue names can be a maximum of 24 bytes.</p>                                                                                                                                                         |
| queue_user     | <p>The name of the user who requires <code>ENQUEUE</code> and <code>DEQUEUE</code> privileges for the queue. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the <code>GRANT</code> option.</p> <p>If <code>NULL</code>, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the <code>DBMS_AQADM</code> package.</p>                                                                                                                                                                                                                                                                                                                        |
| comment        | The comment for the queue                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Usage Notes

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the `CREATE_QUEUE_TABLE` procedure in the `DBMS_AQADM` package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it

creates a multiple consumer `ANYDATA` queue that is both a secure queue and a transactional queue.

Also, if the database is Oracle Database 10g release 2 or later, the `sort_list` setting in `CREATE_QUEUE_TABLE` is set to `commit_time`. If the database is a release before Oracle Database 10g release 2, the `sort_list` setting in `CREATE_QUEUE_TABLE` is set to `enq_time`.

- If the specified queue table exists, then the queue uses the properties of the existing queue table.
- If the specified queue name does not exist, then this procedure runs the `CREATE_QUEUE` procedure in the `DBMS_AQADM` package to create the queue.
- This procedure starts the queue.
- If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants `ENQUEUE` and `DEQUEUE` privileges on the queue to the specified queue user.

To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not exist. If an agent with this name exists and is associated with the queue user only, then it is used. `SET_UP_QUEUE` then runs the `ENABLE_DB_ACCESS` procedure in the `DBMS_AQADM` package, specifying the agent and the user.

#### Note:

If the agent that `SET_UP_QUEUE` tries to create exists and is associated with a user other than the user specified by `queue_user`, then the procedure raises an error. In this case, rename or remove the existing agent, and retry `SET_UP_QUEUE`.

## 209.4.39 SPLIT\_STREAMS Procedure

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Streams replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process's queue. The queue can grow and begin to spill LCRs to the hard disk, degrading the performance of the Oracle Streams environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:

1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.
2. Creates a new propagation that propagates LCRs from the source queue created in Step 1 (page 209-101) to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.
3. Stops the capture process.
4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.
5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original stream. The procedure sets the start SCN for the cloned capture process to the value of the acknowledged SCN queried in Step 4 (page 162-168). The cloned capture process uses the same rule set as the original capture process.
6. Drops the original propagation.
7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4 (page 209-101).
8. If the `auto_merge_threshold` parameter is set to a positive number, then creates an Oracle Scheduler job to run the `MERGE_STREAMS_JOB` procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the `MERGE_STREAMS_JOB` procedure runs the `MERGE_STREAMS` procedure to merge the streams automatically.

After the `SPLIT_STREAMS` procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the `START_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

The `DBA_STREAMS_SPLIT_MERGE` view contains the name of each cloned component and information about the split and merge operation.

 **Note:**

If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.

### Syntax

```
DBMS_XSTREAM_ADM.SPLIT_STREAMS(
 propagation_name IN VARCHAR2,
 cloned_propagation_name IN VARCHAR2 DEFAULT NULL,
 cloned_queue_name IN VARCHAR2 DEFAULT NULL,
 cloned_capture_name IN VARCHAR2 DEFAULT NULL,
 perform_actions IN BOOLEAN DEFAULT TRUE,
 script_name IN VARCHAR2 DEFAULT NULL,
 script_directory_object IN VARCHAR2 DEFAULT NULL,
 auto_merge_threshold IN NUMBER DEFAULT NULL,
 schedule_name IN OUT VARCHAR2,
 merge_job_name IN OUT VARCHAR2);
```

### Parameters

**Table 209-36 SPLIT\_STREAMS Procedure Parameters**

| Parameter                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>propagation_name</code>        | The name of the propagation that cannot send LCRs to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                           |
| <code>cloned_propagation_name</code> | The name of the new propagation created by this procedure for the stream that is split off. If <code>NULL</code> , then the system generates a propagation name.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>cloned_queue_name</code>       | The name of the new queue created by this procedure for the stream that is split off. If <code>NULL</code> , then the system generates a queue name.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>cloned_capture_name</code>     | The name of the new capture process created by this procedure for the stream that is split off. If <code>NULL</code> , then the system generates a capture process name.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>perform_actions</code>         | <p>If <code>TRUE</code>, then the procedure performs the necessary actions to split the stream directly.</p> <p>If <code>FALSE</code>, then the procedure does not perform the necessary actions to split the stream directly.</p> <p>Specify <code>FALSE</code> when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify <code>FALSE</code> and either of the following parameters is <code>NULL</code>:</p> <ul style="list-style-type: none"> <li>• <code>script_name</code></li> <li>• <code>script_directory_object</code></li> </ul> |

Table 209-36 (Cont.) SPLIT\_STREAMS Procedure Parameters

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| script_name             | <p>If non-NULL and the <code>perform_actions</code> parameter is <code>FALSE</code>, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the <code>script_directory_object</code> parameter, then the procedure appends the statements to the existing file.</p> <p>If non-NULL and the <code>perform_actions</code> parameter is <code>TRUE</code>, then the procedure generates the specified script and performs the actions to split the stream directly.</p> <p>If NULL and the <code>perform_actions</code> parameter is <code>TRUE</code>, then the procedure performs the actions to split the stream directly and does not generate a script.</p> <p>If NULL and the <code>perform_actions</code> parameter is <code>FALSE</code>, then the procedure raises an error.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| script_directory_object | <p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the <code>script_name</code> parameter is NULL, then the procedure ignores this parameter and does not generate a script.</p> <p>If NULL and the <code>script_name</code> parameter is non-NULL, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| auto_merge_threshold    | <p>If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the <code>MERGE_STREAMS_JOB</code> procedure at set intervals according to its schedule. The value of the <code>CAPTURE_MESSAGE_CREATE_TIME</code> column for each capture process in the <code>GV\$STREAMS_CAPTURE</code> dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the cloned capture process and the original capture process is less than or equal to the value specified for the <code>auto_merge_threshold</code> parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream.</p> <p>If NULL or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the <code>MERGE_STREAM</code> procedure manually when the <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the cloned capture process catches up to, or nearly catches up to, the <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the original capture process.</p> <p>The <code>CAPTURE_MESSAGE_CREATE_TIME</code> records the time when a captured change was recorded in the redo log.</p> |

**Table 209-36 (Cont.) SPLIT\_STREAMS Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule_name  | <p>The Oracle Scheduler schedule name, specified as <code>[schema_name.]schedule_name</code>. For example, <code>strmadmin.merge_schedule</code>. If the schema is not specified, then the current user is the default.</p> <p>If <code>auto_merge_threshold</code> is a non-NULL positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name to adhere to naming conventions or to track the schedule more easily.</p> <p>If NULL and <code>auto_merge_threshold</code> is a non-NULL positive number, then the system generates a schedule name.</p> <p>If <code>auto_merge_threshold</code> is NULL or 0 (zero), then this parameter must be NULL.</p> <p>If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run.</p> <p>If an existing schedule name is specified, an error is raised.</p> |
| merge_job_name | <p>The Oracle Scheduler job name, specified as <code>[schema_name.]merge_job_name</code>. For example, <code>strmadmin.merge_job</code>. If the schema is not specified, then the current user is the default.</p> <p>If <code>auto_merge_threshold</code> is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name to adhere to naming conventions or to track the job more easily.</p> <p>If NULL and <code>auto_merge_threshold</code> is a non-NULL positive number, then the system generates a job name.</p> <p>If <code>auto_merge_threshold</code> is NULL or 0 (zero), then this parameter must be NULL.</p> <p>If an existing job name is specified, an error is raised.</p>                                                                                                                                                                                                                                   |

## 209.4.40 START\_OUTBOUND Procedure

This procedure starts an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

### Syntax

```
DBMS_XSTREAM_ADM.START_OUTBOUND(
 server_name IN VARCHAR2);
```

## Parameters

**Table 209-37 START\_OUTBOUND Procedure Parameters**

| Parameter                | Description                                                                                                               |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <code>server_name</code> | The name of the outbound server being started. A <code>NULL</code> specification is not allowed. Do not specify an owner. |

## 209.4.41 STOP\_OUTBOUND Procedure

This procedure stops an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

### Syntax

```
DBMS_XSTREAM_ADM.STOP_OUTBOUND(
 server_name IN VARCHAR2,
 force IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 209-38 STOP\_OUTBOUND Procedure Parameters**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>server_name</code> | The name of the outbound server being stopped. A <code>NULL</code> specification is not allowed. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                      |
| <code>force</code>       | If <code>TRUE</code> , then the procedure stops the outbound server and its capture process as soon as possible.<br>If <code>FALSE</code> , then the procedure stops the outbound server after ensuring that there are no gaps in the set of applied transactions.<br>The behavior of the apply component depends on the setting specified for the <code>force</code> parameter and the setting specified for the <code>commit_serialization</code> apply component parameter. |

# DBMS\_XSTREAM\_AUTH

The `DBMS_XSTREAM_AUTH` package provides subprograms for granting privileges to and revoking privileges from XStream administrators.

This chapter contains the following topic:

- [Overview](#) (page 210-1)
- [Security Model](#) (page 210-1)
- [Summary of DBMS\\_XSTREAM\\_AUTH Subprograms](#) (page 210-1)

## See Also:

[GRANT\\_ADMIN\\_PRIVILEGE Procedure](#) (page 210-2)

## 210.1 DBMS\_XSTREAM\_AUTH Overview

This package provides subprograms for granting privileges to XStream administrators and revoking privileges from XStream administrators.

## 210.2 DBMS\_XSTREAM\_AUTH Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

The user executing the subprograms in the `DBMS_XSTREAM_AUTH` package must have `SYSDBA` administrative privilege, and the user must exercise the privilege using `AS SYSDBA` at connect time.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.

## 210.3 Summary of DBMS\_XSTREAM\_AUTH Subprograms

This table lists the `DBMS_XSTREAM_AUTH` subprograms and briefly describes them.

**Table 210-1 DBMS\_XSTREAM\_AUTH Package Subprograms**

| Subprogram                                                           | Description                                                                                                                                       |
|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">GRANT_ADMIN_PRIVILEGE Procedure</a><br>(page 210-2)      | Either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges         |
| <a href="#">GRANT_REMOTE_ADMIN_ACCESS Procedure</a><br>(page 210-6)  | Enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link |
| <a href="#">REVOKE_ADMIN_PRIVILEGE Procedure</a><br>(page 210-6)     | Either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges                         |
| <a href="#">REVOKE_REMOTE_ADMIN_ACCESS Procedure</a><br>(page 210-9) | Disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link                 |

 **Note:**

All subprograms commit unless specified otherwise.

## 210.3.1 GRANT\_ADMIN\_PRIVILEGE Procedure

This procedure either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges.

 **See Also:**

["GRANT\\_ADMIN\\_PRIVILEGE Procedure \(page 210-2\)"](#)

### Syntax

```
DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE(
 grantee IN VARCHAR2,
 privilege_type IN VARCHAR2 DEFAULT '*',
 grant_select_privileges IN BOOLEAN DEFAULT FALSE,
 do_grants IN BOOLEAN DEFAULT TRUE,
 file_name IN VARCHAR2 DEFAULT NULL,
 directory_name IN VARCHAR2 DEFAULT NULL,
 grant_optional_privileges IN VARCHAR2 DEFAULT NULL,
 container IN VARCHAR2 DEFAULT 'CURRENT');
```

## Parameters

**Table 210-2 GRANT\_ADMIN\_PRIVILEGE Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| grantee                 | The user to whom privileges are granted                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| privilege_type          | Specify one of the following values: <ul style="list-style-type: none"> <li>• <code>CAPTURE</code><br/>Specifying <code>CAPTURE</code> grants the minimum privileges required by the user to administer capture processes.</li> <li>• <code>APPLY</code><br/>Specifying <code>APPLY</code> grants the minimum privileges required by the user to administer outbound servers, inbound servers, and apply processes.</li> <li>• <code>*</code><br/>Specifying <code>*</code> grants the minimum privileges required by the user to administer capture processes, outbound servers, inbound servers, and apply processes.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                               |
| grant_select_privileges | If <code>TRUE</code> , then the procedure grants a set of privileges, including <code>SELECT_CATALOG_ROLE</code> , to the user.<br><br>If <code>FALSE</code> , then the procedure does not grant the set of privileges to the user.<br><br><code>SELECT_CATALOG_ROLE</code> enables the user to select from the data dictionary. Set this parameter to <code>TRUE</code> for the XStream trusted user model. Set this parameter to <code>FALSE</code> for the XStream untrusted user model.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| do_grants               | If <code>TRUE</code> , then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the <code>DBA_XSTREAM_ADMINISTRATOR</code> data dictionary view with <code>YES</code> for both the <code>LOCAL_PRIVILEGES</code> column and the <code>ACCESS_FROM_REMOTE</code> column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If <code>TRUE</code> and any of the grant statements fails, then the procedure raises an error.<br><br>If <code>FALSE</code> , then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the <code>DBA_XSTREAM_ADMINISTRATOR</code> data dictionary view.<br><br>You specify <code>FALSE</code> when the procedure is generating a file that you will run later. If you specify <code>FALSE</code> and either the <code>file_name</code> or <code>directory_name</code> parameter is <code>NULL</code> , then the procedure raises an error. |
| file_name               | The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file.<br><br>If <code>NULL</code> , then the procedure does not generate a file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 210-2 (Cont.) GRANT\_ADMIN\_PRIVILEGE Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| directory_name            | <p>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement <code>CREATE DIRECTORY</code>. If you specify a directory, then the user who invokes the procedure must have the <code>WRITE</code> privilege on the directory object.</p> <p>If the <code>file_name</code> parameter is <code>NULL</code>, then this parameter is ignored, and the procedure does not generate a file.</p> <p>If <code>NULL</code> and the <code>file_name</code> parameter is non-<code>NULL</code>, then the procedure raises an error.</p>                                                                                                                              |
| grant_optional_privileges | <p>A comma-separated list of optional privileges to grant to the grantee, such as the <code>DV_XSTREAM_ADMIN</code> and <code>DV_GOLDENGATE_ADMIN</code> privileges</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| container                 | <p>If <code>CURRENT</code>, then grants privileges to the grantee only in the container where the procedure is invoked. <code>CURRENT</code> can be specified while connected to the root or to a PDB.</p> <p>If <code>ALL</code>, then grants privileges to the grantee in all containers in the CDB and all PDBs created after the procedure is invoked. To specify <code>ALL</code>, the procedure must be invoked in the root.</p> <p>If a container name, then grants privileges to the grantee only in the specified container. To specify root, use <code>CDB\$ROOT</code> while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p><b>Note:</b> This parameter only applies to CDBs.</p> |

### Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The `RESTRICTED SESSION` system privilege
- `EXECUTE` on the following packages:
  - `DBMS_APPLY_ADM`
  - `DBMS_AQ`
  - `DBMS_AQADM`
  - `DBMS_AQIN`
  - `DBMS_AQELM`
  - `DBMS_CAPTURE_ADM`
  - `DBMS_FLASHBACK`
  - `DBMS_LOCK`
  - `DBMS_PROPAGATION_ADM`
  - `DBMS_RULE_ADM`
  - `DBMS_STREAMS_ADM`
  - `DBMS_STREAMS_ADVISOR_ADM`

- DBMS\_STREAMS\_HANDLER\_ADM
  - DBMS\_STREAMS\_MESSAGING
  - DBMS\_TRANSFORM
  - DBMS\_XSTREAM\_ADM
- Privileges to enqueue messages into and dequeue messages from any queue
  - Privileges to manage any queue
  - Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
    - Evaluation contexts
    - Rule sets
    - Rules

In addition, the grantee can grant these privileges to other users.

- SELECT\_CATALOG\_ROLE
- SELECT or READ privilege on data dictionary views related to XStream and Oracle Streams
- The ability to allow a remote XStream administrator to perform administrative actions through a database link by connecting to the grantee

This ability is enabled by running the `GRANT_REMOTE_ADMIN_ACCESS` procedure in this package.

#### Note:

- To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
- This procedure grants only the privileges necessary to configure and administer an XStream environment. You can grant additional privileges to the grantee if necessary.

- "[GRANT\\_REMOTE\\_ADMIN\\_ACCESS Procedure](#) (page 210-6)"
- *Oracle Database SQL Language Reference* for information about the `CREATE DIRECTORY` SQL statement

## 210.3.2 GRANT\_REMOTE\_ADMIN\_ACCESS Procedure

This procedure enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

### Syntax

```
DBMS_XSTREAM_AUTH.GRANT_REMOTE_ADMIN_ACCESS(
 grantee IN VARCHAR2);
```

### Parameters

**Table 210-3 GRANT\_REMOTE\_ADMIN\_ACCESS Procedure Parameter**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| grantee   | The user who allows remote access. The procedure adds the grantee to the DBA_XSTREAM_ADMINISTRATOR data dictionary view with YES for the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the ACCESS_FROM_REMOTE column to YES. |

### Usage Notes

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The XStream administrator at a downstream capture database administers the source database using this connection.

#### Note:

The GRANT\_ADMIN\_PRIVILEGE procedure in this package runs this procedure.

## 210.3.3 REVOKE\_ADMIN\_PRIVILEGE Procedure

This procedure either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges.

### Syntax

```
DBMS_XSTREAM_AUTH.REVOKE_ADMIN_PRIVILEGE(
 grantee IN VARCHAR2,
 privilege_type IN VARCHAR2 DEFAULT '*',
 revoke_select_privileges IN BOOLEAN DEFAULT FALSE,
 do_revokes IN BOOLEAN DEFAULT TRUE,
 file_name IN VARCHAR2 DEFAULT NULL,
```

```

directory_name IN VARCHAR2 DEFAULT NULL
revoke_optional_privileges IN VARCHAR2 DEFAULT NULL,
container IN VARCHAR2 DEFAULT 'CURRENT');

```

## Parameters

**Table 210-4 REVOKE\_ADMIN\_PRIVILEGE Procedure Parameters**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| grantee                  | The user from whom privileges are revoked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| privilege_type           | Specify one of the following values: <ul style="list-style-type: none"> <li>CAPTURE<br/>Specifying CAPTURE revokes the minimum privileges required by the user to administer capture processes.</li> <li>APPLY<br/>Specifying APPLY revokes the minimum privileges required by the user to administer outbound servers, inbound servers, and apply processes.</li> <li>*</li> </ul> Specifying * revokes the minimum privileges required by the user to administer capture processes, outbound servers, inbound servers, and apply processes.                                                                                                                                                                                                                                                                                                                                                                   |
| revoke_select_privileges | If TRUE, then the procedure revokes a set of privileges, including SELECT_CATALOG_ROLE, to the user.<br>If FALSE, then the procedure does not revoke the set of privileges to the user.<br>SELECT_CATALOG_ROLE enables the user to select from the data dictionary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| do_revokes               | If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fails, then the procedure raises an error. A revoke statement fails if the user is not granted the privilege that is being revoked.<br>If FALSE, then the procedure does not revoke the privileges from the specified user directly, and does not remove the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view.<br>You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error. |
| file_name                | The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file.<br>If NULL, then the procedure does not generate a file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 210-4 (Cont.) REVOKE\_ADMIN\_PRIVILEGE Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| directory_name             | <p>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement <code>CREATE DIRECTORY</code>. If you specify a directory, then the user who invokes the procedure must have the <code>WRITE</code> privilege on the directory object.</p> <p>If the <code>file_name</code> parameter is <code>NULL</code>, then this parameter is ignored, and the procedure does not generate a file.</p> <p>If <code>NULL</code> and the <code>file_name</code> parameter is non-<code>NULL</code>, then the procedure raises an error.</p>                                                                                   |
| revoke_optional_privileges | <p>A comma-separated list of optional privileges to revoke from the grantee, such as the <code>DV_XSTREAM_ADMIN</code> and <code>DV_GOLDENGATE_ADMIN</code> privileges</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| container                  | <p>If <code>CURRENT</code>, then revokes privileges from the grantee only in the container where the procedure is invoked. <code>CURRENT</code> can be specified while connected to the root or to a PDB.</p> <p>If <code>ALL</code>, then revokes privileges from the grantee in all containers in the CDB. To specify <code>ALL</code>, the procedure must be invoked in the root.</p> <p>If a container name, then revokes privileges from the grantee only in the specified container. To specify root, use <code>CDB\$ROOT</code> while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p><b>Note:</b> This parameter only applies to CDBs.</p> |

### Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the `GRANT_ADMIN_PRIVILEGE` procedure in this package.

#### Note:

To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

#### See Also:

- ["GRANT\\_ADMIN\\_PRIVILEGE Procedure \(page 210-2\)"](#)
- *Oracle Database SQL Language Reference* for information about the `CREATE DIRECTORY` SQL statement

## 210.3.4 REVOKE\_REMOTE\_ADMIN\_ACCESS Procedure

This procedure disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link.

 **Note:**

The `REVOKE_ADMIN_PRIVILEGE` procedure in this package runs this procedure.

 **See Also:**

["REVOKE\\_ADMIN\\_PRIVILEGE Procedure \(page 210-6\)"](#)

### Syntax

```
DBMS_XSTREAM_AUTH.REVOKE_REMOTE_ADMIN_ACCESS(
 grantee IN VARCHAR2);
```

### Parameters

**Table 210-5 REVOKE\_REMOTE\_ADMIN\_ACCESS Procedure Parameter**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| grantee   | <p>The user for whom access from a remote XStream administrator is disabled.</p> <p>If a row for the grantee exists in the <code>DBA_XSTREAM_ADMINISTRATOR</code> data dictionary view, then the procedure updates the <code>ACCESS_FROM_REMOTE</code> column for the grantee to <code>NO</code>. If, after this update, both the <code>LOCAL_PRIVILEGES</code> column and the <code>ACCESS_FROM_REMOTE</code> column are <code>NO</code> for the grantee, then the procedure removes the grantee from the view.</p> <p>If no row for the grantee exists in the <code>DBA_XSTREAM_ADMINISTRATOR</code> data dictionary view, then the procedure does not update the view and does not raise an error.</p> |

# DEBUG\_EXTPROC

The `DEBUG_EXTPROC` package enables you to start up the extproc agent within a session. This utility package can help you debug external procedures.

This chapter contains the following topics:

- [Security Model](#) (page 211-1)
- [Operational Notes](#) (page 211-1)
- [Rules and Limits](#) (page 211-2)
- [Summary of `DEBUG\_EXTPROC` Subprograms](#) (page 211-2)

## 211.1 `DEBUG_EXTPROC` Security Model

Your Oracle account must have `EXECUTE` privileges on the package and `CREATE LIBRARY` privileges.

## 211.2 `DEBUG_EXTPROC` Operational Notes

These operational notes apply to `DEBUG_EXTPROC`.

To install the package, run the script `DBGEXTP.SQL`.

- Install/load this package in the Oracle `USER` where you want to debug the 'extproc' process.
- Ensure that you have execute privileges on package `DEBUG_EXTPROC`

```
SELECT SUBSTR(OBJECT_NAME, 1, 20)
FROM USER_OBJECTS
WHERE OBJECT_NAME = 'DEBUG_EXTPROC';
```

- You can install this package as any other user, as long as you have `EXECUTE` privileges on the package.

### Note:

These notes assumes that you built your shared library with debug symbols to aid in the debugging process. Please check the C compiler manual pages for the appropriate C compiler switches to build the shared library with debug symbols.

Having installed the package, proceed accordingly:

- Start a new Oracle session through `SQL*Plus` or `OCI` program by connecting to `ORACLE`.

- Execute procedure `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT` to startup the extproc agent in this session; for example, execute `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`; Do not exit this session, because that terminates the extproc agent.
- Determine the PID of the extproc agent that was started up for this session.
- Using a debugger (for example, gdb, dbx, or the native system debugger), load the extproc executable and attach to the running process.
- Set a breakpoint on function 'pextproc' and let the debugger continue with its execution.
- Now execute your external procedure in the same session where you first executed `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`
- Your debugger should now break in function 'pextproc'. At this point in time, the shared library referenced by your PL/SQL external function would have been loaded and the function resolved. Now set a breakpoint in your C function and let the debugger continue its execution.

Because PL/SQL loads the shared library at runtime, the debugger you use may or may not automatically be able to track the new symbols from the shared library. You may have to issue some debugger command to load the symbols (for example, 'share' in gdb)

- The debugger should now break in your C function. Its assumed that you had built the shared library with debugging symbols.
- Now proceed with your debugging.

## 211.3 Rules and Limits

`DEBUG_EXTPROC` works only on platforms with debuggers that can attach to a running process.

## 211.4 Summary of `DEBUG_EXTPROC` Subprograms

The `STARTUP_EXTPROC_AGENT` procedure is the only `DEBUG_EXTPROC` subprogram.

**Table 211-1** `DEBUG_EXTPROC` Package Subprograms

| Subprogram                                                      | Description                                        |
|-----------------------------------------------------------------|----------------------------------------------------|
| <a href="#">STARTUP_EXTPROC_AGENT Procedure</a><br>(page 211-2) | Starts up the extproc agent process in the session |

### 211.4.1 `STARTUP_EXTPROC_AGENT` Procedure

This procedure starts up the extproc agent process in the session. This enables you to get the PID of the executing process. This PID is needed to be able to attach to the running process using a debugger.

#### Syntax

```
DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT;
```

# 212

## HTF

The `HTF` (hypertext functions) and `HTP` (hypertext procedures) packages generate HTML tags. For example, the `HTF.ANCHOR` function generates the HTML anchor tag, `<A>`.

### See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

This chapter contains the following topics:

- [Deprecated Subprograms](#) (page 212-1)
- [Operational Notes](#) (page 212-2)
- [Rules and Limits](#) (page 212-2)
- [Examples](#) (page 212-2)
- [Summary of Tags](#) (page 212-3)
- [Summary of HTF Subprograms](#) (page 212-6)

## 212.1 HTF Deprecated Subprograms

The `ESCAPE_URL` function is deprecated with Oracle Database 10g.

### Note:

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

#### Related Topics:

- [ESCAPE\\_URL Function](#) (page 212-30)  
This deprecated function replaces characters that have special meaning in HTML and HTTP with their escape sequences.

## 212.2 HTF Operational Notes

These operational notes apply to the `HTF` package.

For every HTF function that generates one or more HTML tags, there is a corresponding HTP procedure with identical parameters with the following exception:

- The [PRINTS Procedure](#) (page 213-62) and the [PS Procedure](#) (page 213-63) do not have HTF function equivalents. Use the [ESCAPE\\_SC Function](#) (page 212-29) or the [ESCAPE\\_URL Function](#) (page 212-30) if you need a string conversion function. Note that while there is a [ESCAPE\\_SC Procedure](#) (page 213-28) that performs the same operation as the [PRINTS Procedure](#) (page 213-62) and the [PS Procedure](#) (page 213-63), there is no procedural equivalent for the [ESCAPE\\_URL Function](#) (page 212-30).
- The [FORMAT\\_CELL Function](#) (page 212-31) does not have an HTP equivalent. The function formats column values inside an HTML table using [TABLEDATA Function](#) (page 212-71) which does have an HTP equivalent in the [TABLEDATA Procedure](#) (page 213-69). The advantage of this using the [FORMAT\\_CELL Function](#) (page 212-31) is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the `HTF.PRINT` function. It then prints its parameters to the generated Web page.

## 212.3 Rules and Limits

If you use values of the `LONG` datatype in functions such as `HTF.PRINT`, `HTF.PRN`, `HTF.PA` or `OWA_UTIL.CELLSPRINT`, only the first 32 K of the `LONG` data is used. The `LONG` data is bound to a `VARCHAR2` datatype in the function.

## 212.4 HTF Examples

The commands in this example generate a simple HTML document.

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
 HTP.P (HTF.HTMLOPEN); -- generates <HTML>
 HTP.P (HTF.HEADOPEN); -- generates <HEAD>
 HTP.P (HTF.TITLE('Hello')); -- generates <TITLE>Hello</TITLE>
 HTP.P (HTF.HEADCLOSE); -- generates </HEAD>
 HTP.P (HTF.BODYOPEN); -- generates <BODY>
 HTP.P (HTF.HEADER(1, 'Hello')); -- generates <H1>Hello</H1>
 HTP.P (HTF.BODYCLOSE); -- generates </BODY>
 HTP.P (HTF.HTMLCLOSE); -- generates </HTML>
END;
```

## 212.5 Summary of Tags

This list summarizes the HTML tags generated by the `HTF` package.

### HTML, HEAD, and BODY Tags

[HTMLOPEN Function](#) (page 212-48), [HTMLCLOSE Function](#) (page 212-47) - generate `<HTML>` and `</HTML>`

[HEADOPEN Function](#) (page 212-46), [HEADCLOSE Function](#) (page 212-45) - generate `<HEAD>` and `</HEAD>`

[BODYOPEN Function](#) (page 212-19), [BODYCLOSE Function](#) (page 212-19) - generate `<BODY>` and `</BODY>`

### Comment Tag

[COMMENT Function](#) (page 212-23) - generates `<!-- and -->`

[http://www.w3.org.BASE Function](#) (page 212-16) - generates `<BASE>`

[LINKREL Function](#) (page 212-52) - generates `<LINK>` with the `REL` attribute

[LINKREV Function](#) (page 212-53) - generates `<LINK>` with the `REV` attribute

[TITLE Function](#) (page 212-75) - generates `<TITLE>`

[META Function](#) (page 212-57) - generates `<META>`

[SCRIPT Function](#) (page 212-66) - generates `<SCRIPT>`

[STYLE Function](#) (page 212-69) - generates `<STYLE>`

[ISINDEX Function](#) (page 212-49) - generates `<ISINDEX>`

### Applet Tags

[APPLETOPEN Function](#) (page 212-14), [APPLETCLOSE Function](#) (page 212-14) - generate `<APPLET>` and `</APPLET>`

[PARAM Function](#) (page 212-62) - generates `<PARAM>`

### List Tags

[OLISTOPEN Function](#) (page 212-60), [OLISTCLOSE Function](#) (page 212-60) - generate `<OL>` and `</OL>`

[ULISTOPEN Function](#) (page 212-75), [ULISTCLOSE Function](#) (page 212-75) - generate `<UL>` and `</UL>`

[DLISTOPEN Function](#) (page 212-27), [DLISTCLOSE Function](#) (page 212-26) - generate `<DL>` and `</DL>`

[DLISTTERM Function](#) (page 212-28) - generates `<DT>`

[DLISTDEF Function](#) (page 212-26) - generates `<DD>`

[DIRLISTOPEN Function](#) (page 212-25), [DIRLISTCLOSE Function](#) (page 212-24) - generate `<DIR>` and `</DIR>`

[LISTHEADER Function](#) (page 212-53) - generates `<LH>`

[LISTINGOPEN Function](#) (page 212-54), [LISTINGCLOSE Function](#) (page 212-54) - generate `<LISTING>` and `</LISTING>`

[MENULISTOPEN Function](#) (page 212-57) - generate `<MENU>` and `</MENU>`

[LISTITEM Function](#) (page 212-54) - generates `<LI>`

### Form Tags

[FORMOPEN Function](#) (page 212-35), [FORMCLOSE Function](#) (page 212-33) - generate `<FORM>` and `</FORM>`

[FORMCHECKBOX Function](#) (page 212-32) - generates `<INPUT TYPE="CHECKBOX">`

[FORMHIDDEN Function](#) (page 212-33) - generates `<INPUT TYPE="HIDDEN">`

[FORMIMAGE Function](#) (page 212-34) - generates `<INPUT TYPE="IMAGE">`

[FORMPASSWORD Function](#) (page 212-35) - generates `<INPUT TYPE="PASSWORD">`

[FORMRADIO Function](#) (page 212-36) - generates `<INPUT TYPE="RADIO">`

[FORMSELECTOPEN Function](#) (page 212-38), [FORMSELECTCLOSE Function](#) (page 212-37) - generate `<SELECT>` and `</SELECT>`

[FORMSELETOPTION Function](#) (page 212-39) - generates `<OPTION>`

[FORMTEXT Function](#) (page 212-40) - generates `<INPUT TYPE="TEXT">`

[FORMTEXTAREA Function](#) (page 212-40) - generate `<TEXTAREA>`

[FORMTEXTAREAOPEN Function](#) (page 212-42), [FORMTEXTAREACLOSE Function](#) (page 212-42) - generate `<TEXTAREA>` and `</TEXTAREA>`

[FORMRESET Function](#) (page 212-37) - generates `<INPUT TYPE="RESET">`

[FORMSUBMIT Function](#) (page 212-39) - generates `<INPUT TYPE="SUBMIT">`

### Table Tags

[TABLEOPEN Function](#) (page 212-72), [TABLECLOSE Function](#) (page 212-71) - generate `<TABLE>` and `</TABLE>`

[TABLECAPTION Function](#) (page 212-70) - generates `<CAPTION>`

[TABLEROWOPEN Function](#) (page 212-73), [TABLEROWCLOSE Function](#) (page 212-73) - generate `<TR>` and `</TR>`

[TABLEHEADER Function](#) (page 212-72) - generates `<TH>`

[TABLEDATA Function](#) (page 212-71) - generates `<TD>`

### IMG, HR, and A Tags

[HR Function](#) (page 212-47), [LINE Function](#) (page 212-51) - generate `<HR>`

[IMG Function](#) (page 212-48), [IMG2 Function](#) (page 212-49) - generate `<IMG>`

[ANCHOR Function](#) (page 212-13), [ANCHOR2 Function](#) (page 212-13) - generate `<A>`

[MAPOPEN Function](#) (page 212-56), [MAPCLOSE Function](#) (page 212-56) - generate `<MAP>` and `</MAP>`

### Paragraph Formatting Tags

[HEADER Function](#) (page 212-46) - generates heading tags (`<H1>` to `<H6>`)

[PARA Function](#) (page 212-61), [PARAGRAPH Function](#) (page 212-61) - generate `<P>`

[PRN Functions](#) (page 212-65), [PRINT Functions](#) (page 212-64) - generate any text that is passed in

[PRN Functions](#) (page 212-65), [S Function](#) (page 212-65) - generate any text that is passed in; special characters in HTML are escaped

[PREOPEN Function](#) (page 212-63), [PRECLOSE Function](#) (page 212-63) - generate `<PRE>` and `</PRE>`

[BLOCKQUOTEOPEN Function](#) (page 212-18), [BLOCKQUOTECLOSE Function](#) (page 212-18) - generate `<BLOCKQUOTE>` and `</BLOCKQUOTE>`

[DIV Function](#) (page 212-25) - generates `<DIV>`

[NL Function](#) (page 212-58), [BR Function](#) (page 212-21) - generate `<BR>`

[NOBR Function](#) (page 212-59) - generates `<NOBR>`

[WBR Function](#) (page 212-77) - generates `<WBR>`

[PLAINTEXT Function](#) (page 212-62) - generates `<PLAINTEXT>`

[ADDRESS Function](#) (page 212-12) - generates `<ADDRESS>`

[MAILTO Function](#) (page 212-55) - generates `<A>` with the `MAILTO` attribute

[AREA Function](#) (page 212-15) - generates `<AREA>`

[BGSOUND Function](#) (page 212-17) - generates `<BGSOUND>`

### Character Formatting Tags

[BASEFONT Function](#) (page 212-17) - generates `<BASEFONT>`

[BIG Function](#) (page 212-18) - generates `<BIG>`

[BOLD Function](#) (page 212-20) - generates `<B>`

[CENTER Function](#) (page 212-21) - generates `<CENTER>` and `</CENTER>`

[CENTEROPEN Function](#) (page 212-22), [CENTERCLOSE Function](#) (page 212-22) - generate `<CENTER>` and `</CENTER>`

[CITE Function](#) (page 212-22) - generates `<CITE>`

[CODE Function](#) (page 212-23) - generates `<CODE>`

[DFN Function](#) (page 212-24) - generates `<DFN>`

[EM Function](#) (page 212-28), [EMPHASIS Function](#) (page 212-29) - generate `<EM>`

[FONTOPEN Function](#) (page 212-31), [FONTCLOSE Function](#) (page 212-30) - generate `<FONT>` and `</FONT>`

[ITALIC Function](#) (page 212-50) - generates `<I>`

[KBD Function](#) (page 212-50), [KEYBOARD Function](#) (page 212-51) - generate `<KBD>` and `</KBD>`

[S Function](#) (page 212-65) - generates `<S>`

[SAMPLE Function](#) (page 212-66) - generates `<SAMP>`

[SMALL Function](#) (page 212-67) - generates `<SMALL>`

[STRIKE Function](#) (page 212-68) - generates `<STRIKE>`

[STRONG Function](#) (page 212-68) - generates `<STRONG>`

[SUB Function](#) (page 212-69) - generates `<SUB>`

[SUP Function](#) (page 212-70) - generates `<SUP>`

[TELETYPE Function](#) (page 212-74) - generates `<TT>`

[UNDERLINE Function](#) (page 212-76) - generates `<U>`

[VARIABLE Function](#) (page 212-77) - generates `<VAR>`

### Frame Tags

[FRAME Function](#) (page 212-44) - generates `<FRAME>`

[FRAMESETOPEN Function](#) (page 212-45), [FRAMESETCLOSE Function](#) (page 212-44) - generate `<FRAMESET>` and `</FRAMESET>`

[NOFRAMESOPEN Function](#) (page 212-59), [NOFRAMESCLOSE Function](#) (page 212-59) - generate `<NOFRAMES>` and `</NOFRAMES>`

## 212.6 Summary of HTF Subprograms

This table lists the HTF subprograms and briefly describes them.

**Table 212-1 HTF Package Subprograms**

| Subprogram                                         | Description                                                                                                                                     |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADDRESS Function</a> (page 212-12)     | Generates the <code>&lt;ADDRESS&gt;</code> and <code>&lt;/ADDRESS&gt;</code> tags which specify the address, author and signature of a document |
| <a href="#">ANCHOR Function</a> (page 212-13)      | Generates the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags which specify the source or destination of a hypertext link               |
| <a href="#">ANCHOR2 Function</a> (page 212-13)     | Generates the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags which specify the source or destination of a hypertext link               |
| <a href="#">APPLETCLOSE Function</a> (page 212-14) | Closes the applet invocation with the <code>&lt;/APPLET&gt;</code> tag                                                                          |
| <a href="#">APPLETOPEN Function</a> (page 212-14)  | Generates the <code>&lt;APPLET&gt;</code> tag which begins the invocation of a Java applet                                                      |
| <a href="#">AREA Function</a> (page 212-15)        | Generates the <code>&lt;AREA&gt;</code> tag, which defines a client-side image map                                                              |
| <a href="#">BASE Function</a> (page 212-16)        | Generates the <code>&lt;BASE&gt;</code> tag which records the URL of the document                                                               |

**Table 212-1 (Cont.) HTF Package Subprograms**

| Subprogram                                                | Description                                                                                                                                    |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">BASEFONT Function</a><br>(page 212-17)        | Generates the <BASEFONT> tag which specifies the base font size for a Web page                                                                 |
| <a href="#">BGSOUND Function</a><br>(page 212-17)         | Generates the <BGSOUND> tag which includes audio for a Web page                                                                                |
| <a href="#">BIG Function</a> (page 212-18)                | Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font                                               |
| <a href="#">BLOCKQUOTECLOSE Function</a><br>(page 212-18) | Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text                                                                 |
| <a href="#">BLOCKQUOTEOPEN Function</a><br>(page 212-18)  | Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text                                                          |
| <a href="#">BODYCLOSE Function</a><br>(page 212-19)       | Generates the </BODY> tag which marks the end of a body section of an HTML document                                                            |
| <a href="#">BODYOPEN Function</a><br>(page 212-19)        | Generates the <BODY> tag which marks the beginning of the body section of an HTML document                                                     |
| <a href="#">BOLD Function</a> (page 212-20)               | Generates the <B> and </B> tags which direct the browser to display the text in boldface                                                       |
| <a href="#">BR Function</a> (page 212-21)                 | Generates the <BR> tag which begins a new line of text                                                                                         |
| <a href="#">CENTER Function</a><br>(page 212-21)          | Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page                                                     |
| <a href="#">CENTERCLOSE Function</a><br>(page 212-22)     | Generates the </CENTER> tag which marks the end of a section of text to center                                                                 |
| <a href="#">CENTEROPEN Function</a><br>(page 212-22)      | Generates the <CENTER> tag which mark the beginning of a section of text to center                                                             |
| <a href="#">CITE Function</a> (page 212-22)               | Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation                                                |
| <a href="#">CODE Function</a><br>(page 212-23)            | Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically |
| <a href="#">COMMENT Function</a><br>(page 212-23)         | Generates the comment tags <!-- ctext -->                                                                                                      |
| <a href="#">DFN Function</a> (page 212-24)                | Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically      |
| <a href="#">DIRLISTCLOSE Function</a><br>(page 212-24)    | Generates the </DIR> tag which ends a directory list section                                                                                   |
| <a href="#">DIRLISTOPEN Function</a><br>(page 212-25)     | Generates the <DIR> which starts a directory list section                                                                                      |
| <a href="#">DIV Function</a> (page 212-25)                | Generates the <DIV> tag which creates document divisions                                                                                       |
| <a href="#">DLISTCLOSE Function</a><br>(page 212-26)      | Generates the </DL> tag which ends a definition list                                                                                           |
| <a href="#">DLISTDEF Function</a><br>(page 212-26)        | Generates the <DD> tag, which inserts definitions of terms                                                                                     |
| <a href="#">DLISTOPEN Function</a><br>(page 212-27)       | Generates the <DL> tag which starts a definition list                                                                                          |

Table 212-1 (Cont.) HTF Package Subprograms

| Subprogram                                             | Description                                                                                                                            |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DLISTTERM Function</a><br>(page 212-28)    | Generates the <DT> tag which defines a term in a definition list <DL>                                                                  |
| <a href="#">EM Function</a> (page 212-28)              | Generates the <EM> and </EM> tags, which define text to be emphasized                                                                  |
| <a href="#">EMPHASIS Function</a><br>(page 212-29)     | Generates the <EM> and </EM> tags, which define text to be emphasized                                                                  |
| <a href="#">ESCAPE_SC Function</a><br>(page 212-29)    | Replaces characters that have special meaning in HTML with their escape sequences                                                      |
| <a href="#">ESCAPE_URL Function</a><br>(page 212-30)   | Replaces characters that have special meaning in HTML and HTTP with their escape sequences                                             |
| <a href="#">FONTCLOSE Function</a><br>(page 212-30)    | Generates the </FONT> tag which marks the end of a section of text with the specified font characteristics                             |
| <a href="#">FONTOPEN Function</a><br>(page 212-31)     | Generates the <FONT> which marks the beginning of section of text with the specified font characteristics                              |
| <a href="#">FORMAT_CELL Function</a><br>(page 212-31)  | formats column values inside an HTML table using the <a href="#">TABLEDATA Function</a> (page 212-71)                                  |
| <a href="#">FORMCHECKBOX Function</a><br>(page 212-32) | Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form                                              |
| <a href="#">FORMCLOSE Function</a><br>(page 212-33)    | Generates the </FORM> tag which marks the end of a form section in an HTML document                                                    |
| <a href="#">FORMFILE Function</a><br>(page 212-33)     | Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page          |
| <a href="#">FORMHIDDEN Function</a><br>(page 212-33)   | Generates the <INPUT> tag with TYPE="hidden" which inserts a hidden form element                                                       |
| <a href="#">FORMIMAGE Function</a><br>(page 212-34)    | Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately           |
| <a href="#">FORMOPEN Function</a><br>(page 212-35)     | Generates the <FORM> tag which marks the beginning of a form section in an HTML document                                               |
| <a href="#">FORMPASSWORD Function</a><br>(page 212-35) | Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field                                            |
| <a href="#">FORMRADIO Function</a><br>(page 212-36)    | Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form                                             |
| <a href="#">FORMRESET Function</a><br>(page 212-37)    | Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values |
| <a href="#">FORMSELECTCLOSE Function</a> (page 212-37) | Generates the </SELECT> tag which marks the end of a Select form element                                                               |
| <a href="#">FORMSELECTOPEN Function</a> (page 212-38)  | Generates the </SELECT> tag which marks the beginning of a Select form element                                                         |
| <a href="#">FORMSELETOPTION Function</a> (page 212-39) | Generates the <OPTION> tag which represents one choice in a Select element                                                             |
| <a href="#">FORMSUBMIT Function</a><br>(page 212-39)   | Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form                               |

**Table 212-1 (Cont.) HTF Package Subprograms**

| Subprogram                                                  | Description                                                                                                                                         |
|-------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">FORMTEXT Function</a><br>(page 212-40)          | Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text                                                         |
| <a href="#">FORMTEXTAREA Function</a><br>(page 212-40)      | Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area                                               |
| <a href="#">FORMTEXTAREA2 Function</a><br>(page 212-41)     | Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style      |
| <a href="#">FORMTEXTAREACLOSE Function</a><br>(page 212-42) | Generates the </TEXTAREA> tag which ends a text area form element                                                                                   |
| <a href="#">FORMTEXTAREAOPEN Function</a><br>(page 212-42)  | Generates the <TEXTAREA> which marks the beginning of a text area form element                                                                      |
| <a href="#">FORMTEXTAREAOPEN2 Function</a><br>(page 212-43) | Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style                             |
| <a href="#">FRAME Function</a><br>(page 212-44)             | Generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag                                                  |
| <a href="#">FRAMESETCLOSE Function</a><br>(page 212-44)     | Generates the </FRAMESET> tag which ends a frameset section                                                                                         |
| <a href="#">FRAMESETOPEN Function</a><br>(page 212-45)      | Generates the </FRAMESET> tag which begins a frameset section                                                                                       |
| <a href="#">HEADCLOSE Function</a><br>(page 212-45)         | Generates the </HEAD> tag which marks the end of an HTML document head section                                                                      |
| <a href="#">HEADER Function</a><br>(page 212-46)            | Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)                                                 |
| <a href="#">HEADOPEN Function</a><br>(page 212-46)          | Generates the <HEAD> tag which marks the beginning of the HTML document head section                                                                |
| <a href="#">HR Function</a><br>(page 212-47)                | Generates the <HR> tag, which generates a line in the HTML document                                                                                 |
| <a href="#">HTMLCLOSE Function</a><br>(page 212-47)         | Generates the </HTML> tag which marks the end of an HTML document                                                                                   |
| <a href="#">HTMLOPEN Function</a><br>(page 212-48)          | Generates the <HTML> tag which marks the beginning of an HTML document                                                                              |
| <a href="#">IMG Function</a><br>(page 212-48)               | Generates the <IMG> tag which directs the browser to load an image onto the HTML page                                                               |
| <a href="#">IMG2 Function</a><br>(page 212-49)              | Generates the <IMG> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute |
| <a href="#">ISINDEX Function</a><br>(page 212-49)           | Creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program                  |
| <a href="#">ITALIC Function</a><br>(page 212-50)            | Generates the <I> and </I> tags which direct the browser to render the text in italics                                                              |
| <a href="#">KBD Function</a><br>(page 212-50)               | Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font                                                   |
| <a href="#">KEYBOARD Function</a><br>(page 212-51)          | Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font                                                  |

**Table 212-1 (Cont.) HTF Package Subprograms**

| Subprogram                                           | Description                                                                                                                                     |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">LINE Function</a> (page 212-51)          | Generates the <HR> tag, which generates a line in the HTML document                                                                             |
| <a href="#">LINKREL Function</a> (page 212-52)       | Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target |
| <a href="#">LINKREV Function</a> (page 212-53)       | Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor |
| <a href="#">LISTHEADER Function</a> (page 212-53)    | Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list                                                          |
| <a href="#">LISTINGCLOSE Function</a> (page 212-54)  | Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page                                  |
| <a href="#">LISTINGOPEN Function</a> (page 212-54)   | Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page                              |
| <a href="#">LISTITEM Function</a> (page 212-54)      | Generates the <LI> tag, which indicates a list item                                                                                             |
| <a href="#">MAILTO Function</a> (page 212-55)        | Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument                                                      |
| <a href="#">MAPCLOSE Function</a> (page 212-56)      | Generates the </MAP> tag which marks the end of a set of regions in a client-side image map                                                     |
| <a href="#">MAPOPEN Function</a> (page 212-56)       | Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map                                                 |
| <a href="#">MENULISTCLOSE Function</a> (page 212-57) | Generates the </MENU> tag which ends a list that presents one line for each item                                                                |
| <a href="#">MENULISTOPEN Function</a> (page 212-57)  | Generates the <MENU> tag which begins a list that presents one line for each item                                                               |
| <a href="#">META Function</a> (page 212-57)          | Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers                           |
| <a href="#">NL Function</a> (page 212-58)            | Generates the <BR> tag which begins a new line of text                                                                                          |
| <a href="#">NOBR Function</a> (page 212-59)          | Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text                                                         |
| <a href="#">NOFRAMESCLOSE Function</a> (page 212-59) | Generates the </NOFRAMES> tag which marks the end of a no-frames section                                                                        |
| <a href="#">NOFRAMESOPEN Function</a> (page 212-59)  | Generates the <NOFRAMES> tag which mark the beginning of a no-frames section                                                                    |
| <a href="#">OLISTCLOSE Function</a> (page 212-60)    | Generates the </OL> tag which defines the end of an ordered list                                                                                |
| <a href="#">OLISTOPEN Function</a> (page 212-60)     | Generates the <OL> tag which marks the beginning of an ordered list                                                                             |
| <a href="#">PARA Function</a> (page 212-61)          | Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph                                  |
| <a href="#">PARAGRAPH Function</a> (page 212-61)     | Adds attributes to the <P> tag                                                                                                                  |

**Table 212-1 (Cont.) HTF Package Subprograms**

| Subprogram                                              | Description                                                                                                                                                    |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">PARAM Function</a><br>(page 212-62)         | Generates the <PARAM> tag which specifies parameter values for Java applets                                                                                    |
| <a href="#">PLAINTEXT Function</a><br>(page 212-62)     | Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type                                  |
| <a href="#">PRECLOSE Function</a><br>(page 212-63)      | Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page                                                    |
| <a href="#">PREOPEN Function</a><br>(page 212-63)       | Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page                                               |
| <a href="#">PRINT Functions</a><br>(page 212-64)        | Generates the specified parameter as a string terminated with the \n newline character                                                                         |
| <a href="#">PRN Functions</a> (page 212-65)             | Generates the specified parameter as a string                                                                                                                  |
| <a href="#">S Function</a> (page 212-65)                | Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type                                                |
| <a href="#">SAMPLE Function</a><br>(page 212-66)        | Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically |
| <a href="#">SCRIPT Function</a><br>(page 212-66)        | Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript                                          |
| <a href="#">SMALL Function</a><br>(page 212-67)         | Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font                                          |
| <a href="#">STRIKE Function</a><br>(page 212-68)        | Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type                                      |
| <a href="#">STRONG Function</a><br>(page 212-68)        | Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically       |
| <a href="#">STYLE Function</a><br>(page 212-69)         | Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page                                                                              |
| <a href="#">SUB Function</a> (page 212-69)              | Generates the <SUB> and </SUB> tags which direct the browser to render the text they surround as subscript                                                     |
| <a href="#">SUP Function</a> (page 212-70)              | Generates the <SUP> and </SUP> tags which direct the browser to render the text they surround as superscript                                                   |
| <a href="#">TABLECAPTION Function</a><br>(page 212-70)  | Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table                                                                             |
| <a href="#">TABLECLOSE Function</a><br>(page 212-71)    | Generates the </TABLE> tag which marks the end of an HTML table                                                                                                |
| <a href="#">TABLEDATA Function</a><br>(page 212-71)     | Generates the <TD> and </TD> tags which insert data into a cell of an HTML table                                                                               |
| <a href="#">TABLEHEADER Function</a><br>(page 212-72)   | Generates the <TH> and </TH> tags which insert a header cell in an HTML table.                                                                                 |
| <a href="#">TABLEOPEN Function</a><br>(page 212-72)     | Generates the <TABLE> tag which marks the beginning of an HTML table                                                                                           |
| <a href="#">TABLEROWCLOSE Function</a><br>(page 212-73) | Generates the </TR> tag which marks the end of a new row in an HTML table                                                                                      |

**Table 212-1 (Cont.) HTF Package Subprograms**

| Subprogram                                             | Description                                                                                                                                                 |
|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">TABLEROWOPEN Function</a><br>(page 212-73) | Generates the <TR> tag which marks the beginning of a new row in an HTML table                                                                              |
| <a href="#">TELETYPE Function</a><br>(page 212-74)     | Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font |
| <a href="#">TITLE Function</a> (page 212-75)           | Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window                                             |
| <a href="#">ULISTCLOSE Function</a><br>(page 212-75)   | Generates the </UL> tag which marks the end of an unordered list                                                                                            |
| <a href="#">ULISTOPEN Function</a><br>(page 212-75)    | Generates the <UL> tag which marks the beginning of an unordered list                                                                                       |
| <a href="#">UNDERLINE Function</a><br>(page 212-76)    | Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline                                                |
| <a href="#">VARIABLE Function</a><br>(page 212-77)     | Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.    |
| <a href="#">WBR Function</a> (page 212-77)             | Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text                                                                      |

## 212.6.1 ADDRESS Function

This function generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

### Syntax

```
HTF.ADDRESS (
 cvalue IN VARCHAR2
 cnowrap IN VARCHAR2 DEFAULT NULL
 cclear IN VARCHAR2 DEFAULT NULL
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-2 ADDRESS Function Parameters**

| Parameter   | Description                                                                              |
|-------------|------------------------------------------------------------------------------------------|
| cvalue      | The string that goes between the <ADDRESS> and </ADDRESS> tags.                          |
| cnowrap     | If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag |
| cclear      | The value for the CLEAR attribute.                                                       |
| cattributes | The other attributes to be included as-is in the tag                                     |

### Examples

This function generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

## 212.6.2 ANCHOR Function

Like the ANCHOR2 function, this function generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between these subprograms is that the [ANCHOR2 Function](#) (page 212-13) provides a target and therefore can be used for a frame.

### Syntax

```
HTF.ANCHOR (
 curl IN VARCHAR2,
 ctext IN VARCHAR2,
 cname IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-3 ANCHOR Function Parameters**

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
ctext
```

### Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

## 212.6.3 ANCHOR2 Function

Like the ANCHOR function, this function generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between this and the ANCHOR function is that this function provides a target and therefore can be used for a frame.

### Syntax

```
HTF.ANCHOR2 (
 curl IN VARCHAR2,
 ctext IN VARCHAR2,
 cname IN VARCHAR2 DEFAULT NULL,
 ctarger in varchar2 DEFAULT NULL,
```

```

 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 212-4 ANCHOR2 Function Parameters**

Parameter	Description
curl	The value for the HREF attribute.
cctx	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag

### Examples

This function generates

```
cctx
```

## 212.6.4 APPLETCLOSE Function

This function closes the applet invocation with the </APPLET> tag.

You must first invoke the a Java applet using [APPLETOPEN Function](#) (page 212-14)

### Syntax

```

HTF.APPLETCLOSE
RETURN VARCHAR2;

```

## 212.6.5 APPLETOPEN Function

This function generates the <APPLET> tag which begins the invocation of a Java applet.

You close the applet invocation with [APPLETCLOSE Function](#) (page 212-14) which generates the </APPLET> tag.

### Syntax

```

HTF.APPLETOPEN (
 ccode IN VARCHAR2,
 cheight IN NUMBER,
 cwidth IN NUMBER,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

## Parameters

**Table 212-5** APPLETOPEN Function Parameters

Parameter	Description
<code>ccode</code>	The value for the <code>CODE</code> attribute which specifies the name of the applet class.
<code>cheight</code>	The value for the <code>HEIGHT</code> attribute.
<code>cwidth</code>	The value for the <code>WIDTH</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTF.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

## Usage Notes

- Specify parameters to the Java applet using the [PARAM Function](#) (page 212-62) function.
- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.

## 212.6.6 AREA Function

This function generates the `<AREA>` tag, which defines a client-side image map. The `<AREA>` tag defines areas within the image and destinations for the areas.

### Syntax

```
HTF.AREA (
 ccoords IN VARCHAR2
 cshape IN VARCHAR2 DEFAULT NULL,
 chref IN VARCHAR2 DEFAULT NULL,
 cnohref IN VARCHAR2 DEFAULT NULL,
 ctargt IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-6 AREA Function Parameters**

Parameter	Description
ccoords	The value for the COORDS attribute.
cshape	The value for the SHAPE attribute.
chref	The value for the HREF attribute.
cnohref	If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<AREA COORDS="cccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget"
cattributes>
```

## 212.6.7 BASE Function

This function generates the <BASE> tag which records the URL of the document.

### Syntax

```
HTF.BASE (
 ctarget IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-7 BASE Function Parameters**

Parameter	Description
ctarget	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

## 212.6.8 BASEFONT Function

This function generates the <BASEFONT> tag which specifies the base font size for a Web page.

### Syntax

```
HTF.BASEFONT (
 nsize IN INTEGER)
RETURN VARCHAR2;
```

### Parameters

**Table 212-8** BASEFONT Function Parameters

Parameter	Description
nsize	The value for the SIZE attribute.

### Examples

This function generates

```
<BASEFONT SIZE="nsize">
```

## 212.6.9 BGSOUND Function

This function generates the <BGSOUND> tag which includes audio for a Web page.

### Syntax

```
HTF.BGSOUND (
 csrc IN VARCHAR2,
 cloop IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-9** BGSOUND Function Parameters

Parameter	Description
csrc	The value for the SRC attribute.
clloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<BGSOUND SRC="csrc" LOOP="clloop" cattributes>
```

## 212.6.10 BIG Function

This function generates the `<BIG>` and `</BIG>` tags which direct the browser to render the text in a bigger font.

### Syntax

```
HTF.BIG (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-10** BIG Function Parameters

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<BIG cattributes>ctext</BIG>
```

## 212.6.11 BLOCKQUOTECLOSE Function

This function generates the `</BLOCKQUOTE>` tag which mark the end of a section of quoted text.

You mark the beginning of a section of text by means of the [BLOCKQUOTEOPEN Function](#) (page 212-18).

### Syntax

```
HTF.BLOCKQUOTECLOSE
RETURN VARCHAR2;
```

### Examples

This function generates

```
</BLOCKQUOTE>
```

## 212.6.12 BLOCKQUOTEOPEN Function

This function generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text.

You mark the end of a section of text by means of the [BLOCKQUOTECLOSE Function](#) (page 212-18).

### Syntax

```
HTF.BLOCKQUOTEOPEN (
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-11** BLOCKQUOTEOPEN Function Parameters

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

## 212.6.13 BODYCLOSE Function

This function generates the </BODY> tag which marks the end of a body section of an HTML document.

You mark the beginning of a body section by means of the [BODYOPEN Function](#) (page 212-19).

### Syntax

```
HTF.BODYCLOSE
RETURN VARCHAR2;
```

### Examples

This function generates

```
</BODY>
```

## 212.6.14 BODYOPEN Function

This function generates the <BODY> tag which marks the beginning of the body section of an HTML document.

You mark the end of a body section by means of the [BODYCLOSE Function](#) (page 212-19).

### Syntax

```
HTF.BODYOPEN (
 cbackground IN VARCHAR2 DEFAULT NULL,
```

```

 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 212-12 BODYOPEN Function Parameters**

Parameter	Description
cbackground	The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTF.BODYOPEN('/img/background.gif')
RETURN VARCHAR2;
```

generates:

```
<BODY background="/img/background.gif">
```

## 212.6.15 BOLD Function

This function generates the <B> and </B> tags which direct the browser to display the text in boldface.

### Syntax

```

HTF.BOLD (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 212-13 BOLD Function Parameters**

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<B cattributes>ctext
```

## 212.6.16 BR Function

This function generates the `<BR>` tag which begins a new line of text. It performs the same operation as the [NL Function](#) (page 212-58).

### Syntax

```
HTF.BR(
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-14 BR Function Parameters**

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

## 212.6.17 CENTER Function

This function generates the `<CENTER>` and `</CENTER>` tags which center a section of text within a Web page.

### Syntax

```
HTF.CENTER (
 ctext IN VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 212-15 CENTER Parameters**

Parameter	Description
<code>ctext</code>	The text that goes between the tags.

### Examples

This function generates

```
<CENTER>ctext</CENTER>
```

## 212.6.18 CENTERCLOSE Function

This function generates the `</CENTER>` tag which marks the end of a section of text to center.

You mark the beginning of a section of text to center with the [CENTEROPEN Function](#) (page 212-22).

### Syntax

```
HTF.CENTERCLOSE
 RETURN VARCHAR2;
```

### Examples

This function generates

```
</CENTER>
```

## 212.6.19 CENTEROPEN Function

This function generates the `<CENTER>` tag which mark the beginning of a section of text to center.

You mark the beginning of a section of text to center with the [CENTERCLOSE Function](#) (page 212-22).

### Syntax

```
HTF.CENTEROPEN
 RETURN VARCHAR2;
```

### Examples

This function generates

```
<CENTER>
```

## 212.6.20 CITE Function

This function generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation.

### Syntax

```
HTF.CITE (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

## Parameters

**Table 212-16 CITE Function Parameters**

Parameter	Description
c <code>text</code>	The text to render as citation.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<CITE cattributes>ctext</CITE>
```

## 212.6.21 CODE Function

This function generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

## Syntax

```
HTF.CODE (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-17 CODE Function Parameters**

Parameter	Description
c <code>text</code>	The text to render as code.
c <code>attributes</code>	The other attributes to be included as-is in the tag

## Examples

This function generates

```
<CODE cattributes>ctext</CODE>
```

## 212.6.22 COMMENT Function

This function generates the comment tags.

## Syntax

```
HTF.COMMENT (
 ctext IN VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 212-18 COMMENT Function Parameters**

Parameter	Description
c <code>text</code>	The comment.

## Examples

This function generates

```
<!-- ctext -->
```

## 212.6.23 DFN Function

This function generates the `<DFN>` and `</DFN>` tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

### Syntax

```
HTF.DFN (
 ctext IN VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 212-19 DFN Function Parameters**

Parameter	Description
c <code>text</code>	The text to render in italics.

## Examples

This function generates

```
<DFN>ctext</DFN>
```

## 212.6.24 DIRLISTCLOSE Function

This function generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

### Syntax

```
HTF.DIRLISTCLOSE
RETURN VARCHAR2;
```

## Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `<LI>` tag directly or invoke the [LISTITEM Function](#) (page 212-54) so that the `<LI>` tag appears directly after the `</DIR>` tag to define the items as a list.

### Examples

This function generates

```
</DIR>
```

### Related Topics:

- [DIRLISTOPEN Function](#) (page 212-25)  
This function generates the `<DIR>` which starts a directory list section. You end a directory list section with the `DIRLISTCLOSE` Function.

## 212.6.25 DIRLISTOPEN Function

This function generates the `<DIR>` which starts a directory list section. You end a directory list section with the `DIRLISTCLOSE` Function.

### Syntax

```
HTF.DIRLISTOPEN
RETURN VARCHAR2;
```

### Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `<LI>` tag directly or invoke the [LISTITEM Function](#) (page 212-54) so that the `<LI>` tag appears directly after the `</DIR>` tag to define the items as a list.

### Examples

This function generates

```
<DIR>
```

### Related Topics:

- [DIRLISTCLOSE Function](#) (page 212-24)  
This function generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the `DIRLISTOPEN` Function.

## 212.6.26 DIV Function

This function generates the `<DIV>` tag which creates document divisions.

### Syntax

```
HTF.DIV (
 calign IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-20 DIV Function Parameters**

Parameter	Description
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<DIV ALIGN="calign" cattributes>
```

## 212.6.27 DLISTCLOSE Function

This function generates the `</DL>` tag which ends a definition list. You start a definition list by means of the `DLISTOPEN` Function.

### Syntax

```
HTF.DLISTCLOSE
 RETURN VARCHAR2;
```

### Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Function](#) (page 212-28) and definitions are inserted using the [DLISTDEF Function](#) (page 212-26).

### Examples

This function generates

```
</DL>
```

### Related Topics:

- [DLISTOPEN Function](#) (page 212-27)  
This function generates the `<DL>` tag which starts a definition list. You end a definition list by means of the `DLISTCLOSE` Function.

## 212.6.28 DLISTDEF Function

This function generates the `<DD>` tag, which inserts definitions of terms. Use this tag for a definition list `<DL>`. Terms are tagged `<DT>` and definitions are tagged `<DD>`.

### Syntax

```
HTF.DLISTDEF (
 ctext IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-21 DLISTDEF Function Parameters**

Parameter	Description
c <code>text</code>	The definition of the term.
c <code>clear</code>	The value for the <code>CLEAR</code> attribute.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<DD CLEAR="cclear" cattributes>ctext
```

## 212.6.29 DLISTOPEN Function

This function generates the `<DL>` tag which starts a definition list. You end a definition list by means of the `DLISTCLOSE` Function.

## Syntax

```
HTF.DLISTOPEN (
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-22 DLISTOPEN Function Parameters**

Parameter	Description
c <code>clear</code>	The value for the <code>CLEAR</code> attribute.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

## Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Function](#) (page 212-28) and definitions are inserted using the [DLISTDEF Function](#) (page 212-26).

## Examples

This function generates

```
<DL CLEAR="cclear" cattributes>
```

## Related Topics:

- [DLISTCLOSE Function](#) (page 212-26)  
This function generates the `</DL>` tag which ends a definition list. You start a definition list by means of the `DLISTOPEN` Function.

## 212.6.30 DLISTTERM Function

This function generates the <DT> tag which defines a term in a definition list <DL>.

### Syntax

```
HTF.DLISTTERM (
 ctext IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-23 DLISTTERM Function Parameters**

Parameter	Description
ctext	The term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<DT CLEAR="cclear" cattributes>ctext
```

## 212.6.31 EM Function

This function generates the <EM> and </EM> tags, which define text to be emphasized.

It performs the same task as the [EMPHASIS Function](#) (page 212-29).

### Syntax

```
HTF.EM(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-24 EM Function Parameters**

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<EM cattributes>ctext
```

## 212.6.32 EMPHASIS Function

This function generates the `<EM>` and `</EM>` tags, which define text to be emphasized. It performs the same task as the [EM Function](#) (page 212-28).

### Syntax

```
HTF.EMPHASIS(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-25 EMPHASIS Function Parameters**

Parameter	Description
<code>ctext</code>	The text to emphasize.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<EM cattributes>ctext
```

## 212.6.33 ESCAPE\_SC Function

This function replaces characters that have special meaning in HTML with their escape sequences.

The following characters are converted:

- `&` to `&amp;`
- `"` to `&quot;`
- `<` to `&lt;`
- `>` to `&gt;`

This function performs the same operation as HTP. [PRINTS Procedure](#) (page 213-62) and HTP. [PS Procedure](#) (page 213-63).

### Syntax

```
HTF.ESCAPE_SC(
 ctext IN VARCHAR2);
```

## Parameters

**Table 212-26 ESCAPE\_SC Function Parameters**

Parameter	Description
c_text	The text string to convert.

## 212.6.34 ESCAPE\_URL Function

This deprecated function replaces characters that have special meaning in HTML and HTTP with their escape sequences.

**Note:**

This procedure, deprecated in Release 10g, and provided here only for reasons of backward compatibility, does not comply with the Internet Engineering Task Force (IETF) Request for Comments (RFC) standards of URL encoding. If you need to encode URLs, it is recommended you use the [ESCAPE Function](#) (page 276-3) in the [UTL\\_URL](#) (page 276-1) package.

The following characters are converted:

- & to &amp;
- " to &quot;
- < to &lt;
- > to &gt;
- % to &25

### Syntax

```
HTF.ESCAPE_URL(
 p_url IN VARCHAR2);
```

### Parameters

**Table 212-27 ESCAPE\_URL Function Parameters**

Parameter	Description
p_url	The string to convert.

## 212.6.35 FONTCLOSE Function

This function generates the `</FONT>` tag which marks the end of a section of text with the specified font characteristics.

You mark the beginning of the section text by means of the [FONTOPEN Function](#) (page 212-31).

**Syntax**

```
HTF.FONTCLOSE
 RETURN VARCHAR2;
```

**Examples**

This function generates

```

```

## 212.6.36 FONTOPEN Function

This function generates the `<FONT>` which marks the beginning of section of text with the specified font characteristics.

You mark the end of the section text by means of the [FONTCLOSE Function](#) (page 212-30).

**Syntax**

```
HTF.FONTOPEN(
 ccolor IN VARCHAR2 DEFAULT NULL,
 cface IN VARCHAR2 DEFAULT NULL,
 csize IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

**Parameters****Table 212-28** FONTOPEN Function Parameters

Parameter	Description
<code>ccolor</code>	The value for the <code>COLOR</code> attribute.
<code>cface</code>	The value for the <code>FACE</code> attribute
<code>csize</code>	The value for the <code>SIZE</code> attribute
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This function generates

```

```

## 212.6.37 FORMAT\_CELL Function

This function formats column values inside an HTML table using the `TABLEDATA` Function. It allows for better control over the HTML tables.

**Syntax**

```
HTF.FORMAT_CELL(
 columnValue IN VARCHAR2
 format_numbers IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

## Parameters

**Table 212-29** FORMAT\_CELL Function Parameters

Parameter	Description
columnValue	The value that needs to be formatted in an HTML table.
format_numbers	The format that numeric data is displayed in. If the value of this parameter is not NULL, the number fields are right-justified and rounded to two decimal places.

## Examples

This function generates

```
<TD >columnValue</TD>
```

## Related Topics:

- [TABLEDATA Function](#) (page 212-71)  
This function generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

## 212.6.38 FORMCHECKBOX Function

This function generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form.

A checkbox element is a button that the user toggles on or off.

## Syntax

```
HTF.FORMCHECKBOX(
 cname IN VARCHAR2,
 cvalue IN VARCHAR2 DEFAULT 'ON' ,
 cchecked IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-30** FORMCHECKBOX Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

## 212.6.39 FORMCLOSE Function

This function generates the `</FORM>` tag which marks the end of a form section in an HTML document.

You mark the beginning of the form section by means of the [FORMOPEN Function](#) (page 212-35).

### Syntax

```
HTF.FORMCLOSE
 RETURN VARCHAR2;
```

### Examples

This function generates

```
</FORM>
```

## 212.6.40 FORMFILE Function

This function generates the `<INPUT>` tag with `TYPE="file"` which inserts a file form element. This is used for file uploading for a given page.

### Syntax

```
HTF.FORMFILE(
 cname IN VARCHAR2,
 caccept IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

### Parameters

**Table 212-31 FORMFILE Function Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>caccept</code>	A comma-delimited list of MIME types for upload.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

## 212.6.41 FORMHIDDEN Function

This function generates the `<INPUT>` tag with `TYPE="hidden"`, which inserts a hidden form element.

This element is not seen by the user. It submits additional values to the script.

**Syntax**

```
HTF.FORMHIDDEN(
 cname IN VARCHAR2,
 cvalue IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters****Table 212-32 FORMHIDDEN Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This function generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

## 212.6.42 FORMIMAGE Function

This function generates the `<INPUT>` tag with `TYPE="image"` which creates an image field that the user clicks to submit the form immediately.

The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with `.x` appended, and the y coordinate with `.y` appended. Any `VALUE` attribute is ignored.

**Syntax**

```
HTF.FORMIMAGE(
 cname IN VARCHAR2,
 csrc IN VARCHAR2,
 calign IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters****Table 212-33 FORMIMAGE Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
csrc	The value for the SRC attribute that specifies the image file.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

## 212.6.43 FORMOPEN Function

This function generates the `<FORM>` tag which marks the beginning of a form section in an HTML document.

You mark the end of the form section by means of the [FORMCLOSE Function](#) (page 212-33).

### Syntax

```
HTF.FORMOPEN(
 curl IN VARCHAR2,
 cmethod IN VARCHAR2 DEFAULT 'POST',
 ctargt IN VARCHAR2 DEFAULT NULL,
 cenctype IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-34 FORMOPEN Function Parameters**

Parameter	Description
curl	The URL of the Web Request Broker or CGI script where the contents of the form is sent. This parameter is required.
cmethod	The value for the METHOD attribute. The value can be "GET" or "POST".
ctargt	The value for the TARGET attribute.
cenctype	The value for the ENCTYPE attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctargt" ENCTYPE="cenctype" cattributes>
```

## 212.6.44 FORMPASSWORD Function

This function generates the `<INPUT>` tag with `TYPE="password"` which creates a single-line text entry field.

When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

### Syntax

```
HTF.FORMPASSWORD(
 cname IN VARCHAR2,
 csize IN VARCHAR2,
```

```

cmaxlength IN VARCHAR2 DEFAULT NULL,
cvalue IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 212-35 FORMPASSWORD Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```

<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength"
VALUE="cvalue" cattributes>

```

## 212.6.45 FORMRADIO Function

This function generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

### Syntax

```

HTF.FORMRADIO(
 cname IN VARCHAR2,
 cvalue IN VARCHAR2,
 cchecked IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 212-36 FORMRADIO Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

## 212.6.46 FORMRESET Function

This function generates the `<INPUT>` tag with `TYPE="reset"` which creates a button that, when selected, resets the form fields to their initial values.

### Syntax

```
HTF.FORMRESET(
 cvalue IN VARCHAR2 DEFAULT 'Reset',
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-37 FORMRESET Function Parameters**

Parameter	Description
cvalue	The value for the <code>VALUE</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

## 212.6.47 FORMSELECTCLOSE Function

This function generates the `</SELECT>` tag which marks the end of a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the [FORMSELECTOPEN Function](#) (page 212-38). The values are inserted using [FORMSELECTOPTION Function](#) (page 212-39).

### Syntax

```
HTF.FORMSELECTCLOSE
RETURN VARCHAR2;
```

### Examples

This function generates

```
</SELECT>
```

as shown under [Examples](#) (page 212-38) of the [FORMSELECTOPEN Function](#) (page 212-38).

## 212.6.48 FORMSELECTOPEN Function

This function generates the <SELECT> tags which begins a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the [FORMSELECTCLOSE Function](#) (page 212-37). The values are inserted using [FORMSELECTOPTION Function](#) (page 212-39).

### Syntax

```
HTF.FORMSELECTOPEN(
 cname IN VARCHAR2,
 cprompt IN VARCHAR2 DEFAULT NULL,
 nsize IN INTEGER DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-38 FORMSELECTOPEN Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
cprompt	The string preceding the list box.
nsize	The value for the SIZE attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTF.FORMSELECTOPEN('greatest_player';
 'Pick the greatest player:');
HTF.FORMSELECTOPTION('Messier');
HTF.FORMSELECTOPTION('Howe');
HTF.FORMSELECTOPTION('Gretzky');.
HTF.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

## 212.6.49 FORMSELECTOPTION Function

This function generates the `<OPTION>` tag which represents one choice in a Select element.

### Syntax

```
HTF.FORMSELECTOPTION(
 cvalue IN VARCHAR2,
 cselected IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-39 FORMSELECTOPTION Function Parameters**

Parameter	Description
cvalue	The text for the option
cvalue	If the value for this parameter is not NULL, the <code>SELECTED</code> attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates `<OPTION SELECTED cattributes>cvalue` as shown under the Examples section of the [FORMSELECTOPEN Function](#) (page 212-38).

## 212.6.50 FORMSUBMIT Function

This function generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

### Syntax

```
HTF.FORMSUBMIT(
 cname IN VARCHAR2 DEFAULT NULL,
 cvalue IN VARCHAR2 DEFAULT 'Submit',
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-40 FORMSUBMIT Function Parameters**

Parameter	Description
cname	The value for the <code>NAME</code> attribute.
cvalue	The value for the <code>VALUE</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

## 212.6.51 FORMTEXT Function

This function generates the `<INPUT>` tag with `TYPE="text"`, which creates a field for a single line of text.

### Syntax

```
HTF.FORMTEXT(
 cname IN VARCHAR2,
 csize IN VARCHAR2 DEFAULT NULL,
 cmaxlength IN VARCHAR2 DEFAULT NULL,
 cvalue IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-41 FORMTEXT Function Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>csize</code>	The value for the <code>SIZE</code> attribute.
<code>cmaxlength</code>	The value for the <code>MAXLENGTH</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength" VALUE="cvalue"
cattributes>
```

## 212.6.52 FORMTEXTAREA Function

This function generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA2 Function](#) (page 212-41) which in addition has the `cwrap` parameter that lets you specify a wrap style.

### Syntax

```
HTF.FORMTEXTAREA(
 cname IN VARCHAR2,
 nrows IN INTEGER,
 ncolumns IN INTEGER,
 calign IN VARCHAR2 DEFAULT NULL,
```

```

 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 212-42 FORMTEXTAREA Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute. This is an integer.
ncolumns	The value for the COLS attribute. This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```

<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes></
TEXTAREA>

```

## 212.6.53 FORMTEXTAREA2 Function

This function generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA Function](#) (page 212-40) except that in that case you cannot specify a wrap style.

### Syntax

```

HTF.FORMTEXTAREA2(
 cname IN VARCHAR2,
 nrows IN INTEGER,
 ncolumns IN INTEGER,
 calign IN VARCHAR2 DEFAULT NULL,
 cwrap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 212-43 FORMTEXTAREA2 Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute. This is an integer.
ncolumns	The value for the COLS attribute. This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

## 212.6.54 FORMTEXTAREACLOSE Function

This function generates the `</TEXTAREA>` tag which ends a text area form element.

You open a text area element by means of either [FORMTEXTAREAOPEN Function](#) (page 212-42) or [FORMTEXTAREAOPEN2 Function](#) (page 212-43).

### Syntax

```
HTF.FORMTEXTAREACLOSE
RETURN VARCHAR2;
```

## Examples

This function generates

```
</TEXTAREA>
```

## 212.6.55 FORMTEXTAREAOPEN Function

This function generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN2 Function](#) (page 212-43) which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Function](#) (page 212-42).

### Syntax

```
HTF.FORMTEXTAREAOPEN(
 cname IN VARCHAR2,
 nrows IN INTEGER,
 ncolumns IN INTEGER,
 calign IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-44** FORMTEXTAREAOPEN Function Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>nrows</code>	The value for the <code>ROWS</code> attribute. This is an integer.
<code>ncolumns</code>	The value for the <code>COLS</code> attribute. This is an integer.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.

**Table 212-44 (Cont.) FORMTEXTAREAOPEN Function Parameters**

Parameter	Description
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

## 212.6.56 FORMTEXTAREAOPEN2 Function

This function generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN Function](#) (page 212-42) except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Function](#) (page 212-42).

**Syntax**

```
HTF.FORMTEXTAREAOPEN2(
 cname IN VARCHAR2,
 nrows IN INTEGER,
 ncolumns IN INTEGER,
 calign IN VARCHAR2 DEFAULT NULL,
 cwrap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters****Table 212-45 FORMTEXTAREAOPEN2 Function Parameters**

Parameter	Description
cname	The value for the <code>NAME</code> attribute.
nrows	The value for the <code>ROWS</code> attribute. This is an integer.
ncolumns	The value for the <code>COLS</code> attribute. This is an integer.
calign	The value for the <code>ALIGN</code> attribute.
cwrap	The value for the <code>WRAP</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

## 212.6.57 FRAME Function

This function generates the `<FRAME>` tag which begins the characteristics of a frame created by a `<FRAMESET>` tag.

### Syntax

```
HTF.FRAME(
 csrc IN VARCHAR2,
 cname IN VARCHAR2 DEFAULT NULL,
 cmarginwidth IN VARCHAR2 DEFAULT NULL,
 cmarginheight IN VARCHAR2 DEFAULT NULL,
 cscrolling IN VARCHAR2 DEFAULT NULL,
 cnoresize IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-46** FRAME Function Parameters

Parameter	Description
<code>csrc</code>	The URL to display in the frame.
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cmarginwidth</code>	The value for the <code>MARGINWIDTH</code> attribute.
<code>cscrolling</code>	The value for the <code>SCROLLING</code> attribute.
<code>cnoresize</code>	If the value for this parameter is not <code>NULL</code> , the <code>NORESIZE</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

## 212.6.58 FRAMESETCLOSE Function

This function generates the `</FRAMESET>` tag which ends a frameset section.

You mark the beginning of a frameset section by means of the [FRAMESETOPEN Function](#) (page 212-45).

### Syntax

```
HTF.FRAMESETCLOSE
RETURN VARCHAR2;
```

### Examples

This function generates

```
</FRAMESET>
```

## 212.6.59 FRAMESETOPEN Function

This function generates the `<FRAMESET>` tag which define a frameset section.

You mark the end of a frameset section by means of the [FRAMESETCLOSE Function](#) (page 212-44).

### Syntax

```
HTF.FRAMESETOPEN(
 crows IN VARCHAR2 DEFAULT NULL,
 ccols IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-47** FRAMESETOPEN Function Parameters

Parameter	Description
<code>crows</code>	The value for the <code>ROWS</code> attribute.
<code>ccols</code>	The value for the <code>COLS</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

## 212.6.60 HEADCLOSE Function

This function generates the `</HEAD>` tag which marks the end of an HTML document head section.

You mark the beginning of an HTML document head section by means of the [HEADOPEN Function](#) (page 212-46).

### Syntax

```
HTF.HEADCLOSE
RETURN VARCHAR2;
```

### Examples

This function generates

```
</HEAD>
```

## 212.6.61 HEADER Function

This function generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

### Syntax

```
HTF.HEADER(
 nsize IN INTEGER,
 cheader IN VARCHAR2,
 calign IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-48** HEADER Function Parameters

Parameter	Description
nsize	The heading level. This is an integer between 1 and 6.
cheader	The text to display in the heading.
calign	The value for the ALIGN attribute.
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

```
HTF.header (1,'Overview')
RETURN VARCHAR2;
```

produces:

```
<H1>Overview</H1>
```

## 212.6.62 HEADOPEN Function

This function generates the <HEAD> tag which marks the beginning of the HTML document head section.

You mark the end of an HTML document head section by means of the [HEADCLOSE Function](#) (page 212-45).

### Syntax

```
HTF.HEADOPEN
RETURN VARCHAR2;
```

### Examples

This function generates

&lt;HEAD&gt;

## 212.6.63 HR Function

This function generates the <HR> tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [LINE Function](#) (page 212-51).

### Syntax

```
HTF.HR(
 cclear IN VARCHAR2 DEFAULT NULL,
 csrc IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-49** HR Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

## 212.6.64 HTMLCLOSE Function

This function generates the </HTML> tag which marks the end of an HTML document.

You use the [HTMLOPEN Function](#) (page 212-48) to mark the beginning of an HTML document.

### Syntax

```
HTF.HTMLCLOSE
RETURN VARCHAR2;
```

### Examples

This function generates

```
</HTML>
```

## 212.6.65 HTMLOPEN Function

This function generates the <HTML> tag which marks the beginning of an HTML document.

You use the [HTMLCLOSE Function](#) (page 212-47) to mark the end of the an HTML document.

### Syntax

```
HTF.HTMLOPEN
 RETURN VARCHAR2;
```

### Examples

This function generates

```
<HTML>
```

## 212.6.66 IMG Function

This function generates the <IMG> tag which directs the browser to load an image onto the HTML page.

The [IMG2 Function](#) (page 212-49) performs the same operation but additionally uses the `cusemap` parameter.

### Syntax

```
HTF.IMG(
 curl IN VARCHAR2 DEFAULT NULL,
 calign IN VARCHAR2 DEFAULT NULL,
 calt IN VARCHAR2 DEFAULT NULL,
 cismap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

### Parameters

**Table 212-50** IMG Function Parameters

Parameter	Description
<code>curl</code>	The value for the SRC attribute.
<code>calign</code>	The value for the ALIGN attribute.
<code>calt</code>	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
<code>cismap</code>	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```

```

## 212.6.67 IMG2 Function

This function generates the <IMG> tag, which directs the browser to load an image onto the HTML page.

The [IMG Function](#) (page 212-48) performs the same operation but does not use the `cusemap` parameter.

### Syntax

```
HTF.IMG2(
 curl IN VARCHAR2 DEFAULT NULL,
 calign IN VARCHAR2 DEFAULT NULL,
 calt IN VARCHAR2 DEFAULT NULL,
 cismap IN VARCHAR2 DEFAULT NULL,
 cusemap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-51** IMG2 Function Parameters

Parameter	Description
<code>curl</code>	The value for the SRC attribute.
<code>calign</code>	The value for the ALIGN attribute.
<code>calt</code>	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
<code>cismap</code>	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
<code>cusemap</code>	The value for the USEMAP attribute which specifies a client-side image map.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```

```

## 212.6.68 ISINDEX Function

This function creates a single entry field with a prompting text, such as *"enter value,"* then sends that value to the URL of the page or program.

### Syntax

```
HTF.ISINDEX(
 cprompt IN VARCHAR2 DEFAULT NULL,
 curl IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-52** ISINDEX Function Parameters

Parameter	Description
cprompt	The value for the PROMPT attribute.
curl	The value for the HREF attribute.

## Examples

This function generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

## 212.6.69 ITALIC Function

This function generates the <I> and </I> tags which direct the browser to render the text in italics.

### Syntax

```
HTF.ITALIC(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-53** ITALIC Function Parameters

Parameter	Description
ctext	The text to be rendered in italics.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<I cattributes>ctext</I>
```

## 212.6.70 KBD Function

This function generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KEYBOARD Function](#) (page 212-51).

### Syntax

```
HTF.KBD(
 ctext IN VARCHAR2,
```

```

 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 212-54 KBD Function Parameters**

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

## 212.6.71 KEYBOARD Function

This function generates the `<KBD>` and `</KBD>` tags, which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KBD Function](#) (page 212-50).

### Syntax

```

HTF.KEYBOARD(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 212-55 KEYBOARD Function Parameters**

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

## 212.6.72 LINE Function

This function generates the `<HR>` tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [HR Function](#) (page 212-47).

### Syntax

```

HTF.LINE(
 cclear IN VARCHAR2 DEFAULT NULL,

```

```

csrc IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-56** LINE Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

## 212.6.73 LINKREL Function

This function generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present.

This is the opposite of [LINKREV Function](#) (page 212-53). This tag indicates a relationship between documents but does not create a link. To create a link, use the [ANCHOR Function](#) (page 212-13).

### Syntax

```

HTF.LINKREL(
 crel IN VARCHAR2,
 curl IN VARCHAR2,
 ctitle IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-57** LINKREL Function Parameters

Parameter	Description
crel	The value for the REL attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

### Examples

This function generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

## 212.6.74 LINKREV Function

This function generates the `<LINK>` tag with the `REV` attribute which delineates the relationship described by the hypertext link from the target to the anchor.

This is the opposite of the [LINKREL Function](#) (page 212-52). This tag indicates a relationship between documents, but does not create a link. To create a link, use the [ANCHOR Function](#) (page 212-13).

### Syntax

```
HTF.LINKREV(
 crev IN VARCHAR2,
 curl IN VARCHAR2,
 ctitle IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-58 LINKREV Function Parameters**

Parameter	Description
<code>crev</code>	The value for the <code>REV</code> attribute.
<code>curl</code>	The value for the <code>URL</code> attribute.
<code>ctitle</code>	The value for the <code>TITLE</code> attribute.

### Examples

This function generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

## 212.6.75 LISTHEADER Function

This function generates the `<LH>` and `</LH>` tags which print an HTML tag at the beginning of the list.

### Syntax

```
HTF.LISTHEADER(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-59 LISTHEADER Function Parameters**

Parameter	Description
<code>ctext</code>	The text to place between <code>&lt;LH&gt;</code> and <code>&lt;/LH&gt;</code> .
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<LH cattributes>ctext</LH>
```

## 212.6.76 LISTINGCLOSE Function

This function generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page.

To mark the beginning of a section of fixed-width text in the body of an HTML page, use the [LISTINGOPEN Function](#) (page 212-54).

### Syntax

```
HTF.LISTINGCLOSE
RETURN VARCHAR2;
```

### Examples

This function generates

```
</LISTING>
```

## 212.6.77 LISTINGOPEN Function

This function generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page.

To mark the end of a section of fixed-width text in the body of an HTML page, use the [LISTINGCLOSE Function](#) (page 212-54).

### Syntax

```
HTF.LISTINGOPEN
RETURN VARCHAR2;
```

### Examples

This function generates

```
<LISTING>
```

## 212.6.78 LISTITEM Function

This function generates the `<LI>` tag, which indicates a list item.

### Syntax

```
HTF.LISTITEM(
 ctext IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cdingbat IN VARCHAR2 DEFAULT NULL,
 csrc IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-60 LISTITEM Function Parameters**

Parameter	Description
c <code>text</code>	The text for the list item.
c <code>clear</code>	The value for the <code>CLEAR</code> attribute.
c <code>dingbat</code>	The value for the <code>DINGBAT</code> attribute.
c <code>src</code>	The value for the <code>SRC</code> attribute.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

## 212.6.79 MAILTO Function

This function generates the `<A>` tag with the `HREF` set to 'mailto' prepended to the mail address argument.

## Syntax

```
HTF.MAILTO(
 caddress IN VARCHAR2,
 ctext IN VARCHAR2,
 cname IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-61 MAILTO Function Parameters**

Parameter	Description
c <code>address</code>	The email address of the recipient.
c <code>text</code>	The clickable portion of the link.
c <code>name</code>	The value for the <code>NAME</code> attribute.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
ctext
```

so that

```
HTF.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
Send Email to the President
```

## 212.6.80 MAPCLOSE Function

This function generates the `</MAP>` tag which marks the end of a set of regions in a client-side image map.

To mark the beginning of a set of regions in a client-side image map, use the [MAPOPEN Function](#) (page 212-56).

### Syntax

```
HTF.MAPCLOSE
 RETURN VARCHAR2;
```

### Examples

This function generates

```
</MAP>
```

## 212.6.81 MAPOPEN Function

This function generates the `<MAP>` tag which mark the beginning of a set of regions in a client-side image map.

To mark the end of a set of regions in a client-side image map, use the [MAPCLOSE Function](#) (page 212-56).

### Syntax

```
HTF.MAPOPEN(
 cname IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

### Parameters

**Table 212-62** MAPOPEN Function Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<MAP NAME="cname" cattributes>
```

## 212.6.82 MENULISTCLOSE Function

This function generates the `</MENU>` tag which ends a list that presents one line for each item.

To begin a list of this kind, use the [MENULISTOPEN Function](#) (page 212-57). The items in the list appear more compact than an unordered list. The [LISTITEM Function](#) (page 212-54) defines the list items in a menu list.

### Syntax

```
HTF.MENULISTCLOSE
RETURN VARCHAR2;
```

### Examples

This function generates

```
</MENU>
```

## 212.6.83 MENULISTOPEN Function

This function generates the `<MENU>` tag which begins a list that presents one line for each item.

To end a list of this kind, use the [MENULISTCLOSE Function](#) (page 212-57). The items in the list appear more compact than an unordered list. The [LISTITEM Function](#) (page 212-54) defines the list items in a menu list.

### Syntax

```
HTF.MENULISTOPEN
RETURN VARCHAR2;
```

### Examples

This function generates

```
<MENU>
```

## 212.6.84 META Function

This function generates the `<META>` tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

### Syntax

```
HTF.META(
 chttp_equiv IN VARCHAR2,
 cname IN VARCHAR2,
 ccontent IN VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 212-63 META Function Parameters**

Parameter	Description
chttp_equiv	The value for the <code>CHTTP_EQUIV</code> attribute.
cname	The value for the <code>NAME</code> attribute.
ccontent	The value for the <code>CONTENT</code> attribute.

## Examples

This function generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTF.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

## 212.6.85 NL Function

This function generates the `<BR>` tag which begins a new line of text.

It performs the same operation as the [BR Function](#) (page 212-21).

### Syntax

```
HTF.NL(
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-64 NL Function Parameters**

Parameter	Description
cclear	The value for the <code>CLEAR</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

## 212.6.86 NOBR Function

This function generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

### Syntax

```
HTF.NOBR(
 ctext IN VARCHAR2)
 RETURN VARCHAR2;
```

### Parameters

**Table 212-65 NOBR Function Parameters**

Parameter	Description
<code>ctext</code>	The text that is to be rendered on one line.

### Examples

This function generates

```
<NOBR>ctext</NOBR>
```

## 212.6.87 NOFRAMESCLOSE Function

This function generates the `</NOFRAMES>` tag which marks the end of a no-frames section.

To mark the beginning of a no-frames section, use the [FRAMESETOPEN Function](#) (page 212-45). See also [FRAME Function](#) (page 212-44), [FRAMESETOPEN Function](#) (page 212-45) and [FRAMESETCLOSE Function](#) (page 212-44).

### Syntax

```
HTF.NOFRAMESCLOSE
 RETURN VARCHAR2;
```

### Examples

This function generates

```
</NOFRAMES>
```

## 212.6.88 NOFRAMESOPEN Function

This function generates the `<NOFRAMES>` tag which mark the beginning of a no-frames section.

To mark the end of a no-frames section, use the [FRAMESETCLOSE Function](#) (page 212-44). See also [FRAME Function](#) (page 212-44), [FRAMESETOPEN Function](#) (page 212-45) and [FRAMESETCLOSE Function](#) (page 212-44).

**Syntax**

```
HTF.NOFRAMESOPEN
 RETURN VARCHAR2;
```

**Examples**

This function generates

```
<NOFRAMES>
```

## 212.6.89 OLISTCLOSE Function

This function generates the `</OL>` tag which defines the end of an ordered list. An ordered list presents a list of numbered items.

To mark the beginning of a list of this kind, use the [OLISTOPEN Function](#) (page 212-60). Numbered items are added using [LISTITEM Function](#) (page 212-54).

**Syntax**

```
HTF.OLISTCLOSE
 RETURN VARCHAR2;
```

**Examples**

This function generates

```

```

## 212.6.90 OLISTOPEN Function

This function generates the `<OL>` tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items.

To mark the end of a list of this kind, use the [OLISTCLOSE Function](#) (page 212-60). Numbered items are added using [LISTITEM Function](#) (page 212-54).

**Syntax**

```
HTF.OLISTOPEN(
 cclear IN VARCHAR2 DEFAULT NULL,
 cwrap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

**Parameters****Table 212-66 OLISTOPEN Function Parameters**

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cwrap</code>	The value for the <code>WRAP</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

## 212.6.91 PARA Function

This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

You can add attributes to the tag by means of the [PARAGRAPH Function](#) (page 212-61).

### Syntax

```
HTF.PARA
 RETURN VARCHAR2;
```

### Examples

This function generates

```
<P>
```

## 212.6.92 PARAGRAPH Function

You can use this function to add attributes to the <P> tag created by the PARA Function.

### Syntax

```
HTF.PARAGRAPH(
 calign IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

### Parameters

**Table 212-67 PARAGRAPH Function Parameters**

Parameter	Description
calign	The value for the ALIGN attribute.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

**Related Topics:**

- [PARAM Function](#) (page 212-61)  
This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

## 212.6.93 PARAM Function

This function generates the <PARAM> tag which specifies parameter values for Java applets.

The values can reference HTML variables. To invoke a Java applet from a Web page, use [APPLETOPEN Function](#) (page 212-14) to begin the invocation. Use one [PARAM Function](#) (page 212-62) for each desired name-value pair, and use [APPLETCLOSE Function](#) (page 212-14) to end the applet invocation.

**Syntax**

```
HTF.PARAM(
 cname IN VARCHAR2
 cvalue IN VARCHAR2)
RETURN VARCHAR2;
```

**Parameters****Table 212-68 PARAM Function Parameters**

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.

**Examples**

This function generates

```
<PARAM NAME=cname VALUE="cvalue">
```

## 212.6.94 PLAINTEXT Function

This function generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type.

**Syntax**

```
HTF.PLAINTEXT(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-69 PLAINTEXT Function Parameters**

Parameter	Description
<code>c<sub>text</sub></code>	The text to be rendered in fixed-width font.
<code>c<sub>attributes</sub></code>	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

## 212.6.95 PRECLOSE Function

This function generates the `</PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page.

To mark the beginning of a section of preformatted text in the body of the HTML page, use the [PREOPEN Function](#) (page 212-63).

## Syntax

```
HTF.PRECLOSE
 RETURN VARCHAR2;
```

## Examples

This function generates

```
</PRE>
```

## 212.6.96 PREOPEN Function

This function generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page.

To mark the end of a section of preformatted text in the body of the HTML page, use the [PRECLOSE Function](#) (page 212-63).

## Syntax

```
HTF.PREOPEN(
 cclear IN VARCHAR2 DEFAULT NULL,
 cwidth IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

## Parameters

**Table 212-70** PREOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

## 212.6.97 PRINT Functions

These functions generate the specified parameter as a string terminated with the \n newline character.

The [PRN Functions](#) (page 212-65) performs the same operation but does not terminate with a newline character.

## Syntax

```
HTF.PRINT (
 cbuf IN VARCHAR2)
RETURN VARCHAR2;
```

```
HTF.PRINT (
 dbuf IN DATE)
RETURN VARCHAR2;
```

```
HTF.PRINT (
 nbuf IN NUMBER)
RETURN VARCHAR2;
```

## Parameters

**Table 212-71** PRINT Function Parameters

Parameter	Description
cbuf	The string to generate terminated by a newline.
dbuf	The string to generate terminated by a newline.
nbuf	The string to generate terminated by a newline.

## Usage Notes

- The \n character is not the same as <BR>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use <BR> to control how the browser renders the HTML source.
- These functions do not have function equivalents.

## 212.6.98 PRN Functions

These functions generate the specified parameter as a string.

Unlike the [PRINT Functions](#) (page 212-64) the string is not terminated with the \n newline character.

### Syntax

```
HTF.PRN (
 cbuf IN VARCHAR2)
RETURN VARCHAR2;
```

```
HTF.PRN (
 dbuf IN DATE)
RETURN VARCHAR2;
```

```
HTF.PRN (
 nbuf IN NUMBER)
RETURN VARCHAR2;
```

### Parameters

**Table 212-72 PRN Function Parameters**

Parameter	Description
cbuf	The string to generate (not terminated by a newline).
dbuf	The string to generate (not terminated by a newline).
nbuf	The string to generate (not terminated by a newline).

### Usage Notes

These functions do not have function equivalents.

## 212.6.99 S Function

This function generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [STRIKE Function](#) (page 212-68).

### Syntax

```
HTF.S (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-73 S Function Parameters**

Parameter	Description
c <code>text</code>	The text to be rendered in strikethrough type.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<S cattributes>ctext</S>
```

## 212.6.100 SAMPLE Function

This function generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

## Syntax

```
HTF.SAMPLE (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-74 SAMPLE Function Parameters**

Parameter	Description
c <code>text</code>	The text to be rendered in monospace font.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<SAMP cattributes>ctext</SAMP>
```

## 212.6.101 SCRIPT Function

This function generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBScript.

## Syntax

```
HTF.SCRIPT (
 cscript IN VARCHAR2,
 clanguage IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-75** SCRIPT Function Parameters

Parameter	Description
cscript	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
clanguage	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

## Examples

This function generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTF.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

## 212.6.102 SMALL Function

This function generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

## Syntax

```
HTF.SMALL (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 212-76** SMALL Function Parameters

Parameter	Description
ctext	The text to be rendered in small font.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<SMALL cattributes>ctext</SMALL>
```

## 212.6.103 STRIKE Function

This function generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [S Function](#) (page 212-65).

### Syntax

```
STRIKE (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-77 STRIKE Function Parameters**

Parameter	Description
<code>ctext</code>	The text to be rendered in strikethrough type.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<STRIKE cattributes>ctext</STRIKE>
```

## 212.6.104 STRONG Function

This function generates the `<STRONG>` and `</STRONG>` tags which direct the browser to render the text they surround in bold, or however "strong" is defined.

### Syntax

```
HTF.STRONG(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-78 STRONG Function Parameters**

Parameter	Description
<code>ctext</code>	The text to be emphasized.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<STRONG cattributes>ctext
```

## 212.6.105 STYLE Function

This function generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page.

You can get more information about style sheets at <http://www.w3.org>. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

### Syntax

```
HTF.STYLE(
 cstyle IN VARCHAR2)
 RETURN VARCHAR2;
```

### Parameters

**Table 212-79** STYLE Function Parameters

Parameter	Description
cstyle	The style information to include.

### Examples

This function generates

```
<STYLE>cstyle</STYLE>
```

## 212.6.106 SUB Function

This function generates the `<SUB>` and `</SUB>` tags which direct the browser to render the text they surround as subscript.

### Syntax

```
HTF.SUB(
 ctext IN VARCHAR2,
 calign in VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

### Parameters

**Table 212-80** SUB Function Parameters

Parameter	Description
ctext	The text to render in subscript.
calign	The value for the <code>ALIGN</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
_{ctext}
```

## 212.6.107 SUP Function

This function generates the `<SUP>` and `</SUP>` tags which direct the browser to render the text they surround as superscript.

### Syntax

```
HTF.SUP(
 ctext IN VARCHAR2,
 calign in VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-81 SUP Function Parameters**

Parameter	Description
ctext	The text to render in superscript.
calign	The value for the <code>ALIGN</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
^{ctext}
```

## 212.6.108 TABLECAPTION Function

This function generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

### Syntax

```
HTF.TABLECAPTION(
 ccaption IN VARCHAR2,
 calign in VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-82 TABLECAPTION Function Parameters**

Parameter	Description
ctext	The text for the caption.
calign	The value for the <code>ALIGN</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

## 212.6.109 TABLECLOSE Function

This function generates the `</TABLE>` tag which marks the end of an HTML table.

To define the beginning of an HTML table, use the [TABLEOPEN Function](#) (page 212-72).

### Syntax

```
HTF.TABLECLOSE
 RETURN VARCHAR2;
```

### Examples

This function generates

```
</TABLE>
```

## 212.6.110 TABLEDATA Function

This function generates the `<TD>` and `</TD>` tags which insert data into a cell of an HTML table.

### Syntax

```
HTF.TABLEDATA(
 cvalue IN VARCHAR2 DEFAULT NULL,
 calign IN VARCHAR2 DEFAULT NULL,
 cdp IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 crowspan IN VARCHAR2 DEFAULT NULL,
 ccolspan IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

### Parameters

**Table 212-83 TABLEDATA Function Parameters**

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the <code>ALIGN</code> attribute.
cdp	The value for the <code>DP</code> attribute.
cnowrap	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
ccolspan	The value for the <code>COLSPAN</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This function generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

## 212.6.111 TABLEHEADER Function

This function generates the <TH> and </TH> tags which insert a header cell in an HTML table.

The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

### Syntax

```
HTF.TABLEHEADER(
 cvalue IN VARCHAR2 DEFAULT NULL,
 calign IN VARCHAR2 DEFAULT NULL,
 cdp IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 crowspan IN VARCHAR2 DEFAULT NULL,
 ccolspan IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-84 TABLEHEADER Function Parameters**

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crowspan	The value for the ROWSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

## 212.6.112 TABLEOPEN Function

This function generates the <TABLE> tag which marks the beginning of an HTML table.

To define the end of an HTML table, use the [TABLECLOSE Function](#) (page 212-71).

**Syntax**

```
HTF.TABLEOPEN(
 cborder IN VARCHAR2 DEFAULT NULL
 calign IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters****Table 212-85** TABLEOPEN Function Parameters

Parameter	Description
border	The value for the BORDER attribute.
calign	The value for the ALIGN attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This function generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

## 212.6.113 TABLEROWCLOSE Function

This function generates the `</TR>` tag which marks the end of a new row in an HTML table.

To mark the beginning of a new row, use the [TABLEROWOPEN Function](#) (page 212-73).

**Syntax**

```
HTF.TABLEROWCLOSE
RETURN VARCHAR2;
```

**Examples**

This function generates

```
</TABLE>
```

## 212.6.114 TABLEROWOPEN Function

This function generates the `<TR>` tag which marks the beginning of a new row in an HTML table.

To mark the end of a new row, use the [TABLEROWCLOSE Function](#) (page 212-73).

**Syntax**

```
HTF.TABLEROWOPEN(
 calign IN VARCHAR2 DEFAULT NULL,
 cvalign IN VARCHAR2 DEFAULT NULL,
 cdp IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters****Table 212-86** TABLEROWOPEN Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cvalign	The value for the VALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This function generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

## 212.6.115 TELETYPE Function

This function generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

**Syntax**

```
HTF.TELETYPE(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters****Table 212-87** TELETYPE Function Parameters

Parameter	Description
ctext	The text to render in a fixed width typewriter font.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This function generates

```
<TT cattributes>ctext</TT>
```

## 212.6.116 TITLE Function

This function generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window.

### Syntax

```
HTF.TITLE(
 ctitle IN VARCHAR2)
 RETURN VARCHAR2;
```

### Parameters

**Table 212-88** TITLE Function Parameters

Parameter	Description
ctitle	The text to display in the titlebar of the browser window.

### Examples

This function generates

```
<TITLE>ctitle</TITLE>
```

## 212.6.117 ULISTCLOSE Function

This function generates the </UL> tag which marks the end of an unordered list. An unordered list presents items with bullets.

To mark the beginning of an unordered list, use the [ULISTOPEN Function](#) (page 212-75). Add list items with [LISTITEM Function](#) (page 212-54).

### Syntax

```
HTF.ULISTCLOSE
 RETURN VARCHAR2;
```

### Examples

This function generates

```

```

## 212.6.118 ULISTOPEN Function

This function generates the <UL> tag which marks the beginning of an unordered list. An unordered list presents items with bullets.

To mark the end of an unordered list, use the [ULISTCLOSE Function](#) (page 212-75). Add list items with [LISTITEM Function](#) (page 212-54).

### Syntax

```
HTF.ULISTOPEN(
 cclear IN VARCHAR2 DEFAULT NULL,
```

```

cwrap IN VARCHAR2 DEFAULT NULL,
cdingbat IN VARCHAR2 DEFAULT NULL,
csrc IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-89** ULISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

## 212.6.119 UNDERLINE Function

This function generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

### Syntax

```

HTF.UNDERLINE(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-90** UNDERLINE Function Parameters

Parameter	Description
ctext	The text to render with an underline.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<U cattributes>ctext</U>
```

## 212.6.120 VARIABLE Function

This function generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

### Syntax

```
HTF.VARIABLE(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 212-91** VARIABLE Function Parameters

Parameter	Description
ctext	The text to render in italics.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This function generates

```
<VAR cattributes>ctext</VAR>
```

## 212.6.121 WBR Function

This function generates the <WBR> tag, which inserts a soft line break within a section of NOBR text.

### Syntax

```
HTF.WBR
RETURN VARCHAR2;
```

### Examples

This function generates

```
<WBR>
```

# 213

## HTP

The `HTP` (hypertext procedures) and `HTF` (hypertext functions) packages generate HTML tags. For example, the `HTP.ANCHOR` procedure generates the HTML anchor tag, `<A>`.

This chapter contains the following topics:

- [Operational Notes](#) (page 213-1)
- [Rules and Limits](#) (page 213-2)
- [Examples](#) (page 213-2)
- [Summary of Tags](#) (page 213-2)
- [Summary of HTP Subprograms](#) (page 213-6)

### See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware User's Guide for mod\_plsql*

## 213.1 HTP Operational Notes

Certain operational notes apply to the `HTP` package.

For every HTP procedure that generates one or more HTML tags, there is a corresponding HTF function with identical parameters with the following exception:

- The [PRINTS Procedure](#) (page 213-62) and the [PS Procedure](#) (page 213-63) do not have HTF function equivalents. Use the [ESCAPE\\_SC Function](#) (page 212-29) or the [ESCAPE\\_URL Function](#) (page 212-30) if you need a string conversion function. Note that while there is a [ESCAPE\\_SC Procedure](#) (page 213-28) that performs the same operation as the [PRINTS Procedure](#) (page 213-62) and the [PS Procedure](#) (page 213-63), there is no procedural equivalent for the [ESCAPE\\_URL Function](#) (page 212-30).
- The [FORMAT\\_CELL Function](#) (page 212-31) does not have an HTP equivalent. The function formats column values inside an HTML table using [TABLEDATA Function](#) (page 212-71) which does have an HTP equivalent in the [TABLEDATA Procedure](#) (page 213-69). The advantage of this using the [FORMAT\\_CELL Function](#) (page 212-31) is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the

functions from within the `HTP.PRINT` procedure. It then prints its parameters to the generated Web page.

## 213.2 HTP Rules and Limits

If you use values of the `LONG` datatype in procedures such as `HTP.PRINT`, `HTP.PRN`, `HTP.PRINTS`, `HTP.PA` or `OWA_UTIL.CELLSPRINT`, only the first 32 K of the `LONG` data is used. The `LONG` data is bound to a `VARCHAR2` datatype in the procedure.

## 213.3 HTP Examples

These commands generate a simple HTML document.

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
 HTP.HTMLOPEN; -- generates <HTML>
 HTP.HEADOPEN; -- generates <HEAD>
 HTP.TITLE('Hello'); -- generates <TITLE>Hello</TITLE>
 HTP.HEADCLOSE; -- generates </HEAD>
 HTP.BODYOPEN; -- generates <BODY>
 HTP.HEADER(1, 'Hello'); -- generates <H1>Hello</H1>
 HTP.BODYCLOSE; -- generates </BODY>
 HTP.HTMLCLOSE; -- generates </HTML>
END;
```

## 213.4 HTP Summary of Tags

HTP tags can be grouped by type, to make understanding them easier.

### HTML, HEAD, and BODY Tags

[HTMLOPEN Procedure](#) (page 213-45), [HTMLCLOSE Procedure](#) (page 213-45) - generate `<HTML>` and `</HTML>`

[HEADOPEN Procedure](#) (page 213-44), [HEADCLOSE Procedure](#) (page 213-43) - generate `<HEAD>` and `</HEAD>`

[BODYOPEN Procedure](#) (page 213-19), [BODYCLOSE Procedure](#) (page 213-18) - generate `<BODY>` and `</BODY>`

### Comment Tag

[COMMENT Procedure](#) (page 213-23) - generates `<!--` and `-->`

### Tags in the <HEAD> Area

[BASE Procedure](#) (page 213-15) - generates `<BASE>`

[LINKREL Procedure](#) (page 213-50) - generates `<LINK>` with the `REL` attribute

[LINKREV Procedure](#) (page 213-50) - generates `<LINK>` with the `REV` attribute

[TITLE Procedure](#) (page 213-73) - generates `<TITLE>`

[META Procedure](#) (page 213-55) - generates `<META>`

[SCRIPT Procedure](#) (page 213-65) - generates `<SCRIPT>`

[STYLE Procedure](#) (page 213-67) - generates `<STYLE>`

[ISINDEX Procedure](#) (page 213-47) - generates `<ISINDEX>`

### Applet Tags

[APPLETOPEN Procedure](#) (page 213-14), [APPLETCLOSE Procedure](#) (page 213-14) - generate `<APPLET>` and `</APPLET>`

[PARAM Procedure](#) (page 213-59) - generates `<PARAM>`

### List Tags

[OLISTOPEN Procedure](#) (page 213-57), [OLISTCLOSE Procedure](#) (page 213-57) - generate `<OL>` and `</OL>`

[ULISTOPEN Procedure](#) (page 213-74), [ULISTCLOSE Procedure](#) (page 213-74) - generate `<UL>` and `</UL>`

[DLISTOPEN Procedure](#) (page 213-26), [DLISTCLOSE Procedure](#) (page 213-25) - generate `<DL>` and `</DL>`

[DLISTTERM Procedure](#) (page 213-27) - generates `<DT>`

[DLISTDEF Procedure](#) (page 213-25) - generates `<DD>`

[DIRLISTOPEN Procedure](#) (page 213-24), [DIRLISTCLOSE Procedure](#) (page 213-23) - generate `<DIR>` and `</DIR>`

[LISTHEADER Procedure](#) (page 213-51) - generates `<LH>`

[LISTINGOPEN Procedure](#) (page 213-52), [LISTINGCLOSE Procedure](#) (page 213-51) - generate `<LISTING>` and `</LISTING>`

[MENULISTOPEN Procedure](#) (page 213-54) - generate `<MENU>` and `</MENU>`

[LISTITEM Procedure](#) (page 213-52) - generates `<LI>`

### Form Tags

[FORMOPEN Procedure](#) (page 213-31), [FORMCLOSE Procedure](#) (page 213-30) - generate `<FORM>` and `</FORM>`

[FORMCHECKBOX Procedure](#) (page 213-30) - generates `<INPUT TYPE="CHECKBOX">`

[FORMHIDDEN Procedure](#) (page 213-32) - generates `<INPUT TYPE="HIDDEN">`

[FORMIMAGE Procedure](#) (page 213-32) - generates `<INPUT TYPE="IMAGE">`

[FORMPASSWORD Procedure](#) (page 213-33) - generates `<INPUT TYPE="PASSWORD">`

[FORMRADIO Procedure](#) (page 213-34) - generates `<INPUT TYPE="RADIO">`

[FORMSELECTOPEN Procedure](#) (page 213-35), [FORMSELECTCLOSE Procedure](#) (page 213-35) - generate `<SELECT>` and `</SELECT>`

[FORMSELETOPTION Procedure](#) (page 213-36) - generates `<OPTION>`

[FORMTEXT Procedure](#) (page 213-37) - generates `<INPUT TYPE="TEXT">`

[FORMTEXTAREA Procedure](#) (page 213-38) - generate `<TEXTAREA>`

[FORMTEXTAREAOPEN Procedure](#) (page 213-40), [FORMTEXTAREACLOSE Procedure](#) (page 213-39) - generate `<TEXTAREA>` and `</TEXTAREA>`

[FORMRESET Procedure](#) (page 213-34) - generates `<INPUT TYPE="RESET">`

[FORMSUBMIT Procedure](#) (page 213-37) - generates `<INPUT TYPE="SUBMIT">`

### Table Tags

[TABLEOPEN Procedure](#) (page 213-71), [TABLECLOSE Procedure](#) (page 213-69) - generate `<TABLE>` and `</TABLE>`

[TABLECAPTION Procedure](#) (page 213-68) - generates `<CAPTION>`

[TABLEROWOPEN Procedure](#) (page 213-72), [TABLEROWCLOSE Procedure](#) (page 213-72) - generate `<TR>` and `</TR>`

[TABLEHEADER Procedure](#) (page 213-70) - generates `<TH>`

[TABLEDATA Procedure](#) (page 213-69) - generates `<TD>`

### IMG, HR, and A Tags

[HR Procedure](#) (page 213-44), [LINE Procedure](#) (page 213-49) - generate `<HR>`

[IMG Procedure](#) (page 213-45), [IMG2 Procedure](#) (page 213-46) - generate `<IMG>`

[ANCHOR Procedure](#) (page 213-12), [ANCHOR2 Procedure](#) (page 213-13) - generate `<A>`

[MAOPEN Procedure](#) (page 213-54), [MAPCLOSE Procedure](#) (page 213-53) - generate `<MAP>` and `</MAP>`

### Paragraph Formatting Tags

[HEADER Procedure](#) (page 213-43) - generates heading tags (`<H1>` to `<H6>`)

[PARA Procedure](#) (page 213-58), [PARAGRAPH Procedure](#) (page 213-58) - generate `<P>`

[PRN Procedures](#) (page 213-62), [PRINT Procedures](#) (page 213-61) - generate any text that is passed in

[PRINTS Procedure](#) (page 213-62), [PS Procedure](#) (page 213-63) - generate any text that is passed in; special characters in HTML are escaped

[PREOPEN Procedure](#) (page 213-60), [PRECLOSE Procedure](#) (page 213-60) - generate `<PRE>` and `</PRE>`

[BLOCKQUOTEOPEN Procedure](#) (page 213-18), [BLOCKQUOTECLOSE Procedure](#) (page 213-17) - generate `<BLOCKQUOTE>` and `</BLOCKQUOTE>`

[DIV Procedure](#) (page 213-24) - generates `<DIV>`

[NL Procedure](#) (page 213-55), [BR Procedure](#) (page 213-20) - generate `<BR>`

[NOBR Procedure](#) (page 213-56) - generates `<NOBR>`

[WBR Procedure](#) (page 213-76) - generates `<WBR>`

[PLAINTEXT Procedure](#) (page 213-60) - generates `<PLAINTEXT>`

[ADDRESS Procedure](#) (page 213-12) - generates `<ADDRESS>`

[MAILTO Procedure](#) (page 213-53) - generates <A> with the MAILTO attribute

[AREA Procedure](#) (page 213-15) - generates <AREA>

[BGSOUND Procedure](#) (page 213-16) - generates <BGSOUND>

### Character Formatting Tags

[BASEFONT Procedure](#) (page 213-16) - generates <BASEFONT>

[BIG Procedure](#) (page 213-17) - generates <BIG>

[BOLD Procedure](#) (page 213-19) - generates <B>

[CENTER Procedure](#) (page 213-20) - generates <CENTER> and </CENTER>

[CENTEROPEN Procedure](#) (page 213-21), [CENTERCLOSE Procedure](#) (page 213-21) - generate <CENTER> and </CENTER>

[CITE Procedure](#) (page 213-22) - generates <CITE>

[CODE Procedure](#) (page 213-22) - generates <CODE>

[DFN Procedure](#) (page 213-23) - generates <DFN>

[EM Procedure](#) (page 213-27), [EMPHASIS Procedure](#) (page 213-28) - generate <EM>

[FONTOPEN Procedure](#) (page 213-29), [FONTCLOSE Procedure](#) (page 213-29) - generate <FONT> and </FONT>

[ITALIC Procedure](#) (page 213-47) - generates <I>

[KBD Procedure](#) (page 213-48), [KEYBOARD Procedure](#) (page 213-48) - generate <KBD> and </KBD>

[S Procedure](#) (page 213-64) - generates <S>

[SAMPLE Procedure](#) (page 213-64) - generates <SAMP>

[SMALL Procedure](#) (page 213-65) - generates <SMALL>

[STRIKE Procedure](#) (page 213-66) - generates <STRIKE>

[STRONG Procedure](#) (page 213-66) - generates <STRONG>

[SUB Procedure](#) (page 213-67) - generates <SUB>

[SUP Procedure](#) (page 213-68) - generates <SUP>

[TELETYPE Procedure](#) (page 213-73) - generates <TT>

[UNDERLINE Procedure](#) (page 213-75) - generates <U>

[VARIABLE Procedure](#) (page 213-75) - generates <VAR>

### Frame Tags

[FRAME Procedure](#) (page 213-41) - generates <FRAME>

[FRAMESETOPEN Procedure](#) (page 213-42), [FRAMESETCLOSE Procedure](#) (page 213-42) - generate <FRAMESET> and </FRAMESET>

[NOFRAMESOPEN Procedure](#) (page 213-57), [NOFRAMESCLOSE Procedure](#) (page 213-56) - generate <NOFRAMES> and </NOFRAMES>

## 213.5 Summary of HTP Subprograms

This table lists the HTP subprograms and briefly describes them.

**Table 213-1 HTP Package Subprograms**

Subprogram	Description
<a href="#">ADDRESS Procedure</a> (page 213-12)	Generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document
<a href="#">ANCHOR Procedure</a> (page 213-12)	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
<a href="#">ANCHOR2 Procedure</a> (page 213-13)	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
<a href="#">APPLETCLOSE Procedure</a> (page 213-14)	Closes the applet invocation with the </APPLET> tag
<a href="#">APPLETOPEN Procedure</a> (page 213-14)	Generates the <APPLET> tag which begins the invocation of a Java applet
<a href="#">AREA Procedure</a> (page 213-15)	Generates the <AREA> tag, which defines a client-side image map
<a href="#">BASE Procedure</a> (page 213-15)	Generates the <BASE> tag which records the URL of the document
<a href="#">BASEFONT Procedure</a> (page 213-16)	Generates the <BASEFONT> tag which specifies the base font size for a Web page
<a href="#">BGSOUND Procedure</a> (page 213-16)	Generates the <BGSOUND> tag which includes audio for a Web page
<a href="#">BIG Procedure</a> (page 213-17)	Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font
<a href="#">BLOCKQUOTECLOSE Procedure</a> (page 213-17)	Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text
<a href="#">BLOCKQUOTEOPEN Procedure</a> (page 213-18)	Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text
<a href="#">BODYCLOSE Procedure</a> (page 213-18)	Generates the </BODY> tag which marks the end of a body section of an HTML document
<a href="#">BODYOPEN Procedure</a> (page 213-19)	Generates the <BODY> tag which marks the beginning of the body section of an HTML document
<a href="#">BOLD Procedure</a> (page 213-19)	Generates the <B> and </B> tags which direct the browser to display the text in boldface
<a href="#">BR Procedure</a> (page 213-20)	Generates the   tag which begins a new line of text
<a href="#">CENTER Procedure</a> (page 213-20)	Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page
<a href="#">CENTERCLOSE Procedure</a> (page 213-21)	Generates the </CENTER> tag which marks the end of a section of text to center
<a href="#">CENTEROPEN Procedure</a> (page 213-21)	Generates the <CENTER> tag which mark the beginning of a section of text to center
<a href="#">CITE Procedure</a> (page 213-22)	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation

Table 213-1 (Cont.) HTP Package Subprograms

Subprogram	Description
<a href="#">CODE Procedure</a> (page 213-22)	Generates the <code>&lt;CODE&gt;</code> and <code>&lt;/CODE&gt;</code> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically
<a href="#">COMMENT Procedure</a> (page 213-23)	Generates procedure generates the comment tags <code>&lt;!-- ctext --&gt;</code>
<a href="#">DFN Procedure</a> (page 213-23)	Generates the <code>&lt;DFN&gt;</code> and <code>&lt;/DFN&gt;</code> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
<a href="#">DIRLISTCLOSE Procedure</a> (page 213-23)	Generates the <code>&lt;/DIR&gt;</code> tag which ends a directory list section
<a href="#">DIRLISTOPEN Procedure</a> (page 213-24)	Generates the <code>&lt;DIR&gt;</code> which starts a directory list section
<a href="#">DIV Procedure</a> (page 213-24)	Generates the <code>&lt;DIV&gt;</code> tag which creates document divisions
<a href="#">DLISTCLOSE Procedure</a> (page 213-25)	Generates the <code>&lt;/DL&gt;</code> tag which ends a definition list
<a href="#">DLISTDEF Procedure</a> (page 213-25)	Generates the <code>&lt;DD&gt;</code> tag, which inserts definitions of terms
<a href="#">DLISTOPEN Procedure</a> (page 213-26)	Generates the <code>&lt;DL&gt;</code> tag which starts a definition list
<a href="#">DLISTTERM Procedure</a> (page 213-27)	Generates the <code>&lt;DT&gt;</code> tag which defines a term in a definition list <code>&lt;DL&gt;</code>
<a href="#">EM Procedure</a> (page 213-27)	Generates the <code>&lt;EM&gt;</code> and <code>&lt;/EM&gt;</code> tags, which define text to be emphasized
<a href="#">EMPHASIS Procedure</a> (page 213-28)	Generates the <code>&lt;EM&gt;</code> and <code>&lt;/EM&gt;</code> tags, which define text to be emphasized
<a href="#">ESCAPE_SC Procedure</a> (page 213-28)	Replaces characters that have special meaning in HTML with their escape sequences
<a href="#">FONTCLOSE Procedure</a> (page 213-29)	Generates the <code>&lt;/FONT&gt;</code> tag which marks the end of a section of text with the specified font characteristics
<a href="#">FONTOPEN Procedure</a> (page 213-29)	Generates the <code>&lt;FONT&gt;</code> which marks the beginning of section of text with the specified font characteristics
<a href="#">FORMCHECKBOX Procedure</a> (page 213-30)	Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="checkbox"</code> which inserts a checkbox element in a form
<a href="#">FORMCLOSE Procedure</a> (page 213-30)	Generates the <code>&lt;/FORM&gt;</code> tag which marks the end of a form section in an HTML document
<a href="#">FORMOPEN Procedure</a> (page 213-31)	Generates the <code>&lt;FORM&gt;</code> tag which marks the beginning of a form section in an HTML document
<a href="#">FORMFILE Procedure</a> (page 213-31)	Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="file"</code> which inserts a file form element, and is used for file uploading for a given page
<a href="#">FORMHIDDEN Procedure</a> (page 213-32)	Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="hidden"</code> which inserts a hidden form element
<a href="#">FORMIMAGE Procedure</a> (page 213-32)	Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="image"</code> which creates an image field that the user clicks to submit the form immediately

**Table 213-1 (Cont.) HTP Package Subprograms**

Subprogram	Description
<a href="#">FORMPASSWORD Procedure</a> (page 213-33)	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
<a href="#">FORMRADIO Procedure</a> (page 213-34)	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form
<a href="#">FORMRESET Procedure</a> (page 213-34)	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values
<a href="#">FORMSELECTCLOSE Procedure</a> (page 213-35)	Generates the </SELECT> tag which marks the end of a Select form element
<a href="#">FORMSELECTOPEN Procedure</a> (page 213-35)	Generates the </SELECT> tag which marks the beginning of a Select form element
<a href="#">FORMSELETOPTION Procedure</a> (page 213-36)	Generates the <OPTION> tag which represents one choice in a Select element
<a href="#">FORMSUBMIT Procedure</a> (page 213-37)	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
<a href="#">FORMTEXT Procedure</a> (page 213-37)	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
<a href="#">FORMTEXTAREA Procedure</a> (page 213-38)	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area
<a href="#">FORMTEXTAREA2 Procedure</a> (page 213-39)	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
<a href="#">FORMTEXTAREACLOSE Procedure</a> (page 213-39)	Generates the </TEXTAREA> tag which ends a text area form element
<a href="#">FORMTEXTAREAOPEN Procedure</a> (page 213-40)	Generates the <TEXTAREA> which marks the beginning of a text area form element
<a href="#">FORMTEXTAREAOPEN2 Procedure</a> (page 213-40)	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
<a href="#">FRAME Procedure</a> (page 213-41)	Generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag
<a href="#">FRAMESETCLOSE Procedure</a> (page 213-42)	Generates the </FRAMESET> tag which ends a frameset section
<a href="#">FRAMESETOPEN Procedure</a> (page 213-42)	Generates the </FRAMESET> tag which begins a frameset section
<a href="#">HEADCLOSE Procedure</a> (page 213-43)	Generates the </HEAD> tag which marks the end of an HTML document head section
<a href="#">HEADER Procedure</a> (page 213-43)	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)
<a href="#">HEADOPEN Procedure</a> (page 213-44)	Generates the <HEAD> tag which marks the beginning of the HTML document head section
<a href="#">HR Procedure</a> (page 213-44)	Generates the <HR> tag, which generates a line in the HTML document
<a href="#">HTMLCLOSE Procedure</a> (page 213-45)	Generates the </HTML> tag which marks the end of an HTML document

Table 213-1 (Cont.) HTP Package Subprograms

Subprogram	Description
<a href="#">HTMLOPEN Procedure</a> (page 213-45)	Generates the <HTML> tag which marks the beginning of an HTML document
<a href="#">IMG Procedure</a> (page 213-45)	Generates the <IMG> tag which directs the browser to load an image onto the HTML page
<a href="#">IMG2 Procedure</a> (page 213-46)	Generates the <IMG> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute
<a href="#">ISINDEX Procedure</a> (page 213-47)	Creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program
<a href="#">ITALIC Procedure</a> (page 213-47)	Generates the <I> and </I> tags which direct the browser to render the text in italics
<a href="#">KBD Procedure</a> (page 213-48)	Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font
<a href="#">KEYBOARD Procedure</a> (page 213-48)	Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font
<a href="#">LINE Procedure</a> (page 213-49)	Generates the <HR> tag, which generates a line in the HTML document
<a href="#">LINKREL Procedure</a> (page 213-50)	Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target
<a href="#">LINKREV Procedure</a> (page 213-50)	Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor
<a href="#">LISTHEADER Procedure</a> (page 213-51)	Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list
<a href="#">LISTINGCLOSE Procedure</a> (page 213-51)	Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page
<a href="#">LISTINGOPEN Procedure</a> (page 213-52)	Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
<a href="#">LISTITEM Procedure</a> (page 213-52)	Generates the <LI> tag, which indicates a list item
<a href="#">MAILTO Procedure</a> (page 213-53)	Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument
<a href="#">MAPCLOSE Procedure</a> (page 213-53)	Generates the </MAP> tag which marks the end of a set of regions in a client-side image map
<a href="#">MAPOPEN Procedure</a> (page 213-54)	Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map
<a href="#">MENULISTCLOSE Procedure</a> (page 213-54)	Generates the </MENU> tag which ends a list that presents one line for each item
<a href="#">MENULISTOPEN Procedure</a> (page 213-54)	Generates the <MENU> tag which begins a list that presents one line for each item
<a href="#">META Procedure</a> (page 213-55)	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers

**Table 213-1 (Cont.) HTP Package Subprograms**

Subprogram	Description
<a href="#">NL Procedure</a> (page 213-55)	Generates the   tag which begins a new line of text
<a href="#">NOBR Procedure</a> (page 213-56)	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
<a href="#">NOFRAMESCLOSE Procedure</a> (page 213-56)	Generates the </NOFRAMES> tag which marks the end of a no-frames section
<a href="#">NOFRAMESOPEN Procedure</a> (page 213-57)	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section
<a href="#">OLISTCLOSE Procedure</a> (page 213-57)	Generates the </OL> tag which defines the end of an ordered list
<a href="#">OLISTOPEN Procedure</a> (page 213-57)	Generates the <OL> tag which marks the beginning of an ordered list
<a href="#">PARA Procedure</a> (page 213-58)	Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
<a href="#">PARAGRAPH Procedure</a> (page 213-58)	Adds attributes to the <P> tag
<a href="#">PARAM Procedure</a> (page 213-59)	Generates the <PARAM> tag which specifies parameter values for Java applets
<a href="#">PLAINTEXT Procedure</a> (page 213-60)	Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type
<a href="#">PRECLOSE Procedure</a> (page 213-60)	Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page
<a href="#">PREOPEN Procedure</a> (page 213-60)	Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page
<a href="#">PRINT Procedures</a> (page 213-61)	Generates the specified parameter as a string terminated with the \n newline character
<a href="#">PRINTS Procedure</a> (page 213-62)	Generates a string and replaces the following characters with the corresponding escape sequence
<a href="#">PRN Procedures</a> (page 213-62)	Generates the specified parameter as a string
<a href="#">PS Procedure</a> (page 213-63)	Generates a string and replaces the following characters with the corresponding escape sequence.
<a href="#">S Procedure</a> (page 213-64)	Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type
<a href="#">SAMPLE Procedure</a> (page 213-64)	Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
<a href="#">SCRIPT Procedure</a> (page 213-65)	Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript
<a href="#">SMALL Procedure</a> (page 213-65)	Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font
<a href="#">STRIKE Procedure</a> (page 213-66)	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type

**Table 213-1 (Cont.) HTP Package Subprograms**

Subprogram	Description
<a href="#">STRONG Procedure</a> (page 213-66)	Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
<a href="#">STYLE Procedure</a> (page 213-67)	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page
<a href="#">SUB Procedure</a> (page 213-67)	Generates the <SUB> and </SUB> tags which direct the browser to render the text they surround as subscript
<a href="#">SUP Procedure</a> (page 213-68)	Generates the <SUP> and </SUP> tags which direct the browser to render the text they surround as superscript
<a href="#">TABLECAPTION Procedure</a> (page 213-68)	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
<a href="#">TABLECLOSE Procedure</a> (page 213-69)	Generates the </TABLE> tag which marks the end of an HTML table
<a href="#">TABLEDATA Procedure</a> (page 213-69)	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
<a href="#">TABLEHEADER Procedure</a> (page 213-70)	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
<a href="#">TABLEOPEN Procedure</a> (page 213-71)	Generates the <TABLE> tag which marks the beginning of an HTML table
<a href="#">TABLEROWCLOSE Procedure</a> (page 213-72)	Generates the </TR> tag which marks the end of a new row in an HTML table
<a href="#">TABLEROWOPEN Procedure</a> (page 213-72)	Generates the <TR> tag which marks the beginning of a new row in an HTML table
<a href="#">TELETYPE Procedure</a> (page 213-73)	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
<a href="#">TITLE Procedure</a> (page 213-73)	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
<a href="#">ULISTCLOSE Procedure</a> (page 213-74)	Generates the </UL> tag which marks the end of an unordered list
<a href="#">ULISTOPEN Procedure</a> (page 213-74)	Generates the <UL> tag which marks the beginning of an unordered list
<a href="#">UNDERLINE Procedure</a> (page 213-75)	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
<a href="#">VARIABLE Procedure</a> (page 213-75)	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
<a href="#">WBR Procedure</a> (page 213-76)	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

## 213.5.1 ADDRESS Procedure

This procedure generates the `<ADDRESS>` and `</ADDRESS>` tags which specify the address, author and signature of a document.

### Syntax

```
HTP.ADDRESS (
 cvalue IN VARCHAR2
 cnowrap IN VARCHAR2 DEFAULT NULL
 cclear IN VARCHAR2 DEFAULT NULL
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-2 ADDRESS Procedure Parameters**

Parameter	Description
<code>cvalue</code>	The string that goes between the <code>&lt;ADDRESS&gt;</code> and <code>&lt;/ADDRESS&gt;</code> tags.
<code>cnowrap</code>	If the value for this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is included in the tag
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag

### Examples

This procedure generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

## 213.5.2 ANCHOR Procedure

Like the `ANCHOR2` procedure, this procedure generates the `<A>` and `</A>` HTML tags which specify the source or destination of a hypertext link.

The difference between these subprograms is that the [ANCHOR2 Procedure](#) (page 213-13) provides a target and therefore can be used for a frame.

### Syntax

```
HTP.ANCHOR (
 curl IN VARCHAR2,
 ctext IN VARCHAR2,
 cname IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-3 ANCHOR Procedure Parameters**

Parameter	Description
<code>curl</code>	The value for the <code>HREF</code> attribute.

**Table 213-3 (Cont.) ANCHOR Procedure Parameters**

Parameter	Description
<code>c<sub>text</sub></code>	The string that goes between the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags.
<code>c<sub>name</sub></code>	The value for the <code>NAME</code> attribute.
<code>c<sub>attributes</sub></code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
ctext
```

**Usage Notes**

This tag accepts several attributes, but either `HREF` or `NAME` is required. `HREF` specifies to where to link. `NAME` allows this tag to be a target of a hypertext link.

## 213.5.3 ANCHOR2 Procedure

Like the `ANCHOR` procedure, this procedure generates the `<A>` and `</A>` HTML tags which specify the source or destination of a hypertext link.

The difference between this procedure and the `ANCHOR` procedure is that this procedure provides a target and therefore can be used for a frame.

**Syntax**

```
HTP.ANCHOR2 (
 curl IN VARCHAR2,
 ctext IN VARCHAR2,
 cname IN VARCHAR2 DEFAULT NULL,
 ctarget in varchar2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-4 ANCHOR2 Procedure Parameters**

Parameter	Description
<code>c<sub>url</sub></code>	The value for the <code>HREF</code> attribute.
<code>c<sub>text</sub></code>	The string that goes between the <code>&lt;A&gt;</code> and <code>&lt;/A&gt;</code> tags.
<code>c<sub>name</sub></code>	The value for the <code>NAME</code> attribute
<code>c<sub>target</sub></code>	The value for the <code>TARGET</code> attribute.
<code>c<sub>attributes</sub></code>	The other attributes to be included as-is in the tag

**Examples**

This procedure generates

```
ctext
```

## 213.5.4 APPLETCLOSE Procedure

This procedure closes the applet invocation with the `</APPLET>` tag.

You must first invoke the a Java applet using [APPLETOPEN Procedure](#) (page 213-14).

### Syntax

```
HTP.APPLETCLOSE;
```

## 213.5.5 APPLETOPEN Procedure

This procedure generates the `<APPLET>` tag which begins the invocation of a Java applet.

You close the applet invocation with [APPLETCLOSE Procedure](#) (page 213-14) which generates the `</APPLET>` tag.

### Syntax

```
HTP.APPLETOPEN (
 ccode IN VARCHAR2,
 cheight IN NUMBER,
 cwidth IN NUMBER,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-5** APPLETOPEN Procedure Parameters

Parameter	Description
<code>ccode</code>	The the value for the <code>CODE</code> attribute which specifies the name of the applet class.
<code>cheight</code>	The value for the <code>HEIGHT</code> attribute.
<code>cwidth</code>	The value for the <code>WIDTH</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTP.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

### Usage Notes

- Specify parameters to the Java applet using the [PARAM Procedure](#) (page 213-59).
- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.

## 213.5.6 AREA Procedure

This procedure generates the `<AREA>` tag, which defines a client-side image map. The `<AREA>` tag defines areas within the image and destinations for the areas.

### Syntax

```
HTP.AREA (
 ccoords IN VARCHAR2
 cshape IN VARCHAR2 DEFAULT NULL,
 chref IN VARCHAR2 DEFAULT NULL,
 cnohref IN VARCHAR2 DEFAULT NULL,
 ctarget IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-6 AREA Procedure Parameters**

Parameter	Description
<code>ccords</code>	The the value for the <code>COORDS</code> attribute.
<code>cshape</code>	The value for the <code>SHAPE</code> attribute.
<code>chref</code>	The value for the <code>HREF</code> attribute.
<code>cnohref</code>	If the value for this parameter is not <code>NULL</code> , the <code>NOHREF</code> attribute is added to the tag.
<code>ctarget</code>	The value for the <code>TARGET</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<AREA COORDS="ccords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget"
 cattributes>
```

## 213.5.7 BASE Procedure

This procedure generates the `<BASE>` tag which records the URL of the document.

### Syntax

```
HTP.BASE (
 ctarget IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-7 BASE Procedure Parameters**

Parameter	Description
<code>ctarget</code>	The value for the <code>TARGET</code> attribute which establishes a window name to which all links in this document are targeted.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

## 213.5.8 BASEFONT Procedure

This procedure generates the `<BASEFONT>` tag which specifies the base font size for a Web page.

### Syntax

```
HTP.BASEFONT (
 nsize IN INTEGER);
```

## Parameters

**Table 213-8 BASEFONT Procedure Parameters**

Parameter	Description
<code>nsize</code>	The value for the <code>SIZE</code> attribute.

## Examples

This procedure generates

```
<BASEFONT SIZE="nsize">
```

## 213.5.9 BGSOUND Procedure

This procedure generates the `<BGSOUND>` tag which includes audio for a Web page.

### Syntax

```
HTP.BGSOUND (
 csrc IN VARCHAR2,
 cloop IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-9 BGSOUND Procedure Parameters**

Parameter	Description
<code>csrc</code>	The value for the <code>SRC</code> attribute.
<code>clloop</code>	The value for the <code>LOOP</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<BGSOUND SRC="csrc" LOOP="clloop" cattributes>
```

## 213.5.10 BIG Procedure

This procedure generates the `<BIG>` and `</BIG>` tags which direct the browser to render the text in a bigger font.

### Syntax

```
HTP.BIG (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-10 BIG Procedure Parameters**

Parameter	Description
<code>ctext</code>	The the text that goes between the tags.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<BIG cattributes>ctext</BIG>
```

## 213.5.11 BLOCKQUOTECLOSE Procedure

This procedure generates the `</BLOCKQUOTE>` tag which mark the end of a section of quoted text.

You mark the beginning of a section of text by means of the [BLOCKQUOTEOPEN Procedure](#) (page 213-18).

### Syntax

```
HTP.BLOCKQUOTECLOSE;
```

## Examples

This procedure generates

```
</BLOCKQUOTE>
```

## 213.5.12 BLOCKQUOTEOPEN Procedure

This procedure generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text.

You mark the end of a section of text by means of the [BLOCKQUOTECLOSE Procedure](#) (page 213-17).

## Syntax

```
HTP.BLOCKQUOTEOPEN (
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-11 BLOCKQUOTEOPEN Procedure Parameters**

Parameter	Description
<code>cnowrap</code>	If the value for this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

## 213.5.13 BODYCLOSE Procedure

This procedure generates the `</BODY>` tag which marks the end of a body section of an HTML document.

You mark the beginning of a body section by means of the [BODYOPEN Procedure](#) (page 213-19).

## Syntax

```
HTP.BODYCLOSE;
```

## Examples

This procedure generates

```
</BODY>
```

## 213.5.14 BODYOPEN Procedure

This procedure generates the `<BODY>` tag which marks the beginning of the body section of an HTML document.

You mark the end of a body section by means of the [BODYCLOSE Procedure](#) (page 213-18).

### Syntax

```
HTP.BODYOPEN (
 cbackground IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-12 BODYOPEN Procedure Parameters**

Parameter	Description
<code>cbackground</code>	The value for the <code>BACKGROUND</code> attribute which specifies a graphic file to use for the background of the document.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTP.BODYOPEN('/img/background.gif');
```

generates:

```
<BODY background="/img/background.gif">
```

## 213.5.15 BOLD Procedure

This procedure generates the `<B>` and `</B>` tags which direct the browser to display the text in boldface.

### Syntax

```
HTP.BOLD (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-13 BOLD Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text that goes between the tags.

**Table 213-13 (Cont.) BOLD Procedure Parameters**

Parameter	Description
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<B cattributes>ctext
```

## 213.5.16 BR Procedure

This procedure generates the `<BR>` tag which begins a new line of text.

It performs the same operation as the [NL Procedure](#) (page 213-55).

**Syntax**

```
HTP.BR(
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-14 BR Procedure Parameters**

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

## 213.5.17 CENTER Procedure

This procedure generates the `<CENTER>` and `</CENTER>` tags which center a section of text within a Web page.

**Syntax**

```
HTP.CENTER (
 ctext IN VARCHAR2);
```

## Parameters

**Table 213-15** CENTER Parameters

Parameter	Description
<code>c</code> <code>text</code>	The text that goes between the tags.

## Examples

This procedure generates

```
<CENTER>c
```

`text`

```
</CENTER>
```

## 213.5.18 CENTERCLOSE Procedure

This procedure generates the `</CENTER>` tag which marks the end of a section of text to center.

You mark the beginning of a section of text to center with the [CENTEROPEN Procedure](#) (page 213-21).

### Syntax

```
HTP.CENTERCLOSE;
```

### Examples

This procedure generates

```
</CENTER>
```

## 213.5.19 CENTEROPEN Procedure

This procedure generates the `<CENTER>` tag which mark the beginning of a section of text to center.

You mark the beginning of a of a section of text to center by means of the [CENTERCLOSE Procedure](#) (page 213-21).

### Syntax

```
HTP.CENTEROPEN;
```

### Examples

This procedure generates

```
<CENTER>
```

## 213.5.20 CITE Procedure

This procedure generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation.

### Syntax

```
HTP.CITE (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-16** CITE Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to render as citation.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<CITE cattributes>ctext</CITE>
```

## 213.5.21 CODE Procedure

This procedure generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

### Syntax

```
HTP.CODE (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-17** CODE Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to render as code.
<code>cattributes</code>	The other attributes to be included as-is in the tag

### Examples

This procedure generates

```
<CODE cattributes>ctext</CODE>
```

## 213.5.22 COMMENT Procedure

This procedure generates the comment tags.

### Syntax

```
HTP.COMMENT (
 ctext IN VARCHAR2);
```

### Parameters

**Table 213-18** COMMENT Procedure Parameters

Parameter	Description
ctext	The comment.

### Examples

This procedure generates

```
<!-- ctext -->
```

## 213.5.23 DFN Procedure

This procedure generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

### Syntax

```
HTP.DFN (
 ctext IN VARCHAR2);
```

### Parameters

**Table 213-19** DFN Procedure Parameters

Parameter	Description
ctext	The text to render in italics.

### Examples

This procedure generates

```
<DFN>ctext</DFN>
```

## 213.5.24 DIRLISTCLOSE Procedure

This procedure generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

### Syntax

```
HTP.DIRLISTCLOSE;
```

### Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the [LISTITEM Procedure](#) (page 213-52) so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

### Examples

This procedure generates

```
</DIR>
```

### Related Topics:

- [DIRLISTOPEN Procedure](#) (page 213-24)  
This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

## 213.5.25 DIRLISTOPEN Procedure

This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

### Syntax

```
HTP.DIRLISTOPEN;
```

### Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the [LISTITEM Procedure](#) (page 213-52) so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

### Examples

This procedure generates

```
<DIR>
```

### Related Topics:

- [DIRLISTCLOSE Procedure](#) (page 213-23)  
This procedure generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

## 213.5.26 DIV Procedure

This procedure generates the <DIV> tag which creates document divisions.

### Syntax

```
HTP.DIV (
 calign IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-20 DIV Procedure Parameters**

Parameter	Description
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<DIV ALIGN="calign" cattributes>
```

## 213.5.27 DLISTCLOSE Procedure

This procedure generates the `</DL>` tag which ends a definition list. You start a definition list by means of the `DLISTOPEN` Procedure.

### Syntax

```
HTP.DLISTCLOSE;
```

### Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Procedure](#) (page 213-27) and definitions are inserted using the [DLISTDEF Procedure](#) (page 213-25).

## Examples

This procedure generates

```
</DL>
```

### Related Topics:

- [DLISTOPEN Procedure](#) (page 213-26)  
This procedure generates the `<DL>` tag which starts a definition list. You end a definition list by means of the `DLISTCLOSE` Procedure.

## 213.5.28 DLISTDEF Procedure

This procedure generates the `<DD>` tag, which inserts definitions of terms. Use this tag for a definition list `<DL>`. Terms are tagged `<DT>` and definitions are tagged `<DD>`.

### Syntax

```
HTP.DLISTDEF (
 ctext IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-21 DLISTDEF Procedure Parameters**

Parameter	Description
<code>c<sub>text</sub></code>	The definition of the term.
<code>c<sub>clear</sub></code>	The value for the <code>CLEAR</code> attribute.
<code>c<sub>attributes</sub></code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<DD CLEAR="cclear" cattributes>ctext
```

## 213.5.29 DLISTOPEN Procedure

This procedure generates the `<DL>` tag which starts a definition list. You end a definition list by means of the `DLISTCLOSE` Procedure.

## Syntax

```
HTP.DLISTOPEN (
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-22 DLISTOPEN Procedure Parameters**

Parameter	Description
<code>c<sub>clear</sub></code>	The value for the <code>CLEAR</code> attribute.
<code>c<sub>attributes</sub></code>	The other attributes to be included as-is in the tag.

## Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Procedure](#) (page 213-27) and definitions are inserted using the [DLISTDEF Procedure](#) (page 213-25).

## Examples

This procedure generates

```
<DL CLEAR="cclear" cattributes>
```

## Related Topics:

- [DLISTCLOSE Procedure](#) (page 213-25)  
This procedure generates the `</DL>` tag which ends a definition list. You start a definition list by means of the `DLISTOPEN` Procedure.

## 213.5.30 DLISTTERM Procedure

This procedure generates the <DT> tag which defines a term in a definition list <DL>.

### Syntax

```
HTP.DLISTTERM (
 ctext IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-23 DLISTTERM Procedure Parameters**

Parameter	Description
ctext	The term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<DT CLEAR="cclear" cattributes>ctext
```

## 213.5.31 EM Procedure

This procedure generates the <EM> and </EM> tags, which define text to be emphasized.

It performs the same task as the [EMPHASIS Procedure](#) (page 213-28).

### Syntax

```
HTP.EM(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-24 EM Procedure Parameters**

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<EM cattributes>ctext
```

## 213.5.32 EMPHASIS Procedure

This procedure generates the `<EM>` and `</EM>` tags, which define text to be emphasized. It performs the same task as the [EM Procedure](#) (page 213-27).

### Syntax

```
HTP.EMPHASIS(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-25 EMPHASIS Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to emphasize.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<EM cattributes>ctext
```

## 213.5.33 ESCAPE\_SC Procedure

This procedure replaces characters that have special meaning in HTML with their escape sequences.

The following characters are converted:

- `&` to `&amp;`
- `"` to `&quot;`
- `<` to `&lt;`
- `>` to `&gt;`

This procedure performs the same operation as [PRINTS Procedure](#) (page 213-62)s and [PS Procedure](#) (page 213-63).

### Syntax

```
HTP.ESCAPE_SC(
 ctext IN VARCHAR2);
```

### Parameters

**Table 213-26 ESCAPE\_SC Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text string to convert.

## 213.5.34 FONTCLOSE Procedure

This procedure generates the `</FONT>` tag which marks the end of a section of text with the specified font characteristics.

You mark the beginning of the section text by means of the [FONTOPEN Procedure](#) (page 213-29).

### Syntax

```
HTP.FONTCLOSE;
```

### Examples

This procedure generates

```

```

## 213.5.35 FONTOPEN Procedure

This procedure generates the `<FONT>` which marks the beginning of section of text with the specified font characteristics.

You mark the end of the section text by means of the [FONTCLOSE Procedure](#) (page 213-29).

### Syntax

```
HTP.FONTOPEN(
 ccolor IN VARCHAR2 DEFAULT NULL,
 cface IN VARCHAR2 DEFAULT NULL,
 csize IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-27** FONTOPEN Procedure Parameters

Parameter	Description
<code>ccolor</code>	The value for the <code>COLOR</code> attribute.
<code>cface</code>	The value for the <code>FACE</code> attribute
<code>csize</code>	The value for the <code>SIZE</code> attribute
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```

```

## 213.5.36 FORMCHECKBOX Procedure

This procedure generates the `<INPUT>` tag with `TYPE="checkbox"` which inserts a checkbox element in a form.

A checkbox element is a button that the user toggles on or off.

### Syntax

```
HTP.FORMCHECKBOX(
 cname IN VARCHAR2,
 cvalue IN VARCHAR2 DEFAULT 'ON',
 cchecked IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-28 FORMCHECKBOX Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cchecked</code>	If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

## 213.5.37 FORMCLOSE Procedure

This procedure generates the `</FORM>` tag which marks the end of a form section in an HTML document.

You mark the beginning of the form section by means of the [FORMOPEN Procedure](#) (page 213-31).

### Syntax

```
HTP.FORMCLOSE;
```

### Examples

This procedure generates

```
</FORM>
```

## 213.5.38 FORMOPEN Procedure

This procedure generates the `<FORM>` tag which marks the beginning of a form section in an HTML document.

You mark the end of the form section by means of the [FORMCLOSE Procedure](#) (page 213-30).

### Syntax

```
HTP.FORMOPEN(
 curl IN VARCHAR2,
 cmethod IN VARCHAR2 DEFAULT 'POST',
 ctargt IN VARCHAR2 DEFAULT NULL,
 cenctype IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-29 FORMOPEN Procedure Parameters**

Parameter	Description
<code>curl</code>	The URL of the WRB or CGI script where the contents of the form is sent. This parameter is required.
<code>cmethod</code>	The value for the <code>METHOD</code> attribute. The value can be "GET" or "POST".
<code>ctargt</code>	The value for the <code>TARGET</code> attribute.
<code>cenctype</code>	The value for the <code>ENCTYPE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctargt" ENCTYPE="cenctype" cattributes>
```

## 213.5.39 FORMFILE Procedure

This procedure generates the `<INPUT>` tag with `TYPE="file"` which inserts a file form element. This is used for file uploading for a given page.

### Syntax

```
HTP.FORMFILE(
 cname IN VARCHAR2,
 caccept IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-30 FORMFILE Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>caccept</code>	A comma-delimited list of MIME types for upload.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

## 213.5.40 FORMHIDDEN Procedure

This procedure generates the `<INPUT>` tag with `TYPE="hidden"`, which inserts a hidden form element.

This element is not seen by the user. It submits additional values to the script.

## Syntax

```
HTP.FORMHIDDEN(
 cname IN VARCHAR2,
 cvalue IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-31 FORMHIDDEN Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

## 213.5.41 FORMIMAGE Procedure

This procedure generates the `<INPUT>` tag with `TYPE="image"` which creates an image field that the user clicks to submit the form immediately.

The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted

under the name of the field with `.x` appended, and the `y` coordinate with `.y` appended. Any `VALUE` attribute is ignored.

### Syntax

```
HTP.FORMIMAGE(
 cname IN VARCHAR2,
 csrc IN VARCHAR2,
 calign IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-32 FORMIMAGE Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>csrc</code>	The value for the <code>SRC</code> attribute that specifies the image file.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

## 213.5.42 FORMPASSWORD Procedure

This procedure generates the `<INPUT>` tag with `TYPE="password"` which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

### Syntax

```
HTP.FORMPASSWORD(
 cname IN VARCHAR2,
 csize IN VARCHAR2,
 cmaxlength IN VARCHAR2 DEFAULT NULL,
 cvalue IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-33 FORMPASSWORD Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>csize</code>	The value for the <code>SIZE</code> attribute.
<code>cmaxlength</code>	The value for the <code>MAXLENGTH</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```

## 213.5.43 FORMRADIO Procedure

This procedure generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

### Syntax

```
HTP.FORMRADIO(
 cname IN VARCHAR2,
 cvalue IN VARCHAR2,
 cchecked IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-34 FORMRADIO Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cchecked</code>	If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

## 213.5.44 FORMRESET Procedure

This procedure generates the `<INPUT>` tag with `TYPE="reset"` which creates a button that, when selected, resets the form fields to their initial values.

### Syntax

```
HTP.FORMRESET(
 cvalue IN VARCHAR2 DEFAULT 'Reset',
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-35 FORMRESET Procedure Parameters**

Parameter	Description
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

## 213.5.45 FORMSELECTCLOSE Procedure

This procedure generates the `</SELECT>` tag which marks the end of a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the [FORMSELECTOPEN Procedure](#) (page 213-35). The values are inserted using [FORMSELECTOPTION Procedure](#) (page 213-36).

## Syntax

```
HTP.FORMSELECTCLOSE;
```

## Examples

This procedure generates

```
</SELECT>
```

as shown under Examples of the [FORMSELECTOPEN Procedure](#) (page 213-35).

## 213.5.46 FORMSELECTOPEN Procedure

This procedure generates the `<SELECT>` tags which creates a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the [FORMSELECTCLOSE Procedure](#) (page 213-35). The values are inserted using [FORMSELECTOPTION Procedure](#) (page 213-36).

## Syntax

```
FORMSELECTOPEN(
 cname IN VARCHAR2,
 cprompt IN VARCHAR2 DEFAULT NULL,
 nsize IN INTEGER DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-36 FORMSELECTOPEN Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cprompt</code>	The string preceding the list box.
<code>nsiz</code>	The value for the <code>SIZE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
cprompt <SELECT NAME="cname" SIZE="nsiz" cattributes>
</SELECT>
```

so that

```
HTP.FORMSELECTOPEN('greatest_player';
 'Pick the greatest player:');
HTP.FORMSELETOPTION('Messier');
HTP.FORMSELETOPTION('Howe');
HTP.FORMSELETOPTION('Gretzky');.
HTP.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

## 213.5.47 FORMSELETOPTION Procedure

This procedure generates the `<OPTION>` tag which represents one choice in a Select element.

### Syntax

```
HTP.FORMSELETOPTION(
 cvalue IN VARCHAR2,
 cselected IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-37 FORMSELETOPTION Procedure Parameters**

Parameter	Description
<code>cvalue</code>	The text for the option.

**Table 213-37 (Cont.) FORMSELECTOPTION Procedure Parameters**

Parameter	Description
<code>cvalue</code>	If the value for this parameter is not NULL, the <code>SELECTED</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the [FORMSELECTOPEN Procedure](#) (page 213-35).

## 213.5.48 FORMSUBMIT Procedure

This procedure generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

**Syntax**

```
HTP.FORMSUBMIT(
 cname IN VARCHAR2 DEFAULT NULL,
 cvalue IN VARCHAR2 DEFAULT 'Submit',
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-38 FORMSUBMIT Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

## 213.5.49 FORMTEXT Procedure

This procedure generates the `<INPUT>` tag with `TYPE="text"`, which creates a field for a single line of text.

**Syntax**

```
HTP.FORMTEXT(
 cname IN VARCHAR2,
 csize IN VARCHAR2 DEFAULT NULL,
```

```

cmaxlength IN VARCHAR2 DEFAULT NULL,
cvalue IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 213-39 FORMTEXT Procedure Parameters**

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```

<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength" VALUE="cvalue"
cattributes>

```

## 213.5.50 FORMTEXTAREA Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA2 Procedure](#) (page 213-39) which in addition has the `cwrap` parameter that lets you specify a wrap style.

## Syntax

```

HTP.FORMTEXTAREA(
 cname IN VARCHAR2,
 nrows IN INTEGER,
 ncolumns IN INTEGER,
 calign , IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 213-40 FORMTEXTAREA Procedure Parameters**

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute. This is an integer.
ncolumns	The value for the COLS attribute. This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes></TEXTAREA>
```

## 213.5.51 FORMTEXTAREA2 Procedure

This procedure generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA Procedure](#) (page 213-38) except that in that case you cannot specify a wrap style.

### Syntax

```
HTP.FORMTEXTAREA2(
 cname IN VARCHAR2,
 nrows IN INTEGER,
 ncolumns IN INTEGER,
 calign IN VARCHAR2 DEFAULT NULL,
 cwrap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-41 FORMTEXTAREA2 Procedure Parameters**

Parameter	Description
cname	The value for the <code>NAME</code> attribute.
nrows	The value for the <code>ROWS</code> attribute. This is an integer.
ncolumns	The value for the <code>COLS</code> attribute. This is an integer.
calign	The value for the <code>ALIGN</code> attribute.
cwrap	The value for the <code>WRAP</code> attribute.
cattributes	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

## 213.5.52 FORMTEXTAREACLOSE Procedure

This procedure generates the `</TEXTAREA>` tag which ends a text area form element.

You open a text area element by means of either [FORMTEXTAREAOPEN Procedure](#) (page 213-40) or [FORMTEXTAREAOPEN2 Procedure](#) (page 213-40).

### Syntax

```
HTP.FORMTEXTAREACLOSE;
```

## Examples

This procedure generates

```
</TEXTAREA>
```

## 213.5.53 FORMTEXTAREAOPEN Procedure

This procedure generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN2 Procedure](#) (page 213-40) which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Procedure](#) (page 213-39).

## Syntax

```
HTP.FORMTEXTAREAOPEN(
 cname IN VARCHAR2,
 nrows IN INTEGER,
 ncolumns IN INTEGER,
 calign IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-42 FORMTEXTAREAOPEN Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>nrows</code>	The value for the <code>ROWS</code> attribute. This is an integer.
<code>ncolumns</code>	The value for the <code>COLS</code> attribute. This is an integer.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

## 213.5.54 FORMTEXTAREAOPEN2 Procedure

This procedure generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN Procedure](#) (page 213-40) except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Procedure](#) (page 213-39).

## Syntax

```
HTP.FORMTEXTAREAOPEN2(
 cname IN VARCHAR2,
 nrows IN INTEGER,
 ncolumns IN INTEGER,
 calign IN VARCHAR2 DEFAULT NULL,
 cwrap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-43 FORMTEXTAREAOPEN2 Procedure Parameters**

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute. This is an integer.
ncolumns	The value for the COLS attribute. This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

## 213.5.55 FRAME Procedure

This procedure generates the <FRAME> tag which begins the characteristics of a frame created by a <FRAMESET> tag.

## Syntax

```
HTP.FRAME(
 csrc IN VARCHAR2,
 cname IN VARCHAR2 DEFAULT NULL,
 cmarginwidth IN VARCHAR2 DEFAULT NULL,
 cmarginheight IN VARCHAR2 DEFAULT NULL,
 cscrolling IN VARCHAR2 DEFAULT NULL,
 cnoresize IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-44 FRAME Procedure Parameters**

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.

**Table 213-44 (Cont.) FRAME Procedure Parameters**

Parameter	Description
<code>cmarginwidth</code>	The value for the <code>MARGINWIDTH</code> attribute.
<code>cscrolling</code>	The value for the <code>SCROLLING</code> attribute.
<code>cnoresize</code>	If the value for this parameter is not <code>NULL</code> , the <code>NORESIZ</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

## 213.5.56 FRAMESETCLOSE Procedure

This procedure generates the `</FRAMESET>` tag which ends a frameset section.

You mark the beginning of a frameset section by means of the [FRAMESETOPEN Procedure](#) (page 213-42).

**Syntax**

```
HTP.FRAMESETCLOSE;
```

**Examples**

This procedure generates

```
</FRAMESET>
```

## 213.5.57 FRAMESETOPEN Procedure

This procedure generates the `<FRAMESET>` tag which define a frameset section.

You mark the end of a frameset section by means of the [FRAMESETCLOSE Procedure](#) (page 213-42).

**Syntax**

```
HTP.FRAMESETOPEN(
 crows IN VARCHAR2 DEFAULT NULL,
 ccols IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-45 FRAMESETOPEN Procedure Parameters**

Parameter	Description
<code>crows</code>	The value for the <code>ROWS</code> attribute.

**Table 213-45 (Cont.) FRAMESETOPEN Procedure Parameters**

Parameter	Description
<code>ccols</code>	The value for the <code>COLS</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

## 213.5.58 HEADCLOSE Procedure

This procedure generates the `</HEAD>` tag which marks the end of an HTML document head section.

You mark the beginning of an HTML document head section by means of the [HEADOPEN Procedure](#) (page 213-44).

**Syntax**

```
HTP.HEADCLOSE;
```

**Examples**

This procedure generates

```
</HEAD>
```

## 213.5.59 HEADER Procedure

This procedure generates opening heading tags (`<H1>` to `<H6>`) and their corresponding closing tags (`</H1>` to `</H6>`).

**Syntax**

```
HTP.HEADER(
 nsize IN INTEGER,
 cheader IN VARCHAR2,
 calign IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-46 HEADER Procedure Parameters**

Parameter	Description
<code>nsize</code>	The the heading level. This is an integer between 1 and 6.
<code>cheader</code>	The text to display in the heading.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.

**Table 213-46 (Cont.) HEADER Procedure Parameters**

Parameter	Description
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

```
HTP.header (1, 'Overview');
```

produces:

```
<H1>Overview</H1>
```

## 213.5.60 HEADOPEN Procedure

This procedure generates the <HEAD> tag which marks the beginning of the HTML document head section.

You mark the end of an HTML document head section by means of the [HEADCLOSE Procedure](#) (page 213-43).

**Syntax**

```
HTP.HEADOPEN;
```

**Examples**

This procedure generates

```
<HEAD>
```

## 213.5.61 HR Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [LINE Procedure](#) (page 213-49).

**Syntax**

```
HTP.HR(
 cclear IN VARCHAR2 DEFAULT NULL,
 csrc IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-47 HR Procedure Parameters**

Parameter	Description
cclear	The value for the CLEAR attribute.

**Table 213-47 (Cont.) HR Procedure Parameters**

Parameter	Description
<code>csrc</code>	The value for the <code>SRC</code> attribute which specifies a custom image as the source of the line.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

## 213.5.62 HTMLCLOSE Procedure

This procedure generates the `</HTML>` tag which marks the end of an HTML document.

You use the [HTMLOPEN Procedure](#) (page 213-45) to mark the beginning of an HTML document.

**Syntax**

```
HTP.HTMLCLOSE;
```

**Examples**

This procedure generates

```
</HTML>
```

## 213.5.63 HTMLOPEN Procedure

This procedure generates the `<HTML>` tag which marks the beginning of an HTML document.

You use the [HTMLCLOSE Procedure](#) (page 213-45) to mark the end of the an HTML document.

**Syntax**

```
HTP.HTMLOPEN;
```

**Examples**

This procedure generates

```
<HTML>
```

## 213.5.64 IMG Procedure

This procedure generates the `<IMG>` tag which directs the browser to load an image onto the HTML page.

The [IMG2 Procedure](#) (page 213-46) performs the same operation but additionally uses the `cusemap` parameter.

**Syntax**

```
HTP.IMG(
 curl IN VARCHAR2 DEFAULT NULL,
 calign IN VARCHAR2 DEFAULT NULL,
 calt IN VARCHAR2 DEFAULT NULL,
 cismap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-48 IMG Procedure Parameters**

Parameter	Description
curl	The value for the SRC attribute.
calign	The value for the ALIGN attribute.
calt	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
cismap	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```

```

## 213.5.65 IMG2 Procedure

This procedure generates the <IMG> tag, which directs the browser to load an image onto the HTML page.

The [IMG Procedure](#) (page 213-45) performs the same operation but does not use the `cusemap` parameter.

**Syntax**

```
HTP.IMG2(
 curl IN VARCHAR2 DEFAULT NULL,
 calign IN VARCHAR2 DEFAULT NULL,
 calt IN VARCHAR2 DEFAULT NULL,
 cismap IN VARCHAR2 DEFAULT NULL,
 cusemap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-49 IMG2 Procedure Parameters**

Parameter	Description
curl	The value for the SRC attribute.
calign	The value for the ALIGN attribute.

**Table 213-49 (Cont.) IMG2 Procedure Parameters**

Parameter	Description
<code>calt</code>	The value for the <code>ALT</code> attribute which specifies alternative text to display if the browser does not support images.
<code>cismap</code>	If the value for this parameter is not <code>NULL</code> , the <code>ISMAP</code> attribute is added to the tag. The attribute indicates that the image is an imagemap.
<code>cusemap</code>	The value for the <code>USEMAP</code> attribute which specifies a client-side image map.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```

```

## 213.5.66 ISINDEX Procedure

This procedure creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program.

**Syntax**

```
HTP.ISINDEX(
 cprompt IN VARCHAR2 DEFAULT NULL,
 curl IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-50 ISINDEX Procedure Parameters**

Parameter	Description
<code>cprompt</code>	The value for the <code>PROMPT</code> attribute.
<code>curl</code>	The value for the <code>HREF</code> attribute.

**Examples**

This procedure generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

## 213.5.67 ITALIC Procedure

This procedure generates the `<I>` and `</I>` tags which direct the browser to render the text in italics.

**Syntax**

```
HTP.ITALIC(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-51** ITALIC Procedure Parameters

Parameter	Description
<code>c<sub>text</sub></code>	The text to be rendered in italics.
<code>c<sub>attributes</sub></code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<I cattributes>ctext</I>
```

## 213.5.68 KBD Procedure

This procedure generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KEYBOARD Procedure](#) (page 213-48).

## Syntax

```
HTP.KBD(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-52** KBD Procedure Parameters

Parameter	Description
<code>c<sub>text</sub></code>	The text to be rendered in monospace.
<code>c<sub>attributes</sub></code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

## 213.5.69 KEYBOARD Procedure

This procedure generates the `<KBD>` and `</KBD>` tags, which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KBD Procedure](#) (page 213-48).

**Syntax**

```
HTP.KEYBOARD(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-53** KEYBOARD Procedure Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

## 213.5.70 LINE Procedure

This procedure generates the `<HR>` tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [HR Procedure](#) (page 213-44).

**Syntax**

```
HTP.LINE(
 cclear IN VARCHAR2 DEFAULT NULL,
 csrc IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-54** LINE Procedure Parameters

Parameter	Description
cclear	The value for the <code>CLEAR</code> attribute.
csrc	The value for the <code>SRC</code> attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

## 213.5.71 LINKREL Procedure

This procedure generates the `<LINK>` tag with the `REL` attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the `HREF` attribute is present.

This is the opposite of [LINKREV Procedure](#) (page 213-50). This tag indicates a relationship between documents but does not create a link. To create a link, use the [ANCHOR Procedure](#) (page 213-12).

### Syntax

```
HTP.LINKREL(
 crel IN VARCHAR2,
 curl IN VARCHAR2,
 ctitle IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-55 LINKREL Procedure Parameters**

Parameter	Description
<code>crel</code>	The value for the <code>REL</code> attribute.
<code>curl</code>	The value for the <code>URL</code> attribute.
<code>ctitle</code>	The value for the <code>TITLE</code> attribute.

### Examples

This procedure generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

## 213.5.72 LINKREV Procedure

This procedure generates the `<LINK>` tag with the `REV` attribute which delineates the relationship described by the hypertext link from the target to the anchor.

This is the opposite of the [LINKREL Procedure](#) (page 213-50). This tag indicates a relationship between documents, but does not create a link. To create a link, use the [ANCHOR Procedure](#) (page 213-12).

### Syntax

```
HTP.LINKREV(
 crev IN VARCHAR2,
 curl IN VARCHAR2,
 ctitle IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-56 LINKREV Procedure Parameters**

Parameter	Description
<code>crel</code>	The value for the <code>REV</code> attribute.
<code>curl</code>	The value for the <code>URL</code> attribute.
<code>ctitle</code>	The value for the <code>TITLE</code> attribute.

## Examples

This procedure generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

## 213.5.73 LISTHEADER Procedure

This procedure generates the `<LH>` and `</LH>` tags which print an HTML tag at the beginning of the list.

### Syntax

```
HTP.LISTHEADER(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-57 LISTHEADER Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to place between <code>&lt;LH&gt;</code> and <code>&lt;/LH&gt;</code> .
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<LH cattributes>ctext</LH>
```

## 213.5.74 LISTINGCLOSE Procedure

This procedure generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page.

To mark the beginning of a section of fixed-width text in the body of an HTML page, use the [LISTINGOPEN Procedure](#) (page 213-52).

### Syntax

```
HTP.LISTINGCLOSE;
```

### Examples

This procedure generates

```
</LISTING>
```

## 213.5.75 LISTINGOPEN Procedure

This procedure generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page.

To mark the end of a section of fixed-width text in the body of an HTML page, use the [LISTINGCLOSE Procedure](#) (page 213-51).

### Syntax

```
HTP.LISTINGOPEN;
```

### Examples

This procedure generates

```
<LISTING>
```

## 213.5.76 LISTITEM Procedure

This procedure generates the `<LI>` tag, which indicates a list item.

### Syntax

```
HTP.LISTITEM(
 ctext IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cdingbat IN VARCHAR2 DEFAULT NULL,
 csrc IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-58 LISTITEM Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text for the list item.
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cdingbat</code>	The value for the <code>DINGBAT</code> attribute.
<code>csrc</code>	The value for the <code>SRC</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

## 213.5.77 MAILTO Procedure

This procedure generates the <A> tag with the `HREF` set to 'mailto' prepended to the mail address argument.

### Syntax

```
HTP.MAILTO(
 address IN VARCHAR2,
 ctext IN VARCHAR2,
 cname IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-59 MAILTO Procedure Parameters**

Parameter	Description
<code>caddress</code>	The email address of the recipient.
<code>ctext</code>	The clickable portion of the link.
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
ctext
```

so that

```
HTP.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
Send Email to the President
```

## 213.5.78 MAPCLOSE Procedure

This procedure generates the </MAP> tag which marks the end of a set of regions in a client-side image map.

To mark the beginning of a set of regions in a client-side image map, use the [MAOPEN Procedure](#) (page 213-54).

### Syntax

```
HTP.MAPCLOSE;
```

### Examples

This procedure generates

```
</MAP>
```

## 213.5.79 MAPOPEN Procedure

This procedure generates the `<MAP>` tag which mark the beginning of a set of regions in a client-side image map.

To mark the end of a set of regions in a client-side image map, use the [MAPCLOSE Procedure](#) (page 213-53).

### Syntax

```
HTP.MAPOPEN(
 cname IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-60 MAPOPEN Procedure Parameters**

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<MAP NAME="cname" cattributes>
```

## 213.5.80 MENULISTCLOSE Procedure

This procedure generates the `</MENU>` tag which ends a list that presents one line for each item.

To begin a list of this kind, use the [MENULISTOPEN Procedure](#) (page 213-54). The items in the list appear more compact than an unordered list. The [LISTITEM Procedure](#) (page 213-52) defines the list items in a menu list.

### Syntax

```
HTP.MENULISTCLOSE;
```

### Examples

This procedure generates

```
</MENU>
```

## 213.5.81 MENULISTOPEN Procedure

This procedure generates the `<MENU>` tag which begins a list that presents one line for each item.

To end a list of this kind, use the [MENULISTCLOSE Procedure](#) (page 213-54). The items in the list appear more compact than an unordered list. The [LISTITEM Procedure](#) (page 213-52) defines the list items in a menu list.

**Syntax**

```
HTP.MENULISTOPEN;
```

**Examples**

This procedure generates

```
<MENU>
```

## 213.5.82 META Procedure

This procedure generates the `<META>` tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

**Syntax**

```
HTP.META(
 chttp_equiv IN VARCHAR2,
 cname IN VARCHAR2,
 ccontent IN VARCHAR2);
```

**Parameters****Table 213-61 META Procedure Parameters**

Parameter	Description
<code>chttp_equiv</code>	The value for the <code>CHTTP_EQUIV</code> attribute.
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>ccontent</code>	The value for the <code>CONTENT</code> attribute.

**Examples**

This procedure generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTP.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

## 213.5.83 NL Procedure

This procedure generates the `<BR>` tag which begins a new line of text.

It performs the same operation as the [BR Procedure](#) (page 213-20).

**Syntax**

```
HTP.NL(
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-62 NL Procedure Parameters**

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

## 213.5.84 NOBR Procedure

This procedure generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

**Syntax**

```
HTP.NOBR(
 ctext IN VARCHAR2);
```

**Parameters****Table 213-63 NOBR Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text that is to be rendered on one line.

**Examples**

This procedure generates

```
<NOBR>ctext</NOBR>
```

## 213.5.85 NOFRAMESCLOSE Procedure

This procedure generates the `</NOFRAMES>` tag which marks the end of a no-frames section.

To mark the beginning of a no-frames section, use the [FRAMESETOPEN Procedure](#) (page 213-42). See also [FRAME Procedure](#) (page 213-41), [FRAMESETOPEN Procedure](#) (page 213-42) and [FRAMESETCLOSE Procedure](#) (page 213-42).

### Syntax

```
HTP.NOFRAMESCLOSE;
```

### Examples

This procedure generates

```
</NOFRAMES>
```

## 213.5.86 NOFRAMESOPEN Procedure

This procedure generates the `<NOFRAMES>` tag which mark the beginning of a no-frames section.

To mark the end of a no-frames section, use the [FRAMESETCLOSE Procedure](#) (page 213-42). See also [FRAME Procedure](#) (page 213-41), [FRAMESETOPEN Procedure](#) (page 213-42) and [FRAMESETCLOSE Procedure](#) (page 213-42).

### Syntax

```
HTP.NOFRAMESOPEN;
```

### Examples

This procedure generates

```
<NOFRAMES>
```

## 213.5.87 OLISTCLOSE Procedure

This procedure generates the `</OL>` tag which defines the end of an ordered list. An ordered list presents a list of numbered items.

To mark the beginning of a list of this kind, use the [OLISTOPEN Procedure](#) (page 213-57). Numbered items are added using [LISTITEM Procedure](#) (page 213-52).

### Syntax

```
HTP.OLISTCLOSE;
```

### Examples

This procedure generates

```

```

## 213.5.88 OLISTOPEN Procedure

This procedure generates the `<OL>` tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items.

To mark the end of a list of this kind, use the [OLISTCLOSE Procedure](#) (page 213-57). Numbered items are added using [LISTITEM Procedure](#) (page 213-52).

**Syntax**

```
HTP.OLISTOPEN(
 cclear IN VARCHAR2 DEFAULT NULL,
 cwrap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-64** OLISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

## 213.5.89 PARA Procedure

This procedure generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

You can add attributes to the tag by means of the [PARAGRAPH Procedure](#) (page 213-58).

**Syntax**

```
HTP.PARA;
```

**Examples**

This procedure generates

```
<P>
```

## 213.5.90 PARAGRAPH Procedure

You can use this procedure to add attributes to the <P> tag created by the PARA Procedure.

**Syntax**

```
HTP.PARAGRAPH(
 calign IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-65** PARAGRAPH Procedure Parameters

Parameter	Description
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cnowrap</code>	If the value for this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

## Related Topics:

- [PARA Procedure](#) (page 213-58)  
This procedure generates the `<P>` tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

## 213.5.91 PARAM Procedure

This procedure generates the `<PARAM>` tag which specifies parameter values for Java applets.

The values can reference HTML variables. To invoke a Java applet from a Web page, use [APPLETOPEN Procedure](#) (page 213-14) to begin the invocation. Use one [PARAM Procedure](#) (page 213-59) for each desired name-value pair, and use [APPLETCLOSE Procedure](#) (page 213-14) to end the applet invocation.

## Syntax

```
HTP.PARAM(
 cname IN VARCHAR2
 cvalue IN VARCHAR2);
```

## Parameters

**Table 213-66** PARAM Procedure Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.

## Examples

This procedure generates

```
<PARAM NAME=cname VALUE="cvalue">
```

## 213.5.92 PLAINTEXT Procedure

This procedure generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

### Syntax

```
HTP.PLAINTEXT(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-67** PLAINTEXT Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to be rendered in fixed-width font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

## 213.5.93 PRECLOSE Procedure

This procedure generates the `</PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page.

To mark the beginning of a section of preformatted text in the body of the HTML page, use the [PREOPEN Procedure](#) (page 213-60).

### Syntax

```
HTP.PRECLOSE;
```

### Examples

This procedure generates

```
</PRE>
```

## 213.5.94 PREOPEN Procedure

This procedure generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page.

To mark the end of a section of preformatted text in the body of the HTML page, use the [PRECLOSE Procedure](#) (page 213-60).

### Syntax

```
HTP.PREOPEN(
 cclear IN VARCHAR2 DEFAULT NULL,
```

```

cwidth IN VARCHAR2 DEFAULT NULL,
cattributes IN VARCHAR2 DEFAULT NULL);

```

### Parameters

**Table 213-68** PREOPEN Procedure Parameters

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cwidth</code>	The value for the <code>WIDTH</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

## 213.5.95 PRINT Procedures

These procedures generate the specified parameter as a string terminated with the `\n` newline character.

The [PRN Procedures](#) (page 213-62) performs the same operation but does not terminate with a newline character.

### Syntax

```
HTP.PRINT (
 cbuf IN VARCHAR2);
```

```
HTP.PRINT (
 dbuf IN DATE);
```

```
HTP.PRINT (
 nbuf IN NUMBER);
```

### Parameters

**Table 213-69** PRINT Procedure Parameters

Parameter	Description
<code>cbuf</code>	The string to generate terminated by a newline.
<code>dbuf</code>	The string to generate terminated by a newline.
<code>nbuf</code>	The string to generate terminated by a newline.

### Usage Notes

- The `\n` character is not the same as `<BR>`. The `\n` character formats the HTML source but it does not affect how the browser renders the HTML source. Use `<BR>` to control how the browser renders the HTML source.
- These procedures do not have function equivalents.

## 213.5.96 PRINTS Procedure

This procedure generates a string and replaces certain characters with a corresponding escape sequence.

The following characters are replaced with the corresponding escape sequence.

- < to &lt;
- > to &gt;
- " to &quot;
- & to &amp;

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the [PS Procedure](#) (page 213-63) perform the same operation as the [PRN Procedures](#) (page 213-62) but with character substitution.

### Syntax

```
HTP.PRINTS (
 ctext IN VARCHAR2);
```

### Parameters

**Table 213-70 PRINTS Procedure Parameters**

Parameter	Description
ctext	The string where to perform character substitution.

### Usage Notes

This procedure does not have an HTF function equivalent (see [Operational Notes](#) (page 213-1) for the HTF implementation).

## 213.5.97 PRN Procedures

These procedures generate the specified parameter as a string.

Unlike the [PRINT Procedures](#) (page 213-61) the string is not terminated with the \n newline character.

### Syntax

```
HTP.PRN (
 cbuf IN VARCHAR2);
```

```
HTP.PRN (
 dbuf IN DATE);
```

```
HTP.PRN (
 nbuf IN NUMBER);
```

## Parameters

**Table 213-71 PRN Procedure Parameters**

Parameter	Description
cbuf	The string to generate (not terminated by a newline).
dbuf	The string to generate (not terminated by a newline).
nbuf	The string to generate (not terminated by a newline).

## Usage Notes

These procedures do not have function equivalents.

## 213.5.98 PS Procedure

This procedure generates a string and replaces certain characters with the corresponding escape sequence.

This procedure replaces the following characters with the corresponding escape sequence.

- < to &lt;
- > to &gt;
- " to &quot;
- & to &amp;

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the [PRINTS Procedure](#) (page 213-62) perform the same operation as the [PRN Procedures](#) (page 213-62) but with character substitution.

## Syntax

```
HTP.PS (
 ctext IN VARCHAR2);
```

## Parameters

**Table 213-72 PS Procedure Parameters**

Parameter	Description
ctext	The string where to perform character substitution.

## Usage Notes

This procedure does not have an HTF function equivalent (see [Operational Notes](#) (page 213-1) for the HTF implementation).

## 213.5.99 S Procedure

This procedure generates the `<S>` and `</S>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [STRIKE Procedure](#) (page 213-66).

### Syntax

```
HTP.S (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-73 S Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to be rendered in strikethrough type.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<S cattributes>ctext</S>
```

## 213.5.100 SAMPLE Procedure

This procedure generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

### Syntax

```
HTP.SAMPLE (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-74 SAMPLE Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to be rendered in monospace font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<SAMP cattributes>ctext</SAMP>
```

## 213.5.101 SCRIPT Procedure

This procedure generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBScript.

### Syntax

```
HTP.SCRIPT (
 cscript IN VARCHAR2,
 clanguage IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-75** SCRIPT Procedure Parameters

Parameter	Description
cscript	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
clanguage	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

### Examples

This procedure generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTP.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

## 213.5.102 SMALL Procedure

This procedure generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

### Syntax

```
HTP.SMALL (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-76** SMALL Procedure Parameters

Parameter	Description
ctext	The text to be rendered in small font.

**Table 213-76 (Cont.) SMALL Procedure Parameters**

Parameter	Description
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<SMALL cattributes>ctext</SMALL>
```

## 213.5.103 STRIKE Procedure

This procedure generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [S Procedure](#) (page 213-64).

**Syntax**

```
HTP.STRIKE (
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-77 STRIKE Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to be rendered in strikethrough type.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<STRIKE cattributes>ctext</STRIKE>
```

## 213.5.104 STRONG Procedure

This procedure generates the `<STRONG>` and `</STRONG>` tags which direct the browser to render the text they surround in bold, or however "strong" is defined.

**Syntax**

```
HTP.STRONG(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-78** STRONG Procedure Parameters

Parameter	Description
<code>c<sub>text</sub></code>	The text to be emphasized.
<code>c<sub>attributes</sub></code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<STRONG cattributes>ctext
```

## 213.5.105 STYLE Procedure

This procedure generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page.

You can get more information about style sheets at <http://www.w3.org>. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

## Syntax

```
HTP.STYLE(
 cstyle IN VARCHAR2);
```

## Parameters

**Table 213-79** STYLE Procedure Parameters

Parameter	Description
<code>c<sub>style</sub></code>	The the style information to include.

## Examples

This procedure generates

```
<STYLE>cstyle</STYLE>
```

## 213.5.106 SUB Procedure

This procedure generates the `<SUB>` and `</SUB>` tags which direct the browser to render the text they surround as subscript.

## Syntax

```
HTP.SUB(
 ctext IN VARCHAR2,
 calign in VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-80 SUB Procedure Parameters**

Parameter	Description
<code>c<sub>text</sub></code>	The text to render in subscript.
<code>c<sub>align</sub></code>	The value for the <code>ALIGN</code> attribute.
<code>c<sub>attributes</sub></code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
_{ctext}
```

## 213.5.107 SUP Procedure

This procedure generates the `<SUP>` and `</SUP>` tags which direct the browser to render the text they surround as superscript.

### Syntax

```
HTP.SUP(
 ctext IN VARCHAR2,
 calign in VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-81 SUP Procedure Parameters**

Parameter	Description
<code>c<sub>text</sub></code>	The text to render in superscript.
<code>c<sub>align</sub></code>	The value for the <code>ALIGN</code> attribute.
<code>c<sub>attributes</sub></code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
^{ctext}
```

## 213.5.108 TABLECAPTION Procedure

This procedure generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

### Syntax

```
HTP.TABLECAPTION(
 ccaption IN VARCHAR2,
```

```

 calign in VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);

```

### Parameters

**Table 213-82** TABLECAPTION Procedure Parameters

Parameter	Description
c <code>text</code>	The text for the caption.
c <code>align</code>	The value for the <code>ALIGN</code> attribute.
c <code>attributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

## 213.5.109 TABLECLOSE Procedure

This procedure generates the `</TABLE>` tag which marks the end of an HTML table.

To define the beginning of an HTML table, use the [TABLEOPEN Procedure](#) (page 213-71).

### Syntax

```
HTP.TABLECLOSE;
```

### Examples

This procedure generates

```
</TABLE>
```

## 213.5.110 TABLEDATA Procedure

This procedure generates the `<TD>` and `</TD>` tags which insert data into a cell of an HTML table.

### Syntax

```

HTP.TABLEDATA(
 cvalue IN VARCHAR2 DEFAULT NULL,
 calign IN VARCHAR2 DEFAULT NULL,
 cdp IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 crowspan IN VARCHAR2 DEFAULT NULL,
 ccolspan IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 213-83 TABLEDATA Procedure Parameters**

Parameter	Description
<code>cvalue</code>	The data for the cell in the table.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cdp</code>	The value for the <code>DP</code> attribute.
<code>cnowrap</code>	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>ccolspan</code>	The value for the <code>COLSPAN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

## Examples

This procedure generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

## 213.5.111 TABLEHEADER Procedure

This procedure generates the `<TH>` and `</TH>` tags which insert a header cell in an HTML table.

The `<TH>` tag is similar to the `<TD>` tag except that the text in this case the rows are usually rendered in bold type.

## Syntax

```
HTP.TABLEHEADER(
 cvalue IN VARCHAR2 DEFAULT NULL,
 calign IN VARCHAR2 DEFAULT NULL,
 cdp IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 crowspan IN VARCHAR2 DEFAULT NULL,
 ccolspan IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 213-84 TABLEHEADER Procedure Parameters**

Parameter	Description
<code>cvalue</code>	The data for the cell in the table.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cdp</code>	The value for the <code>DP</code> attribute.
<code>cnowrap</code>	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>crispen</code>	The value for the <code>ROWSPAN</code> attribute.

**Table 213-84 (Cont.) TABLEHEADER Procedure Parameters**

Parameter	Description
<code>c colspan</code>	The value for the <code>COLSPAN</code> attribute.
<code>c attributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
c attributes>cvalue</TH>
```

## 213.5.112 TABLEOPEN Procedure

This procedure generates the `<TABLE>` tag which marks the beginning of an HTML table.

To define the end of an HTML table, use the [TABLECLOSE Procedure](#) (page 213-69).

**Syntax**

```
HTP.TABLEOPEN(
 cborder IN VARCHAR2 DEFAULT NULL
 calign IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cclear IN VARCHAR2 DEFAULT NULL
 c attributes IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 213-85 TABLEOPEN Procedure Parameters**

Parameter	Description
<code>border</code>	The value for the <code>BORDER</code> attribute.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cnowrap</code>	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>c attributes</code>	The other attributes to be included as-is in the tag.

**Examples**

This procedure generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" c attributes>
```

## 213.5.113 TABLEROWCLOSE Procedure

This procedure generates the `</TR>` tag which marks the end of a new row in an HTML table.

To mark the beginning of a new row, use the [TABLEROWOPEN Procedure](#) (page 213-72).

### Syntax

```
HTP.TABLEROWCLOSE;
```

### Examples

This procedure generates

```
</TABLE>
```

## 213.5.114 TABLEROWOPEN Procedure

This procedure generates the `<TR>` tag which marks the beginning of a new row in an HTML table.

To mark the end of a new row, use the [TABLEROWCLOSE Procedure](#) (page 213-72).

### Syntax

```
HTP.TABLEROWOPEN(
 calign IN VARCHAR2 DEFAULT NULL,
 cvalign IN VARCHAR2 DEFAULT NULL,
 cdp IN VARCHAR2 DEFAULT NULL,
 cnowrap IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-86** TABLEROWOPEN Procedure Parameters

Parameter	Description
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cvalign</code>	The value for the <code>VALIGN</code> attribute.
<code>cdp</code>	The value for the <code>DP</code> attribute.
<code>cnowrap</code>	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

## 213.5.115 TELETYPE Procedure

This procedure generates the `<TT>` and `</TT>` tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

### Syntax

```
HTP.TELETYPE(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-87 TELETYPE Procedure Parameters**

Parameter	Description
<code>ctext</code>	The text to render in a fixed width typewriter font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<TT cattributes>ctext</TT>
```

## 213.5.116 TITLE Procedure

This procedure generates the `<TITLE>` and `</TITLE>` tags which specify the text to display in the titlebar of the browser window.

### Syntax

```
HTP.TITLE(
 ctitle IN VARCHAR2);
```

### Parameters

**Table 213-88 TITLE Procedure Parameters**

Parameter	Description
<code>ctitle</code>	The text to display in the titlebar of the browser window.

### Examples

This procedure generates

```
<TITLE>ctitle</TITLE>
```

## 213.5.117 ULISTCLOSE Procedure

This procedure generates the `</UL>` tag which marks the end of an unordered list. An unordered list presents items with bullets.

To mark the beginning of an unordered list, use the [ULISTOPEN Procedure](#) (page 213-74). Add list items with [LISTITEM Procedure](#) (page 213-52).

### Syntax

```
HTP.ULISTCLOSE;
```

### Examples

This procedure generates

```
</TABLE>
```

## 213.5.118 ULISTOPEN Procedure

This procedure generates the `<UL>` tag which marks the beginning of an unordered list. An unordered list presents items with bullets.

To mark the end of an unordered list, use the [ULISTCLOSE Procedure](#) (page 213-74). Add list items with [LISTITEM Procedure](#) (page 213-52).

### Syntax

```
HTP.ULISTOPEN(
 cclear IN VARCHAR2 DEFAULT NULL,
 cwrap IN VARCHAR2 DEFAULT NULL,
 cdingbat IN VARCHAR2 DEFAULT NULL,
 csrc IN VARCHAR2 DEFAULT NULL,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-89** ULISTOPEN Procedure Parameters

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cwrap</code>	The value for the <code>WRAP</code> attribute.
<code>cdingbat</code>	The value for the <code>DINGBAT</code> attribute.
<code>csrc</code>	The value for the <code>SRC</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

## 213.5.119 UNDERLINE Procedure

This procedure generates the `<U>` and `</U>` tags, which direct the browser to render the text they surround with an underline.

### Syntax

```
HTP.UNDERLINE(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-90** UNDERLINE Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to render with an underline.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<U cattributes>ctext</U>
```

## 213.5.120 VARIABLE Procedure

This procedure generates the `<VAR>` and `</VAR>` tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

### Syntax

```
HTP.VARIABLE(
 ctext IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 213-91** VARIABLE Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to render in italics.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

### Examples

This procedure generates

```
<VAR cattributes>ctext</VAR>
```

## 213.5.121 WBR Procedure

This procedure generates the `<WBR>` tag, which inserts a soft line break within a section of `NOBR` text.

### Syntax

```
HTP.WBR;
```

### Examples

This procedure generates

```
<WBR>
```

## ORD\_AUDIO

This Oracle Multimedia package supports the management and manipulation of audio data stored in BLOBs and BFILES.

The Oracle Multimedia `ORD_AUDIO` package provides functions and procedures to perform common operations such as exporting audio data from Oracle Database into operating system files, and extracting information from audio data. Information from audio data such as format, encoding type, and sampling rate can be extracted from audio data into an XML string and optionally into individual attributes.

For a complete description of this package within the context of Oracle Multimedia, see `ORD_AUDIO` in the *Oracle Multimedia Reference*.

## ORD\_DICOM

This Oracle Multimedia package supports the management and manipulation of Digital Imaging and Communications in Medicine (DICOM) content stored in BLOBs or BFILES.

 **Note:**

ORD\_DICOM is deprecated in Oracle Database 12c Release 2 (12.2). Oracle recommends that you do not use deprecated features. Support for deprecated features is for backward compatibility only.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other content, such as single-frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

The Oracle Multimedia `ORD_DICOM` package provides functions and procedures to extract standard and private DICOM metadata from DICOM content into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM content. This Oracle Multimedia package also provides functions and procedures to check DICOM content for conformance based on a set of user-specified conformance rules, and to make DICOM content anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

For a complete description of this package within the context of Oracle Multimedia, see `ORD_DICOM` in the *Oracle Multimedia DICOM Developer's Guide*.

## ORD\_DICOM\_ADMIN

This Oracle Multimedia package is used by Oracle Multimedia Digital Imaging and Communications in Medicine (DICOM) administrators to maintain the Oracle Multimedia DICOM data model repository.

 **Note:**

ORD\_DICOM\_ADMIN is deprecated in Oracle Database 12c Release 2 (12.2). Oracle recommends that you do not use deprecated features. Support for deprecated features is for backward compatibility only.

The DICOM data model repository is a collection of documents. An initial set of documents is loaded during installation. After installation, DICOM administrators can use the procedures and functions provided in the data model repository API of the Oracle Multimedia `ORD_DICOM_ADMIN` package to obtain document content as well as to insert, edit, and delete documents in the data model repository.

For a complete description of this package within the context of Oracle Multimedia, see `ORD_DICOM_ADMIN` in the *Oracle Multimedia DICOM Developer's Guide*.

## ORD\_DOC

This Oracle Multimedia package supports the management and manipulation of media data stored in BLOBs and BFILEs. This package can be used in applications that require different types of multimedia data such as image, audio, and video to be stored in the same BLOB or BFILE column.

The Oracle Multimedia `ORD_DOC` package provides functions and procedures to perform common operations such as exporting multimedia data from Oracle Database into operating system files, and extracting information from multimedia data. Information from image, audio, and video data such as format, mime type, and content length can be extracted into an XML string and optionally into individual attributes.

For a complete description of this package within the context of Oracle Multimedia, see `ORD_DOC` in the *Oracle Multimedia Reference*.

## ORD\_IMAGE

This Oracle Multimedia package supports the management and manipulation of image data stored in BLOBs and BFILES.

The Oracle Multimedia `ORD_IMAGE` package provides functions and procedures to perform common operations such as exporting image data from Oracle Database into operating system files, creating thumbnail images, converting images from one format to another, and extracting information from image data. Information from image data such as format, width, height, and compression type can be extracted from image data into an XML string and optionally into individual attributes.

For a complete description of this package within the context of Oracle Multimedia, see `ORD_IMAGE` in the *Oracle Multimedia Reference*.

## ORD\_VIDEO

This Oracle Multimedia package supports the management and manipulation of video data stored in BLOBs and BFILEs.

The Oracle Multimedia `ORD_VIDEO` package provides functions and procedures to perform common operations such as exporting video data from Oracle Database into operating system files, and extracting information from video data. Information from video data such as format, width, height, and frame rate can be extracted from video data into an XML string and optionally into individual attributes.

For a complete description of this package within the context of Oracle Multimedia, see `ORD_VIDEO` in the *Oracle Multimedia Reference*.

# 220

## OWA\_CACHE

The `OWA_CACHE` package provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications.

### See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Constants](#) (page 220-1)
- [Summary of OWA\\_CACHE Subprograms](#) (page 220-1)

## 220.1 OWA\_CACHE Constants

`OWA_CACHE` defines several constants to use when specifying parameter values.

- `system_level` CONSTANT VARCHAR(6) := 'SYSTEM';
- `user_level` CONSTANT VARCHAR(4) := 'USER';

## 220.2 Summary of OWA\_CACHE Subprograms

This table lists the `OWA_CACHE` subprograms and briefly describes them.

**Table 220-1 OWA\_CACHE Package Subprograms**

Subprogram	Description
<a href="#">DISABLE Procedure</a> (page 220-2)	Disables the cache for this particular request
<a href="#">GET_ETAG Function</a> (page 220-2)	Returns the tag associated with the cached content (used in the Validation technique model only)
<a href="#">GET_LEVEL Function</a> (page 220-2)	Returns the caching level (used in the Validation technique model only)
<a href="#">SET_CACHE Procedure</a> (page 220-2)	Sets up the cache headers for validation model cache type
<a href="#">SET_EXPIRES Procedure</a> (page 220-3)	Sets up the cache headers for expires model cache type
<a href="#">SET_NOT_MODIFIED Procedure</a> (page 220-3)	Sets up the headers for a not modified cache hit (used in the Validation technique model only)

**Table 220-1 (Cont.) OWA\_CACHE Package Subprograms**

Subprogram	Description
<a href="#">SET_SURROGATE_CONTROL Procedure</a> (page 220-4)	Sets up the headers for a surrogate-control header for Web cache

## 220.2.1 DISABLE Procedure

This procedure disables the cache for this particular request.

### Syntax

```
OWA_CACHE.DISABLE;
```

## 220.2.2 GET\_ETAG Function

This function returns the tag associated with the cached content. It is used in the Validation technique only.

### Syntax

```
OWA_CACHE.GET_ETAG
RETURN VARCHAR2;
```

### Return Values

The tag for cache hit, otherwise `NULL`.

## 220.2.3 GET\_LEVEL Function

This returns the caching level. It is used in the Validation technique model only.

### Syntax

```
OWA_CACHE.GET_LEVEL
RETURN VARCHAR2;
```

### Return Values

The caching level string ('USER' or 'SYSTEM') for cache hit, otherwise `NULL`.

## 220.2.4 SET\_CACHE Procedure

This procedure sets up the cache headers for validation model cache type.

### Syntax

```
OWA_CACHE.SET_CACHE(
 p_etag IN VARCHAR2,
 p_level IN VARCHAR2);
```

## Parameters

**Table 220-2** *SET\_CACHE Procedure Parameters*

Parameter	Description
p_etag	The etag associated with this content
p_level	The caching level ('USER' or 'SYSTEM').

## Exceptions

VALUE\_ERROR is thrown if

- p\_etag is greater than 55
- p\_level is not 'USER' or 'SYSTEM'

## 220.2.5 SET\_EXPIRES Procedure

This procedure sets up the cache headers for expires model cache type.

### Syntax

```
OWA_CACHE.SET_EXPIRES(
 p_expires IN NUMBER,
 p_level IN VARCHAR2);
```

## Parameters

**Table 220-3** *SET\_EXPIRES Procedure Parameters*

Parameter	Description
p_expires	The number of minutes this content is valid.
p_level	The caching level ('USER' or 'SYSTEM').

## Exceptions

VALUE\_ERROR is thrown if

- p\_expires is negative or zero
- p\_level is not 'USER' or 'SYSTEM'
- p\_expires is > 525600 (1 year)

## 220.2.6 SET\_NOT\_MODIFIED Procedure

This procedure sets up the headers for a not-modified cache hit. It is used in the Validation technique only.

### Syntax

```
OWA_CACHE.SET_NOT_MODIFIED;
```

### Exceptions

VALUE\_ERROR is thrown if If the etag was not passed in

## 220.2.7 SET\_SURROGATE\_CONTROL Procedure

This procedure sets the headers for a surrogate-control header for Web cache

### Syntax

```
OWA_CACHE.SET_SURROGATE_CONTROL(
 p_value IN VARCHAR2);
```

### Parameters

**Table 220-4 SET\_SURROGATE\_CONTROL Procedure Parameters**

Parameter	Description
p_value	The value to be passed as the Surrogate-Control header.

### Exceptions

VALUE\_ERROR is thrown if If p\_value is greater than 55 in length.

# 221

## OWA\_COOKIE

The OWA\_COOKIE package provides an interface for sending and retrieving HTTP cookies from the client's browser.

### See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Overview](#) (page 221-1)
- [Types](#) (page 221-1)
- [Rules and Limits](#) (page 221-1)
- [Summary of OWA\\_COOKIE Subprograms](#) (page 221-2)

### 221.1 OWA\_CUSTOM Overview

Cookies are opaque strings sent to the browser to maintain state between HTTP calls. State can be maintained throughout the client's sessions, or longer if an expiration date is included. The system date is calculated with reference to the information specified in the OWA\_CUSTOM package.

### 221.2 OWA\_COOKIE Types

This datatype contains cookie name-value pairs.

Since the HTTP standard allows cookie names to be overloaded (that is, multiple values can be associated with the same cookie name), there is a PL/SQL RECORD holding all values associated with a given cookie name.

```
TYPE vc_arr IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER.
```

```
TYPE COOKIE IS RECORD (
 name VARCHAR2(4000),
 vals vc_arr,
 num_vals INTEGER);
```

### 221.3 OWA\_COOKIE Rules and Limits

All HTTP headers must be in English and the ASCII character set. If the headers are generated from the database, verify they are created in the English language.

## 221.4 Summary of OWA\_COOKIE Subprograms

This table lists the OWA\_COOKIE subprograms and briefly describes them.

**Table 221-1 OWA\_COOKIE Package Subprograms**

Subprogram	Description
<a href="#">GET Function</a> (page 221-2)	Gets the value of the specified cookie
<a href="#">GET_ALL Procedure</a> (page 221-2)	Gets all cookie name-value pairs
<a href="#">REMOVE Procedure</a> (page 221-3)	Removes the specified cookie
<a href="#">SEND procedure</a> (page 221-3)	Generates a "Set-Cookie" line in the HTTP header

### 221.4.1 GET Function

This function returns the values associated with the specified cookie. The values are returned in a OWA\_COOKIE.COOKIE DATA TYPE .

#### Syntax

```
OWA_COOKIE.GET(
 name IN VARCHAR2)
RETURN COOKIE;
```

#### Parameters

**Table 221-2 GET Function Parameters**

Parameter	Description
name	The name of the cookie.

#### Return Values

OWA\_COOKIE.COOKIE DATA TYPE.

### 221.4.2 GET\_ALL Procedure

This procedure returns all cookie names and their values from the client's browser. The values appear in the order in which they were sent from the browser.

#### Syntax

```
OWA_COOKIE.GET_ALL(
 names OUT vc_arr,
 vals OUT vc_arr,
 num_vals OUT INTEGER);
```

## Parameters

**Table 221-3 GET\_ALL Procedure Parameters**

Parameter	Description
names	The names of the cookies.
vals	The values of the cookies.
num_vals	The number of cookie-value pairs.

## 221.4.3 REMOVE Procedure

This procedure forces a cookie to expire immediately by setting the "expires" field of a Set-Cookie line in the HTTP header to "01-Jan-1990".

This procedure must be called within the context of an HTTP header.

### Syntax

```
OWA_COOKIE.REMOVE(
 name IN VARCHAR2,
 val IN VARCHAR2,
 path IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 221-4 REMOVE Procedure Parameters**

Parameter	Description
name	The name of the cookie to expire.
val	The value of the cookie.
path	[Currently unused]

## 221.4.4 SEND procedure

This procedure generates a Set-Cookie line, which transmits a cookie to the client.

This procedure must occur in the context of an HTTP header.

### Syntax

```
OWA_COOKIE.SEND(
 name in varchar2,
 value in varchar2,
 expires in date DEFAULT NULL,
 path in varchar2 DEFAULT NULL,
 domain in varchar2 DEFAULT NULL,
 secure in varchar2 DEFAULT NULL);
```

## Parameters

**Table 221-5 SEND Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
name	The name of the cookie.
value	The value of the cookie.
expires	The date at which the cookie will expire
path	The value for the path field.
domain	The value for the domain field.
secure	If the value of this parameter is not NULL, the "secure" field is added to the line.

# OWA\_CUSTOM

The `OWA_CUSTOM` package provides a Global PLSQL Agent Authorization callback function.

It is used when PLSQL Agent's authorization scheme is set to `GLOBAL` or `CUSTOM` when there is no overriding `OWA_CUSTOM` package.

## See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Constants](#) (page 222-1)
- [Summary of OWA\\_CUSTOM Subprograms](#) (page 222-1)

## 222.1 OWA\_CUSTOM Constants

`OWA_CUSTOM` defines several constants to use when specifying parameter values.

- `dbms_server_timezone` CONSTANT VARCHAR2(3) := 'PST';
- `dbms_server_gmtdiff` CONSTANT NUMBER := NULL;

## 222.2 Summary of OWA\_CUSTOM Subprograms

The `AUTHORIZE` function is the only subprogram in the `OWA_CUSTOM` package.

**Table 222-1** *OWA\_CUSTOM Package Subprograms*

Subprogram	Description
<a href="#">AUTHORIZE</a> Function (page 222-2)	Provides a Global PLSQL Agent Authorization callback function

## 222.2.1 AUTHORIZE Function

This function is used when PLSQL Agent's authorization scheme is set to GLOBAL or CUSTOM when there is no overriding OWA\_CUSTOM package.

### Syntax

```
OWA_CUSTOM.AUTHORIZE
RETURN BOOLEAN;
```

# 223

## OWA\_IMAGE

The `OWA_IMAGE` package provides an interface to access the coordinates where a user clicked on an image.

The chapter contains the following topics:

- [Overview](#) (page 223-1)
- [Types](#) (page 223-1)
- [Variables](#) (page 223-1)
- [Examples](#) (page 223-2)
- [Summary of OWA\\_IMAGE Subprograms](#) (page 223-2)

### See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

## 223.1 OWA\_IMAGE Overview

Use this package when you have any image map whose destination links invoke the PL/SQL Gateway.

## 223.2 OWA\_IMAGE Types

This datatype (`point`) contain the `x` and `y` values of a coordinate, and so provides the coordinates of a user's click on an imagemap.

It is defined as:

```
TYPE POINT IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER
```

## 223.3 OWA\_IMAGE Variables

This package variable (`null_point`) of `TYPE POINT` is used to default point parameters. Both the `X` and the `Y` fields of this variable are `NULL`.

## 223.4 OWA\_IMAGE Examples

This example shows use of OWA\_IMAGE.

```
CREATE OR REPLACE PROCEDURE process_image
 (my_img in OWA_IMAGE.POINT)
AS
 x integer := OWA_IMAGE.GET_X(my_img);
 y integer := OWA_IMAGE.GET_Y(my_img);
BEGIN
 /* process the coordinate */
END
```

## 223.5 Summary of OWA\_IMAGE Subprograms

This table lists the OWA\_IMAGE subprograms and briefly describes them.

**Table 223-1 OWA\_IMAGE Package Subprograms**

Subprogram	Description
<a href="#">GET_X Function</a> (page 223-2)	Gets the X value of a point type
<a href="#">GET_Y Function</a> (page 223-3)	Gets the Y value of a point type

### 223.5.1 GET\_X Function

This function returns the x coordinate of the point where the user clicked on an image map.

#### Syntax

```
OWA_IMAGE.GET_X(
 p IN point)
RETURN INTEGER;
```

#### Parameters

**Table 223-2 GET\_X Function Parameters**

Parameter	Description
p	The point where the user clicked.

#### Return Values

The X coordinate as an integer.

## 223.5.2 GET\_Y Function

This function returns the Y coordinate of the point where the user clicked on an image map.

### Syntax

```
OWA_IMAGE.GET_Y(
 p IN point)
 RETURN INTEGER;
```

### Parameters

**Table 223-3** GET\_Y Function Parameters

Parameter	Description
p	The point where the user clicked.

### Return Values

The Y coordinate as an integer.

# OWA\_OPT\_LOCK

The `OWA_OPT_LOCK` package contains subprograms that impose optimistic locking strategies so as to prevent lost updates.

This chapter contains the following topics:

- [Overview](#) (page 224-1)
- [Types](#) (page 224-1)
- [Summary of OWA\\_OPT\\_LOCK Subprograms](#) (page 224-2)

## See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

## 224.1 OWA\_OPT\_LOCK Overview

The `OWA_OPT_LOCK` package contains subprograms that impose optimistic locking strategies, so as to prevent lost updates.

It checks if the row that the user is interested in updating has been changed by someone else in the meantime.

The PL/SQL Gateway cannot use conventional database locking schemes because HTTP is a stateless protocol. The `OWA_OPT_LOCK` package gives you two ways of dealing with the lost update problem:

- The hidden fields method stores the previous values in hidden fields in the HTML page. When the user requests an update, the PL/SQL Gateway checks these values against the current state of the database. The update operation is performed only if the values match. To use this method, call the `owa_opt_lock.store_values` procedure.
- The checksum method stores a checksum rather than the values themselves. To use this method, call the `owa_opt_lock.checksum` function.

These methods are optimistic. They do not prevent other users from performing updates, but they do reject the current update if an intervening update has occurred.

## 224.2 OWA\_TEXT Types

This datatype is a PL/SQL table intended to hold ROWIDs.

```
TYPE VCARRAY IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER
```

Note that this is different from the `OWA_TEXT.VC_ARR DATA TYPE`.

## 224.3 Summary of OWA\_OPT\_LOCK Subprograms

This table lists the `OWA_OPT_LOCK` subprograms and briefly describes them.

**Table 224-1 OWA\_OPT\_LOCK Package Subprograms**

Subprogram	Description
<a href="#">CHECKSUM Functions</a> (page 224-2)	Returns the checksum value
<a href="#">GET_ROWID Function</a> (page 224-3)	Returns the ROWID value
<a href="#">STORE_VALUES Procedure</a> (page 224-3)	Stores unmodified values in hidden fields for later verification
<a href="#">VERIFY_VALUES Function</a> (page 224-4)	Verifies the stored values against modified values

### 224.3.1 CHECKSUM Functions

This function returns a `checksum` value for a specified string, or for a row in a table. For a row in a table, the function calculates the `checksum` value based on the values of the columns in the row. This function comes in two versions.

The first version returns a `checksum` based on the specified string. This is a "pure" 32-bit `checksum` executed by the database and based on the Internet 1 protocol.

The second version returns a `checksum` based on the values of a row in a table. This is a "impure" 32-bit checksum based on the Internet 1 protocol.

#### Syntax

```
OWA_OPT_LOCK.CHECKSUM(
 p_buff IN VARCHAR2)
 RETURN NUMBER;
```

```
OWA_OPT_LOCK.CHECKSUM(
 p_owner IN VARCHAR2,
 p_tname IN VARCHAR2,
 p_rowid IN ROWID)
 RETURN NUMBER;
```

#### Parameters

**Table 224-2 CHECKSUM Function Parameters**

Parameter	Description
<code>p_buff</code>	The nstring where you want to calculate the <code>checksum</code> .
<code>p_owner</code>	The owner of the table.
<code>p_tname</code>	The table name.

**Table 224-2 (Cont.) CHECKSUM Function Parameters**

Parameter	Description
p_rowid	The row in p_tname where you want to calculate the checksum value. Use the <a href="#">GET_ROWID Function</a> (page 224-3) to convert VCARRAY values to proper rowids.

## 224.3.2 GET\_ROWID Function

This function returns the ROWID datatype from the specified OWA\_OPT\_LOCK.VCARRAY DATA TYPE.

### Syntax

```
OWA_OPT_LOCK.GET_ROWID(
 p_old_values IN vccarray)
RETURN ROWID;
```

### Parameters

**Table 224-3 GET\_ROWID Function Parameters**

Parameter	Description
p_old_values	This parameter is usually passed in from an HTML form.

## 224.3.3 STORE\_VALUES Procedure

This procedure stores the column values of the row that you want to update later. The values are stored in hidden HTML form elements.

### Syntax

```
OWA_OPT_LOCK.STORE_VALUES(
 p_owner IN VARCHAR2,
 p_tname IN VARCHAR2,
 p_rowid IN ROWID);
```

### Parameters

**Table 224-4 STORE\_VALUES Procedure Parameters**

Parameter	Description
p_owner	The owner of the table.
p_tname	The name of the table.
p_rowid	The row where you want to store values.

## Usage Notes

Before updating the row, compare these values with the current row values to ensure that the values in the row have not been changed. If the values have changed, you can warn the users and let them decide if the update should take place.

The procedure generates series of hidden form elements:

- One hidden form element is created for the table owner. The name of the element is "old\_p\_tname", where p\_tname is the name of the table. The value of the element is the owner name.
- One hidden form element is created for the table name. The name of the element is "old\_p\_tname", where p\_tname is the name of the table. The value of the element is the table name.
- One element is created for each column in the row. The name of the element is "old\_p\_tname", where p\_tname is the name of the table. The value of the element is the column value.

See also the [VERIFY\\_VALUES Function](#) (page 224-4).

## 224.3.4 VERIFY\_VALUES Function

This function verifies whether values in the specified row have been updated since the last query.

Use this function with the [STORE\\_VALUES Procedure](#) (page 224-3).

### Syntax

```
OWA_OPT_LOCK.VERIFY_VALUES(
 p_old_values IN varray)
 RETURN BOOLEAN;
```

### Parameters

**Table 224-5 VERIFY\_VALUES Function Parameters**

Parameter	Description
p_old_values	<p>A PL/SQL table containing the following information:</p> <ul style="list-style-type: none"> <li>• p_old_values(1) specifies the owner of the table.</li> <li>• p_old_values(2) specifies the table.</li> <li>• p_old_values(3) specifies the rowid of the row to verify.</li> </ul> <p>The remaining indexes contain values for the columns in the table.</p> <p>Typically, this parameter is passed in from the HTML form, where you have previously called the <a href="#">STORE_VALUES Procedure</a> (page 224-3) to store the row values on hidden form elements.</p>

### Return Values

TRUE if no other update has been performed, otherwise FALSE.

# OWA\_PATTERN

The OWA\_PATTERN package provides an interface to locate text patterns within strings and replace the matched string with another string.

## See Also:

For more information about implementation of this package, see the following:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Types](#) (page 225-1)
- [Operational Notes](#) (page 225-1)
- [Summary of OWA\\_PATTERN Subprograms](#) (page 225-3)

## 225.1 OWA\_PATTERN Types

You can use a pattern as both an input and output parameter. Because of this, you can pass the same regular expression to OWA\_PATTERN function calls, and it only has to be parsed once.

- OWA\_PATTERN.PATTERN

## 225.2 OWA\_PATTERN Operational Notes

The OWA\_PATTERN subprograms are overloaded. Specifically, there are six versions of MATCH, and four each of AMATCH and CHANGE.

The subprograms use the following parameters:

- `line` - This is the target to be examined for a match. It can be more than one line of text or a `owa_text.multi_line` datatype.
- `pat` - This is the pattern that the subprograms attempt to locate in line. The pattern can contain regular expressions. In the `owa_pattern.change` function and procedure, this parameter is called `from_str`.
- `flags` - This specifies whether the search is case-sensitive or if substitutions are done globally.

Use regular expressions with the subprograms in this package. You Specify a regular expression by creating the string you want to match interspersed with various wildcard tokens and quantifiers.

- [Wildcards](#) (page 225-2)
- [Quantifiers](#) (page 225-2)
- [Flags](#) (page 225-3)

## 225.2.1 OWA\_PATTERN Wildcards

Wildcard tokens match something other than themselves.

**Table 225-1** *Wildcard tokens recognized by OWA\_PATTERN package*

Token	Description
<code>^</code>	Matches newline or the beginning of the target
<code>\$</code>	Matches newline or the end of the target
<code>\n</code>	Matches newline
<code>.</code>	Matches any character except newline
<code>\t</code>	Matches tab
<code>\d</code>	Matches digits [0-9]
<code>\D</code>	Matches non-digits [not 0-9]
<code>\w</code>	Matches word characters (0-9, a-z, A-Z, or <code>_</code> )
<code>\W</code>	Matches non-word characters (not 0-9, a-z, A-Z, or <code>_</code> )
<code>\s</code>	Matches whitespace characters (blank, tab, or newline).
<code>\S</code>	Matches non-whitespace characters (not blank, tab, or newline)
<code>\b</code>	Matches "word" boundaries (between <code>\w</code> and <code>\W</code> )
<code>\x&lt;HEX&gt;</code>	Matches the value in the current character set of the two hexadecimal digits
<code>\&lt;OCT&gt;</code>	Matches the value in the current character set of the two or three octal digits
<code>\</code>	Followed by any character not covered by another case matches that character
<code>&amp;</code>	Applies only to <code>CHANGE</code> . This causes the string that matched the regular expression to be included in the string that replaces it. This differs from the other tokens in that it specifies how a target is changed rather than how it is matched. This is explained further under <a href="#">CHANGE Functions and Procedures</a> (page 225-5).

## 225.2.2 OWA\_PATTERN Quantifiers

Any tokens except `&` can have their meaning extended by any of the following quantifiers. You can also apply these quantifiers to literals.

**Table 225-2** **Quantifiers**

Quantifier	Description
<code>?</code>	0 or 1 occurrence(s)
<code>*</code>	0 or more occurrences
<code>+</code>	1 or more occurrence(s)
<code>{n}</code>	Exactly <i>n</i> occurrences

**Table 225-2 (Cont.) Quantifiers**

Quantifier	Description
$(n, \}$	At least $n$ occurrences
$\{n, m\}$	At least $n$ , but not more than $m$ , occurrences

## 225.2.3 OWA\_PATTERN Flags

In addition to targets and regular expressions, the `OWA_PATTERN` functions and procedures use flags to affect how they are interpreted.

**Table 225-3 Flags**

Flag	Description
<code>i</code>	This indicates a case-insensitive search.
<code>g</code>	This applies only to <code>CHANGE</code> . It indicates a global replace. That is, all portions of the target that match the regular expression are replaced.

## 225.3 Summary of OWA\_PATTERN Subprograms

This table lists the `OWA_PATTERN` subprograms and briefly describes them.

**Table 225-4 OWA\_PATTERN Package Subprograms**

Subprogram	Description
<a href="#">AMATCH Function</a> (page 225-3)	Determines if a string contains the specified pattern. It lets you specify where in the string the match has to occur
<a href="#">CHANGE Functions and Procedures</a> (page 225-5)	Replaces a pattern within a string. If you call it as a function it returns the number of times the regular expression was found and replaced
<a href="#">GETPAT Procedure</a> (page 225-6)	Generates a pattern datatype from a <code>VARCHAR2</code> type
<a href="#">MATCH Function</a> (page 225-7)	Determines if a string contains the specified pattern

### 225.3.1 AMATCH Function

This function specifies if a pattern occurs in a particular location in a string.

There are four versions to this function:

- The first and second versions of the function do not save the matched tokens (these are saved in the `backrefs` parameters in the third and fourth versions). The difference between the first and second versions is the `pat` parameter, which can be a `VARCHAR2` or a pattern datatype.
- The third and fourth versions of the function save the matched tokens in the `backrefs` parameter. The difference between the third and fourth versions is the `pat` parameter, which can be a `VARCHAR2` or a pattern datatype.

 **Note:**

If multiple overlapping strings match the regular expression, this function takes the longest match.

### Syntax

```
OWA_PATTERN.AMATCH(
 line IN VARCHAR2,
 from_loc IN INTEGER,
 pat IN VARCHAR2,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH(
 line IN VARCHAR2,
 from_loc IN INTEGER,
 pat IN OUT PATTERN,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH(
 line IN VARCHAR2
 from_loc IN INTEGER
 pat in varchar2
 backrefs OUT owa_text.vc_arr
 flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH(
 line IN VARCHAR2
 from_loc IN INTEGER
 pat IN OUT PATTERN
 backrefs OUT owa_text.vc_arr
 flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

### Parameters

**Table 225-5 AMATCH Function Parameters**

Parameter	Description
line	The text to search in.
from_loc	The location (in number of characters) in line where the search is to begin.
pat	The string to match. It can contain regular expressions. This can be either a VARCHAR2 or a pattern. If it is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

### Return Values

The index of the character after the end of the match, counting from the beginning of `line`. If there was no match, the function returns 0.

## 225.3.2 CHANGE Functions and Procedures

This function or procedure searches and replaces a string or `multi_line` datatype. If multiple overlapping strings match the regular expression, this subprogram takes the longest match.

### Syntax

```
OWA_PATTERN.CHANGE(
 line IN OUT VARCHAR2,
 from_str IN VARCHAR2,
 to_str IN VARCHAR2,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.CHANGE(
 line IN OUT VARCHAR2,
 from_str IN VARCHAR2,
 to_str IN VARCHAR2,
 flags IN VARCHAR2 DEFAULT NULL);
```

```
owa_pattern.change(
 mline IN OUT owa_text.multi_line,
 from_str IN VARCHAR2,
 to_str IN VARCHAR2,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.CHANGE(
 mline IN OUT owa_text.multi_line,
 from_str IN VARCHAR2,
 to_str IN VARCHAR2,
 flags IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 225-6 CHANGE Procedure Parameters**

Parameter	Description
<code>line</code>	The text to search in. The output value of this parameter is the altered string.
<code>mline</code>	The text to search in. This is a <code>owa_text.multi_line</code> datatype. The output value of this parameter is the altered string.
<code>from_str</code>	The regular expression to replace.
<code>to_str</code>	The substitution pattern.
<code>flags</code>	Whether or not the search is case-sensitive, and whether or not changes are to be made globally. If "i" is specified, the search is case-insensitive. If "g" is specified, changes are made to all matches. Otherwise, the function stops after the first substitution is made.

## Return Values

As a function, it returns the number of substitutions made. If the flag "g" is not used, this number can only be 0 or 1 and only the first match is replaced. The flag "g" specifies to replace all matches with the regular expression.

## Examples

```
OWA_PATTERN.CHANGE('Cats in pajamas', 'C.+in', '& red ')
```

The regular expression matches the substring "Cats in". It then replaces this string with "& red". The ampersand character "&" indicates "Cats in" because that is what matched the regular expression. Thus, this procedure replaces the string "Cats in pajamas" with "Cats in red". If you call this as a function instead of a procedure, the value returned is 1, indicating that a single substitution has been made.

### Example 2:

```
CREATE OR REPLACE PROCEDURE test_pattern as theline VARCHAR2(256);
num_found INTEGER;
BEGIN
 theline := 'what is the goal?';
 num_found := OWA_PATTERN.CHANGE(theline, 'goal', 'idea', 'g');
 HTP.PRINT(num_found); -- num_found is 1
 HTP.PRINT(theline); -- theline is 'what is the idea?'
END;
/
SHOW ERRORS
```

## 225.3.3 GETPAT Procedure

This procedure converts a VARCHAR2 string into an OWA\_PATTERN.PATTERN DATA TYPE.

### Syntax

```
OWA_PATTERN.GETPAT(
 arg IN VARCHAR2,
 pat IN OUT pattern);
```

### Parameters

**Table 225-7 GETPAT Procedure Parameters**

Parameter	Description
arg	The string to convert.
pat	the OWA_PATTERN.PATTERN DATA TYPE initialized with arg.

## 225.3.4 MATCH Function

This function determines if a string contains the specified pattern. The pattern can contain regular expressions. If multiple overlapping strings can match the regular expression, this function takes the longest match.

### Syntax

```
owa_pattern.match(
 line IN VARCHAR2,
 pat IN VARCHAR2,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
 line IN VARCHAR2,
 pat IN OUT PATTERN,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
 line IN VARCHAR2,
 pat IN VARCHAR2,
 backrefs OUT owa_text.vc_arr,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

```
OWA_PATTERN.MATCH(
 line IN VARCHAR2,
 pat IN OUT PATTERN,
 backrefs OUT owa_text.vc_arr,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
 mline IN owa_text.multi_line,
 pat IN VARCHAR2,
 rlist OUT owa_text.row_list,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

```
OWA_PATTERN.MATCH(
 mline IN owa_text.multi_line,
 pat IN OUT pattern,
 rlist OUT owa_text.row_list,
 flags IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

### Parameters

**Table 225-8 MATCH Function Parameters**

Parameter	Description
line	The line to search in.
mline	The text to search in. This is a <code>owa_text.multi_line</code> datatype..

**Table 225-8 (Cont.) MATCH Function Parameters**

Parameter	Description
pat	The pattern to match. This is either a VARCHAR2 or a OWA_PATTERN.PATTERN DATA TYPE. It is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table. This parameter is a row_list that holds each string in the target that was matched by a sequence of tokens in the regular expression.
rlist	An output parameter containing a list of matches.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

### Return Values

TRUE if a match was found, FALSE otherwise.

### Examples

KAZOO is the target where it is searching for the zoo.\* regular expression. The period indicates any character other than newline, and the asterisk matches 0 or more of the preceding characters. In this case, it matches any character other than the newline.

Therefore, this regular expression specifies that a matching target consists of zoo, followed by any set of characters neither ending in nor including a newline (which does not match the period). The i flag indicates to ignore case in the search. In this case, the function returns TRUE, which indicates that a match had been found.

```
boolean foundMatch;
foundMatch := owa_pattern.match('KAZOO', 'zoo.*', 'i');
```

The following example searches for the string "goal" followed by any number of characters in sometext. If found,

```
sometext VARCHAR2(256);
pat VARCHAR2(256);

sometext := 'what is the goal?';
pat := 'goal.*';
IF OWA_PATTERN.MATCH(sometext, pat)
THEN
 HTP.PRINT('Match found');
ELSE
 HTP.PRINT('Match not found');
END IF;
```

### Operational Notes

- The regular expression in this function can be either a VARCHAR2 or an OWA\_PATTERN.PATTERN DATA TYPE. Create an OWA\_PATTERN.PATTERN DATA TYPE from a string using the OWA\_PATTERN.GETPAT procedure.

- Create a `MULTI_LINE` DATA TYPE from a long string using the `OWA_TEXT.STREAM2MULTI` procedure. If a `multi_line` is used, the `rlist` parameter specifies a list of chunks where matches were found.
- If the line is a string and not a `multi_line`, you can add an optional output parameter called `backrefs`. This parameter is a `row_list` that holds each string in the target that was matched by a sequence of tokens in the regular expression.

The `OWA_SEC` package provides an interface for custom authentication.

 **See Also:**

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Operational Notes](#) (page 226-1)
- [Summary of OWA\\_SEC Subprograms](#) (page 226-1)

## 226.1 OWA\_SEC Operational Notes

Parameters that have default values are optional.

## 226.2 Summary of OWA\_SEC Subprograms

This table lists the `OWA_SEC` subprograms in alphabetical order and briefly describes them.

**Table 226-1** *OWA\_SEC Package Subprograms*

Subprogram	Description
<a href="#">GET_CLIENT_HOSTNAME Function</a> (page 226-2)	Returns the client's hostname
<a href="#">GET_CLIENT_IP Function</a> (page 226-2)	Returns the client's IP address
<a href="#">GET_PASSWORD Function</a> (page 226-2)	Returns the password that the user entered
<a href="#">GET_USER_ID Function</a> (page 226-3)	Returns the username that the user entered
<a href="#">SET_AUTHORIZATION Procedure</a> (page 226-3)	Enables the PL/SQL application to use custom authentication
<a href="#">SET_PROTECTION_REALM Procedure</a> (page 226-4)	Defines the realm that the page is in

## 226.2.1 GET\_CLIENT\_HOSTNAME Function

This function returns the hostname of the client.

### Syntax

```
OWA_SEC.GET_CLIENT_HOSTNAME
RETURN VARCHAR2;
```

### Return Values

The hostname.

## 226.2.2 GET\_CLIENT\_IP Function

This function returns the IP address of the client.

### Syntax

```
OWA_SEC.GET_CLIENT_IP
RETURN OWA_UTIL.IP_ADDRESS;
```

### Return Values

The IP address. The `owa_util.ip_address` datatype is a PL/SQL table where the first four elements contain the four numbers of the IP address. For example, if the IP address is 123.45.67.89 and the variable `ipaddr` is of the `owa_util.ip_address` datatype, the variable would contain the following values:

```
ipaddr(1) = 123
ipaddr(2) = 45
ipaddr(3) = 67
ipaddr(4) = 89
```

## 226.2.3 GET\_PASSWORD Function

This function returns the password that the user used to log in.

### Syntax

```
OWA_SEC.GET_PASSWORD
RETURN VARCHAR2;
```

### Return Values

The password.

### Usage Notes

For security reasons, this function returns a true value only when custom authentication is used. If you call this function when you are not using custom authentication, the function returns an undefined value. Thus, the database passwords are not exposed.

## 226.2.4 GET\_USER\_ID Function

This function returns the username that the user used to log in.

### Syntax

```
OWA_SEC.GET_USER_ID
 RETURN VARCHAR2;
```

### Return Values

The username.

## 226.2.5 SET\_AUTHORIZATION Procedure

This procedure, called in the initialization portion of the OWA\_CUSTOM package, sets the authorization scheme for the PL/SQL Gateway.

This implements your `authorize` function, which authorizes the user before his requested procedure is run. The placement of the `authorize` function depends on the scheme you select.

### Syntax

```
OWA_SEC.SET_AUTHORIZATION(
 scheme IN INTEGER);
```

## Parameters

**Table 226-2 SET\_AUTHORIZATION Procedure Parameters**

Parameter	Description
scheme	<p>The authorization scheme. It is one of the following schemes for SET_AUTHORIZATION:</p> <ul style="list-style-type: none"> <li>OWA_SEC.NO_CHECK - Specifies that the PL/SQL application is not to do any custom authentication. This is the default.</li> <li>OWA_SEC.GLOBAL - Defines an authorize function that is called for all users and all procedures. This is the OWA_CUSTOM.AUTHORIZE Function (page 222-2) in the "sys" schema.</li> <li>OWA_SEC.PER_PACKAGE - Define an authorize function that is called when procedures in a package or anonymous procedures are called. If the procedures are in a package, the package.AUTHORIZE function in the user's schema is called to authorize the user. If the procedures are not in a package, then the anonymous authorize function in the user's schema is called.</li> <li>OWA_SEC.CUSTOM - Implements different authorize functions for each user. The function OWA_CUSTOM.AUTHORIZE Function (page 222-2) in the user's schema is called to authorize the user. If the user's schema does not contain an OWA_CUSTOM.AUTHORIZE Function, the PL/SQL Gateway looks for it in the "sys" schema.</li> </ul> <p>The custom authorize function has the following signature:</p> <pre>FUNCTION AUTHORIZE RETURN BOOLEAN;</pre> <p>If the function returns TRUE, authentication succeeded. If it returns FALSE, authentication failed. If the authorize function is not defined, the Gateway returns an error and fails.</p>

### Related Topics:

- OWA\_CUSTOM (page 222-1)  
The OWA\_CUSTOM package provides a Global PLSQL Agent Authorization callback function.

## 226.2.6 SET\_PROTECTION\_REALM Procedure

This procedure sets the realm of the page that is returned to the user. The user enters a username and login that already exist in the realm.

### Syntax

```
OWA_SEC.SET_PROTECTION_REALM(
 realm IN VARCHAR2);
```

### Parameters

**Table 226-3 SET\_PROTECTION\_REALM Procedure Parameters**

Parameter	Description
realm	The realm where the page belongs. This string is displayed to the user.

# OWA\_TEXT

The `OWA_TEXT` package contains subprograms used by `OWA_PATTERN` for manipulating strings. They are externalized so you can use them directly.

## See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Types](#) (page 227-1)
- [Summary of OWA\\_TEXT Subprograms](#) (page 227-2)

## 227.1 OWA\_OPT\_LOCK Types

There are three `OWA_OPT_LOCK` lock types.

- [MULTI\\_LINE DATA TYPE](#) (page 227-1)
- [ROW\\_LIST DATA TYPE](#) (page 227-1)
- [VC\\_ARR DATA TYPE](#) (page 227-2)

### 227.1.1 MULTI\_LINE DATA TYPE

This datatype is a PL/SQL record that holds large amounts of text. The `rows` field, of type `OWA_TEXT.VC_ARR DATA TYPE`, contains the text data in the record.

```
TYPE multi_line IS RECORD (
 rows vc_arr,
 num_rows INTEGER,
 partial_row BOOLEAN);
```

### 227.1.2 ROW\_LIST DATA TYPE

This is the datatype for holding data to be processed.

```
TYPE row_list IS RECORD (
 rows int_arr,
 num_rows INTEGER);
```

```
int_arr IS DEFINED AS:
```

```
TYPE int_arr IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

## 227.1.3 VC\_ARR DATA TYPE

This is a component of the MULTI\_LINE DATA TYPE and is used for holding large amounts of text.

```
TYPE vc_arr IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

### Related Topics:

- [MULTI\\_LINE DATA TYPE](#) (page 227-1)  
This datatype is a PL/SQL record that holds large amounts of text. The rows field, of type OWA\_TEXT.VC\_ARR DATA TYPE, contains the text data in the record.

## 227.2 Summary of OWA\_TEXT Subprograms

This table lists the OWA\_TEXT subprograms and briefly describes them.

**Table 227-1 OWA\_TEXT Package Subprograms**

Subprogram	Description
<a href="#">ADD2MULTI Procedure</a> (page 227-2)	Adds text to an existing multi_line type
<a href="#">NEW_ROW_LIST Function and Procedure</a> (page 227-3)	Creates a new row_list
<a href="#">PRINT_MULTI Procedure</a> (page 227-3)	Prints out the contents of a multi_list
<a href="#">PRINT_ROW_LIST Procedure</a> (page 227-4)	Prints out the contents of a row_list
<a href="#">STREAM2MULTI Procedure</a> (page 227-4)	Converts a varchar2 to a multi_line type

### 227.2.1 ADD2MULTI Procedure

This procedure adds content to an existing Multi\_Line Data Type

#### Syntax

```
OWA_TEXT.ADD2MULTI(
 stream IN VARCHAR2,
 mline IN OUT multi_line,

 continue IN BOOLEAN DEFAULT TRUE);
```

#### Parameters

**Table 227-2 ADD2MULTI Procedure Parameters**

Parameter	Description
stream	The text to add.
mline	The OWA_TEXT.MULTI_LINE DATA TYPE. The output of this parameter contains <i>stream</i> .

**Table 227-2 (Cont.) ADD2MULTI Procedure Parameters**

Parameter	Description
continue	If TRUE, the procedure appends <i>stream</i> within the previous final row (assuming it is less than 32K). If FALSE, the procedure places <i>stream</i> in a new row.

## 227.2.2 NEW\_ROW\_LIST Function and Procedure

This function or procedure creates a new OWA\_TEX.ROW\_LIST DATA TYPE.

The function version uses no parameters and returns a new empty row\_list. The procedure version creates the row\_list datatype as an output parameter.

### Syntax

```
OWA_TEXT.NEW_ROW_LIST
 RETURN ROW_LIST;

OWA_TEXT.NEW_ROW_LIST(
 rlist OUT row_list);
```

### Parameters

**Table 227-3 NEW\_ROW\_LIST Procedure Parameters**

Parameter	Description
rlist	This is an output parameter containing the new row_list datatype

### Return Values

The function version returns the new row\_list datatype.

## 227.2.3 PRINT\_MULTI Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the OWA\_TEXT.MULTI\_LINE DATA TYPE.

### Syntax

```
OWA_TEXT.PRINT_MULTI(
 mline IN multi_line);
```

### Parameters

**Table 227-4 PRINT\_MULTI Procedure Parameters**

Parameter	Description
mline	The multi_line datatype to print.

**Return Values**

The contents of the `multi_line`.

**Related Topics:**

- [PRINT Procedures](#) (page 213-61)  
These procedures generate the specified parameter as a string terminated with the `\n` newline character.
- [PRN Procedures](#) (page 213-62)  
These procedures generate the specified parameter as a string.

## 227.2.4 PRINT\_ROW\_LIST Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the `OWA_TEXT.ROW_LIST` DATA TYPE.

**Syntax**

```
OWA_TEXT.PRINT_ROW_LIST(
 rlist IN multi_line);
```

**Parameters****Table 227-5 PRINT\_ROW\_LIST Procedure Parameters**

Parameter	Description
<code>rlist</code>	The <code>row_list</code> datatype to print.

**Return Values**

The contents of the `row_list`.

**Related Topics:**

- [PRINT Procedures](#) (page 213-61)  
These procedures generate the specified parameter as a string terminated with the `\n` newline character.
- [PRN Procedures](#) (page 213-62)  
These procedures generate the specified parameter as a string.

## 227.2.5 STREAM2MULTI Procedure

This procedure converts a string to a `multi_line` datatype.

**Syntax**

```
OWA_TEXT.STREAM2MULTI(
 stream IN VARCHAR2
 mline OUT multi_line);
```

## Parameters

**Table 227-6** STREAM2MULTI Procedure Parameters

Parameter	Description
stream	The string to convert.
mline	The stream in OWA_TEXT.MULTI_LINE DATA TYPE format

# OWA\_UTIL

The `OWA_UTIL` package contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.

## See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

This chapter contains the following topics:

- [Overview](#) (page 228-1)
- [Types](#) (page 228-1)
- [Summary of OWA\\_UTIL Subprograms](#) (page 228-2)

## 228.1 OWA\_UTIL Overview

The `OWA_UTIL` package contains three types of utility subprograms.

- Dynamic SQL Utilities enable you to produce pages with dynamically generated SQL code.
- HTML utilities enable you to retrieve the values of CGI environment variables and perform URL redirects.
- Date utilities enable correct date-handling. Date values are simple strings in HTML, but are treated as a datatype by the Oracle database.

## 228.2 OWA\_UTIL Types

`OWA_UTIL` uses Types to specify creating information.

- [DATATYPE Datatype](#) (page 228-2)
- [IDENT\\_ARR Datatype](#) (page 228-2)
- [IP\\_ADDRESS Datatype](#) (page 228-2)

## 228.2.1 DATETYPE Datatype

The TODATE Function converts an item of this type to the type `DATE`, which is understood and properly handled as data by the database. The procedure `CHOOSE_DATE` Procedure enables the user to select the desired date.

```
TYPE dateType IS TABLE OF VARCHAR2(10) INDEX BY BINARY_INTEGER;
```

### Related Topics:

- [TODATE Function](#) (page 228-17)  
This function converts the DATETYPE Datatype to the standard Oracle `DATE` type.
- [CHOOSE\\_DATE Procedure](#) (page 228-7)  
This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

## 228.2.2 IDENT\_ARR Datatype

This datatype is used for an array.

```
TYPE ident_arr IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

## 228.2.3 IP\_ADDRESS Datatype

This datatype is used by the `GET_CLIENT_IP` Function in the `OWA_SEC` package.

```
TYPE ip_address IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

### Related Topics:

- [GET\\_CLIENT\\_IP Function](#) (page 226-2)  
This function returns the IP address of the client.
- [OWA\\_SEC](#) (page 226-1)  
The `OWA_SEC` package provides an interface for custom authentication.

## 228.3 Summary of OWA\_UTIL Subprograms

This table lists the `OWA_UTIL` subprograms and briefly describes them.

**Table 228-1 OWA\_UTIL Package Subprograms**

Subprogram	Description
<a href="#">BIND_VARIABLES Function</a> (page 228-3)	Prepares a SQL query and binds variables to it
<a href="#">CALENDARPRINT Procedures</a> (page 228-4)	Prints a calendar
<a href="#">CELLSPRINT Procedures</a> (page 228-5)	Prints the contents of a query in an HTML table
<a href="#">CHOOSE_DATE Procedure</a> (page 228-7)	Generates HTML form elements that allow the user to select a date

**Table 228-1 (Cont.) OWA\_UTIL Package Subprograms**

Subprogram	Description
<a href="#">GET_CGI_ENV Function</a> (page 228-8)	Returns the value of the specified CGI environment variable
<a href="#">GET_OWA_SERVICE_PATH Function</a> (page 228-8)	Returns the full virtual path for the PL/SQL Gateway
<a href="#">GET_PROCEDURE Function</a> (page 228-8)	Returns the name of the procedure that is invoked by the PL/SQL Gateway
<a href="#">HTTP_HEADER_CLOSE Procedure</a> (page 228-9)	Closes the HTTP header
<a href="#">LISTPRINT Procedure</a> (page 228-9)	Generates a HTML form element that contains data from a query
<a href="#">MIME_HEADER Procedure</a> (page 228-10)	Generates the Content-type line in the HTTP header
<a href="#">PRINT_CGI_ENV Procedure</a> (page 228-11)	Generates a list of all CGI environment variables and their values
<a href="#">REDIRECT_URL Procedure</a> (page 228-11)	Generates the Location line in the HTTP header
<a href="#">SHOWPAGE Procedure</a> (page 228-12)	Prints a page generated by the HTP and HTF packages in SQL*Plus
<a href="#">SHOWSOURCE Procedure</a> (page 228-12)	Prints the source for the specified subprogram
<a href="#">SIGNATURE procedure</a> (page 228-13)	Prints a line that says that the page is generated by the PL/SQL Agent
<a href="#">STATUS_LINE Procedure</a> (page 228-13)	Generates the Status line in the HTTP header
<a href="#">TABLEPRINT Function</a> (page 228-14)	Prints the data from a table in the database as an HTML table
<a href="#">TODATE Function</a> (page 228-17)	Converts dateType data to the standard PL/SQL date type
<a href="#">WHO_CALLED_ME Procedure</a> (page 228-17)	Returns information on the caller of the procedure.

### 228.3.1 BIND\_VARIABLES Function

This function prepares a SQL query by binding variables to it, and stores the output in an opened cursor. Use this function as a parameter to a procedure sending a dynamically generated query. Specify up to 25 bind variables.

#### Syntax

```
OWA_UTIL.BIND_VARIABLES(
 theQuery IN VARCHAR2 DEFAULT NULL,
 bv1Name IN VARCHAR2 DEFAULT NULL,
 bv1Value IN VARCHAR2 DEFAULT NULL,
 bv2Name IN VARCHAR2 DEFAULT NULL,
 bv2Value IN VARCHAR2 DEFAULT NULL,
 bv3Name IN VARCHAR2 DEFAULT NULL,
 bv3Value IN VARCHAR2 DEFAULT NULL,
 ...
```

```

 bv25Name IN VARCHAR2 DEFAULT NULL,
 bv25Value IN VARCHAR2 DEFAULT NULL)
RETURN INTEGER;
```

### Parameters

**Table 228-2 BIND\_VARIABLES Function Parameters**

Parameter	Description
theQuery	The SQL query statement which must be a SELECT statement
bv1Name	The name of the variable
bv1Value	The value of the variable

### Return Values

An integer identifying the opened cursor.

## 228.3.2 CALENDARPRINT Procedures

These procedures creates a calendar in HTML with a visible border. Each date in the calendar can contain any number of hypertext links.

This procedure has 2 versions.

- Version 1 uses a hard-coded query stored in a varchar2 string.
- Version 2 uses a dynamic query prepared with the [BIND\\_VARIABLES Function](#) (page 228-3).

### Syntax

```

OWA_UTIL.CALENDARPRINT(
 p_query IN VARCHAR2,
 p_mf_only IN VARCHAR2 DEFAULT 'N');

OWA_UTIL.CALENDARPRINT(
 p_cursor IN INTEGER,
 p_mf_only IN VARCHAR2 DEFAULT 'N');
```

### Parameters

**Table 228-3 CALENDARPRINT Procedure Parameters**

Parameter	Description
p_query	A PL/SQL query.
p_cursor	A PL/SQL cursor containing the same format as p_query.
p_mf_only	If "N" (the default), the generated calendar includes Sunday through Saturday. Otherwise, it includes Monday through Friday only.

### Usage Notes

Design your query as follows:

- The first column is a DATE. This correlates the information produced by the query with the calendar output generated by the procedure.
- The query output must be sorted on this column using ORDER BY.
- The second column contains the text, if any, that you want printed for that date.
- The third column contains the destination for generated links. Each item in the second column becomes a hypertext link to the destination given in this column. If this column is omitted, the items in the second column are simple text, not links.

### 228.3.3 CELLSPRINT Procedures

This procedure generates an HTML table from the output of a SQL query. SQL atomic data items are mapped to HTML cells and SQL rows to HTML rows. You must write the code to begin and end the HTML table.

There are nine versions of this procedure:

- The first version passes the results of a query into an index table. Perform the query and CELLSPRINT does the formatting. To have more control in generating an HTML table from the output of an SQL query, use the [FORMAT\\_CELL Function](#) (page 212-31) in the "HTF (page 212-1)" package.
- The second and third versions display rows (up to the specified maximum) returned by the query or cursor.
- The fourth and fifth versions exclude a specified number of rows from the HTML table. Use the fourth and fifth versions to scroll through result sets by saving the last row seen in a hidden form element.
- The sixth through ninth versions are the same as the first four versions, except that they return a row count output parameter.

#### Syntax

```
OWA_UTIL.CELLSPRINT(
 p_colCnt IN INTEGER,
 p_resultTbl IN vc_arr,

 p_format_numbers IN VARCHAR2 DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT(
 p_theQuery IN VARCHAR2,
 p_max_rows IN NUMBER DEFAULT 100,
 p_format_numbers IN VARCHAR2 DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT(
 p_theCursor IN INTEGER,
 p_max_rows IN NUMBER DEFAULT 100,
 p_format_numbers IN VARCHAR2 DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT(
 p_theQuery IN VARCHAR2,
 p_max_rows IN NUMBER DEFAULT 100,
 p_format_numbers IN VARCHAR2 DEFAULT NULL,
 p_skip_rec IN NUMBER DEFAULT 0,
 p_more_data OUT BOOLEAN);
```

```
OWA_UTIL.CELLSPRINT(
```

```

p_theCursor IN INTEGER,
p_max_rows IN NUMBER DEFAULT 100,
p_format_numbers IN VARCHAR2 DEFAULT NULL,
p_skip_rec IN NUMBER DEFAULT 0,
p_more_data OUT BOOLEAN;

OWA_UTIL.CELLSPRINT(
 p_theQuery IN VARCHAR2,
 p_max_rows IN NUMBER DEFAULT 100,
 p_format_numbers IN VARCHAR2 DEFAULT NULL,
 p_recCnt OUT NUMBER);

OWA_UTIL.CELLSPRINT(
 p_theCursor IN INTEGER,
 p_max_rows IN NUMBER DEFAULT 100,
 p_format_numbers IN VARCHAR2 DEFAULT NULL,
 p_recCnt OUT NUMBER);

OWA_UTIL.CELLSPRINT(
 p_theQuery IN VARCHAR2,
 p_max_rows IN NUMBER DEFAULT 100,
 p_format_numbers IN VARCHAR2 DEFAULT NULL,
 p_skip_rec IN NUMBER DEFAULT 0,
 p_more_data OUT BOOLEAN,
 p_recCnt OUT NUMBER);

OWA_UTIL.CELLSPRINT(
 p_theCursor IN INTEGER,
 p_max_rows IN NUMBER DEFAULT 100,
 p_format_numbers IN VARCHAR2 DEFAULT NULL,
 p_skip_rec IN NUMBER DEFAULT 0,
 p_more_data OUT BOOLEAN,
 p_recCnt OUT NUMBER);

```

## Parameters

**Table 228-4** CELLSPRINT Procedure Parameters

Parameter	Description
p_query	A PL/SQL query.
p_colCnt	The number of columns in the table.
p_theQuery	A SQL SELECT statement.
p_theCursor	A cursor ID. This can be the return value from the <a href="#">BIND_VARIABLES Function</a> (page 228-3).
p_max_rows	The maximum number of rows to print.
p_format_numbers	If the value of this parameter is not NULL, number fields are right justified and rounded to two decimal places.
p_skip_rec	The number of rows to exclude from the HTML table.
p_more_data	TRUE if there are more rows in the query or cursor, FALSE otherwise.
p_recCnt	The number of rows that have been returned by the query. This value does not include skipped rows (if any).
p_resultTbl	The index table which will contain the result of the query. Each entry in the query will correspond to one column value.

## Examples

This procedure generates

```
<tr><td>QueryResultItem</td><td>QueryResultItem</td></tr>...
```

## 228.3.4 CHOOSE\_DATE Procedure

This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

### Syntax

```
OWA_UTIL.CHOOSE_DATE(
 p_name IN VARCHAR2,
 p_date IN DATE DEFAULT SYSDATE);
```

### Parameters

**Table 228-5 CHOOSE\_DATE Procedure Parameters**

Parameter	Description
p_name	The name of the form elements.
p_date	The initial date that is selected when the HTML page is displayed.

### Usage Notes

- The parameter in the procedure that receives the data from these elements must be a [GET\\_CGI\\_ENV Function](#) (page 228-8).
- Use the [TODATE Function](#) (page 228-17) to convert the [GET\\_CGI\\_ENV Function](#) (page 228-8) value to the standard Oracle DATE datatype.

### Examples

```
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">1
 ...
<OPTION value="31">31
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">JAN
 ...
<OPTION value="12">DEC
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="1992">1992
 ...
<OPTION value="2002">2002
</SELECT>
```

## 228.3.5 GET\_CGI\_ENV Function

This function returns the value of the specified CGI environment variable.

### Syntax

```
OWA_UTIL.GET_CGI_ENV(
 param_name IN VARCHAR2)
 RETURN VARCHAR2;
```

### Parameters

**Table 228-6 GET\_CGI\_ENV Function Parameters**

Parameter	Description
param_name	The name of the CGI environment variable. It is case-insensitive.

### Return Values

The value of the specified CGI environment variable. If the variable is not defined, the function returns `NULL`.

## 228.3.6 GET\_OWA\_SERVICE\_PATH Function

This function returns the full virtual path of the PL/SQL Gateway that is handling the request.

### Syntax

```
OWA_UTIL.GET_OWA_SERVICE_PATH
 RETURN VARCHAR2;
```

### Return Values

A virtual path of the PL/SQL Gateway that is handling the request.

## 228.3.7 GET\_PROCEDURE Function

This function returns the name of the procedure that is being invoked by the PL/SQL Gateway.

### Syntax

```
OWA_UTIL.GET_PROCEDURE
 RETURN VARCHAR2;
```

### Return Values

The name of a procedure, including the package name if the procedure is defined in a package.

## 228.3.8 HTTP\_HEADER\_CLOSE Procedure

This procedure generates a newline character to close the HTTP header.

### Syntax

```
OWA_UTIL.HTTP_HEADER_CLOSE;
```

### Return Values

A newline character, which closes the HTTP header.

### Usage Notes

- Use this procedure if you have not closed the header by using the `bclose_header` parameter in calls such as [MIME\\_HEADER Procedure](#) (page 228-10), [REDIRECT\\_URL Procedure](#) (page 228-11), or [STATUS\\_LINE Procedure](#) (page 228-13)
- The HTTP header must be closed before any `HTP.PRINT` or `HTP.PRN` calls.

## 228.3.9 LISTPRINT Procedure

This procedure generates an HTML selection list form element from the output of a SQL query.

There are two versions of this procedure.

- The first version contains a hard-coded SQL query.
- The second version uses a dynamic query prepared with the [BIND\\_VARIABLES Function](#) (page 228-3).

### Syntax

```
OWA_UTIL.LISTPRINT(
 p_theQuery IN VARCHAR2,
 p_cname IN VARCHAR2,
 p_nsize IN NUMBER,
 p_multiple IN BOOLEAN DEFAULT FALSE);
```

```
OWA_UTIL.LISTPRINT(
 p_theCursor IN INTEGER,
 p_cname IN VARCHAR2,
 p_nsize IN NUMBER,
 p_multiple IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 228-7 LISTPRINT Procedure Parameters**

Parameter	Description
<code>p_theQuery</code>	The SQL query.
<code>p_theCursor</code>	The cursor ID. This can be the return value from the <a href="#">BIND_VARIABLES Function</a> (page 228-3).
<code>p_cname</code>	The name of the HTML form element.

**Table 228-7 (Cont.) LISTPRINT Procedure Parameters**

Parameter	Description
p_nsize	The size of the form element (this controls how many items the user can see without scrolling).
p_multiple	Whether multiple selection is permitted.

### Usage Notes

The columns in the output of the query are handled in the following manner:

- The first column specifies the values that are sent back. These values are for the VALUE attribute of the OPTION tag.
- The second column specifies the values that the user sees.
- The third column specifies whether or not the row is marked as SELECTED in the OPTION tag. If the value is not NULL, the row is selected.

### Examples

```
<SELECT NAME="p_cname" SIZE="p_nsize">
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
...
</SELECT>
```

## 228.3.10 MIME\_HEADER Procedure

This procedure changes the default MIME header that the script returns. This procedure must come before any HTTP.PRINT or HTTP.PRN calls to direct the script not to use the default MIME header.

### Syntax

```
OWA_UTIL.MIME_HEADER(
 ccontent_type IN VARCHAR2 DEFAULT 'text/html',
 bclose_header IN BOOLEAN DEFAULT TRUE,
 ccharset IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 228-8 MIME\_HEADER Procedure Parameters**

Parameter	Description
ccontent_type	The MIME type to generate
bclose_header	Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.
ccharset	The character set to use. The character set only makes sense if the MIME type is of type 'text'. Therefore, the character set is only tagged on to the Content-Type header only if the MIME type passed in is of type 'text'. Any other MIME type, such as 'image', will not have any character set tagged on.

**Examples**

```
Content-type: <ccontent_type>; charset=<ccharset>
```

so that

```
owa_util.mime_header('text/plain', false, 'ISO-8859-4')
```

generates

```
Content-type: text/plain; charset=ISO-8859-4\n
```

## 228.3.11 PRINT\_CGI\_ENV Procedure

This procedure generates all the CGI environment variables and their values made available by the PL/SQL Gateway to the stored procedure.

**Syntax**

```
OWA_UTIL.PRINT_CGI_ENV;
```

**Examples**

This procedure generates a list in the following format:

```
cgi_env_var_name = value\n
```

## 228.3.12 REDIRECT\_URL Procedure

This procedure specifies that the application server is to visit the specified URL. The URL may specify either a Web page to return or a program to execute.

**Syntax**

```
OWA_UTIL.REDIRECT_URL(
 curl IN VARCHAR2
 bclose_header IN BOOLEAN DEFAULT TRUE);
```

**Parameters****Table 228-9 REDIRECT\_URL Procedure Parameters**

Parameter	Description
curl	The URL to visit.
bclose_header	Whether or not to close the HTTP header. If <code>TRUE</code> , two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

**Usage Notes**

This procedure must come before any HTTP procedure or HTTP function call.

**Examples**

This procedure generates

Location: <curl>\n\n

## 228.3.13 SHOWPAGE Procedure

This procedure prints out the HTML output of a procedure in SQL\*Plus.

The procedure must use the HTP or HTF packages to generate the HTML page, and this procedure must be issued after the HTP or HTF page-generating subprogram has been called and before any other HTP or HTF subprograms are directly or indirectly called.

### Syntax

```
OWA_UTIL.SHOWPAGE;
```

### Usage Notes

- This method is useful for generating pages filled with static data.
- This procedure uses the [DBMS\\_OUTPUT](#) (page 111-1) package and is limited to 32767 characters for each line and an overall buffer size of 1,000,000 bytes.

### Examples

The output of htp procedure is displayed in SQL\*Plus, SQL\*DBA, or Oracle Server Manager. For example:

```
SQL> set serveroutput on
SQL> spool gretzky.html
SQL> execute hockey.pass("Gretzky")
SQL> execute owa_util.showpage
SQL> exit
```

This would generate an HTML page that could be accessed from Web browsers.

## 228.3.14 SHOWSOURCE Procedure

This procedure prints the source of the specified procedure, function, or package. If a procedure or function which belongs to a package is specified, then the entire package is displayed.

### Syntax

```
OWA_UTIL.SHOWSOURCE (
 cname IN VARCHAR2);
```

### Parameters

**Table 228-10 SHOWSOURCE Procedure Parameters**

Parameter	Description
cname	The function or procedure whose source you want to show.

## 228.3.15 SIGNATURE procedure

This procedure generates an HTML line followed by a signature line on the HTML document.

If a parameter is specified, the procedure also generates a hypertext link to view the PL/SQL source for that procedure. The link calls the [SHOWSOURCE Procedure](#) (page 228-12).

### Syntax

```
OWA_UTIL.SIGNATURE;

OWA_UTIL.SIGNATURE (
 cname IN VARCHAR2);
```

### Parameters

**Table 228-11 SIGNATURE Procedure Parameters**

Parameter	Description
cname	The function or procedure whose source you want to show.

### Examples

Without a parameter, the procedure generates a line that looks like the following:

```
This page was produced by the PL/SQL Agent on August 9, 2001 09:30.
```

With a parameter, the procedure generates a signature line in the HTML document that looks like the following:

```
This page was produced by the PL/SQL Agent on 8/09/01 09:30
View PL/SQL Source
```

## 228.3.16 STATUS\_LINE Procedure

This procedure sends a standard HTTP status code to the client.

This procedure must come before any `http.print` or `http.prn` calls so that the status code is returned as part of the header, rather than as "content data".

### Syntax

```
OWA_UTIL.STATUS_LINE(
 nstatus IN INTEGER,
 creason IN VARCHAR2 DEFAULT NULL,
 bclose_header IN BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 228-12 STATUS\_LINE Procedure Parameters**

Parameter	Description
nstatus	The status code.
creason	The string for the status code.
bclose_header	Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

## Examples

This procedure generates

```
Status: <nstatus> <creason>\n\n
```

## 228.3.17 TABLEPRINT Function

This function generates either preformatted tables or HTML tables (depending on the capabilities of the user's browser) from database tables.

### Syntax

```
OWA_UTIL.TABLEPRINT(
 ctable IN VARCHAR2,
 cattributes IN VARCHAR2 DEFAULT NULL,
 ntable_type IN INTEGER DEFAULT HTML_TABLE,
 ccolumns IN VARCHAR2 DEFAULT '*',
 cclauses IN VARCHAR2 DEFAULT NULL,
 ccol_aliases IN VARCHAR2 DEFAULT NULL,
 nrow_min IN NUMBER DEFAULT 0,
 nrow_max IN NUMBER DEFAULT NULL)
RETURN BOOLEAN;
```

## Parameters

**Table 228-13 TABLEPRINT Function Parameters**

Parameter	Description
ctable	The database table.
cattributes	Other attributes to be included as-is in the tag.
ntable_type	How to generate the table. Specify HTML_TABLE to generate the table using <TABLE> tags or PRE_TABLE to generate the table using the <PRE> tags. These are constants: <ul style="list-style-type: none"> <li>HTML_TABLE CONSTANT INTEGER := 1;</li> <li>PRE_TABLE CONSTANT INTEGER := 2;</li> </ul>
ccolumns	A comma-delimited list of columns from ctable to include in the generated table.
cclauses	WHERE or ORDER BY clauses, which specify which rows to retrieve from the database table, and how to order them.

**Table 228-13 (Cont.) TABLEPRINT Function Parameters**

Parameter	Description
ccol_aliases	A comma-delimited list of headings for the generated table.
nrow_min	The first row, of those retrieved, to display.
nrow_max	The last row, of those retrieved, to display.

### Return Values

Returns `TRUE` if there are more rows beyond the `nrow_max` requested, `FALSE` otherwise.

### Usage Notes

- `RAW` columns are supported, but `LONG RAW` columns are not. References to `LONG RAW` columns will print the result 'Not Printable'.
- Note that in this function, `cattributes` is the second rather than the last parameter.

### Examples

For browsers that do not support HTML tables, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps IS
 ignore_more BOOLEAN;
BEGIN
 ignore_more := OWA_UTIL.TABLEPRINT('emp', 'BORDER', OWA_UTIL.PRE_TABLE);
END;
```

Requesting a URL such as

`http://myhost:7777/pls/hr/showemps`

returns to the following to the client:

```
<PRE>

| EMPNO | ENAME | JOB | MGR | HIREDATE | SAL | COMM | DEPTNO |
-----|-----|-----|-----|-----|-----|-----|-----|
| 7369 | SMITH | CLERK | 7902 | 17-DEC-80 | 800 | | 20 |
| 7499 | ALLEN | SALESMAN | 7698 | 20-FEB-81 | 1600 | 300 | 30 |
| 7521 | WARD | SALESMAN | 7698 | 22-FEB-81 | 1250 | 500 | 30 |
| 7566 | JONES | MANAGER | 7839 | 02-APR-81 | 2975 | | 20 |
| 7654 | MARTIN | SALESMAN | 7698 | 28-SEP-81 | 1250 | 1400 | 30 |
| 7698 | BLAKE | MANAGER | 7839 | 01-MAY-81 | 2850 | | 30 |
| 7782 | CLARK | MANAGER | 7839 | 09-JUN-81 | 2450 | | 10 |
| 7788 | SCOTT | ANALYST | 7566 | 09-DEC-82 | 3000 | | 20 |
| 7839 | KING | PRESIDENT | | 17-NOV-81 | 5000 | | 10 |
| 7844 | TURNER | SALESMAN | 7698 | 08-SEP-81 | 1500 | 0 | 30 |
| 7876 | ADAMS | CLERK | 7788 | 12-JAN-83 | 1100 | | 20 |
| 7900 | JAMES | CLERK | 7698 | 03-DEC-81 | 950 | | 30 |
| 7902 | FORD | ANALYST | 7566 | 03-DEC-81 | 3000 | | 20 |
| 7934 | MILLER | CLERK | 7782 | 23-JAN-82 | 1300 | | 10 |

</PRE>
```

To view the employees in department 10, and only their employee ids, names, and salaries, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps_10 IS
 ignore_more BOOLEAN;
begin
 ignore_more := OWA_UTIL.TABLEPRINT
 ('EMP', 'BORDER', OWA_UTIL.PRE_TABLE,
 'empno, ename, sal', 'WHERE deptno=10 ORDER BY empno',
 'Employee Number, Name, Salary');
END;
```

### A request for a URL like

`http://myhost:7777/pls/hr/showemps_10`

would return the following to the client:

```
<PRE>

| Employee Number |Name | Salary |

| 7782 | CLARK | 2450 |
| 7839 | KING | 5000 |
| 7934 | MILLER| 1300 |

</PRE>
```

For browsers that support HTML tables, to view the department table in an HTML table, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showdept IS
 ignore_more BOOLEAN;
BEGIN
 ignore_more := oWA_UTIL.TABLEPRINT('dept', 'BORDER');
END;
```

### A request for a URL like

`http://myhost:7777/pls/hr/showdept`

would return the following to the client:

```
<TABLE BORDER>
<TR>
<TH>DEPTNO</TH>
<TH>DNAME</TH>
<TH>LOC</TH>
</TR>
<TR>
<TD ALIGN="LEFT">10</TD>
<TD ALIGN="LEFT">ACCOUNTING</TD>
<TD ALIGN="LEFT">NEW YORK</TD>
</TR>
<TR>
<TD ALIGN="LEFT">20</TD>
<TD ALIGN="LEFT">RESEARCH</TD>
<TD ALIGN="LEFT">DALLAS</TD>
</TR>
<TR>
<TD ALIGN="LEFT">30</TD>
<TD ALIGN="LEFT">SALES</TD>
<TD ALIGN="LEFT">CHICAGO</TD>
</TR>
<TR>
```

```

<TD ALIGN="LEFT">40</TD>
<TD ALIGN="LEFT">OPERATIONS</TD>
<TD ALIGN="LEFT">BOSTON</TD>
</TR>
</TABLE>

```

A Web browser would format this to look like the following table:

DEPTNO	DNAME	LOC
10	ACCOUNTING	NEW YORK
20	RESEARCH	DALLAS
30	SALES	CHICAGO

## 228.3.18 TODATE Function

This function converts the DATETYPE Datatype to the standard Oracle DATE type.

### Syntax

```

OWA_UTIL.TODATE(
 p_dateArray IN dateType)
RETURN DATE;

```

### Parameters

**Table 228-14** TODATE Function Parameters

Parameter	Description
p_dateArray	The value to convert.

### Related Topics:

- [DATETYPE Datatype](#) (page 228-2)  
The TODATE Function converts an item of this type to the type DATE, which is understood and properly handled as data by the database. The procedure CHOOSE\_DATE Procedure enables the user to select the desired date.

## 228.3.19 WHO\_CALLED\_ME Procedure

This procedure returns information (in the form of output parameters) about the PL/SQL code unit that invoked it.

### Syntax

```

OWA_UTIL.WHO_CALLED_ME(
 owner OUT VARCHAR2,
 name OUT VARCHAR2,
 lineno OUT NUMBER,
 caller_t OUT VARCHAR2);

```

## Parameters

**Table 228-15 WHO\_CALLED\_ME Procedure Parameters**

Parameter	Description
owner	The owner of the program unit.
name	The name of the program unit. This is the name of the package, if the calling program unit is wrapped in a package, or the name of the procedure or function if the calling program unit is a standalone procedure or function. If the calling program unit is part of an anonymous block, this is NULL.
lineno	The line number within the program unit where the call was made.
caller_t	The type of program unit that made the call. The possibilities are: package body, anonymous block, procedure, and function. Procedure and function are only for standalone procedures and functions.

## SDO\_CS

The `SDO_CS` package contains functions and procedures for working with coordinate systems.

You can perform explicit coordinate transformations on a single geometry or an entire layer of geometries (that is, all geometries in a specified column in a table).

For a complete description of this package within the context of Oracle Spatial, see `SDO_CS` in the *Oracle Spatial and Graph Developer's Guide*.

230

## SDO\_CSW\_PROCESS

The `SDO_CSW_PROCESS` package contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW).

For a complete description of this package within the context of Oracle Spatial, see `SDO_CSW_PROCESS` in the *Oracle Spatial and Graph Developer's Guide*.

# 231

## SDO\_GCDR

The `SDO_GCDR` package contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GCDR` in the *Oracle Spatial and Graph Developer's Guide*.

## SDO\_GEOM

The `SDO_GEOM` package contains the geometry functions.

These can be grouped into the following categories (with examples of each):

- **Relationship (True/False) between two objects:** `RELATE`, `WITHIN_DISTANCE`
- **Validation:** `VALIDATE_GEOMETRY_WITH_CONTEXT`, `VALIDATE_LAYER_WITH_CONTEXT`
- **Single-object operations:** `SDO_ARC_DENSIFY`, `SDO_AREA`, `SDO_BUFFER`, `SDO_CENTROID`, `SDO_CONVEXHULL`, `SDO_LENGTH`, `SDO_MBR`, `SDO_POINTONSURFACE`
- **Two-object operations:** `SDO_DISTANCE`, `SDO_DIFFERENCE`, `SDO_INTERSECTION`, `SDO_UNION`, `SDO_XOR`

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOM` in the *Oracle Spatial and Graph Developer's Guide*.

# 233

## SDO\_GEOR

The `SDO_GEOR` package contains functions and procedures for the Oracle Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated spatial vector geometry data and metadata.

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

## SDO\_GEOR\_ADMIN

The `SDO_GEOR_ADMIN` package contains subprograms for administrative operations related to GeoRaster.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_ADMIN` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

235

## SDO\_GEOR\_AGGR

The `SDO_GEOR_AGGR` package provides an interface to the `SDO_GEOR_AGGR` package for performing aggregate operations on GeoRaster objects.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_AGGR` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

## SDO\_GEOR\_RA

The `SDO_GEOR_RA` package provides an interface to the `SDO_GEOR_RA` package for performing raster algebra and analytic operations related to GeoRaster.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_RA` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

237

## SDO\_GEOR\_UTL

The `SDO_GEOR_UTL` package contains utility functions and procedures for the Oracle Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_UTL` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

## SDO\_LRS

The `SDO_LRS` package contains functions that create, modify, query, and convert linear referencing elements.

For a complete description of this package within the context of Oracle Spatial, see `SDO_LRS` in the *Oracle Spatial and Graph Developer's Guide*.

239

## SDO\_MIGRATE

The `SDO_MIGRATE` package lets you upgrade geometry tables from previous releases of Oracle Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_MIGRATE` in the *Oracle Spatial and Graph Developer's Guide*.

# 240

## SDO\_NET

The `SDO_NET` package contains functions and procedures for working with data modeled as nodes and links in a network.

For a complete description of this package within the context of Oracle Spatial, see `SDO_NET` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

# 241

## SDO\_NFE

The `SDO_NFE` package contains functions and procedures for performing network feature editing.

For a complete description of this package within the context of Oracle Spatial and Graph, see [SDO\\_NFE](#) (page 241-1) in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

# 242

## SDO\_OLS

The `SDO_OLS` package contains subprograms for Spatial OpenLS support.

For a complete description of this package within the context of Oracle Spatial, see `SDO_OLS` in the *Oracle Spatial and Graph Developer's Guide*.

# 243

## SDO\_PC\_PKG

The `SDO_PC_PKG` package contains subprograms to support the use of point clouds in Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_PC_PKG` in the *Oracle Spatial and Graph Developer's Guide*.

# 244

## SDO\_SAM

The `SDO_SAM` package contains functions and procedures for spatial analysis and data mining.

For a complete description of this package within the context of Oracle Spatial, see `SDO_SAM` in the *Oracle Spatial and Graph Developer's Guide*.

# 245

## SDO\_TIN\_PKG

The `SDO_TIN_PKG` package contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_TIN_PKG` in the

# 246

## SDO\_TOPO

The `SDO_TOPO` package contains subprograms for creating and managing Oracle Spatial topologies.

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

## SDO\_TOPO\_MAP

The `SDO_TOPO_MAP` package contains subprograms for editing Oracle Spatial topologies using a cache (TopoMap object).

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO_MAP` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

# 248

## SDO\_TUNE

The `SDO_TUNE` package contains Spatial tuning functions and procedures.

For complete description of this package within the context of Oracle Spatial, see `SDO_TUNE` in the *Oracle Spatial and Graph Developer's Guide*.

# 249

## SDO\_UTIL

The `SDO_UTIL` package contains the utility functions and procedures for Oracle Spatial.

For complete description of this package within the context of Oracle Spatial, see `SDO_UTIL` in the *Oracle Spatial and Graph Developer's Guide*.

# 250

## SDO\_WFS\_LOCK

The `SDO_WFS_LOCK` package contains subprograms for WFS support for registering and unregistering feature tables. Registering a feature table enables the table for WFS transaction locking; unregistering a feature table disables the table for WFS transaction locking.

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_LOCK` in the *Oracle Spatial and Graph Developer's Guide*.

# 251

## SDO\_WFS\_PROCESS

The `SDO_WFS_PROCESS` package contains subprograms for various processing operations related to support for Web Feature Services.

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_PROCESS` in the *Oracle Spatial and Graph Developer's Guide*.

252

## SEM\_APIS

The `SEM_APIS` package contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_APIS` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

# 253

## SEM\_OLS

The `SEM_OLS` package provides an interface to the `SEM_OLS` package for providing triple-level security to RDF data, using Oracle Label Security (OLS).

For a complete description of this package, see `SEM_OLS` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

## SEM\_PERF

The `SEM_PERF` package contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_PERF` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

255

## SEM\_RDFCTX

The `SEM_RDFCTX` package contains subprograms for managing extractor policies and semantic indexes created for documents.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_RDFCTX` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*

# 256

## SEM\_RDFSA

The `SEM_RDFSA` package contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS).

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_RDFSA` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

# UTL\_CALL\_STACK

The `UTL_CALL_STACK` package provides an interface to provide information about currently executing subprograms.

Functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. Other functions return error stack information.

This chapter contains the following topics:

- [Overview](#) (page 257-1)
- [Security Model](#) (page 257-2)
- [UTL\\_CALL\\_STACK Operational Notes](#) (page 257-3)
- [UTL\\_CALL\\_STACK Exceptions](#) (page 257-3)
- [Data Structures](#) (page 257-3)
- [Summary of UTL\\_CALL\\_STACK Subprograms](#) (page 257-4)

## See Also:

- *Oracle Database PL/SQL Language Reference* regarding Conditional Compilation
- *Oracle Database Development Guide* regarding Using PL/Scope and Using the PL/SQL Hierarchical Profiler

## 257.1 UTL\_CALL\_STACK Overview

The `UTL_CALL_STACK` package provides an interface for PL/SQL programmers to obtain information about currently executing programs including the subprogram name from dynamic and lexical stacks and the depths of those stacks.

Individual functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. More functions return error stack information. Such information can be used to create more revealing error logs and application execution traces.

### Dynamic Depth

The dynamic depth of an executing instance of a PL/SQL subprogram is defined recursively.

- The dynamic depth of the currently executing subprogram instance is one.
- Otherwise, the dynamic depth of the subprogram instance is one more than the dynamic depth of the subprogram it invoked.

- If there is a SQL, Java, or other non-PL/SQL context that invoked or was invoked by an executing subprogram, it occupies a level on the call stack as if it were a subprogram.

In the case of a call stack in which A calls B, which calls C, which calls D, which calls E, which calls F, which calls E, this stack can be written as a line with the dynamic depths underneath:

```
A B C D E F E
7 6 5 4 3 2 1
```

### Lexical Depth

The lexical depth of a PL/SQL subprogram is defined recursively.

- The lexical depth of a unit, an anonymous block, trigger, or ADT is one (1).
- The lexical depth of a subprogram defined within another object is one plus the lexical depth of that object.

Blocks do not affect lexical depth.

### Error Depth

The error depth is the number of errors on the error stack.

For example, consider the following anonymous block.

```
BEGIN
 BEGIN
 ... (1)
 raise zero_divide;
 EXCEPTION
 when others then
 raise no_data_found;
 END;
EXCEPTION
 WHEN others THEN
 ... (2)
END;
```

The error depth at (1) is zero and at (2) is two.

### Backtrace

The backtrace is a trace from where the exception was thrown to where the backtrace was examined.

Consider a call stack in which A calls B which calls C and C raises an exception. If the backtrace was examined in C, the backtrace would have one unit, C, and the backtrace depth would be one. If it was examined in A, it would have three units, A, B and C, and backtrace depth would be three.

The depth of a backtrace is zero in the absence of an exception.

## 257.2 UTL\_CALL\_STACK Security Model

EXECUTE ON UTL\_CALL\_STACK is granted to PUBLIC.

The UTL\_CALL\_STACK package does not show wrapped program units. For example, consider a call stack in which program unit A calls B, which calls C, and in turn calls

UTL\_CALL\_STACK to determine the subprogram list. If program unit B is wrapped, then the subprogram list only shows program unit C.

## 257.3 UTL\_CALL\_STACK Operational Notes

Certain operational notes apply to UTL\_CALL\_STACK.

- Compiler optimizations can change lexical, dynamic and backtrace depth.
- UTL\_CALL\_STACK is not supported past RPC boundaries. For example, if A calls remote procedure B, B will not be able to obtain information about A using UTL\_CALL\_STACK.
- Lexical unit information is available through the PL/SQL conditional compilation feature and is therefore not exposed through UTL\_CALL\_STACK.

## 257.4 UTL\_CALL\_STACK Exceptions

This table lists the exceptions raised by UTL\_CALL\_STACK.

**Table 257-1 Exceptions Raised by UTL\_CALL\_STACK**

Exception	Error Code	Description
BAD_DEPTH_INDICATOR	64610	This exception is raised when a provided depth is out of bounds. Dynamic and lexical depth are positive integer values. Error and backtrace depths are non-negative integer values and are zero only in the absence of an exception.

## 257.5 UTL\_CALL\_STACK Data Structures

The UTL\_CALL\_STACK package defines a VARRAY type, UNIT\_QUALIFIED\_NAME.

### VARRAY Type

- [UNIT\\_QUALIFIED\\_NAME](#) (page 257-3)

### 257.5.1 UNIT\_QUALIFIED\_NAME

This data structure is a varray whose individual elements are, in order, the unit name, any lexical parents of the subprogram, and the subprogram name.

```
TYPE UNIT_QUALIFIED_NAME IS VARRAY(256) OF VARCHAR2(32767);
```

#### Example

Consider the following contrived PL/SQL procedure:

```
PROCEDURE topLevel IS
 FUNCTION localFunction(...) RETURNS VARCHAR2 IS
 FUNCTION innerFunction(...) RETURNS VARCHAR2 IS
 BEGIN
 DECLARE
 localVar PLS_INTEGER;
 BEGIN
```

```

 ... (1)
 END;
END;
BEGIN
 ...
END;

```

The unit qualified name at (1) would be

```
["topLevel", "localFunction", "innerFunction"]
```

If the unit were an anonymous block, the unit name would be "\_\_anonymous\_block"

## 257.6 Summary of UTL\_CALL\_STACK Subprograms

This table lists the subprograms in the UTL\_CALL\_STACK package.

**Table 257-2 UTL\_CALL\_STACK Package Subprograms**

Subprogram	Description
<a href="#">BACKTRACE_DEPTH Function</a> (page 257-5)	Returns the number of backtrace items in the backtrace
<a href="#">BACKTRACE_LINE Function</a> (page 257-5)	Returns the line number of the unit at the specified backtrace depth
<a href="#">BACKTRACE_UNIT Function</a> (page 257-5)	Returns the name of the unit at the specified backtrace depth
<a href="#">CURRENT_EDITION Function</a> (page 257-6)	Returns the current edition name of the unit of the subprogram at the specified dynamic depth
<a href="#">CONCATENATE_SUBPROGRAM Function</a> (page 257-6)	Returns a concatenated form of a unit-qualified name
<a href="#">DYNAMIC_DEPTH Function</a> (page 257-7)	Returns the number of subprograms on the call stack
<a href="#">ERROR_DEPTH Function</a> (page 257-7)	Returns the number of errors on the error stack
<a href="#">ERROR_MSG Function</a> (page 257-7)	Returns the error message of the error at the specified error depth
<a href="#">ERROR_NUMBER Function</a> (page 257-8)	Returns the error number of the error at the specified error depth
<a href="#">LEXICAL_DEPTH Function</a> (page 257-8)	Returns the lexical nesting level of the subprogram at the specified dynamic depth
<a href="#">OWNER Function</a> (page 257-8)	Returns the owner name of the unit of the subprogram at the specified dynamic depth
<a href="#">UNIT_LINE Function</a> (page 257-9)	Returns the line number of the unit of the subprogram at the specified dynamic depth
<a href="#">SUBPROGRAM Function</a> (page 257-9)	Returns the unit-qualified name of the subprogram at the specified dynamic depth

## 257.6.1 BACKTRACE\_DEPTH Function

This function returns the number of backtrace items in the backtrace.

### Syntax

```
UTL_CALL_STACK.BACKTRACE_DEPTH
RETURN PLS_INTEGER;
```

### Return Values

The number of backtrace items in the backtrace, zero in the absence of an exception.

## 257.6.2 BACKTRACE\_LINE Function

This function returns the line number of the unit at the specified backtrace depth.

### Syntax

```
UTL_CALL_STACK.BACKTRACE_LINE (
 backtrace_depth IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

### Parameters

**Table 257-3** *BACKTRACE\_LINE Function Parameters*

Parameter	Description
backtrace_depth	Depth in backtrace

### Return Values

The line number of the unit at the specified backtrace depth

## 257.6.3 BACKTRACE\_UNIT Function

This function returns the name of the unit at the specified backtrace depth.

### Syntax

```
UTL_CALL_STACK.BACKTRACE_UNIT (
 backtrace_depth IN PLS_INTEGER)
RETURN VARCHAR2;
```

### Parameters

**Table 257-4** *BACKTRACE\_UNIT Function Parameters*

Parameter	Description
backtrace_depth	Depth in backtrace

### Return Values

The name of the unit at the specified backtrace depth

## 257.6.4 CURRENT\_EDITION Function

This function returns the current edition name of the unit of the subprogram at the specified dynamic depth.

### Syntax

```
UTL_CALL_STACK.CURRENT_EDITION (
 dynamic_depth IN PLS_INTEGER)
RETURN VARCHAR2;
```

### Parameters

**Table 257-5** *CURRENT\_EDITION Function Parameters*

Parameter	Description
dynamic_depth	Depth in the error stack

### Return Values

The current edition name of the unit of the subprogram at the specified dynamic depth

## 257.6.5 CONCATENATE\_SUBPROGRAM Function

This function returns a concatenated form of a unit-qualified name.

### Syntax

```
UTL_CALL_STACK.CONCATENATE_SUBPROGRAM (
 qualified_name IN UNIT_QUALIFIED_NAME)
RETURN VARCHAR2;
```

### Parameters

**Table 257-6** *CONCATENATE\_SUBPROGRAM Function Parameters*

Parameter	Description
qualified_name	A unit-qualified name

### Return Values

A string of the form `UNIT.SUBPROGRAM.LOCAL_SUBPROGRAM`

## 257.6.6 DYNAMIC\_DEPTH Function

This function returns the number of subprograms on the call stack.

### Syntax

```
UTL_CALL_STACK.DYNAMIC_DEPTH
RETURN PLS_INTEGER;
```

### Return Values

The number of subprograms on the call stack

## 257.6.7 ERROR\_DEPTH Function

This function returns the number of errors on the error stack.

### Syntax

```
UTL_CALL_STACK.ERROR_DEPTH
RETURN PLS_INTEGER;
```

### Return Values

The number of errors on the error stack

## 257.6.8 ERROR\_MSG Function

This function returns the error message of the error at the specified error depth.

### Syntax

```
UTL_CALL_STACK.ERROR_MSG (
 error_depth IN PLS_INTEGER)
RETURN VARCHAR2;
```

### Parameters

**Table 257-7** *ERROR\_MSG Function Parameters*

Parameter	Description
error_depth	Depth in the error stack

### Return Values

The error message of the error at the specified error depth.

## 257.6.9 ERROR\_NUMBER Function

This function returns the error number of the error at the specified error depth.

### Syntax

```
UTL_CALL_STACK.ERROR_NUMBER (
 error_depth IN PLS_INTEGER)
 RETURN PLS_INTEGER;
```

### Parameters

**Table 257-8** *ERROR\_NUMBER Function Parameters*

Parameter	Description
error_depth	Depth in the call stack

### Return Values

The error number of the error at the specified error depth

## 257.6.10 LEXICAL\_DEPTH Function

This function returns the lexical nesting level of the subprogram at the specified dynamic depth.

### Syntax

```
UTL_CALL_STACK.LEXICAL_DEPTH (
 dynamic_depth IN PLS_INTEGER)
 RETURN PLS_INTEGER;
```

### Parameters

**Table 257-9** *LEXICAL\_DEPTH Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

### Return Values

The lexical nesting level of the subprogram at the specified dynamic depth

## 257.6.11 OWNER Function

This function returns the owner name of the unit of the subprogram at the specified dynamic depth.

### Syntax

```
UTL_CALL_STACK.OWNER (
 dynamic_depth IN PLS_INTEGER)
 RETURN VARCHAR2;
```

## Parameters

**Table 257-10** *OWNER Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

## Return Values

The owner name of the unit of the subprogram at the specified dynamic depth

## 257.6.12 UNIT\_LINE Function

This function returns the line number of the unit of the subprogram at the specified dynamic depth.

### Syntax

```
UTL_CALL_STACK.UNIT_LINE (
 dynamic_depth IN PLS_INTEGER)
 RETURN PLS_INTEGER;
```

## Parameters

**Table 257-11** *UNIT\_LINE Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

## Return Values

The line number of the unit of the subprogram at the specified dynamic depth

## 257.6.13 SUBPROGRAM Function

This function returns the unit-qualified name of the subprogram at the specified dynamic depth.

### Syntax

```
UTL_CALL_STACK.SUBPROGRAM (
 dynamic_depth IN PLS_INTEGER)
 RETURN UNIT_QUALIFIED_NAME;
```

## Parameters

**Table 257-12** *SUBPROGRAM Function Parameters*

Parameter	Description
dynamic_depth	Depth in the call stack

### **Return Values**

Returns the unit-qualified name of the subprogram at the specified dynamic depth

# UTL\_COLL

The `UTL_COLL` package lets PL/SQL programs use collection locators to query and update.

This chapter contains the following topics:

- [Summary of UTL\\_COLL Subprograms](#) (page 258-1)

## 258.1 Summary of UTL\_COLL Subprograms

The `UTL_COLL` package has one subprogram, the `IS_LOCATOR` function.

**Table 258-1 UTL\_COLL Package Subprograms**

Subprogram	Description
<a href="#">IS_LOCATOR Function</a> (page 258-1)	Determines whether a collection item is actually a locator or not

### 258.1.1 IS\_LOCATOR Function

This function determines whether a collection item is actually a locator or not.

#### Syntax

```
UTL_COLL.IS_LOCATOR (
 coln IN STANDARD)
 RETURNS BOOLEAN;
```

#### Pragmas

Asserts `WNDS`, `WNPS` and `RNPS` pragmas

#### Parameters

**Table 258-2 IS\_LOCATOR Function Parameters**

Parameter	Description
<code>coln</code>	Nested table or varray item.

#### Return Values

**Table 258-3 IS\_LOCATOR Function Return Values**

Return Value	Description
1	Collection item is indeed a locator.

**Table 258-3 (Cont.) IS\_LOCATOR Function Return Values**

Return Value	Description
0	Collection item is not a locator.

**Examples**

```
CREATE OR REPLACE TYPE list_t AS TABLE OF VARCHAR2(20);
/

CREATE OR REPLACE TYPE phone_book_t AS OBJECT (
 pno number,
 ph list_t);
/

CREATE TABLE phone_book OF phone_book_t
 NESTED TABLE ph STORE AS nt_ph;
CREATE TABLE phone_book1 OF phone_book_t
 NESTED TABLE ph STORE AS nt_ph_1 RETURN LOCATOR;

INSERT INTO phone_book VALUES(1, list_t('650-633-5707','650-323-0953'));
INSERT INTO phone_book1 VALUES(1, list_t('415-555-1212'));

CREATE OR REPLACE PROCEDURE chk_coll IS
 plist list_t;
 plist1 list_t;
BEGIN
 SELECT ph INTO plist FROM phone_book WHERE pno=1;

 SELECT ph INTO plist1 FROM phone_book1 WHERE pno=1;

 IF (UTL_COLL.IS_LOCATOR(plist)) THEN
 DBMS_OUTPUT.PUT_LINE('plist is a locator');
 ELSE
 DBMS_OUTPUT.PUT_LINE('plist is not a locator');
 END IF;

 IF (UTL_COLL.IS_LOCATOR(plist1)) THEN
 DBMS_OUTPUT.PUT_LINE('plist1 is a locator');
 ELSE
 DBMS_OUTPUT.PUT_LINE('plist1 is not a locator');
 END IF;

END chk_coll;

SET SERVEROUTPUT ON
EXECUTE chk_coll;
```

# UTL\_COMPRESS

The `UTL_COMPRESS` package provides a set of data compression utilities.

This chapter contains the following topics:

- [Constants](#) (page 259-1)
- [Exceptions](#) (page 259-1)
- [Operational Notes](#) (page 259-1)
- [Summary of UTL\\_COMPRESS Subprograms](#) (page 259-2)

## 259.1 UTL\_COMPRESS Constants

The maximum number of handles for piecewise operations can be defined by a constant.

```
UTLCOMP_MAX_HANDLE CONSTANT PLS_INTEGER := 5;
```

## 259.2 UTL\_COMPRESS Exceptions

This table describes exceptions raised by `UTL_COMPRESS` subprograms.

**Table 259-1 UTL\_COMPRESS Exceptions**

Exception	Description
<code>BUFFER_TOO_SMALL</code>	The compressed representation is too big.
<code>DATA_ERROR</code>	The input or output data stream was found to be an invalid format.
<code>INVALID_ARGUMENT</code>	One of the arguments was an invalid type or value.
<code>INVALID_HANDLE</code>	Invalid handle for piecewise compress or uncompress.
<code>STREAM_ERROR</code>	An error occurred during compression or uncompression of the data stream

## 259.3 UTL\_COMPRESS Operational Notes

Certain operational notes apply to `UTL_COMPRESS`.

- It is the caller's responsibility to free the temporary `LOB` returned by the `LZ*` functions with `DBMS_LOB.FREETEMPORARY` call.
- A `BFILE` passed into `LZ_COMPRESS*` or `LZ_UNCOMPRESS*` has to be opened by `DBMS_LOB.FILEOPEN`.
- Under special circumstances (especially if the input has already been compressed) the output produced by one of the `UTL_COMPRESS` subprograms may be the same size, or even slightly larger than, the input.

- The output of the UTL\_COMPRESS compressed data is compatible with `gzip`(with `-n` option)/`gunzip` on a single file.

## 259.4 Summary of UTL\_COMPRESS Subprograms

This table lists the UTL\_COMPRESS subprograms and briefly describes them.

**Table 259-2 UTL\_COMPRESS Package Subprograms**

Subprogram	Description
<a href="#">ISOPEN Function</a> (page 259-2)	Checks to see if the handle to a piecewise (un)compress context is open or closed
<a href="#">LZ_COMPRESS Functions and Procedures</a> (page 259-3)	Compresses data using Lempel-Ziv compression algorithm
<a href="#">LZ_COMPRESS_ADD Procedure</a> (page 259-4)	Adds a piece of compressed data
<a href="#">LZ_COMPRESS_CLOSE</a> (page 259-5)	Closes and finishes piecewise compress operation
<a href="#">LZ_COMPRESS_OPEN</a> (page 259-5)	Initializes a piecewise context that maintains the compress state and data
<a href="#">LZ_UNCOMPRESS Functions and Procedures</a> (page 259-6)	Accepts compressed input, verifies it to be a valid and uncompresses it
<a href="#">LZ_UNCOMPRESS_EXTRACT Procedure</a> (page 259-7)	Extracts a piece of uncompressed data
<a href="#">LZ_UNCOMPRESS_OPEN Function</a> (page 259-7)	Initializes a piecewise context that maintains the uncompress state and data
<a href="#">LZ_UNCOMPRESS_CLOSE Procedure</a> (page 259-8)	Closes and finishes the piecewise uncompress

### 259.4.1 ISOPEN Function

This function checks to see if the handle to a piecewise (un)compress context is open or closed.

#### Syntax

```
UTL_COMPRESS.ISOPEN(
 handle in binary_integer)
RETURN BOOLEAN;
```

#### Parameters

**Table 259-3 ISOPEN Function Parameters**

Parameter	Description
handle	The handle to a piecewise uncompress context.

#### Return Values

TRUE if the given piecewise handle is opened, otherwise FALSE.

**Examples**

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) then
 UTL_COMPRESS.LZ_COMPRESS_CLOSE(myhandle, lob_1);
END IF;
```

**Alternatively:**

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) THEN
 UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(myhandle);
END IF;
```

## 259.4.2 LZ\_COMPRESS Functions and Procedures

These functions and procedures compress data using Lempel-Ziv compression algorithm.

**Syntax**

This function accept a RAW as input, compress it and return the compressed RAW result and metadata:

```
UTL_COMPRESS.LZ_COMPRESS (
 src IN RAW,
 quality IN BINARY_INTEGER DEFAULT 6)
RETURN RAW;
```

This function accept a BLOB as input, compress it and returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
 src IN BLOB,
 quality IN BINARY_INTEGER DEFAULT 6)
RETURN BLOB;
```

This procedure returns the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
 src IN BLOB,
 dst IN OUT NOCOPY BLOB,
 quality IN BINARY_INTEGER DEFAULT 6);
```

This function returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
 src IN BFILE,
 quality IN BINARY_INTEGER DEFAULT 6)
RETURN BLOB;
```

This procedure will return the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
 src IN BFILE,
 dst IN OUT NOCOPY BLOB,
 quality IN BINARY_INTEGER DEFAULT 6);
```

## Parameters

**Table 259-4 LZ\_COMPRESS Function and Procedures Parameters**

Parameter	Description
src	Data (RAW, BLOB or BFILE) to be compressed.
dst	Destination for compressed data
quality	An integer in the range 1 to 9, 1=fast compression, 9=best compression, default=6

## Usage Notes

- `quality` is an optional compression tuning value. It allows the `UTL_COMPRESS` user to choose between speed and compression quality, meaning the percentage of reduction in size. A faster compression speed will result in less compression of the data. A slower compression speed will result in more compression of the data. Valid values are [1..9], with 1=fastest and 9=slowest. The default 'quality' value is 6.

## 259.4.3 LZ\_COMPRESS\_ADD Procedure

This procedure adds a piece of compressed data.

### Syntax

```
UTL_COMPRESS.LZ_COMPRESS_ADD (
 handle IN BINARY_INTEGER,
 dst IN OUT NOCOPY BLOB,
 src IN RAW);
```

## Parameters

**Table 259-5 LZ\_COMPRESS\_ADD Procedure Parameters**

Parameter	Description
handle	The handle to a piecewise compress context.
dst	The opened LOB from <code>LZ_COMPRESS_OPEN</code> to store compressed data.
src	The input data to be compressed.

## Exceptions

- `invalid_handle` - out of range invalid or unopened handle.
- `invalid_argument` - NULL handle, src, dst, or invalid dst.

## 259.4.4 LZ\_COMPRESS\_CLOSE

This procedure closes and finishes piecewise compress operation.

### Syntax

```
UTL_COMPRESS.LZ_COMPRESS_CLOSE (
 handle IN BINARY_INTEGER,
 dst IN OUT NOCOPY BLOB);
```

### Parameters

**Table 259-6 LZ\_COMPRESS\_CLOSE Procedure Parameters**

Parameter	Description
handle	The handle to a piecewise compress context.
dst	The opened LOB from LZ_COMPRESS_OPEN to store compressed data.

### Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle, dst, or invalid dst.

## 259.4.5 LZ\_COMPRESS\_OPEN

This function initializes a piecewise context that maintains the compress state and data.

### Syntax

```
UTL_COMPRESS.LZ_COMPRESS_OPEN (
 dst IN OUT NOCOPY BLOB,
 quality IN BINARY_INTEGER DEFAULT 6)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 259-7 LZ\_COMPRESS\_OPEN Function Parameters**

Parameter	Description
dst	User supplied LOB to store compressed data.
quality	Speed versus efficiency of resulting compressed output. <ul style="list-style-type: none"> <li>• Valid values are the range 1..9, with a default value of 6.</li> <li>• 1=fastest compression, 9=slowest compression and best compressed file size.</li> </ul>

### Return Values

A handle to an initialized piecewise compress context.

### Exceptions

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - NULL `dst` or invalid quality specified.

### Usage Notes

Close the opened handle with `LZ_COMPRESS_CLOSE`

- once the piecewise compress is completed
  - in the event of an exception in the middle of process
- because lack of doing so will cause these handles to leak.

## 259.4.6 LZ\_UNCOMPRESS Functions and Procedures

This procedure accepts as input a `RAW`, `BLOB` or `BFILE` compressed string, verifies it to be a valid compressed value, uncompresses it using Lempel-Ziv compression algorithm, and returns the uncompressed `RAW` or `BLOB` result.

### Syntax

This function returns uncompressed data as `RAW`:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
 src IN RAW)
 RETURN RAW;
```

This function returns uncompressed data as a temporary `BLOB`:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
 src IN BLOB)
 RETURN BLOB;
```

This procedure returns the uncompressed data into the existing `BLOB(dst)`, which will be trimmed to the uncompressed data size:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
 src IN BLOB,
 dst IN OUT NOCOPY BLOB);
```

This function returns a temporary `BLOB` for the uncompressed data:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
 src IN BFILE)
 RETURN BLOB;
```

This procedure returns the uncompressed data into the existing `BLOB(dst)`. The original `dst` data will be overwritten.

```
UTL_COMPRESS.LZ_UNCOMPRESS(
 src IN BFILE,
 dst IN OUT NOCOPY BLOB);
```

## Parameters

**Table 259-8 LZ\_UNCOMPRESS Function and Procedures Parameters**

Parameter	Description
src	Compressed data.
dst	Destination for uncompressed data.

## 259.4.7 LZ\_UNCOMPRESS\_EXTRACT Procedure

This procedure extracts a piece of uncompressed data.

### Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_EXTRACT(
 handle IN BINARY_INTEGER,
 dst OUT NOCOPY RAW);
```

### Parameters

**Table 259-9 LZ\_UNCOMPRESS\_EXTRACT Function Parameters**

Parameter	Description
handle	The handle to a piecewise uncompress context.
dst	The uncompressed data.

### Exceptions

- no\_data\_found - finished uncompress.
- invalid\_handle - out of range invalid or uninitialized handle.
- invalid\_argument - NULL handle.

## 259.4.8 LZ\_UNCOMPRESS\_OPEN Function

This function initializes a piecewise context that maintains the uncompress state and data.

### Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_OPEN(
 src IN BLOB)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 259-10 LZ\_UNCOMPRESS\_OPEN Function Parameters**

Parameter	Description
src	The input data to be uncompressed.

**Return Values**

A handle to an initialized piecewise compress context.

**Exceptions**

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - NULL src.

**Usage Notes**

Close the opened handle with `LZ_UNCOMPRESS_CLOSE`

- once the piecewise uncompress is completed
- in the event of an exception in the middle of process because lack of doing so will cause these handles to leak.

## 259.4.9 LZ\_UNCOMPRESS\_CLOSE Procedure

This procedure closes and finishes the piecewise uncompress.

**Syntax**

```
UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(
 handle IN BINARY_INTEGER);
```

**Parameters**

**Table 259-11 LZ\_UNCOMPRESS\_CLOSE Procedure Parameters**

Parameter	Description
handle	The handle to a piecewise uncompress context.

**Exceptions**

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle.

# UTL\_ENCODE

The `UTL_ENCODE` package provides functions that encode `RAW` data into a standard encoded format so that the data can be transported between hosts.

You can use `UTL_ENCODE` functions to encode the body of email text. The package also contains the decode counterpart functions of the encode functions. The functions follow published standards for encoding to accommodate non-Oracle utilities on the sending or receiving ends.

This chapter contains the following topic:

- [Summary of UTL\\_ENCODE Subprograms](#) (page 260-1)

## 260.1 Summary of UTL\_ENCODE Subprograms

This table lists the `UTL_ENCODE` subprograms and briefly describes them.

**Table 260-1** *UTL\_ENCODE Package Subprograms*

Subprogram	Description
<a href="#">BASE64_DECODE Function</a> (page 260-2)	Reads the base 64-encoded <code>RAW</code> input string and decodes it to its original <code>RAW</code> value
<a href="#">BASE64_ENCODE Function</a> (page 260-2)	Encodes the binary representation of the <code>RAW</code> value into base 64 elements and returns it in the form of a <code>RAW</code> string
<a href="#">MIMEHEADER_DECODE Function</a> (page 260-3)	Decodes a string from mime header format
<a href="#">MIMEHEADER_ENCODE Function</a> (page 260-4)	Encodes a string into mime header format
<a href="#">QUOTED_PRINTABLE_DECODE Function</a> (page 260-5)	Reads the <code>varchar2</code> quoted printable format input string and decodes it to the corresponding <code>RAW</code> string
<a href="#">QUOTED_PRINTABLE_ENCODE Function</a> (page 260-5)	Reads the <code>RAW</code> input string and encodes it to the corresponding quoted printable format string
<a href="#">TEXT_DECODE Function</a> (page 260-6)	Decodes a character set sensitive text string
<a href="#">TEXT_ENCODE Function</a> (page 260-7)	Encodes a character set sensitive text string
<a href="#">UUDECODE Function</a> (page 260-8)	Reads the <code>RAW</code> uuencode format input string and decodes it to the corresponding <code>RAW</code> string
<a href="#">UUENCODE Function</a> (page 260-9)	Reads the <code>RAW</code> input string and encodes it to the corresponding uuencode format string

## 260.1.1 BASE64\_DECODE Function

This function reads the base 64-encoded `RAW` input string and decodes it to its original `RAW` value.

### Syntax

```
UTL_ENCODE.BASE64_DECODE (
 r IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(base64_decode, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 260-2 BASE64\_DECODE Function Parameters**

Parameter	Description
<code>r</code>	The <code>RAW</code> string containing base 64-encoded data. There are no defaults or optional parameters.

### Return Values

**Table 260-3 BASE64\_DECODE Function Return Values**

Return	Description
<code>RAW</code>	Contains the decoded string

## 260.1.2 BASE64\_ENCODE Function

This function encodes the binary representation of the `RAW` value into base 64 elements and returns it in the form of a `RAW` string.

### Syntax

```
UTL_ENCODE.BASE64_ENCODE (
 r IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(base64_encode, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 260-4 BASE64\_ENCODE Function Parameters**

Parameter	Description
<code>r</code>	The <code>RAW</code> value to be encoded. There are no defaults or optional parameters.

## Return Values

**Table 260-5 BASE64\_ENCODE Function Return Values**

Return	Description
RAW	Contains the encoded base 64 elements

## 260.1.3 MIMEHEADER\_DECODE Function

This function accepts as input an "encoded word."

It uses the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some encoded text?=-
```

The <encoded text> is encapsulated in mime header tags which give the `MIMEHEADER_DECODE` function information about how to decode the string. The mime header metadata tags are stripped from the input string and the <encoded text> is converted to the base database character set as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

The string is decoded using either quoted-printable or base64 decoding, as specified by the <encoding> metadata tag in the encoded word. The resulting converted and decoded text is returned to the caller as a `VARCHAR2` string.

### Syntax

```
UTL_ENCODE.MIMEHEADER_DECODE (
 buf IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN data VARCHAR2 CHARACTER SET buf%CHARSET;
```

### Parameters

**Table 260-6 MIMEHEADER\_DECODE Function Parameters**

Parameter	Description
buf	The encoded text data with mime header format tags.

### Return Values

**Table 260-7 MIMEHEADER\_DECODE Function Return Values**

Return	Description
data	The encoded text data with mime header format tags

### Examples

```
v2:=utl_encode.mimeheader_decode('=?ISO-8859-1?Q?Here is some encoded text?=');
```

## 260.1.4 MIMEHEADER\_ENCODE Function

This function returns as an output an "encoded word".

The output is in the following form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some text?=
```

The `buf` input parameter is the text to be encoded and becomes the `<encoded text>`.

The `<encoding>` value is either "Q" or "B" for quoted-printable encode or base64 encoding respectively. The `ENCODING` input parameter accepts as valid values `UTL_ENCODE.QUOTED_PRINTABLE` or `UTL_ENCODE.BASE64` or `NULL`. If `NULL`, quoted-printable encoding is selected as a default value.

The `<charset>` value is specified as the input parameter `encode_charset`. If `NULL`, the database character set is selected as a default value.

The mimeheader encoding process includes conversion of the `buf` input string to the character set specified by the `encode_charset` parameter. The converted string is encoded to either quoted-printable or base64 encoded format. The mime header tags are appended and prepended.

Finally, the string is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed.

### Syntax

```
UTL_ENCODE.MIMEHEADER_ENCODE (
 buf IN VARCHAR2 CHARACTER SET ANY_CS,
 encode_charset IN VARCHAR2 DEFAULT NULL,
 encoding IN PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

### Parameters

**Table 260-8** MIMEHEADER\_ENCODE Function Parameters

Parameter	Description
<code>buf</code>	The text data.
<code>encode_charset</code>	The target character set.
<code>encoding</code>	The encoding format. Valid values are <code>UTL_ENCODE.BASE64</code> , <code>UTL_ENCODE.QUOTED_PRINTABLE</code> and <code>NULL</code>

## Return Values

**Table 260-9 MIMEHEADER\_ENCODE Function Return Values**

Return	Description
string	A VARCHAR2 encoded string with mime header format tags.

## 260.1.5 QUOTED\_PRINTABLE\_DECODE Function

This function reads the `varchar2` quoted printable format input string and decodes it to the corresponding `RAW` string.

### Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_DECODE (
 r IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_decode, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 260-10 QUOTED\_PRINTABLE\_DECODE Function Parameters**

Parameters	Description
r	The RAW string containing a quoted printable data string. There are no defaults or optional parameters.

### Return Values

**Table 260-11 QUOTED\_PRINTABLE\_DECODE Function Return Values**

Return	Description
RAW	The decoded string

## 260.1.6 QUOTED\_PRINTABLE\_ENCODE Function

This function reads the `RAW` input string and encodes it to the corresponding quoted printable format string.

### Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_ENCODE (
 r IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_encode, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 260-12 QUOTED\_PRINTABLE\_ENCODE Function Parameters**

Parameter	Description
r	The RAW string. There are no defaults or optional parameters.

## Return Values

**Table 260-13 QUOTED\_PRINTABLE\_ENCODE Function Return Values**

Return	Description
RAW	Contains the quoted printable string

## 260.1.7 TEXT\_DECODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not `NULL`.

The encoded text is converted to the base character set of database, as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

You can decode from either quoted-printable or base64 format, with regard to each `encoding` parameter. If `NULL`, quoted-printable is selected as a default decoding format. If `encode_charset` is not `NULL`, you convert the string from the specified character set to the database character set. The resulting decoded and converted text string is returned to the caller.

### Syntax

```
UTL_ENCODE.TEXT_DECODE(
 buf IN VARCHAR2 CHARACTER SET ANY_CS,
 encode_charset IN VARCHAR2 DEFAULT NULL,
 encoding IN PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

## Parameters

**Table 260-14 TEXT\_DECODE Function Parameters**

Parameter	Description
buf	The encoded text data.
encode_charset	The source character set.
encoding	The encoding format. Valid values are <code>UTL_ENCODE.BASE64</code> , <code>UTL_ENCODE.QUOTED_PRINTABLE</code> and <code>NULL</code> .

## Return Values

**Table 260-15** TEXT\_DECODE Function Return Values

Return	Description
string	A VARCHAR2 decoded text string.

## Examples

```
v2:=UTL_ENCODE.TEXT_DECODE(
 'Here is some text',
 WE8ISO8859P1,
 UTL_ENCODE.BASE64);
```

## 260.1.8 TEXT\_ENCODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not `NULL`.

The text is encoded to either base64 or quoted-printable format, as specified by the `encoding` parameter. Quoted-printable is selected as a default if `ENCODING` is `NULL`.

The encoded text is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed

The resulting encoded and converted text string is returned to the caller.

## Syntax

```
UTL_ENCODE.TEXT_ENCODE (
 buf IN VARCHAR2 CHARACTER SET ANY_CS,
 encode_charset IN VARCHAR2 DEFAULT NULL,
 encoding IN PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

## Parameters

**Table 260-16** TEXT\_ENCODE Function Parameters

Parameter	Description
<code>buf</code>	The text data.
<code>encode_charset</code>	The target character set.
<code>encoding</code>	The encoding format. Valid values are <code>UTL_ENCODE.BASE64</code> , <code>UTL_ENCODE.QUOTED_PRINTABLE</code> and <code>NULL</code> .

## Return Values

**Table 260-17 TEXT\_ENCODE Function Return Values**

Return	Description
string	A VARCHAR2 encoded string with mime header format tags.

## Examples

```
v2:=utl_encode.text_encode(
 'Here is some text',
 'WE8ISO8859P1',
 UTL_ENCODE.BASE64);
```

## 260.1.9 UUDECODE Function

This function reads the RAW uuencode format input string and decodes it to the corresponding RAW string.

See "[UUENCODE Function](#) (page 260-9)" for discussion of the cumulative nature of UUENCODE and UUDECODE for data streams.

## Syntax

```
UTL_ENCODE.UUDECODE (
 r IN RAW)
RETURN RAW;
```

## Pragmas

```
pragma RESTRICT_REFERENCES(uudecode, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 260-18 UUDECODE Function Parameters**

Parameter	Description
r	The RAW string containing the uuencoded data string. There are no defaults or optional parameters.

## Return Values

**Table 260-19 UUDECODE Function Return Values**

Return	Description
RAW	The decoded RAW string

## 260.1.10 UUENCODE Function

This function reads the RAW input string and encodes it to the corresponding uuencode format string.

The output of this function is cumulative, in that it can be used to encode large data streams, by splitting the data stream into acceptably sized RAW values, encoded, and concatenated into a single encoded string.

### Syntax

```
UTL_ENCODE.UUENCODE (
 r IN RAW,
 type IN PLS_INTEGER DEFAULT 1,
 filename IN VARCHAR2 DEFAULT NULL,
 permission IN VARCHAR2 DEFAULT NULL) RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(uuencode, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 260-20 UUENCODE Function Parameters**

Parameter	Description
r	RAW string
type	Optional number parameter containing the type of uuencoded output. Options: complete—a defined PL/SQL constant with a value of 1. (default) header_piece ...middle_piece ...end_piece
filename	Optional varchar2 parameter containing the uuencode filename; the default is uuencode.txt
permission	Optional varchar2 parameter containing the permission mode; the default is 0 (a text string zero).

### Return Values

**Table 260-21 UUENCODE Function Return Values**

Return	Description
RAW	Contains the uuencode format string

# UTL\_FILE

With the `UTL_FILE` package, PL/SQL programs can read and write operating system text files. `UTL_FILE` provides a restricted version of operating system stream file I/O.

This chapter contains the following topics:

- [Deprecated Subprograms](#) (page 261-1)
- [Security Model](#) (page 261-1)
- [Operational Notes](#) (page 261-2)
- [Rules and Limits](#) (page 261-3)
- [Exceptions](#) (page 261-3)
- [Examples](#) (page 261-4)
- [Data Structures](#) (page 261-6)
- [Summary of UTL\\_FILE Subprograms](#) (page 261-6)

## 261.1 UTL\_FILE Deprecated Subprograms

In prior releases, you used the `UTL_FILE_DIR` initialization parameter to specify a directory location. However, as of Oracle Database 12c release 2 (12.2), the `UTL_FILE_DIR` initialization parameter is deprecated. It is still supported for backward compatibility, but Oracle recommends that you instead use directory objects.

 **Note:**

Oracle recommends that do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following initialization parameter is deprecated from the `UTL_FILE` package starting with Oracle Database 12c release 12.2:

- `UTL_FILE_DIR`

## 261.2 UTL\_FILE Security Model

The set of files and directories that are accessible to the user through `UTL_FILE` is controlled by a number of factors and database parameters. Foremost of these is the set of directory objects that have been granted to the user.

The nature of directory objects is discussed in the *Oracle Database SQL Language Reference*.

Assuming the user has both `READ` and `WRITE` access to the directory object `USER_DIR`, the user can open a file located in the operating system directory described by `USER_DIR`, but not in subdirectories or parent directories of this directory.

Lastly, the client (text I/O) and server implementations are subject to operating system file permission checking.

`UTL_FILE` provides file access both on the client side and on the server side. When run on the server, `UTL_FILE` provides access to all operating system files that are accessible from the server. On the client side, as in the case for Forms applications, `UTL_FILE` provides access to operating system files that are accessible from the client.

In the past, accessible directories for the `UTL_FILE` functions were specified in the initialization file using the `UTL_FILE_DIR` parameter. However, as of Oracle Database 12c Release 2 (12.2.0.1), the `UTL_FILE_DIR` initialization parameter is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you instead use the directory object feature, which replaces `UTL_FILE_DIR`. Directory objects offer more flexibility and granular control to the `UTL_FILE` application administrator, can be maintained dynamically (that is, without shutting down the database), and are consistent with other Oracle tools. `CREATE ANY DIRECTORY` privilege is granted only to `SYS` and `SYSTEM` by default.

**Note:**

Use the `CREATE DIRECTORY` feature instead of `UTL_FILE_DIR` for directory access verification.

Note that neither hard nor symbolic links are supported.

On UNIX systems, the owner of a file created by the `FOPEN` function is the owner of the shadow process running the instance. Normally, this owner is `ORACLE`. Files created using `FOPEN` are always writable and readable using the `UTL_FILE` subprograms. However, non-privileged operating system users who need to read these files outside of PL/SQL may need access from a system administrator.

**WARNING:**

The privileges needed to access files in a directory object are operating system specific. `UTL_FILE` directory object privileges give you read and write access to all files within the specified directory.

## 261.3 UTL\_FILE Operational Notes

Keep these notes in mind when using `UTL_FILE`.

The file location and file name parameters are supplied to the `FOPEN` function as separate strings, so that the file location can be checked against the list of accessible directories as specified by the `ALL_DIRECTORIES` view of accessible directory objects. Together, the file location and name must represent a legal filename on the system, and the directory must be accessible. A subdirectory of an accessible directory is not

necessarily also accessible; it too must be specified using a complete path name matching an `ALL_DIRECTORIES` object.

`UTL_FILE` implicitly interprets line terminators on read requests, thereby affecting the number of bytes returned on a `GET_LINE` call. For example, the `len` parameter of `UTL_FILE.GET_LINE` specifies the requested number of bytes of character data. The number of bytes actually returned to the user will be the lesser of:

- The `GET_LINE len` parameter, or
- The number of bytes until the next line terminator character, or
- The `max_linesize` parameter specified by `UTL_FILE.FOPEN`

The `FOPEN max_linesize` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies a default value of 1024. The `GET_LINE len` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies the default value of `max_linesize`. If `max_linesize` and `len` are defined to be different values, then the lesser value takes precedence.

`UTL_FILE.GET_RAW` ignores line terminators.

`UTL_FILE` expects that files opened by `UTL_FILE.FOPEN` in text mode are encoded in the database character set. It expects that files opened by `UTL_FILE.FOPEN_NCHAR` in text mode are encoded in the UTF8 character set. If an opened file is not encoded in the expected character set, the result of an attempt to read the file is indeterminate. When data encoded in one character set is read and Globalization Support is told (such as by means of `NLS_LANG`) that it is encoded in another character set, the result is indeterminate. If `NLS_LANG` is set, it should therefore be the same as the database character set.

## 261.4 UTL\_FILE Rules and Limits

Operating system-specific parameters, such as C-shell environment variables under UNIX, cannot be used in the file location or file name parameters.

`UTL_FILE` I/O capabilities are similar to standard operating system stream file I/O (`OPEN`, `GET`, `PUT`, `CLOSE`) capabilities, but with some limitations. For example, you call the `FOPEN` function to return a file handle, which you use in subsequent calls to `GET_LINE` or `PUT` to perform stream I/O to a file. When file I/O is done, you call `FCLOSE` to complete any output and free resources associated with the file.

### Note:

The `UTL_FILE` package is similar to the client-side `TEXT_IO` package currently provided by Oracle Procedure Builder. Restrictions for a server implementation require some API differences between `UTL_FILE` and `TEXT_IO`. In PL/SQL file I/O, errors are returned using PL/SQL exceptions.

## 261.5 UTL\_FILE Exceptions

This table describes exceptions raised by `UTL_FILE` subprograms.

**Table 261-1 UTL\_FILE Package Exceptions**

Exception Name	Description
INVALID_PATH	File location is invalid.
INVALID_MODE	The <code>open_mode</code> parameter in <code>FOPEN</code> is invalid.
INVALID_FILEHANDLE	File handle is invalid.
INVALID_OPERATION	File could not be opened or operated on as requested.
READ_ERROR	Destination buffer too small, or operating system error occurred during the read operation
WRITE_ERROR	Operating system error occurred during the write operation.
INTERNAL_ERROR	Unspecified PL/SQL error
CHARSETMISMATCH	A file is opened using <code>FOPEN_NCHAR</code> , but later I/O operations use nonchar functions such as <code>PUTF</code> or <code>GET_LINE</code> .
FILE_OPEN	The requested operation failed because the file is open.
INVALID_MAXLINESIZE	The <code>MAX_LINESIZE</code> value for <code>FOPEN()</code> is invalid; it should be within the range 1 to 32767.
INVALID_FILENAME	The filename parameter is invalid.
ACCESS_DENIED	Permission to access to the file location is denied.
INVALID_OFFSET	Causes of the <code>INVALID_OFFSET</code> exception: <ul style="list-style-type: none"> <li>• <code>ABSOLUTE_OFFSET = NULL</code> and <code>RELATIVE_OFFSET = NULL</code>, or</li> <li>• <code>ABSOLUTE_OFFSET &lt; 0</code>, or</li> <li>• Either offset caused a seek past the end of the file</li> </ul>
DELETE_FAILED	The requested file delete operation failed.
RENAME_FAILED	The requested file rename operation failed.

Procedures in `UTL_FILE` can also raise predefined PL/SQL exceptions such as `NO_DATA_FOUND` or `VALUE_ERROR`.

## 261.6 UTL\_FILE Examples

These two examples show use of the procedure.

### Example 1

#### Note:

The examples are UNIX-specific.

Given the following:

```
SQL> CREATE DIRECTORY log_dir AS '/appl/gl/log';
SQL> GRANT READ ON DIRECTORY log_dir TO DBA;
SQL> GRANT WRITE ON DIRECTORY log_dir TO DBA;

SQL> CREATE DIRECTORY USER_DIR AS '/appl/gl/user';
```

```
SQL> GRANT READ ON DIRECTORY USER_DIR TO PUBLIC;
SQL> GRANT WRITE ON DIRECTORY USER_DIR TO PUBLIC;
```

The following file locations and filenames are valid and accessible as follows:

File Location	Filename	READ and WRITE
/appl/gl/log	L12345.log	Users with DBA privilege
/appl/gl/user	u12345.tmp	All users

The following file locations and filenames are invalid:

File Location	Filename	Invalid Because
/appl/gl/log/backup	L12345.log	# subdirectories are not accessible
/APPL/gl/log	L12345.log	# directory strings must follow case sensitivity rules as required by the O/S
/appl/gl/log	backup/L1234.log	# filenames may not include portions of directory paths
/user/tmp	L12345.log	# no corresponding CREATE DIRECTORY command has been issued

## Example 2

```
DECLARE
 V1 VARCHAR2(32767);
 F1 UTL_FILE.FILE_TYPE;
BEGIN
 -- In this example MAX_LINESIZE is less than GET_LINE's length request
 -- so the number of bytes returned will be 256 or less if a line terminator is
 -- seen.
 F1 := UTL_FILE.FOPEN('USER_DIR', 'u12345.tmp', 'R', 256);
 UTL_FILE.GET_LINE(F1, V1, 32767);
 UTL_FILE.FCLOSE(F1);

 -- In this example, FOPEN's MAX_LINESIZE is NULL and defaults to 1024,
 -- so the number of bytes returned will be 1024 or less if a line terminator is
 -- seen.
 F1 := UTL_FILE.FOPEN('USER_DIR', 'u12345.tmp', 'R');
 UTL_FILE.GET_LINE(F1, V1, 32767);
 UTL_FILE.FCLOSE(F1);

 -- In this example, GET_LINE doesn't specify a number of bytes, so it defaults to
 -- the same value as FOPEN's MAX_LINESIZE which is NULL in this case and defaults
 -- to 1024.
 -- So the number of bytes returned will be 1024 or less if a line terminator is
 -- seen.
 F1 := UTL_FILE.FOPEN('USER_DIR', 'u12345.tmp', 'R');
 UTL_FILE.GET_LINE(F1, V1);
 UTL_FILE.FCLOSE(F1);
END;
```

## 261.7 UTL\_FILE Data Structures

The UTL\_FILE package defines a RECORD type.

### Record Types

- [FILETYPE Record Type](#) (page 261-6)

### 261.7.1 FILETYPE Record Type

The contents of FILE\_TYPE are private to the UTL\_FILE package. You should not reference or change components of this record.

```
TYPE file_type IS RECORD (
 id BINARY_INTEGER,
 datatype BINARY_INTEGER,
 byte_mode BOOLEAN);
```

### Fields

**Table 261-2 FILE\_TYPE Fields**

Field	Description
id	A numeric value indicating the internal file handle number
datatype	Indicates whether the file is a CHAR file, Nchar file or other (binary)
byte_mode	Indicates whether the file was open as a binary file, or as a text file

 **Caution:**

Oracle does not guarantee the persistence of FILE\_TYPE values between database sessions or within a single session. Attempts to clone file handles or use dummy file handles may have indeterminate outcomes.

## 261.8 Summary of UTL\_FILE Subprograms

This table lists the UTL\_FILE subprograms and briefly describes them.

**Table 261-3 UTL\_FILE Subprograms**

Subprogram	Description
<a href="#">FCLOSE Procedure</a> (page 261-8)	Closes a file
<a href="#">FCLOSE_ALL Procedure</a> (page 261-8)	Closes all open file handles

**Table 261-3 (Cont.) UTL\_FILE Subprograms**

Subprogram	Description
<a href="#">FCOPY Procedure</a> (page 261-9)	Copies a contiguous portion of a file to a newly created file
<a href="#">FFLUSH Procedure</a> (page 261-10)	Physically writes all pending output to a file
<a href="#">FGETATTR Procedure</a> (page 261-10)	Reads and returns the attributes of a disk file
<a href="#">FGETPOS Function</a> (page 261-11)	Returns the current relative offset position within a file, in bytes
<a href="#">FOPEN Function</a> (page 261-12)	Opens a file for input or output
<a href="#">FOPEN_NCHAR Function</a> (page 261-13)	Opens a file in Unicode for input or output
<a href="#">FREMOVE Procedure</a> (page 261-14)	Deletes a disk file, assuming that you have sufficient privileges
<a href="#">FRENAME Procedure</a> (page 261-15)	Renames an existing file to a new name, similar to the UNIX <code>mv</code> function
<a href="#">FSEEK Procedure</a> (page 261-16)	Adjusts the file pointer forward or backward within the file by the number of bytes specified
<a href="#">GET_LINE Procedure</a> (page 261-16)	Reads text from an open file
<a href="#">GET_LINE_NCHAR Procedure</a> (page 261-17)	Reads text in Unicode from an open file
<a href="#">GET_RAW Procedure</a> (page 261-18)	Reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read
<a href="#">IS_OPEN Function</a> (page 261-19)	Determines if a file handle refers to an open file
<a href="#">NEW_LINE Procedure</a> (page 261-20)	Writes one or more operating system-specific line terminators to a file
<a href="#">PUT Procedure</a> (page 261-20)	Writes a string to a file
<a href="#">PUT_LINE Procedure</a> (page 261-21)	Writes a line to a file, and so appends an operating system-specific line terminator
<a href="#">PUT_LINE_NCHAR Procedure</a> (page 261-22)	Writes a Unicode line to a file
<a href="#">PUT_NCHAR Procedure</a> (page 261-23)	Writes a Unicode string to a file
<a href="#">PUTF Procedure</a> (page 261-24)	A <code>PUT</code> procedure with formatting
<a href="#">PUTF_NCHAR Procedure</a> (page 261-25)	A <code>PUT_NCHAR</code> procedure with formatting, and writes a Unicode string to a file, with formatting
<a href="#">PUT_RAW Procedure</a> (page 261-26)	Accepts as input a RAW data value and writes the value to the output buffer

## 261.8.1 FCLOSE Procedure

This procedure closes an open file identified by a file handle.

### Syntax

```
UTL_FILE.FCLOSE (
 file IN OUT FILE_TYPE);
```

### Parameters

**Table 261-4 FCLOSE Procedure Parameters**

Parameter	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call

### Usage Notes

If there is buffered data yet to be written when `FCLOSE` runs, then you may receive a `WRITE_ERROR` exception when closing a file.

### Exceptions

```
WRITE_ERROR
INVALID_FILEHANDLE
```

## 261.8.2 FCLOSE\_ALL Procedure

This procedure closes all open file handles for the session. This should be used as an emergency cleanup procedure, for example, when a PL/SQL program exits on an exception.

### Syntax

```
UTL_FILE.FCLOSE_ALL;
```

### Usage Notes

 **Note:**

`FCLOSE_ALL` does not alter the state of the open file handles held by the user. This means that an `IS_OPEN` test on a file handle after an `FCLOSE_ALL` call still returns `TRUE`, even though the file has been closed. No further read or write operations can be performed on a file that was open before an `FCLOSE_ALL`.

### Exceptions

```
WRITE_ERROR
```

## 261.8.3 FCOPY Procedure

This procedure copies a contiguous portion of a file to a newly created file.

By default, the whole file is copied if the `start_line` and `end_line` parameters are omitted. The source file is opened in read mode. The destination file is opened in write mode. A starting and ending line number can optionally be specified to select a portion from the center of the source file for copying.

### Syntax

```
UTL_FILE.FCOPY (
 src_location IN VARCHAR2,
 src_filename IN VARCHAR2,
 dest_location IN VARCHAR2,
 dest_filename IN VARCHAR2,
 start_line IN BINARY_INTEGER DEFAULT 1,
 end_line IN BINARY_INTEGER DEFAULT NULL);
```

### Parameters

**Table 261-5 FCOPY Procedure Parameters**

Parameters	Description
<code>src_location</code>	Directory location of the source file, a <code>DIRECTORY_NAME</code> from the <code>ALL_DIRECTORIES</code> view (case sensitive)
<code>src_filename</code>	Source file to be copied
<code>dest_location</code>	Destination directory where the destination file is created
<code>dest_filename</code>	Destination file created from the source file
<code>start_line</code>	Line number at which to begin copying. The default is 1 for the first line
<code>end_line</code>	Line number at which to stop copying. The default is <code>NULL</code> , signifying end of file

### Exceptions

`INVALID_FILENAME`  
`INVALID_PATH`  
`INVALID_OPERATION`  
`INVALID_OFFSET`  
`READ_ERROR`  
`WRITE_ERROR`

## 261.8.4 FFLUSH Procedure

`FFLUSH` physically writes pending data to the file identified by the file handle. Normally, data being written to a file is buffered. The `FFLUSH` procedure forces the buffered data to be written to the file. The data must be terminated with a newline character.

Flushing is useful when the file must be read while still open. For example, debugging messages can be flushed to the file so that they can be read immediately.

### Syntax

```
UTL_FILE.FFLUSH (
 file IN FILE_TYPE);
```

### Parameters

**Table 261-6 FFLUSH Procedure Parameters**

Parameters	Description
file	Active file handle returned by an <code>FOPEN</code> or <code>FOPEN_NCHAR</code> call

### Exceptions

`INVALID_FILENAME`

`INVALID_MAXLINESIZE`

`INVALID_OPERATION`

`WRITE_ERROR`

## 261.8.5 FGETATTR Procedure

This procedure reads and returns the attributes of a disk file.

### Syntax

```
UTL_FILE.FGETATTR(
 location IN VARCHAR2,
 filename IN VARCHAR2,
 fexists OUT BOOLEAN,
 file_length OUT NUMBER,
 block_size OUT BINARY_INTEGER);
```

### Parameters

**Table 261-7 FGETATTR Procedure Parameters**

Parameters	Description
location	Directory location of the source file, a <code>DIRECTORY_NAME</code> from the <code>ALL_DIRECTORIES</code> view (case sensitive)
filename	Name of the file to be examined
fexists	A <code>BOOLEAN</code> for whether or not the file exists

**Table 261-7 (Cont.) FGETATTR Procedure Parameters**

Parameters	Description
<code>file_length</code>	Length of the file in bytes. <code>NULL</code> if file does not exist.
<code>block_size</code>	File system block size in bytes. <code>NULL</code> if the file does not exist.

**Exceptions**

`INVALID_PATH`  
`INVALID_FILENAME`  
`INVALID_OPERATION`  
`READ_ERROR`  
`ACCESS_DENIED`

## 261.8.6 FGETPOS Function

This function returns the current relative offset position within a file, in bytes.

**Syntax**

```
UTL_FILE.FGETPOS (
 file IN FILE_TYPE)
 RETURN PLS_INTEGER;
```

**Parameters****Table 261-8 FGETPOS Parameters**

Parameters	Description
<code>file</code>	Directory location of the source file

**Return Values**

`FGETPOS` returns the relative offset position for an open file, in bytes. It raises an exception if the file is not open. It returns 0 for the beginning of the file.

**Exceptions**

`INVALID_FILEHANDLE`  
`INVALID_OPERATION`  
`READ_ERROR`

**Usage Notes**

If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

## 261.8.7 FOPEN Function

This function opens a file. You can specify the maximum line size and have a maximum of 50 files open simultaneously.

See also [FOPEN\\_NCHAR Function](#) (page 261-13).

### Syntax

```
UTL_FILE.FOPEN (
 location IN VARCHAR2,
 filename IN VARCHAR2,
 open_mode IN VARCHAR2,
 max_linesize IN BINARY_INTEGER DEFAULT 1024)
RETURN FILE_TYPE;
```

### Parameters

**Table 261-9 FOPEN Function Parameters**

Parameter	Description
location	Directory location of file. This string is a directory object name and must be specified in upper case. Read privileges must be granted on this directory object for the UTL_FILE user to run FOPEN.
filename	File name, including extension (file type), without directory path. If a directory path is given as a part of the filename, it is ignored by FOPEN. On Unix, the filename cannot end with /.
open_mode	Specifies how the file is opened. Modes include: <ul style="list-style-type: none"> <li>r -- read text</li> <li>w -- write text</li> <li>a -- append text</li> <li>rb -- read byte mode</li> <li>wb -- write byte mode</li> <li>ab -- append byte mode</li> </ul> If you try to open a file specifying 'a' or 'ab' for open_mode but the file does not exist, the file is created in write mode.
max_linesize	Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767). If unspecified, Oracle supplies a default value of 1024.

### Return Values

FOPEN returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL\_FILE package, and individual components should not be referenced or changed by the UTL\_FILE user.

**Table 261-10 FOPEN Function Return Values**

Return	Description
FILE_TYPE	Handle to open file

## Exceptions

INVALID\_MAXLINESIZE

INVALID\_MODE

INVALID\_OPERATION

INVALID\_PATH

INVALID\_FILENAME

## Usage Notes

The file location and file name parameters must be supplied to the `FOPEN` function as quoted strings so that the file location can be checked against the list of accessible directories as specified by the `ALL_DIRECTORIES` view of accessible directory objects.

## 261.8.8 FOPEN\_NCHAR Function

This function opens a file in national character set mode for input or output, with the maximum line size specified. With this function, you can read or write a text file in Unicode instead of in the database character set.

You can have a maximum of 50 files open simultaneously.

Even though the contents of an `NVARCHAR2` buffer may be AL16UTF16 or UTF8 (depending on the national character set of the database), the contents of the file are always read and written in UTF8. `UTL_FILE` converts between UTF8 and AL16UTF16 as necessary.

See also [FOPEN Function](#) (page 261-12).

## Syntax

```
UTL_FILE.FOPEN_NCHAR (
 location IN VARCHAR2,
 filename IN VARCHAR2,
 open_mode IN VARCHAR2,
 max_linesize IN BINARY_INTEGER DEFAULT 1024)
RETURN FILE_TYPE;
```

## Parameters

**Table 261-11 FOPEN\_NCHAR Function Parameters**

Parameter	Description
location	Directory location of file
filename	File name (including extension)
open_mode	Open mode (r,w,a,rb,wb,ab)
max_linesize	Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767)

## Return Values

FOPEN\_NCHAR returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL\_FILE package, and individual components should not be referenced or changed by the UTL\_FILE user.

**Table 261-12 FOPEN\_NCHAR Function Return Values**

Return	Description
FILE_TYPE	Handle to open file

## Exceptions

INVALID\_MAXLINESIZE

INVALID\_MODE

INVALID\_OPERATION

INVALID\_PATH

## 261.8.9 REMOVE Procedure

This procedure deletes a disk file, assuming that you have sufficient privileges.

### Syntax

```
UTL_FILE.REMOVE (
 location IN VARCHAR2,
 filename IN VARCHAR2);
```

### Parameters

**Table 261-13 REMOVE Procedure Parameters**

Parameters	Description
location	Directory location of the file, a DIRECTORY_NAME from ALL_DIRECTORIES (case sensitive)
filename	Name of the file to be deleted

### Exceptions

ACCESS\_DENIED

DELETE\_FAILED

INVALID\_FILENAME

INVALID\_OPERATION

INVALID\_PATH

## Usage Notes

The `FREMOVE` procedure does not verify privileges before deleting a file. The O/S verifies file and directory permissions. An exception is returned on failure.

## 261.8.10 FRENAME Procedure

This procedure renames an existing file to a new name, similar to the UNIX `mv` function.

### Syntax

```
UTL_FILE.FRENAME (
 src_location IN VARCHAR2,
 src_filename IN VARCHAR2,
 dest_location IN VARCHAR2,
 dest_filename IN VARCHAR2,
 overwrite IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 261-14 FRENAME Procedure Parameters**

Parameters	Description
<code>src_location</code>	Directory location of the source file, a <code>DIRECTORY_NAME</code> from the <code>ALL_DIRECTORIES</code> view (case sensitive)
<code>src_filename</code>	Source file to be renamed
<code>dest_location</code>	Destination directory of the destination file, a <code>DIRECTORY_NAME</code> from the <code>ALL_DIRECTORIES</code> view (case sensitive)
<code>dest_filename</code>	New name of the file
<code>overwrite</code>	Default is <code>FALSE</code> . Permission on both the source and destination directories must be granted. You can use the <code>overwrite</code> parameter to specify whether or not to overwrite a file if one exists in the destination directory. The default is <code>FALSE</code> for no overwrite.

### Exceptions

`ACCESS_DENIED`  
`INVALID_FILENAME`  
`INVALID_PATH`  
`RENAME_FAILED`

## 261.8.11 FSEEK Procedure

This procedure adjusts the file pointer forward or backward within the file by the number of bytes specified.

### Syntax

```
UTL_FILE.FSEEK (
 file IN OUT UTL_FILE.FILE_TYPE,
 absolute_offset IN PL_INTEGER DEFAULT NULL,
 relative_offset IN PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 261-15 FSEEK Procedure Parameters**

Parameters	Description
file	File handle
absolute_offset	Absolute location to which to seek; default = NULL
relative_offset	Number of bytes to seek forward or backward; positive = forward, negative integer = backward, zero = current position, default = NULL

### Exceptions

INVALID\_FILEHANDLE

INVALID\_OFFSET

INVALID\_OPERATION

READ\_ERROR

### Usage Notes

- Using `FSEEK`, you can read previous lines in the file without first closing and reopening the file. You must know the number of bytes by which you want to navigate.
- If `relative_offset`, the procedure seeks forward. If `relative_offset > 0`, or backward, if `relative_offset < 0`, the procedure seeks through the file by the number of `relative_offset` bytes specified.
- If the beginning of the file is reached before the number of bytes specified, then the file pointer is placed at the beginning of the file. If the end of the file is reached before the number of bytes specified, then an `INVALID_OFFSET` error is raised.
- If `absolute_offset`, the procedure seeks to an absolute location specified in bytes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

## 261.8.12 GET\_LINE Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. Text is read up to, but not including, the line

terminator, or up to the end of the file, or up to the end of the `len` parameter. It cannot exceed the `max_linesize` specified in `FOPEN`.

### Syntax

```
UTL_FILE.GET_LINE (
 file IN FILE_TYPE,
 buffer OUT VARCHAR2,
 len IN PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 261-16 GET\_LINE Procedure Parameters**

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN</code> call. The file must be open for reading (mode <code>r</code> ); otherwise an <code>INVALID_OPERATION</code> exception is raised.
<code>buffer</code>	Data buffer to receive the line read from the file
<code>len</code>	The number of bytes read from the file. Default is <code>NULL</code> . If <code>NULL</code> , Oracle supplies the value of <code>max_linesize</code> .

### Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`NO_DATA_FOUND`

`READ_ERROR`

### Usage Notes

If the line does not fit in the `buffer`, a `READ_ERROR` exception is raised. If no text was read due to end of file, the `NO_DATA_FOUND` exception is raised. If the file is opened for byte mode operations, the `INVALID_OPERATION` exception is raised.

Because the line terminator character is not read into the buffer, reading blank lines returns empty strings.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. See also "[GET\\_LINE\\_NCHAR Procedure](#) (page 261-17)".

## 261.8.13 GET\_LINE\_NCHAR Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. With this function, you can read a text file in Unicode instead of in the database character set.

The file must be opened in national character set mode, and must be encoded in the UTF8 character set. The expected buffer datatype is `NVARCHAR2`. If a variable of another datatype, such as `NCHAR`, `NCLOB`, or `VARCHAR2` is specified, PL/SQL will perform standard implicit conversion from `NVARCHAR2` after the text is read.

See also [GET\\_LINE Procedure](#) (page 261-16)

### Syntax

```
UTL_FILE.GET_LINE_NCHAR (
 file IN FILE_TYPE,
 buffer OUT NVARCHAR2,
 len IN PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 261-17 GET\_LINE\_NCHAR Procedure Parameters**

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
buffer	Data buffer to receive the line read from the file
len	The number of bytes read from the file. Default is NULL. If NULL, Oracle supplies the value of max_linesize.

### Exceptions

INVALID\_FILEHANDLE  
INVALID\_OPERATION  
NO\_DATA\_FOUND  
READ\_ERROR

## 261.8.14 GET\_RAW Procedure

This procedure reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read. UTL\_FILE.GET\_RAW ignores line terminators.

### Syntax

```
UTL_FILE.GET_RAW (
 file IN UTL_FILE.FILE_TYPE,
 buffer OUT NOCOPY RAW,
 len IN PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 261-18 GET\_RAW Procedure Parameters**

Parameters	Description
file	File handle
buffer	RAW data
len	The number of bytes read from the file. Default is NULL. If NULL, len is assumed to be the maximum length of RAW.

## Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

LENGTH\_MISMATCH

NO\_DATA\_FOUND

READ\_ERROR

## Usage Notes

The subprogram will raise `No_Data_Found` when it attempts to read past the end of the file. Your application should allow for this by catching the exception in its processing loop.

```

PROCEDURE Sys.p (n IN VARCHAR2) IS
 h UTL_FILE.FILE_TYPE := UTL_FILE.FOPEN('D', n, 'r', 32767);
 Buf RAW(32767);
 Amnt CONSTANT PLS_INTEGER := 32767;
BEGIN
 LOOP
 BEGIN
 Utl_File.Get_Raw(h, Buf, Amnt);
 -- Do something with this chunk
 EXCEPTION WHEN No_Data_Found THEN EXIT; END;
 END LOOP;
 UTL_FILE.FCLOSE (h);
END;

```

## 261.8.15 IS\_OPEN Function

This function tests a file handle to see if it identifies an open file.

`IS_OPEN` reports only whether a file handle represents a file that has been opened, but not yet closed. It does not guarantee that there will be no operating system errors when you attempt to use the file handle.

### Syntax

```

UTL_FILE.IS_OPEN (
 file IN FILE_TYPE)
RETURN BOOLEAN;

```

### Parameters

**Table 261-19** IS\_OPEN Function Parameters

Parameter	Description
file	Active file handle returned by an <code>FOPEN</code> or <code>FOPEN_NCHAR</code> call

### Return Values

TRUE OR FALSE

## Exceptions

INVALID\_FILEHANDLE

## 261.8.16 NEW\_LINE Procedure

This procedure writes one or more line terminators to the file identified by the input file handle.

This procedure is separate from `PUT` because the line terminator is a platform-specific character or sequence of characters.

### Syntax

```
UTL_FILE.NEW_LINE (
 file IN FILE_TYPE,
 lines IN BINARY_INTEGER := 1);
```

### Parameters

**Table 261-20** NEW\_LINE Procedure Parameters

Parameters	Description
file	Active file handle returned by an <code>FOPEN</code> or <code>FOPEN_NCHAR</code> call
lines	Number of line terminators to be written to the file

### Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

WRITE\_ERROR

## 261.8.17 PUT Procedure

`PUT` writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

The file must be open for write operations. No line terminator is appended by `PUT`; use `NEW_LINE` to terminate the line or use `PUT_LINE` to write a complete line with a line terminator. See also "[PUT\\_NCHAR Procedure](#) (page 261-23)".

### Syntax

```
UTL_FILE.PUT (
 file IN FILE_TYPE,
 buffer IN VARCHAR2);
```

## Parameters

**Table 261-21 PUT Procedure Parameters**

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for writing.
<code>buffer</code>	Buffer that contains the text to be written to the file. User must have opened the file using mode <code>w</code> or mode <code>a</code> ; otherwise, an <code>INVALID_OPERATION</code> exception is raised.

## Usage Notes

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

## Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

## 261.8.18 PUT\_LINE Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

The file must be open for write operations. `PUT_LINE` terminates the line with the platform-specific line terminator character or characters.

See also "[PUT\\_LINE\\_NCHAR Procedure \(page 261-22\)](#)".

## Syntax

```
UTL_FILE.PUT_LINE (
 file IN FILE_TYPE,
 buffer IN VARCHAR2,
 autoflush IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 261-22 PUT\_LINE Procedure Parameters**

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN</code> call
<code>buffer</code>	Text buffer that contains the lines to be written to the file
<code>autoflush</code>	Flushes the buffer to disk after the <code>WRITE</code>

## Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

WRITE\_ERROR

## Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

## 261.8.19 PUT\_LINE\_NCHAR Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle. With this function, you can write a text file in Unicode instead of in the database character set.

This procedure is equivalent to the [PUT\\_NCHAR Procedure](#) (page 261-23), except that the line separator is appended to the written text. See also [PUT\\_LINE Procedure](#) (page 261-21).

## Syntax

```
UTL_FILE.PUT_LINE_NCHAR (
 file IN FILE_TYPE,
 buffer IN NVARCHAR2);
```

## Parameters

**Table 261-23** PUT\_LINE\_NCHAR Procedure Parameters

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for writing.
<code>buffer</code>	Text buffer that contains the lines to be written to the file

## Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

WRITE\_ERROR

## Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The

sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

- If file is opened for byte mode operations, then the `INVALID_OPERATION` exception is raised.

## 261.8.20 PUT\_NCHAR Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

With this function, you can write a text file in Unicode instead of in the database character set. The file must be opened in the national character set mode. The text string will be written in the UTF8 character set. The expected buffer datatype is `NVARCHAR2`. If a variable of another datatype is specified, PL/SQL will perform implicit conversion to `NVARCHAR2` before writing the text.

### Syntax

```
UTL_FILE.PUT_NCHAR (
 file IN FILE_TYPE,
 buffer IN NVARCHAR2);
```

### Parameters

**Table 261-24 PUT\_NCHAR Procedure Parameters**

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN_NCHAR</code> call. If the file is opened by <code>FOPEN</code> instead of <code>FOPEN_NCHAR</code> , a <code>CHARSETMISMATCH</code> exception is raised.
<code>buffer</code>	Buffer that contains the text to be written to the file. User must have opened the file using mode <code>w</code> or mode <code>a</code> ; otherwise, an <code>INVALID_OPERATION</code> exception is raised.

### Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

### Usage Notes

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

### Related Topics:

- [PUT Procedure](#) (page 261-20)  
`PUT` writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

## 261.8.21 PUTF Procedure

This procedure is a formatted `PUT` procedure.

It works like a limited `printf()`.

### Syntax

```
UTL_FILE.PUTF (
 file IN FILE_TYPE,
 format IN VARCHAR2,
 [arg1 IN VARCHAR2 DEFAULT NULL,
 . . .
 arg5 IN VARCHAR2 DEFAULT NULL]);
```

### Parameters

**Table 261-25** PUTF Procedure Parameters

Parameters	Description
file	Active file handle returned by an <code>FOPEN</code> call
format	Format string that can contain text as well as the formatting characters <code>\n</code> and <code>%s</code>
arg1..arg5	From one to five operational argument strings. Argument strings are substituted, in order, for the <code>%s</code> formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each <code>%s</code> for which there is no argument.

### Usage Notes

- If file is opened for byte mode operations, then the `INVALID_OPERATION` exception is raised.
- The format string can contain any text, but the character sequences `%s` and `\n` have special meaning.

Character Sequence	Meaning
<code>%s</code>	Substitute this sequence with the string value of the next argument in the argument list.
<code>\n</code>	Substitute with the appropriate platform-specific line terminator.

### Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

### Examples

The following example writes the lines:

```

Hello, world!
I come from Zork with greetings for all earthlings.

my_world varchar2(4) := 'Zork';
...
PUTF(my_handle, 'Hello, world!\nI come from %s with %s.\n',
 my_world,
 'greetings for all earthlings');

```

If there are more %s formatters in the format parameter than there are arguments, then an empty string is substituted for each %s for which there is no matching argument.

#### Related Topics:

- [PUTF\\_NCHAR Procedure](#) (page 261-25)  
This procedure is a formatted version of a PUT\_NCHAR Procedure.

## 261.8.22 PUTF\_NCHAR Procedure

This procedure is a formatted version of a PUT\_NCHAR Procedure.

Using PUTF\_NCHAR, you can write a text file in Unicode instead of in the database character set. It accepts a format string with formatting elements \n and %s, and up to five arguments to be substituted for consecutive instances of %s in the format string. The expected datatype of the format string and the arguments is NVARCHAR2.

If variables of another datatype are specified, PL/SQL will perform implicit conversion to NVARCHAR2 before formatting the text. Formatted text is written in the UTF8 character set to the file identified by the file handle. The file must be opened in the national character set mode.

#### Syntax

```

UTL_FILE.PUTF_NCHAR (
 file IN FILE_TYPE,
 format IN NVARCHAR2,
 [arg1 IN NVARCHAR2 DEFAULT NULL,
 . . .
 arg5 IN NVARCHAR2 DEFAULT NULL]);

```

#### Parameters

**Table 261-26 PUTF\_NCHAR Procedure Parameters**

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
format	Format string that can contain text as well as the formatting characters \n and %s
arg1..arg5	From one to five operational argument strings. Argument strings are substituted, in order, for the %s formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each %s for which there is no argument.

## Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

WRITE\_ERROR

## Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

## Related Topics:

- [PUT\\_NCHAR Procedure](#) (page 261-23)  
This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

## 261.8.23 PUT\_RAW Procedure

This procedure accepts as input a `RAW` data value and writes the value to the output buffer.

## Syntax

```

UTL_FILE.PUT_RAW (
 file IN UTL_FILE.FILE_TYPE,
 buffer IN RAW,
 autoflush IN BOOLEAN DEFAULT FALSE);

```

## Parameters

**Table 261-27 PUT\_RAW Procedure Parameters**

Parameters	Description
<code>file</code>	File handle
<code>buffer</code>	The <code>RAW</code> data written to the buffer
<code>autoflush</code>	If <code>TRUE</code> , then performs a flush after writing the value to the output buffer; default is <code>FALSE</code> .

## Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

WRITE\_ERROR

### Usage Notes

You can request an automatic flush of the buffer by setting the third argument to `TRUE`.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

# UTL\_HTTP

The `UTL_HTTP` package makes Hypertext Transfer Protocol (HTTP) callouts from SQL and PL/SQL. You can use it to access data on the Internet over HTTP.

When the package fetches data from a Web site using HTTPS, it requires Oracle Wallet Manager which can be created by either Oracle Wallet Manager or the `orapki` utility. Non-HTTPS fetches do not require an Oracle wallet.

This chapter contains the following topics:

- [Overview](#) (page 262-1)
- [Security Model](#) (page 262-2)
- [Constants](#) (page 262-2)
- [Exceptions](#) (page 262-6)
- [Examples](#) (page 262-8)
- [Data Structures](#) (page 262-12)
- [Operations](#) (page 262-16)
- [Subprogram Groups](#) (page 262-22)
- [Summary of UTL\\_HTTP Subprograms](#) (page 262-26)

## See Also:

- [UTL\\_URL](#) (page 276-1)
- [UTL\\_SMTP](#) (page 273-1)
- *Oracle Database Enterprise User Security Administrator's Guide* for more information on Wallet Manager

## 262.1 UTL\_HTTP Overview

With the `UTL_HTTP` package, you can write PL/SQL programs that communicate with Web (HTTP) servers. `UTL_HTTP` also contains a function that can be used in SQL queries.

The package supports HTTP over the Secured Socket Layer protocol (SSL), also known as HTTPS. It also supports SSL client authentication by sending the client-certificate in a wallet to authenticate with the remote Web server.

Other Internet-related data-access protocols (such as the File Transfer Protocol (FTP) or the Gopher protocol) are also supported using an HTTP proxy server that supports those protocols.

## 262.2 UTL\_HTTP Security Model

This package is an invoker's rights package. The invoking user will need the `connect` privilege granted in the access control list assigned to the remote network host to which he wants to connect, as well as the `use-client-certificates` or the `use-passwords` privilege to authenticate himself with the remote Web server using the credentials stored in an Oracle wallet.

 **Note:**

For more information about managing fine-grained access, see *Oracle Database Security Guide*

## 262.3 UTL\_HTTP Constants

The `UTL_HTTP` package defines several constants to use when specifying parameter values.

These are shown in following tables.

- [Table 262-1](#) (page 262-2)
- [Table 262-2](#) (page 262-2)
- [Table 262-3](#) (page 262-3)

**Table 262-1 UTL\_HTTP Constants - HTTP Versions**

Name	Type	Value	Description
<code>HTTP_VERSION_1_0</code>	<code>VARCHAR2(10)</code>	'HTTP/ 1.0'	Denotes HTTP version 1.0 that can be used in the function <code>BEGIN_REQUEST</code> .
<code>HTTP_VERSION_1_1</code>	<code>VARCHAR2(10)</code>	'HTTP/ 1.1'	Denotes HTTP version 1.1 that can be used in the function <code>BEGIN_REQUEST</code> .

**Table 262-2 UTL\_HTTP Constants - Default Ports**

Name	Type	Value	Description
<code>DEFAULT_HTTP_PORT</code>	<code>PLS_INTEGER</code>	80	The default TCP/IP port (80) at which a Web server or proxy server listens
<code>DEFAULT_HTTPS_PORT</code>	<code>PLS_INTEGER</code>	443	The default TCP/IP port (443) at which an HTTPS Web server listens

**Table 262-3 UTL\_HTTP Constants - HTTP 1.1 Status Codes**

Name	Type	Value	Description
HTTP_CONTINUE	PLS_INTEGER	100	The client should continue with its request. This interim response is used to inform the client that the initial part of the request has been received and has not yet been rejected by the server.
HTTP_SWITCHING_PROTOCOLS	PLS_INTEGER	101	The server understands and is willing to comply with the client's request, through the Upgrade message header field, for a change in the application protocol being used on this connection. The server will switch protocols to those defined by the response's Upgrade header field immediately after the empty line which terminates the 101 response.
HTTP_OK	PLS_INTEGER	200	The request has succeeded. The information returned with the response is dependent on the method used in the request
HTTP_CREATED	PLS_INTEGER	201	The request has been fulfilled and resulted in a new resource being created.
HTTP_ACCEPTED	PLS_INTEGER	202	The request has been accepted for processing, but the processing has not been completed. The request might or might not eventually be acted upon, as it might be disallowed when processing actually takes place.
HTTP_NON_AUTHORITATIVE_INFORMATION	PLS_INTEGER	203	The returned meta-information in the entity-header is not the definitive set as available from the origin server, but is gathered from a local or a third-party copy.
HTTP_NO_CONTENT	PLS_INTEGER	204	The server has fulfilled the request but does not need to return an entity-body, and might want to return updated meta-information.
HTTP_RESET_CONTENT	PLS_INTEGER	205	The server has fulfilled the request and the user agent should reset the document view which caused the request to be sent. The response must not include an entity.
HTTP_PARTIAL_CONTENT	PLS_INTEGER	206	The server has fulfilled the partial GET request for the resource.

**Table 262-3 (Cont.) UTL\_HTTP Constants - HTTP 1.1 Status Codes**

Name	Type	Value	Description
HTTP_MULTIPLE_CHOICES	PLS_INTEGER	300	The requested resource corresponds to any one of a set of representations, each with its own specific location, and agent-driven negotiation information is being provided so that the user (or user agent) can select a preferred representation and redirect its request to that location.
HTTP_MOVED_PERMANENTLY	PLS_INTEGER	301	The requested resource has been assigned a new permanent URI and any future references to this resource should use one of the returned URIs.
HTTP_FOUND_CONSTANT	PLS_INTEGER	302	The requested resource resides temporarily under a different URI.
HTTP_SEE_OTHER	PLS_INTEGER	303	The response to the request can be found under a different URI and should be retrieved using a GET method on that resource.
HTTP_NOT_MODIFIED	PLS_INTEGER	304	If the client has performed a conditional GET request and access is allowed, but the document has not been modified, the server responds with this status code.
HTTP_USE_PROXY	PLS_INTEGER	305	The requested resource must be accessed through the proxy given by the Location field. The Location field gives the URI of the proxy.
HTTP_TEMPORARY_REDIRECT	PLS_INTEGER	307	The requested resource resides temporarily under a different URI.
HTTP_BAD_REQUEST	PLS_INTEGER	400	The request could not be understood by the server due to malformed syntax.
HTTP_UNAUTHORIZED	PLS_INTEGER	401	The request requires user authentication. The client may repeat the request with a suitable Authorization header field. If the request already included Authorization credentials, then the 401 response indicates that authorization has been refused for those credentials.
HTTP_PAYMENT_REQUIRED	PLS_INTEGER	402	This code is reserved for future use.
HTTP_FORBIDDEN	PLS_INTEGER	403	The server understood the request, but is refusing to fulfill it.
HTTP_NOT_FOUND	PLS_INTEGER	404	The server has not found anything matching the Request-URI.

**Table 262-3 (Cont.) UTL\_HTTP Constants - HTTP 1.1 Status Codes**

Name	Type	Value	Description
HTTP_NOT_ACCEPTABLE	PLS_INTEGER	406	The resource identified by the request is only capable of generating response entities which have content characteristics not acceptable according to the accept headers sent in the request.
HTTP_PROXY_AUTH_REQ UIRED	PLS_INTEGER	407	This code is similar to 401 (Unauthorized), but indicates that the client must first authenticate itself with the proxy.
HTTP_REQUEST_TIME_O UT	PLS_INTEGER	408	The client did not produce a request within the time that the server was prepared to wait.
HTTP_CONFLICT	PLS_INTEGER	409	The request could not be completed due to a conflict with the current state of the resource.
HTTP_GONE	PLS_INTEGER	410	The requested resource is no longer available at the server and no forwarding address is known.
HTTP_LENGTH_REQUIRE D	PLS_INTEGER	411	The server refuses to accept the request without a defined Content-Length.
HTTP_PRECONDITION_F AILED	PLS_INTEGER	412	The precondition given in one or more of the request-header fields evaluated to false when it was tested on the server.
HTTP_REQUEST_ENTITY _TOO_LARGE CONSTANT	PLS_INTEGER	413	The server is refusing to process a request because the request entity is larger than the server is willing or able to process.
HTTP_REQUEST_URI_TO O_LARGE	PLS_INTEGER	414	The server is refusing to service the request because the Request-URI is longer than the server is willing to interpret.
HTTP_UNSUPPORTED_ME DIA_TYPE	PLS_INTEGER	415	The server is refusing to service the request because the entity of the request is in a format not supported by the requested resource for the requested method.
HTTP_REQ_RANGE_NOT_ SATISFIABLE	PLS_INTEGER	416	A server returns a response with this status code if a request included a Range request-header field, and none of the range-specifier values in this field overlap the current extent of the selected resource, and the request did not include an If-Range request-header field.

**Table 262-3 (Cont.) UTL\_HTTP Constants - HTTP 1.1 Status Codes**

Name	Type	Value	Description
HTTP_EXPECTATION_FAILED	PLS_INTEGER	417	The expectation given in an Expect request-header field could not be met by this server, or, if the server is a proxy, the server has unambiguous evidence that the request could not be met by the next-hop server.
HTTP_NOT_IMPLEMENTED	PLS_INTEGER	501	The server does not support the functionality required to fulfill the request.
HTTP_BAD_GATEWAY	PLS_INTEGER	502	The server, while acting as a gateway or proxy, received an invalid response from the upstream server it accessed in attempting to fulfill the request
HTTP_SERVICE_UNAVAILABLE	PLS_INTEGER	503	The server is currently unable to handle the request due to a temporary overloading or maintenance of the server.
HTTP_GATEWAY_TIMEOUT	PLS_INTEGER	504	The server, while acting as a gateway or proxy, did not receive a timely response from the upstream server specified by the URI (for example, HTTP, FTP, LDAP) or some other auxiliary server (for example, DNS) it needed to access in attempting to complete the request.
HTTP_VERSION_NOT_SUPPORTED	PLS_INTEGER	505	The server does not support, or refuses to support, the HTTP protocol version that was used in the request message.

## 262.4 UTL\_HTTP Exceptions

Exceptions indicate that the UTL\_HTTP package encountered issues.

The following table lists these exceptions . By default, UTL\_HTTP raises the exception `request_failed` when a request fails to execute. If the package is set to raise a detailed exception by `set_detailed_excp_support`, the rest of the exceptions will be raised directly (except for the exception `end_of_body`, which will be raised by `READ_TEXT`, `READ_LINE`, and `READ_RAW` regardless of the setting).

**Table 262-4 UTL\_HTTP Exceptions**

Exception	Error Code	Reason	Where Raised
BAD_ARGUMENT	29261	The argument passed to the interface is bad	Any HTTP request or response interface when <code>detailed_exception</code> is enabled
BAD_URL	29262	The requested URL is badly formed	BEGIN_REQUEST, when <code>detailed_exception</code> is enabled
END_OF_BODY	29266	The end of HTTP response body is reached	READ_RAW, READ_TEXT, and READ_LINE, when <code>detailed_exception</code> is enabled
HEADER_NOT_FOUND	29265	The header is not found	GET_HEADER, GET_HEADER_BY_NAME, when <code>detailed_exception</code> is enabled
HTTP_CLIENT_ERROR	29268	From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 4xx range). Or from begin_request, the HTTP proxy returns a status code in the 4xx range when making an HTTPS request through the proxy.	GET_RESPONSE, BEGIN_REQUEST when <code>detailed_exception</code> is enabled
HTTP_SERVER_ERROR	29269	From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 5xx range). Or from begin_request, the HTTP proxy returns a status code in the 5xx range when making an HTTPS request through the proxy.	GET_RESPONSE, BEGIN_REQUEST when <code>detailed_exception</code> is enabled
NETWORK_ACCESS_DENIED	24247	Access to the remote network host or credentials in an Oracle wallet is denied	BEGIN_REQUEST and SET_AUTHENTICATION_FROM_WALLET when <code>detailed_exception</code> is enabled
ILLEGAL_CALL	29267	The call to UTL_HTTP is illegal at the current state of the HTTP request	SET_HEADER, SET_AUTHENTICATION, and SET_PERSISTENT_CONN_SUPPORT, when <code>detailed_exception</code> is enabled
PARTIAL_MULTIBYTE_EXCEPTION	29275	No complete character is read and a partial multibyte character is found at the end of the response body	READ_TEXT and READ_LINE, when <code>detailed_exception</code> is enabled
PROTOCOL_ERROR	29263	An HTTP protocol error occurs when communicating with the Web server	SET_HEADER, GET_RESPONSE, READ_RAW, READ_TEXT, and READ_LINE, when <code>detailed_exception</code> is enabled
REQUEST_FAILED	29273	The request fails to execute	Any HTTP request or response interface when <code>detailed_exception</code> is disabled
TOO_MANY_REQUESTS	29270	Too many requests or responses are open	BEGIN_REQUEST, when <code>detailed_exception</code> is enabled

Table 262-4 (Cont.) UTL\_HTTP Exceptions

Exception	Error Code	Reason	Where Raised
TRANSFER_TIMEOUT	29276	No data is read and a read timeout occurred	READ_TEXT and READ_LINE, when detailed_exception is enabled
UNKNOWN_SCHEME	29264	The scheme of the requested URL is unknown	BEGIN_REQUEST and GET_RESPONSE, when detailed_exception is enabled

 **Note:**

The `partial_multibyte_char` and `transfer_timeout` exceptions are duplicates of the same exceptions defined in `UTL_TCP`. They are defined in this package so that the use of this package does not require the knowledge of the `UTL_TCP`. As those exceptions are duplicates, an exception handle that catches the `partial_multibyte_char` and `transfer_timeout` exceptions in this package also catch the exceptions in the `UTL_TCP`.

For `REQUEST` and `REQUEST_PIECES`, the `request_failed` exception is raised when any exception occurs and `detailed_exception` is disabled.

## 262.5 UTL\_HTTP Examples

These five examples demonstrate how to use `UTL_HTTP`.

- [General Usage](#) (page 262-8)
- [Retrieving HTTP Response Headers](#) (page 262-9)
- [Handling HTTP Authentication](#) (page 262-9)
- [Retrieving and Restoring Cookies](#) (page 262-10)
- [Making HTTP Request with Private Wallet and Cookie Table](#) (page 262-11)

### 262.5.1 UTL\_HTTP General Usage

This is an general example of `UTL_HTTP` usage.

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
 req UTL_HTTP.REQ;
 resp UTL_HTTP.RESP;
 value VARCHAR2(1024);
BEGIN
 UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
 req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
 UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
 resp := UTL_HTTP.GET_RESPONSE(req);
 LOOP
 UTL_HTTP.READ_LINE(resp, value, TRUE);
```

```

 DBMS_OUTPUT.PUT_LINE(value);
 END LOOP;
 UTL_HTTP.END_RESPONSE(resp);
EXCEPTION
 WHEN UTL_HTTP.END_OF_BODY THEN
 UTL_HTTP.END_RESPONSE(resp);
END;
```

## 262.5.2 UTL\_HTTP Retrieving HTTP Response Headers

This example shows how UTL\_HTTP retrieves HTTP response headers.

```

SET SERVEROUTPUT ON SIZE 40000

DECLARE
 req UTL_HTTP.REQ;
 resp UTL_HTTP.RESP;
 name VARCHAR2(256);
 value VARCHAR2(1024);
BEGIN
 UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
 req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
 UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
 resp := UTL_HTTP.GET_RESPONSE(req);
 DBMS_OUTPUT.PUT_LINE('HTTP response status code: ' || resp.status_code);
 DBMS_OUTPUT.PUT_LINE('HTTP response reason phrase: ' || resp.reason_phrase);
 FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
 UTL_HTTP.GET_HEADER(resp, i, name, value);
 DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
 END LOOP;
 UTL_HTTP.END_RESPONSE(resp);
END;
```

## 262.5.3 UTL\_HTTP Handling HTTP Authentication

This code sample indicates how UTL\_HTTP handles HTTP authentication.

```

SET serveroutput ON SIZE 40000

CREATE OR REPLACE PROCEDURE get_page (url IN VARCHAR2,
 username IN VARCHAR2 DEFAULT NULL,
 password IN VARCHAR2 DEFAULT NULL,
 realm IN VARCHAR2 DEFAULT NULL) AS

 req UTL_HTTP.REQ;
 resp UTL_HTTP.RESP;
 my_scheme VARCHAR2(256);
 my_realm VARCHAR2(256);
 name VARCHAR2(256);
 value VARCHAR2(256);
BEGIN
 -- Turn off checking of status code. We will check it by ourselves.
 UTL_HTTP.SET_RESPONSE_ERROR_CHECK(FALSE);
 req := UTL_HTTP.BEGIN_REQUEST(url);
 IF (username IS NOT NULL) THEN
 UTL_HTTP.SET_AUTHENTICATION(req, username, password); -- Use HTTP Basic Authen.
 Scheme
 END IF;
 resp := UTL_HTTP.GET_RESPONSE(req);
 IF (resp.status_code = UTL_HTTP.HTTP_UNAUTHORIZED) THEN
 UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, FALSE);
 END IF;
```

```

 DBMS_OUTPUT.PUT_LINE('Web proxy server is protected.');
```

```

 DBMS_OUTPUT.PUT('Please provide the required ' || my_scheme || ' authentication
username/password for realm ' || my_realm || '
 for the proxy server.');
```

```

 UTL_HTTP.END_RESPONSE(resp);
 RETURN;
 ELSIF (resp.status_code = UTL_HTTP.HTTP_PROXY_AUTH_REQUIRED) THEN
 UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, TRUE);
 DBMS_OUTPUT.PUT_LINE('Web page ' || url || ' is protected.');
```

```

 DBMS_OUTPUT.PUT('Please provide the required ' || my_scheme || ' authentication
username/password for realm ' || my_realm || '
 for the Web page.');
```

```

 UTL_HTTP.END_RESPONSE(resp);
 RETURN;
 END IF;
 FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
 UTL_HTTP.GET_HEADER(resp, i, name, value);
 DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
 END LOOP;
 UTL_HTTP.END_RESPONSE(resp);
END;
```

## 262.5.4 UTL\_HTTP Retrieving and Restoring Cookies

This example show how UTL\_HTTP can be used to retrieve and restore cookies.

```

CREATE TABLE my_cookies (
 session_id INTEGER,
 name VARCHAR2(256),
 value VARCHAR2(1024),
 domain VARCHAR2(256),
 expire DATE,
 path VARCHAR2(1024),
 secure VARCHAR2(1),
 version INTEGER);

CREATE SEQUENCE session_id;

## 262.5.5 UTL\_HTTP Making HTTP Request with Private Wallet and Cookie Table

This example shows how UTL\_HTTP creates a request context with a wallet and cookie table, then makes an HTTP Request using that wallet and cookie table.

```

SET SERVEROUTPUT ON SIZE 40000

CREATE OR REPLACE PROCEDURE DISPLAY_PAGE(url IN VARCHAR2) AS
 request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
 req UTL_HTTP.REQ;
 resp UTL_HTTP.RESP;
 data VARCHAR2(1024);

BEGIN

 -- Create a request context with its wallet and cookie table
 request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
 wallet_path => 'file:/oracle/wallets/test/wallet',
 wallet_password => '*****',
 enable_cookies => TRUE,
 max_cookies => 300,
 max_cookies_per_site => 20);

 -- Make a HTTP request using the private wallet and cookie
 -- table in the request context
 req := UTL_HTTP.BEGIN_REQUEST(

```

```

 url => url,
 request_context => request_context);
resp := UTL_HTTP.GET_RESPONSE(req);

BEGIN
 LOOP
 UTL_HTTP.READ_TEXT(resp, data);
 DBMS_OUTPUT.PUT(data);
 END LOOP;
EXCEPTION
 WHEN UTL_HTTP.END_OF_BODY THEN
 UTL_HTTP.END_RESPONSE(resp);
END;

-- Destroy the request context
UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);

END;

BEGIN
 DISPLAY_PAGE('https://www.example.com/');
END;
/

```

## 262.6 UTL\_HTTP Data Structures

Data structures are used to represent requests, responses, cookies, connections, and request context.

- [REQ Type](#) (page 262-12)
- [RESP Type](#) (page 262-13)
- [COOKIE and COOKIE\\_TABLE Types](#) (page 262-14)
- [CONNECTION Type](#) (page 262-15)
- [REQUEST\\_CONTEXT\\_KEY Type](#) (page 262-13)

### 262.6.1 REQ Type

Use this PL/SQL record type to represent an HTTP request.

#### Syntax

```

TYPE req IS RECORD (
 url VARCHAR2(32767),
 method VARCHAR2(64),
 http_version VARCHAR2(64));

```

#### Parameters

**Table 262-5 REQ Type Parameters**

Parameter	Description
url	The URL of the HTTP request. It is set after the request is created by <code>BEGIN_REQUEST</code> .

**Table 262-5 (Cont.) REQ Type Parameters**

Parameter	Description
method	The method to be performed on the resource identified by the URL. It is set after the request is created by <code>BEGIN_REQUEST</code> .
http_version	The HTTP protocol version used to send the request. It is set after the request is created by <code>BEGIN_REQUEST</code> .

**Usage Notes**

The information returned in `REQ` from the interface `begin_request` is for read-only. Changing the field values in the record has no effect on the request.

There are other fields in `REQ` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

## 262.6.2 REQUEST\_CONTEXT\_KEY Type

This type is used to represent the key to a request context.

A request context is a context that holds a private wallet and cookie table to make a HTTP request. This private wallet and cookie table, unlike the session-wide ones maintained in the package, will not be shared with other HTTP requests within the database session.

**Syntax**

```
SUBTYPE request_context_key IS PLS_INTEGER;
```

**Usage Notes**

To provide enhanced security, `UTL_HTTP` allows PL/SQL programs to create request contexts. A request context is a private context that holds a wallet and a cookie table that will not be shared with other programs in the same database session when making HTTP requests and receiving HTTP responses. PL/SQL programs should use request contexts when they need to use wallets or cookies that contain sensitive information such as authentication credentials.

## 262.6.3 RESP Type

This PL/SQL record type is used to represent an HTTP response.

**Syntax**

```
TYPE resp IS RECORD (
 status_code PLS_INTEGER,
 reason_phrase VARCHAR2(256),
 http_version VARCHAR2(64));
```

## Parameters

**Table 262-6 RESP Type Parameters**

Parameter	Description
status_code	The status code returned by the Web server. It is a 3-digit integer that indicates the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.
reason_phrase	The short textual message returned by the Web server that describe the status code. It gives a brief description of the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.
http_version	The HTTP protocol version used in the HTTP response. It is set after the response is processed by GET_RESPONSE.

## Usage Notes

The information returned in `RESP` from the interface `GET_RESPONSE` is read-only. There are other fields in the `RESP` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

## 262.6.4 COOKIE and COOKIE\_TABLE Types

The `COOKIE` type is the PL/SQL record type that represents an HTTP cookie. The `COOKIE_TABLE` type is a PL/SQL index-by-table type that represents a collection of HTTP cookies.

### Syntax

```
TYPE cookie IS RECORD (
 name VARCHAR2(256),
 value VARCHAR2(1024),
 domain VARCHAR2(256),
 expire TIMESTAMP WITH TIME ZONE,
 path VARCHAR2(1024),
 secure BOOLEAN,
 version PLS_INTEGER,
 comment VARCHAR2(1024));

TYPE cookie_table IS TABLE OF cookie INDEX BY binary_integer;
```

### Fields of COOKIE Record Type

[Table 262-7](#) (page 262-14) shows the fields for the `COOKIE` and `COOKIE_TABLE` record types.

**Table 262-7 Fields of COOKIE and COOKIE\_TABLE Type**

Field	Description
name	The name of the HTTP cookie
value	The value of the cookie

**Table 262-7 (Cont.) Fields of COOKIE and COOKIE\_TABLE Type**

Field	Description
domain	The domain for which the cookie is valid
expire	The time by which the cookie will expire
path	The subset of URLs to which the cookie applies
secure	Should the cookie be returned to the Web server using secured means only.
version	The version of the HTTP cookie specification the cookie conforms. This field is NULL for Netscape cookies.
comment	The comment that describes the intended use of the cookie. This field is NULL for Netscape cookies.

**Usage Notes**

PL/SQL programs do not usually examine or change the cookie information stored in the UTL\_HTTP package. The cookies are maintained by the package transparently. They are maintained inside the UTL\_HTTP package, and they last for the duration of the database session only. PL/SQL applications that require cookies to be maintained beyond the lifetime of a database session can read the cookies using GET\_COOKIES, store them persistently in a database table, and re-store the cookies back in the package using ADD\_COOKIES in the next database session. All the fields in the cookie record, except for the comment field, must be stored. Do not alter the cookie information, which can result in an application error in the Web server or compromise the security of the PL/SQL and the Web server applications. See ["Retrieving and Restoring Cookies \(page 262-10\)"](#).

## 262.6.5 CONNECTION Type

Use the PL/SQL record type to represent the remote hosts and TCP/IP ports of a network connection that is kept persistent after an HTTP request is completed, according to the HTTP 1.1 protocol specification. The persistent network connection may be reused by a subsequent HTTP request to the same host and port. The subsequent HTTP request may be completed faster because the network connection latency is avoided. connection\_table is a PL/SQL table of connection.

For a direct HTTP persistent connection to a Web server, the host and port fields contain the host name and TCP/IP port number of the Web server. The proxy\_host and proxy\_port fields are not set. For an HTTP persistent connection that was previously used to connect to a Web server using a proxy, the proxy\_host and proxy\_port fields contain the host name and TCP/IP port number of the proxy server. The host and port fields are not set, which indicates that the persistent connection, while connected to a proxy server, is not bound to any particular target Web server. An HTTP persistent connection to a proxy server can be used to access any target Web server that is using a proxy.

The ssl field indicates if Secured Socket Layer (SSL) is being used in an HTTP persistent connection. An HTTPS request is an HTTP request made over SSL. For an HTTPS (SSL) persistent connection connected using a proxy, the host and port fields contain the host name and TCP/IP port number of the target HTTPS Web server and the fields will always be set. An HTTPS persistent connection to an HTTPS Web

server using a proxy server can only be reused to make another request to the same target Web server.

### Syntax

```
TYPE connection IS RECORD (
 host VARCHAR2(256),
 port PLS_INTEGER,
 proxy_host VARCHAR2(256),
 proxy_port PLS_INTEGER,
 ssl BOOLEAN);
```

```
TYPE connection_table IS TABLE OF connection INDEX BY BINARY_INTEGER;
```

## 262.7 UTL\_HTTP Operations

These topics provide information about how UTL\_HTTP makes HTTP requests from SQL and PL/SQL.

- [Operational Flow](#) (page 262-16)
- [Simple HTTP Fetches](#) (page 262-19)
- [HTTP Requests](#) (page 262-19)
- [HTTP Responses](#) (page 262-20)
- [HTTP Persistent Connections](#) (page 262-20)
- [Error Conditions](#) (page 262-20)
- [Session Settings](#) (page 262-21)
- [Request Context](#) (page 262-21)
- [External Password Store](#) (page 262-21)

### 262.7.1 UTL\_HTTP Operational Flow

The UTL\_HTTP package provides access to the HTTP protocol.

The interfaces must be called in the order shown in the following illustration, or an exception will be raised.

Figure 262-1 Flow of the Core UTL\_HTTP Package

**illustration:** arpls006  
**release:** 9  
**caption:** The flow of the core UTL\_HTTP Package API  
**date:** 9/5/01  
**platform:** pc

The following can be called at any time:

- Non-protocol interfaces that manipulate cookies
  - GET\_COOKIE\_COUNT
  - GET\_COOKIES
  - ADD\_COOKIES
  - CLEAR\_COOKIES
- Persistent connections
  - GET\_PERSISTENT\_CONN\_COUNT
  - GET\_PERSISTENT\_CONNS
  - CLOSE\_PERSISTENT\_CONN
  - CLOSE\_PERSISTENT\_CONNS
- Interfaces that manipulate attributes and configurations of the UTL\_HTTP package in the current session
  - SET\_PROXY
  - GET\_PROXY
  - SET\_COOKIE\_SUPPORT
  - GET\_COOKIE\_SUPPORT
  - SET\_FOLLOW\_REDIRECT
  - GET\_FOLLOW\_REDIRECT
  - SET\_BODY\_CHARSET
  - GET\_BODY\_CHARSET
  - SET\_PERSISTENT\_CONN\_SUPPORT
  - GET\_PERSISTENT\_CONN\_SUPPORT
  - SET\_DETAILED\_EXCP\_SUPPORT
  - GET\_DETAILED\_EXCP\_SUPPORT
  - SET\_WALLET
  - SET\_TRANSFER\_TIMEOUT
  - GET\_TRANSFER\_TIMEOUT
- Interfaces that retrieve the last detailed exception code and message UTL\_HTTP package in the current session
  - GET\_DETAILED\_SQLCODE
  - GET\_DETAILED\_SQLERRM

 **Note:**

Some of the request and response interfaces bear the same name as the interface that manipulates the attributes and configurations of the package in the current session. They are overloaded versions of the interface that manipulate a request or a response.

## 262.7.2 UTL\_HTTP Simple HTTP Fetches

`REQUEST` and `REQUEST_PIECES` take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

You should not expect `REQUEST` or `REQUEST_PIECES` to succeed in contacting a URL unless you can contact that URL by using a browser on the same machine (and with the same privileges, environment variables, and so on.)

If `REQUEST` or `REQUEST_PIECES` fails (for example, if it raises an exception, or if it returns an HTML-formatted error message, but you believe that the URL argument is correct), then try contacting that same URL with a browser to verify network availability from your machine. You may have a proxy server set in your browser that needs to be set with each `REQUEST` or `REQUEST_PIECES` call using the optional `proxy` parameter.

### Note:

`UTL_HTTP` can also use environment variables to specify its proxy behavior. For example, on UNIX, setting the environment variable `http_proxy` to a URL uses that service as the proxy server for HTTP requests. Setting the environment variable `no_proxy` to a domain name does not use the HTTP proxy server for URLs in that domain. When the `UTL_HTTP` package is executed in the Oracle database server, the environment variables are the ones that are set when the database instance is started.

### See Also:

[Simple HTTP Fetches in a Single Call Subprograms](#) (page 262-22)

## 262.7.3 UTL\_HTTP HTTP Requests

The HTTP Requests group of subprograms begin an HTTP request, manipulate attributes, and send the request information to the Web server. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. The settings can be changed by calling the request interface.

### See Also:

[HTTP Requests Subprograms](#) (page 262-23)

## 262.7.4 UTL\_HTTP HTTP Responses

The HTTP Responses group of subprograms manipulate an HTTP response obtained from `GET_RESPONSE` and receive response information from the Web server.

When a response is created for a request, it inherits settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout from the request. Only the body character set can be changed by calling the response interface.

### See Also:

[HTTP Responses Subprograms](#) (page 262-24)

## 262.7.5 UTL\_HTTP HTTP Cookies

The `UTL_HTTP` package provides subprograms to manipulate HTTP cookies.

### See Also:

[HTTP Cookies Subprograms](#) (page 262-25)

## 262.7.6 UTL\_HTTP HTTP Persistent Connections

The `UTL_HTTP` package provides subprograms to manipulate persistent connections.

### See Also:

[HTTP Persistent Connections Subprograms](#) (page 262-25)

## 262.7.7 UTL\_HTTP Error Conditions

The `UTL_HTTP` package provides subprograms to retrieve error information.

### See Also:

[Error Conditions Subprograms](#) (page 262-26)

## 262.7.8 UTL\_HTTP Session Settings

Session settings manipulate the configuration and default behavior of `UTL_HTTP` when HTTP requests are executed within a database user session.

When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. Those settings can be changed later by calling the request interface. When a response is created for a request, it inherits those settings from the request. Only the body character set can be changed later by calling the response interface.

### See Also:

[Session Settings Subprograms](#) (page 262-22)

## 262.7.9 UTL\_HTTP Request Context

The `UTL_HTTP` package maintains a common wallet and cookie table within the database session that all HTTP requests and responses share. This makes it easy for users to share the wallet or to maintain application state in the cookies within the session. However, if an application stores private information in the wallet or in the cookies that it does not want to share with other applications in the same database session, it may define a request context to hold its own wallet and cookie table and use this request context to make HTTP requests.

### See Also:

[HTTP Requests Subprograms](#) (page 262-23)

## 262.7.10 UTL\_HTTP External Password Store

The `UTL_HTTP` package allows HTTP password credentials to be stored in an Oracle wallet's external password store. The external password store provides an easy but secure storage for passwords and frees the application developers from the need to maintain their own storage.

### See Also:

[SET\\_AUTHENTICATION\\_FROM\\_WALLET Procedure](#) (page 262-59)

## 262.8 UTL\_HTTP Subprogram Groups

This section describes the `UTL_HTTP` subprograms. They are grouped by function.

- [Simple HTTP Fetches in a Single Call Subprograms](#) (page 262-22)
- [Session Settings Subprograms](#) (page 262-22)
- [HTTP Requests Subprograms](#) (page 262-23)
- [HTTP Request Contexts Subprograms](#) (page 262-24)
- [HTTP Responses Subprograms](#) (page 262-24)
- [HTTP Cookies Subprograms](#) (page 262-25)
- [HTTP Persistent Connections Subprograms](#) (page 262-25)
- [Error Conditions Subprograms](#) (page 262-26)

### 262.8.1 UTL\_HTTP Simple HTTP Fetches in a Single Call Subprograms

`REQUEST` and `REQUEST_PIECES` take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

**Table 262-8 UTL\_HTTP Subprograms—Simple HTTP Fetches in a Single Call**

Subprogram	Description
<a href="#">REQUEST Function</a> (page 262-54)	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.
<a href="#">REQUEST_PIECES Function</a> (page 262-56)	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL

### 262.8.2 UTL\_HTTP Session Settings Subprograms

This table lists and briefly describes the `UTL_HTTP` Session Settings Subprograms.

**Table 262-9 UTL\_HTTP Subprograms—Session Settings**

Subprogram	Description
<a href="#">GET_BODY_CHARSET Procedure</a> (page 262-39)	Retrieves the default character set of the body of all future HTTP requests
<a href="#">GET_COOKIE_SUPPORT Procedure</a> (page 262-40)	Retrieves the current cookie support settings
<a href="#">GET_DETAILED_EXCP_SUPPORT Procedure</a> (page 262-41)	Checks if the <code>UTL_HTTP</code> package will raise a detailed exception or not
<a href="#">GET_FOLLOW_REDIRECT Procedure</a> (page 262-42)	Retrieves the follow-redirect setting in the current session
<a href="#">GET_PERSISTENT_CONN_SUPPORT Procedure</a> (page 262-46)	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session
<a href="#">GET_PROXY Procedure</a> (page 262-47)	Retrieves the current proxy settings

**Table 262-9 (Cont.) UTL\_HTTP Subprograms—Session Settings**

Subprogram	Description
<a href="#">GET_RESPONSE_ERROR_CHECK Procedure</a> (page 262-49)	Checks if the response error check is set or not
<a href="#">GET_TRANSFER_TIMEOUT Procedure</a> (page 262-50)	Retrieves the current network transfer timeout value
<a href="#">SET_TRANSFER_TIMEOUT Procedure</a> (page 262-71)	Sets the default character set of the body of all future HTTP requests when the media type is <code>text</code> and the character set is not specified in the <code>Content-Type</code> header
<a href="#">SET_COOKIE_SUPPORT Procedures</a> (page 262-62)	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session
<a href="#">SET_DETAILED_EXCP_SUPPORT Procedure</a> (page 262-63)	Sets the UTL_HTTP package to raise a detailed exception
<a href="#">SET_FOLLOW_REDIRECT Procedures</a> (page 262-64)	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the <code>GET_RESPONSE</code> function
<a href="#">SET_PERSISTENT_CONN_SUPPORT Procedure</a> (page 262-66)	Sets whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session
<a href="#">SET_PROXY Procedure</a> (page 262-69)	Sets the proxy to be used for requests of HTTP or other protocols
<a href="#">SET_RESPONSE_ERROR_CHECK Procedure</a> (page 262-70)	Sets whether or not <code>GET_RESPONSE</code> raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges
<a href="#">SET_TRANSFER_TIMEOUT Procedure</a> (page 262-71)	Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server
<a href="#">SET_WALLET Procedure</a> (page 262-72)	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS

### 262.8.3 UTL\_HTTP HTTP Requests Subprograms

This table lists and briefly describes the UTL\_HTTP HTTP Requests.

**Table 262-10 UTL\_HTTP Subprograms—HTTP Requests**

Subprogram	Description
<a href="#">BEGIN_REQUEST Function</a> (page 262-31)	Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line.
<a href="#">SET_HEADER Procedure</a> (page 262-65)	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.
<a href="#">SET_AUTHENTICATION Procedure</a> (page 262-58)	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.
<a href="#">SET_AUTHENTICATION_FROM_WALLET Procedure</a> (page 262-59)	Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.
<a href="#">SET_BODY_CHARSET Procedures</a> (page 262-61)	Sets the character set of the request body when the media type is <code>text</code> but the character set is not specified in the <code>Content-Type</code> header

**Table 262-10 (Cont.) UTL\_HTTP Subprograms—HTTP Requests**

Subprogram	Description
<a href="#">SET_COOKIE_SUPPORT Procedures</a> (page 262-62)	Enables or disables support for the HTTP cookies in the request
<a href="#">SET_FOLLOW_REDIRECT Procedures</a> (page 262-64)	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request in the <a href="#">GET_RESPONSE Function</a> (page 262-47)
<a href="#">SET_PERSISTENT_CONN_SUPPORT Procedure</a> (page 262-66)	Enables or disables support for the HTTP 1.1 persistent-connection in the request
<a href="#">SET_PROXY Procedure</a> (page 262-69)	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP)
<a href="#">WRITE_RAW Procedure</a> (page 262-74)	Writes some binary data in the HTTP request body
<a href="#">WRITE_TEXT Procedure</a> (page 262-75)	Writes some text data in the HTTP request body

## 262.8.4 UTL\_HTTP HTTP Request Contexts Subprograms

UTL\_HTTP HTTP Request Contexts subprograms create or destroy a request context.

The following table lists and briefly describes the UTL\_HTTP HTTP Request Contexts.

**Table 262-11 UTL\_HTTP Subprograms—HTTP Request Contexts**

Subprogram	Description
<a href="#">CREATE_REQUEST_CONTEXT Function</a> (page 262-35)	Creates a request context in UTL_HTTP for a wallet and a cookie table
<a href="#">DESTROY_REQUEST_CONTEXT Procedure</a> (page 262-36)	Destroys a request context in UTL_HTTP

## 262.8.5 UTL\_HTTP HTTP Responses Subprograms

This table lists and briefly describes the HTTP Responses Subprograms of UTL\_HTTP.

**Table 262-12 UTL\_HTTP Subprograms—HTTP Responses**

Subprogram	Description
<a href="#">END_RESPONSE Procedure</a> (page 262-38)	Ends the HTTP response. It completes the HTTP request and response.
<a href="#">GET_AUTHENTICATION Procedure</a> (page 262-38)	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header
<a href="#">GET_HEADER Procedure</a> (page 262-43)	Returns the n <sup>th</sup> HTTP response header name and value returned in the response
<a href="#">GET_HEADER_BY_NAME Procedure</a> (page 262-44)	Returns the HTTP response header value returned in the response given the name of the header
<a href="#">GET_HEADER_COUNT Function</a> (page 262-44)	Returns the number of HTTP response headers returned in the response

**Table 262-12 (Cont.) UTL\_HTTP Subprograms—HTTP Responses**

Subprogram	Description
<a href="#">GET_RESPONSE Function</a> (page 262-47)	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed.
<a href="#">READ_LINE Procedure</a> (page 262-50)	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer
<a href="#">READ_RAW Procedure</a> (page 262-51)	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer
<a href="#">READ_TEXT Procedure</a> (page 262-52)	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer
<a href="#">SET_BODY_CHARSET Procedures</a> (page 262-61)	Sets the character set of the response body when the media type is "text" but the character set is not specified in the <code>Content-Type</code> header

## 262.8.6 UTL\_HTTP HTTP Cookies Subprograms

The HTTP cookies subprograms manages cookies in the `UTL_HTTP` package.

The following table lists and briefly describes the HTTP cookies subprograms of `UTL_HTTP`.

**Table 262-13 UTL\_HTTP Subprograms—HTTP Cookies**

Subprogram	Description
<a href="#">ADD_COOKIES Procedure</a> (page 262-30)	Add the cookies either to a request context or to the <code>UTL_HTTP</code> package's session state
<a href="#">CLEAR_COOKIES Procedure</a> (page 262-33)	Clears all the cookies maintained either in a request context or in the <code>UTL_HTTP</code> package's session state
<a href="#">GET_COOKIE_COUNT Function</a> (page 262-40)	Returns the number of cookies maintained either in a request context or in the <code>UTL_HTTP</code> package's session states
<a href="#">GET_COOKIES Function</a> (page 262-41)	Returns all the cookies maintained either in a request context or in the <code>UTL_HTTP</code> package's session state.

## 262.8.7 UTL\_HTTP HTTP Persistent Connections Subprograms

This table lists and briefly describes the `UTL_HTTP` HTTP Persistent Connections subprograms.

**Table 262-14 UTL\_HTTP Subprograms—HTTP Persistent Connections**

Subprogram	Description
<a href="#">CLOSE_PERSISTENT_CONN Procedure</a> (page 262-33)	Closes an HTTP persistent connection maintained by the <code>UTL_HTTP</code> package in the current database session
<a href="#">CLOSE_PERSISTENT_CONNS Procedure</a> (page 262-34)	Closes a group of HTTP persistent connections maintained by the <code>UTL_HTTP</code> package in the current database session
<a href="#">GET_PERSISTENT_CONN_COUNT Function</a> (page 262-45)	Returns the number of network connections currently kept persistent by the <code>UTL_HTTP</code> package to the Web servers

**Table 262-14 (Cont.) UTL\_HTTP Subprograms—HTTP Persistent Connections**

Subprogram	Description
<a href="#">GET_PERSISTENT_CONNS Procedure</a> (page 262-46)	Returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers

## 262.8.8 UTL\_HTTP Error Conditions Subprograms

This table lists and briefly describes error conditions subprograms of UTL\_HTTP .

**Table 262-15 UTL\_HTTP Subprograms—Error Conditions**

Subprogram	Description
<a href="#">GET_DETAILED_SQLCODE Function</a> (page 262-42)	Retrieves the detailed SQLCODE of the last exception raised
<a href="#">GET_DETAILED_SQLERRM Function</a> (page 262-42)	Retrieves the detailed SQLERRM of the last exception raised

## 262.9 Summary of UTL\_HTTP Subprograms

This table lists the UTL\_HTTP subprograms and briefly describes them.

**Table 262-16 UTL\_HTTP Package Subprograms**

Subprogram	Description	Group
<a href="#">ADD_COOKIES Procedure</a> (page 262-30)	Add the cookies either to a request context or to the UTL_HTTP package's session state	<a href="#">HTTP Cookies Subprograms</a> (page 262-25)
<a href="#">BEGIN_REQUEST Function</a> (page 262-31)	Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line	<a href="#">HTTP Requests Subprograms</a> (page 262-23)
<a href="#">CLEAR_COOKIE S Procedure</a> (page 262-33)	Clears all the cookies maintained either in a request context or in the UTL_HTTP package's session state	<a href="#">HTTP Cookies Subprograms</a> (page 262-25)
<a href="#">CLOSE_PERSISTENT_CONN Procedure</a> (page 262-33)	Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session	<a href="#">HTTP Persistent Connections Subprograms</a> (page 262-25)
<a href="#">CLOSE_PERSISTENT_CONNS Procedure</a> (page 262-34)	Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session	<a href="#">HTTP Persistent Connections Subprograms</a> (page 262-25)
<a href="#">CREATE_REQUEST_CONTEXT Function</a> (page 262-35)	Creates a request context in UTL_HTTP for a wallet and a cookie table	<a href="#">HTTP Requests Subprograms</a> (page 262-23)

**Table 262-16 (Cont.) UTL\_HTTP Package Subprograms**

Subprogram	Description	Group
<a href="#">DESTROY_REQUEST_CONTEXT Procedure</a> (page 262-36)	Destroys a request context in UTL_HTTP for a wallet and a cookie table	<a href="#">HTTP Requests Subprograms</a> (page 262-23)
<a href="#">END_REQUEST Procedure</a> (page 262-37)	Ends the HTTP request	<a href="#">HTTP Requests Subprograms</a> (page 262-23)
<a href="#">END_RESPONSE Procedure</a> (page 262-38)	Ends the HTTP response. It completes the HTTP request and response	<a href="#">HTTP Responses Subprograms</a> (page 262-24)
<a href="#">GET_AUTHENTICATION Procedure</a> (page 262-38)	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header	<a href="#">HTTP Responses Subprograms</a> (page 262-24)
<a href="#">GET_BODY_CHARACTERSET Procedure</a> (page 262-39)	Retrieves the default character set of the body of all future HTTP requests	<a href="#">Session Settings Subprograms</a> (page 262-22)
<a href="#">GET_COOKIE_COUNT Function</a> (page 262-40)	Returns the number of cookies currently maintained by the UTL_HTTP package set by all Web servers	<a href="#">HTTP Cookies Subprograms</a> (page 262-25)
<a href="#">GET_COOKIE_SUPPORT Procedure</a> (page 262-40)	Retrieves the current cookie support settings	<a href="#">Session Settings Subprograms</a> (page 262-22)
<a href="#">GET_COOKIES Function</a> (page 262-41)	Returns all the cookies currently maintained by the UTL_HTTP package set by all Web servers	<a href="#">HTTP Cookies Subprograms</a> (page 262-25)
<a href="#">GET_DETAILED_EXCEPTION_SUPPORT Procedure</a> (page 262-41)	Checks if the UTL_HTTP package will raise a detailed exception or not	<a href="#">Session Settings Subprograms</a> (page 262-22)
<a href="#">GET_DETAILED_SQLCODE Function</a> (page 262-42)	Retrieves the detailed <code>SQLCODE</code> of the last exception raised	<a href="#">Error Conditions Subprograms</a> (page 262-26)
<a href="#">GET_DETAILED_SQLERRM Function</a> (page 262-42)	Retrieves the detailed <code>SQLERRM</code> of the last exception raised	<a href="#">Error Conditions Subprograms</a> (page 262-26)
<a href="#">GET_FOLLOW_REDIRECT Procedure</a> (page 262-42)	Retrieves the follow-redirect setting in the current session	<a href="#">Session Settings Subprograms</a> (page 262-22)
<a href="#">GET_HEADER Procedure</a> (page 262-43)	Returns the $n^{\text{th}}$ HTTP response header name and value returned in the response	<a href="#">HTTP Responses Subprograms</a> (page 262-24)

**Table 262-16 (Cont.) UTL\_HTTP Package Subprograms**

Subprogram	Description	Group
<a href="#">GET_HEADER_BY_NAME Procedure</a> (page 262-44)	Returns the HTTP response header value returned in the response given the name of the header	<a href="#">HTTP Responses Subprograms</a> (page 262-24)
<a href="#">GET_HEADER_COUNT Function</a> (page 262-44)	Returns the number of HTTP response headers returned in the response	<a href="#">HTTP Responses</a> (page 262-20) and <a href="#">HTTP Responses Subprograms</a> (page 262-24)
<a href="#">GET_PERSISTENT_CONN_COUNT Function</a> (page 262-45)	Returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers	<a href="#">HTTP Persistent Connections Subprograms</a> (page 262-25)
<a href="#">GET_HEADER_COUNT Function</a> (page 262-44)	Sees whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session	<a href="#">Session Settings Subprograms</a> (page 262-22)
<a href="#">GET_PERSISTENT_CONN_SUPPORT Procedure</a> (page 262-46)	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session (see <a href="#">Session Settings Subprograms</a> (page 262-22))	<a href="#">HTTP Persistent Connections Subprograms</a> (page 262-25)
<a href="#">GET_PERSISTENT_CONNS Procedure</a> (page 262-46)	Returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers	<a href="#">HTTP Persistent Connections Subprograms</a> (page 262-25)
<a href="#">GET_PROXY Procedure</a> (page 262-47)	Retrieves the current proxy settings	<a href="#">Session Settings Subprograms</a> (page 262-22)
<a href="#">GET_RESPONSE Function</a> (page 262-47)	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed	<a href="#">HTTP Responses Subprograms</a> (page 262-24)
<a href="#">GET_RESPONSE_ERROR_CHECK Procedure</a> (page 262-49)	Checks if the response error check is set or no	<a href="#">Session Settings Subprograms</a> (page 262-22)
<a href="#">GET_TRANSFER_TIMEOUT Procedure</a> (page 262-50)	Retrieves the current network transfer timeout value	<a href="#">Session Settings Subprograms</a> (page 262-22)
<a href="#">READ_LINE Procedure</a> (page 262-50)	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer	<a href="#">HTTP Responses Subprograms</a> (page 262-24)
<a href="#">READ_RAW Procedure</a> (page 262-51)	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer	<a href="#">HTTP Responses Subprograms</a> (page 262-24)
<a href="#">READ_TEXT Procedure</a> (page 262-52)	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer	<a href="#">HTTP Responses Subprograms</a> (page 262-24)

**Table 262-16 (Cont.) UTL\_HTTP Package Subprograms**

Subprogram	Description	Group
<a href="#">REQUEST Function</a> (page 262-54)	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.	<a href="#">Simple HTTP Fetches in a Single Call Subprograms</a> (page 262-22)
<a href="#">REQUEST_PIECES Function</a> (page 262-56)	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL	<a href="#">Simple HTTP Fetches in a Single Call Subprograms</a> (page 262-22)
<a href="#">SET_AUTHENTICATION Procedure</a> (page 262-58)	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.	<a href="#">HTTP Requests Subprograms</a> (page 262-23)
<a href="#">SET_AUTHENTICATION_FROM_WALLET Procedure</a> (page 262-59)	Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.	<a href="#">HTTP Requests Subprograms</a> (page 262-23)
<a href="#">SET_BODY_CHARACTER_SET Procedures</a> (page 262-61)	Sets the default character set of the body of all future HTTP requests when the media type is <code>text</code> and the character set is not specified in the <code>Content-Type</code> header	<a href="#">Session Settings Subprograms</a> (page 262-22)
<a href="#">SET_BODY_CHARACTER_SET Procedures</a> (page 262-61)	Sets the character set of the request body when the media type is <code>text</code> but the character set is not specified in the <code>Content-Type</code> header	<a href="#">HTTP Requests Subprograms</a> (page 262-23)
<a href="#">SET_BODY_CHARACTER_SET Procedures</a> (page 262-61)	Sets the character set of the response body when the media type is <code>text</code> but the character set is not specified in the <code>Content-Type</code> header	<a href="#">HTTP Responses Subprograms</a> (page 262-24) and <a href="#">Session Settings Subprograms</a> (page 262-22)
<a href="#">SET_COOKIE_SUPPORT Procedures</a> (page 262-62)	Enables or disables support for the HTTP cookies in the request	<a href="#">HTTP Requests Subprograms</a> (page 262-23)
<a href="#">SET_DETAILED_EXCEPTION_SUPPORT Procedure</a> (page 262-63)	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session	<a href="#">Session Settings Subprograms</a> (page 262-22)
<a href="#">SET_DETAILED_EXCEPTION_SUPPORT Procedure</a> (page 262-63)	Sets the UTL_HTTP package to raise a detailed exception	<a href="#">Session Settings Subprograms</a> (page 262-22)
<a href="#">SET_FOLLOW_REDIRECT Procedures</a> (page 262-64)	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request in the <code>GET_RESPONSE</code> function	<a href="#">HTTP Requests Subprograms</a> (page 262-23)

**Table 262-16 (Cont.) UTL\_HTTP Package Subprograms**

Subprogram	Description	Group
<a href="#">SET_HEADER Procedure</a> (page 262-65)	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the GET_RESPONSE function	<a href="#">Session Settings Subprograms</a> (page 262-22)
<a href="#">SET_HEADER Procedure</a> (page 262-65)	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.	<a href="#">HTTP Requests Subprograms</a> (page 262-23)
<a href="#">SET_PERSISTENT_CONNECTION_SUPPORT Procedure</a> (page 262-66)	Enables or disables support for the HTTP 1.1 persistent connection in the request	<a href="#">HTTP Requests Subprograms</a> (page 262-23)
<a href="#">SET_PROXY Procedure</a> (page 262-69)	Sets the proxy to be used for requests of HTTP or other protocols	<a href="#">Session Settings</a> (page 262-21) and <a href="#">Session Settings Subprograms</a> (page 262-22)
<a href="#">SET_RESPONSE_ERROR_CHECK Procedure</a> (page 262-70)	Sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges	<a href="#">Session Settings Subprograms</a> (page 262-22)
<a href="#">SET_TRANSFER_TIMEOUT Procedure</a> (page 262-71)	Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server	<a href="#">Session Settings</a> (page 262-21) and <a href="#">Session Settings Subprograms</a> (page 262-22)
<a href="#">SET_WALLET Procedure</a> (page 262-72)	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS	<a href="#">Session Settings Subprograms</a> (page 262-22)
<a href="#">WRITE_LINE Procedure</a> (page 262-73)	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP	<a href="#">HTTP Requests Subprograms</a> (page 262-23)
<a href="#">WRITE_RAW Procedure</a> (page 262-74)	Writes some binary data in the HTTP request body	<a href="#">HTTP Requests Subprograms</a> (page 262-23)
<a href="#">WRITE_TEXT Procedure</a> (page 262-75)	Writes some text data in the HTTP request body	<a href="#">HTTP Requests Subprograms</a> (page 262-23)

## 262.9.1 ADD\_COOKIES Procedure

This procedure adds the cookies either to a request context or to the UTL\_HTTP package's session state.

### See Also:

[HTTP Cookies](#) (page 262-20) and [HTTP Cookies Subprograms](#) (page 262-25)

**Syntax**

```
UTL_HTTP.ADD_COOKIES (
 cookies IN cookie_table,
 request_context IN request_context_key DEFAULT NULL);
```

**Parameters****Table 262-17** ADD\_COOKIES Procedure Parameters

Parameter	Description
cookies	The cookies to be added
request_context	Request context to add the cookies. If NULL, the cookies will be added to the UTL_HTTP package's session state instead.

**Usage Notes**

The cookies that the package currently maintains are not cleared before new cookies are added.

## 262.9.2 BEGIN\_REQUEST Function

This function begins a new HTTP request. UTL\_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. The PL/SQL program continues the request by calling some other interface to complete the request.

The URL may contain the username and password needed to authenticate the request to the server. The format is:

```
scheme://[user[:password]@]host[:port]/[...]
```

**See Also:**

[HTTP Requests](#) (page 262-19) and [HTTP Requests Subprograms](#) (page 262-23)

**Syntax**

```
UTL_HTTP.BEGIN_REQUEST (
 url IN VARCHAR2,
 method IN VARCHAR2 DEFAULT 'GET',
 http_version IN VARCHAR2 DEFAULT NULL,
 request_context IN request_context_key DEFAULT NULL,
 https_host IN VARCHAR2 DEFAULT NULL)
RETURN req;
```

## Parameters

**Table 262-18 BEGIN\_REQUEST Function Parameters**

Parameter	Description
url	The URL of the HTTP request
method	The method performed on the resource identified by the URL
http_version	The HTTP protocol version that sends the request. The format of the protocol version is HTTP/major-version.minor-version, where major-version and minor-version are positive numbers. If this parameter is set to NULL, UTL_HTTP uses the latest HTTP protocol version that it supports to send the request. The latest version that the package supports is 1.1 and it can be upgraded to a later version. The default is NULL.
request_context	Request context that holds the private wallet and the cookie table to use in this HTTP request. If this parameter is NULL, the wallet and cookie table shared in the current database session will be used instead.
https_host	The host name to be matched against the common name (CN) of the remote server's certificate for an HTTPS request. It can also be a domain name like *.example.com. If NULL, the host name in the given URL will be used.

## Usage Notes

- The URL passed as an argument to this function is not examined for illegal characters, such as spaces, according to URL specification RFC 2396. You should escape those characters with the `UTL_URL` package to return illegal and reserved characters. URLs should consist of US-ASCII characters only. See [UTL\\_URL](#) (page 276-1) for a list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.
- `BEGIN_REQUEST` can send a URL whose length is up to 32767 bytes. However, different Web servers impose different limits on the length of the URL they can accept. This limit is often about 4000 bytes. If this limit is exceeded, the outcome will depend on the Web server. For example, a Web server might simply drop the HTTP connection without returning a response of any kind. If this happens, a subsequent invocation of the [GET\\_RESPONSE Function](#) (page 262-47) will raise the `PROTOCOL_ERROR` exception.

A URL will be long when its `QUERY_STRING` (that is, the information that follows the question mark (?)) is long. In general, it is better to send this parameterization in the body of the request using the `POST` method.

```
req := UTL_HTTP.BEGIN_REQUEST (url=>the_url, method=>'POST');
UTL_HTTP.SET_HEADER (r => req,
 name => 'Content-Type',
 value => 'application/x-www-form-urlencoded');
UTL_HTTP.SET_HEADER (r => req,
 name => 'Content-Length',
 value => '<length of data posted in bytes>');
UTL_HTTP.WRITE_TEXT (r => req,
 data => 'p1 = value1&p2=value2...');
resp := UTL_HTTP.GET_RESPONSE
```

```
(r => req);
...
```

The programmer must determine whether a particular Web server may, or may not, accept data provided in this way.

- An Oracle wallet must be set before accessing Web servers over HTTPS. See the [SET\\_WALLET Procedure](#) (page 262-72) procedure on how to set up an Oracle wallet. To use SSL client authentication, the client certificate should be stored in the wallet and the caller must have the `use-client-certificates` privilege on the wallet. See "Managing Fine-grained Access to External Network Services" in the *Oracle Database Security Guide* to grant the privilege.
- To connect to the remote Web server directly, or indirectly through a HTTP proxy, the `UTL_HTTP` must have the `connect` ACL privilege to the remote Web server host or the proxy host respectively.

### 262.9.3 CLEAR\_COOKIES Procedure

This procedure clears all the cookies maintained either in a request context or in the `UTL_HTTP` package's session state.

#### See Also:

[HTTP Cookies](#) (page 262-20) and [HTTP Cookies Subprograms](#) (page 262-25)

#### Syntax

```
UTL_HTTP.CLEAR_COOKIES (
 request_context IN request_context_key DEFAULT NULL);
```

#### Parameters

**Table 262-19 CLEAR\_COOKIES Procedure Parameters**

Parameter	Description
<code>request_context</code>	Request context to clear the cookies. If <code>NULL</code> , the cookies maintained in the <code>UTL_HTTP</code> package's session state will be cleared instead.

### 262.9.4 CLOSE\_PERSISTENT\_CONN Procedure

This procedure closes an HTTP persistent connection maintained by the `UTL_HTTP` package in the current database session.

#### See Also:

[HTTP Persistent Connections](#) (page 262-20) and [HTTP Persistent Connections Subprograms](#) (page 262-25)

**Syntax**

```
UTL_HTTP.CLOSE_PERSISTENT_CONN (
 conn IN connection);
```

**Parameters****Table 262-20 CLOSE\_PERSISTENT\_CONN Procedure Parameters**

Parameter	Description
conn	The HTTP persistent connection to close

## 262.9.5 CLOSE\_PERSISTENT\_CONNS Procedure

This procedure closes a group of HTTP persistent connections maintained by the `UTL_HTTP` package in the current database session. This procedure uses a pattern-match approach to decide which persistent connections to close.

To close a group of HTTP persistent connection that share a common property (for example, all connections to a particular host, or all SSL connections), set the particular parameters and leave the rest of the parameters `NULL`. If a particular parameter is set to `NULL` when this procedure is called, that parameter will not be used to decide which connections to close.

For example, the following call to the procedure closes all persistent connections to foobar:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(host => 'foobar');
```

And the following call to the procedure closes all persistent connections through the foobar at TCP/IP port 80:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(proxy_host => 'foobar',
 proxy_port => 80);
```

And the following call to the procedure closes all persistent connections:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS;
```

**See Also:**

[HTTP Persistent Connections](#) (page 262-20) and [HTTP Persistent Connections Subprograms](#) (page 262-25)

**Syntax**

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS (
 host IN VARCHAR2 DEFAULT NULL,
 port IN PLS_INTEGER DEFAULT NULL,
 proxy_host IN VARCHAR2 DEFAULT NULL,
 proxy_port IN PLS_INTEGER DEFAULT NULL,
 ssl IN BOOLEAN DEFAULT NULL);
```

## Parameters

**Table 262-21 CLOSE\_PERSISTENT\_CONNS Procedure Parameters**

Parameter	Description
host	The host for which persistent connections are to be closed
port	The port number for which persistent connections are to be closed
proxy_host	The proxy host for which persistent connections are to be closed
proxy_port	The proxy port for which persistent connections are to be closed
ssl	Close persistent SSL connection

## Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

Note that the use of a `NULL` value in a parameter when this procedure is called means that the caller does not care about its value when the package decides which persistent connection to close. If you want a `NULL` value in a parameter to match only a `NULL` value of the parameter of a persistent connection (which is when you want to close a specific persistent connection), you should use the `CLOSE_PERSISTENT_CONN` procedure that closes a specific persistent connection.

## 262.9.6 CREATE\_REQUEST\_CONTEXT Function

This function creates a request context. A request context is a context that holds a wallet and a cookie for private use in making a HTTP request. This allows the HTTP request to use a wallet and a cookie table that will not be shared with other applications making HTTP requests in the same database session.

### See Also:

[Request Context](#) (page 262-21) and [HTTP Request Contexts Subprograms](#) (page 262-24)

## Syntax

```
UTL_HTTP.CREATE_REQUEST_CONTEXT (
 wallet_path IN VARCHAR2 DEFAULT NULL,
 wallet_password IN VARCHAR2 DEFAULT NULL,
 enable_cookies IN BOOLEAN DEFAULT TRUE,
 max_cookies IN PLS_INTEGER DEFAULT 300,
 max_cookies_per_site IN PLS_INTEGER DEFAULT 20)
RETURN request_context_key;
```

## Parameters

**Table 262-22 CREATE\_REQUEST\_CONTEXT Function Parameters**

Parameter	Description
wallet_path	Directory path that contains the Oracle wallet. The format is <code>file:directory-path</code>
wallet_password	The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to <code>NULL</code> . See the <i>Oracle Database Enterprise User Security Administrator's Guide</i> for detailed information about wallets.
enable_cookies	Sets whether HTTP requests using this request context should support HTTP cookies or not: <code>TRUE</code> to enable the support, <code>FALSE</code> to disable it.
max_cookies	Sets the maximum total number of cookies that will be maintained in this request context
max_cookies_per_site	Sets the maximum number of cookies per each Web site that will be maintained in this request context

## Return Values

The request context created.

## Examples

```

DECLARE
 request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
 req utl_http.req;
BEGIN
 request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
 wallet_path => 'file:/oracle/wallets/test_wallets',
 wallet_password => NULL,
 enable_cookies => TRUE,
 max_cookies => 300,
 max_cookies_per_site => 20);
 req := UTL_HTTP.BEGIN_REQUEST(
 url => 'http://www.example.com/',
 request_context => request_context);
END;

```

## 262.9.7 DESTROY\_REQUEST\_CONTEXT Procedure

This procedure destroys a request context in `UTL_HTTP`. A request context cannot be destroyed when it is in use by a HTTP request or response.

### See Also:

[Request Context](#) (page 262-21) and [HTTP Request Contexts Subprograms](#) (page 262-24)

## Syntax

```
UTL_HTTP.DESTROY_REQUEST_CONTEXT (
 request_context request_context_key);
```

## Parameters

**Table 262-23 DESTROY\_REQUEST\_CONTEXT Procedure Parameters**

Parameter	Description
request_context	Request context to destroy

## Examples

```
DECLARE
 request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
BEGIN
 request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(...);
 ...
 UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);
END;
```

## 262.9.8 END\_REQUEST Procedure

This procedure ends the HTTP request. To terminate the HTTP request without completing the request and waiting for the response, the program can call this procedure. Otherwise, the program should go through the normal sequence of beginning a request, getting the response, and closing the response. The network connection will always be closed and will not be reused.

### See Also:

[HTTP Requests](#) (page 262-19) and [HTTP Requests Subprograms](#) (page 262-23)

## Syntax

```
UTL_HTTP.END_REQUEST (
 r IN OUT NOCOPY req);
```

## Parameters

**Table 262-24 END\_REQUEST Procedure Parameters**

Parameter	Description
r	The HTTP request

## 262.9.9 END\_RESPONSE Procedure

This procedure ends the HTTP response. It completes the HTTP request and response. Unless HTTP 1.1 persistent connection is used in this request, the network connection is also closed.

### See Also:

[HTTP Responses](#) (page 262-20) and [HTTP Responses Subprograms](#) (page 262-24)

### Syntax

```
UTL_HTTP.END_RESPONSE (
 r IN OUT NOCOPY resp);
```

### Parameters

**Table 262-25 END\_RESPONSE Procedure Parameters**

Parameter	Description
r	The HTTP response

## 262.9.10 GET\_AUTHENTICATION Procedure

This procedure retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header.

### See Also:

[HTTP Responses](#) (page 262-20) and [HTTP Responses Subprograms](#) (page 262-24)

### Syntax

```
UTL_HTTP.GET_AUTHENTICATION(
 r IN OUT NOCOPY resp,
 scheme OUT VARCHAR2,
 realm OUT VARCHAR2,
 for_proxy IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 262-26 GET\_AUTHENTICATION Procedure Parameters**

Parameter	Description
r	The HTTP response

**Table 262-26 (Cont.) GET\_AUTHENTICATION Procedure Parameters**

Parameter	Description
scheme	The scheme for the required HTTP authentication
realm	The realm for the required HTTP authentication
for_proxy	Returns the HTTP authentication information required for the access to the HTTP proxy server instead of the Web server? Default is <code>FALSE</code>

**Usage Notes**

When a Web client is unaware that a document is protected, at least two HTTP requests are required for the document to be retrieved. In the first HTTP request, the Web client makes the request without supplying required authentication information; so the request is denied. The Web client can determine the authentication information required for the request to be authorized by calling `GET_AUTHENTICATION`. The Web client makes the second request and supplies the required authentication information with `SET_AUTHORIZATION`. If the authentication information can be verified by the Web server, the request will succeed and the requested document is returned. Before making the request, if the Web client knows that authentication information is required, it can supply the required authentication information in the first request, thus saving an extra request.

## 262.9.11 GET\_BODY\_CHARSET Procedure

This procedure retrieves the default character set of the body of all future HTTP requests.

**See Also:**

[Session Settings](#) (page 262-21) and [Session Settings Subprograms](#) (page 262-22)

**Syntax**

```
UTL_HTTP.GET_BODY_CHARSET (
 charset OUT NOCOPY VARCHAR2);
```

**Parameters****Table 262-27 GET\_BODY\_CHARSET Procedure Parameters**

Parameter	Description
charset	The default character set of the body of all future HTTP requests

## 262.9.12 GET\_COOKIE\_COUNT Function

This function returns the number of cookies maintained either in a request context or in the `UTL_HTTP` package's session state.

### See Also:

[HTTP Cookies](#) (page 262-20) and [HTTP Cookies Subprograms](#) (page 262-25)

### Syntax

```
UTL_HTTP.GET_COOKIE_COUNT (
 request_context IN request_context_key DEFAULT NULL)
RETURN PLS_INTEGER;
```

### Parameters

**Table 262-28** GET\_COOKIE\_COUNT Function Parameters

Parameter	Description
<code>request_context</code>	Request context to return the cookie count for. If <code>NULL</code> , the cookie count maintained in the <code>UTL_HTTP</code> package's session state will be returned instead.

## 262.9.13 GET\_COOKIE\_SUPPORT Procedure

This procedure retrieves the current cookie support settings.

### See Also:

[Session Settings](#) (page 262-21) and [Session Settings Subprograms](#) (page 262-22)

### Syntax

```
UTL_HTTP.GET_COOKIE_SUPPORT (
 enable OUT BOOLEAN,
 max_cookies OUT PLS_INTEGER,
 max_cookies_per_site OUT PLS_INTEGER);
```

### Parameters

**Table 262-29** GET\_COOKIE\_SUPPORT Procedure Parameters

Parameter	Description
<code>enable</code>	Indicates whether future HTTP requests should support HTTP cookies ( <code>TRUE</code> ) or not ( <code>FALSE</code> )

**Table 262-29 (Cont.) GET\_COOKIE\_SUPPORT Procedure Parameters**

Parameter	Description
max_cookies	Indicates the maximum total number of cookies maintained in the current session
max_cookies_per_site	Indicates the maximum number of cookies maintained in the current session for each Web site

## 262.9.14 GET\_COOKIES Function

This function returns all the cookies maintained either in a request context or in the UTL\_HTTP package's session state.

**See Also:**

[HTTP Cookies](#) (page 262-20) and [HTTP Cookies Subprograms](#) (page 262-25)

### Syntax

```
UTL_HTTP.GET_COOKIES (
 cookies IN OUT NOCOPY cookie_table,
 request_context IN request_context_key DEFAULT NULL);
```

### Parameters

**Table 262-30 GET\_COOKIES Function Parameters**

Parameter	Description
cookies	The cookies returned
request_context	Request context to return the cookies for. If NULL, the cookies maintained in the UTL_HTTP package's session state will be returned instead.

## 262.9.15 GET\_DETAILED\_EXCP\_SUPPORT Procedure

This procedure checks if the UTL\_HTTP package will raise a detailed exception or not.

**See Also:**

[Session Settings](#) (page 262-21) and [Session Settings Subprograms](#) (page 262-22)

### Syntax

```
UTL_HTTP.GET_DETAILED_EXCP_SUPPORT (
 enable OUT BOOLEAN);
```

## Parameters

**Table 262-31 GET\_DETAILED\_EXCP\_SUPPORT Procedure Parameters**

Parameter	Description
enable	TRUE if UTL_HTTP raises a detailed exception; otherwise FALSE

## 262.9.16 GET\_DETAILED\_SQLCODE Function

This function retrieves the detailed `SQLCODE` of the last exception raised.

### See Also:

[Error Conditions](#) (page 262-20) and [Error Conditions Subprograms](#) (page 262-26)

### Syntax

```
UTL_HTTP.GET_DETAILED_SQLCODE
RETURN PLS_INTEGER;
```

## 262.9.17 GET\_DETAILED\_SQLERRM Function

This function retrieves the detailed `SQLERRM` of the last exception raised.

### See Also:

[Error Conditions](#) (page 262-20) and [Error Conditions Subprograms](#) (page 262-26)

### Syntax

```
UTL_HTTP.GET_DETAILED_SQLERRM
RETURN VARCHAR2;
```

## 262.9.18 GET\_FOLLOW\_REDIRECT Procedure

This procedure retrieves the follow-redirect setting in the current session

### See Also:

[Session Settings](#) (page 262-21) and [Session Settings Subprograms](#) (page 262-22)

## Syntax

```
UTL_HTTP.GET_FOLLOW_REDIRECT (
 max_redirects OUT PLS_INTEGER);
```

## Parameters

**Table 262-32 GET\_FOLLOW\_REDIRECT Procedure Parameters**

Parameter	Description
max_redirects	The maximum number of redirections for all future HTTP requests

## 262.9.19 GET\_HEADER Procedure

This procedure returns the  $n^{\text{th}}$  HTTP response header name and value returned in the response.

### See Also:

[HTTP Responses](#) (page 262-20) and [HTTP Responses Subprograms](#) (page 262-24)

## Syntax

```
UTL_HTTP.GET_HEADER (
 r IN OUT NOCOPY resp,
 n IN PLS_INTEGER,
 name OUT NOCOPY VARCHAR2,
 value OUT NOCOPY VARCHAR2);
```

## Parameters

**Table 262-33 GET\_HEADER Procedure Parameters**

Parameter	Description
r	The HTTP response
n	The $n^{\text{th}}$ header to return
name	The name of the HTTP response header
value	The value of the HTTP response header

## Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

## 262.9.20 GET\_HEADER\_BY\_NAME Procedure

This procedure returns the HTTP response header value returned in the response given the name of the header.

### See Also:

[HTTP Responses](#) (page 262-20) and [HTTP Responses Subprograms](#) (page 262-24)

### Syntax

```
UTL_HTTP.GET_HEADER_BY_NAME(
 r IN OUT NOCOPY resp,
 name IN VARCHAR2,
 value OUT NOCOPY VARCHAR2,
 n IN PLS_INTEGER DEFAULT 1);
```

### Parameters

**Table 262-34** GET\_HEADER\_BY\_NAME Procedure Parameters

Parameter	Description
r	The HTTP response
name	The name of the HTTP response header for which the value is to return
value	The value of the HTTP response header
n	The $n^{\text{th}}$ occurrence of an HTTP response header by the specified name to return. The default is 1.

### Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

## 262.9.21 GET\_HEADER\_COUNT Function

This function returns the number of HTTP response headers returned in the response.

### See Also:

[HTTP Responses](#) (page 262-20) and [HTTP Responses Subprograms](#) (page 262-24)

### Syntax

```
UTL_HTTP.GET_HEADER_COUNT (
 r IN OUT NOCOPY resp)
RETURN PLS_INTEGER;
```

### Parameters

**Table 262-35** GET\_HEADER\_COUNT Function Parameters

Parameter	Description
r	The HTTP response

### Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

## 262.9.22 GET\_PERSISTENT\_CONN\_COUNT Function

This function returns the number of network connections currently kept persistent by the UTL\_HTTP package to the Web servers.

### See Also:

[HTTP Persistent Connections](#) (page 262-20) and [HTTP Persistent Connections Subprograms](#) (page 262-25)

### Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_COUNT
RETURN PLS_INTEGER;
```

### Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

## 262.9.23 GET\_PERSISTENT\_CONN\_SUPPORT Procedure

This procedure checks if the persistent connection support is enabled, and gets the maximum number of persistent connections in the current session.

### See Also:

[Session Settings](#) (page 262-21) and [Session Settings Subprograms](#) (page 262-22)

### Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_SUPPORT (
 enable OUT BOOLEAN,
 max_conns OUT PLS_INTEGER);
```

### Parameters

**Table 262-36 GET\_PERSISTENT\_CONN\_SUPPORT Procedure Parameters**

Parameter	Description
enable	TRUE if persistent connection support is enabled; otherwise FALSE
max_conns	the maximum number of persistent connections maintained in the current session

## 262.9.24 GET\_PERSISTENT\_CONNS Procedure

This procedure returns all the network connections currently kept persistent by the UTL\_HTTP package to the Web servers.

### See Also:

[HTTP Persistent Connections](#) (page 262-20) and [HTTP Persistent Connections Subprograms](#) (page 262-25)

### Syntax

```
UTL_HTTP.get_persistent_conns (
 connections IN OUT NOCOPY connection_table);
```

### Parameters

**Table 262-37 GET\_PERSISTENT\_CONNS Procedure Parameters**

Parameter	Description
connections	The network connections kept persistent

### Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

## 262.9.25 GET\_PROXY Procedure

This procedure retrieves the current proxy settings.

### See Also:

[Session Settings](#) (page 262-21) and [Session Settings Subprograms](#) (page 262-22)

### Syntax

```
UTL_HTTP.GET_PROXY (
 proxy OUT NOCOPY VARCHAR2,
 no_proxy_domains OUT NOCOPY VARCHAR2);
```

### Parameters

**Table 262-38 GET\_PROXY Procedure Parameters**

Parameter	Description
proxy	The proxy (host and an optional port number) currently used by the UTL_HTTP package
no_proxy_domains	The list of hosts and domains for which no proxy is used for all requests

## 262.9.26 GET\_RESPONSE Function

This function reads the HTTP response.

When the function returns, the status line and the HTTP response headers have been read and processed. The status code, reason phrase, and the HTTP protocol version are stored in the response record. This function completes the HTTP headers section.

### See Also:

[HTTP Responses](#) (page 262-20) and [HTTP Responses Subprograms](#) (page 262-24)

## Syntax

```
UTL_HTTP.GET_RESPONSE (
 r IN OUT NOCOPY req,
 return_info_response IN BOOLEAN DEFAULT FALSE)
RETURN resp;
```

## Parameters

**Table 262-39 GET\_RESPONSE Function Parameters**

Parameter	Description
r	The HTTP response
return_info_response	Return 100 informational response or not. <ul style="list-style-type: none"> <li>TRUE means <code>get_response</code> should return 100 informational response when it is received from the HTTP server. The request will not be ended if a 100 response is returned.</li> <li>FALSE means the API should ignore any 100 informational response received from the HTTP server and should return the following non-100 response instead. The default is FALSE.</li> </ul>

## Exceptions

- When detailed-exception is disabled:
  - ORA-29273 `REQUEST_FAILED` - the request fails to execute. Use the [GET\\_DETAILED\\_EXCP\\_SUPPORT Procedure](#) (page 262-41) and the [GET\\_DETAILED\\_SQLERRM Function](#) (page 262-42) to get the detailed error message.
- When detailed-exception is enabled:
  - ORA-29261 `BAD_ARGUMENT` - some arguments passed are not valid
- When response error check is enabled:
  - ORA-29268 `HTTP_CLIENT_ERROR` - the response code is in 400 range
  - ORA-29269 `HTTP_SERVER_ERROR` - the response code is in 500 range

## Usage Notes

- The request will be ended when this functions returns regardless of whether an exception is raised or not. There is no need to invoke the [END\\_REQUEST Procedure](#) (page 262-37).
- If URL redirection occurs, the URL and method fields in the `req` record will be updated to the last redirected URL and the method used to access the URL.

## Examples

In certain situations (initiated by the HTTP client or not), the HTTP server may return a 1xx informational response. The user who does not expect such a response may indicate to `GET_RESPONSE` to ignore the response and proceed to receive the regular response. In the case when the user expects such a response, the user can indicate to `GET_RESPONSE` to return the response.

For example, when a user is issuing a HTTP POST request with a large request body, the user may want to check with the HTTP server to ensure that the server will accept the request before sending the data. To do so, the user will send the additional EXPECT: 100-CONTINUE request header, and check for 100 CONTINUE response from the server before proceeding to send the request body. Then, the user will get the regular HTTP response.

The following code example illustrates this:

```
DECLARE
 data VARCHAR2(1024) := '...';
 req utl_http.req;
 resp utl_http.resp;
BEGIN

 req := utl_http.begin_request('http://www.acme.com/receiver', 'POST');
 utl_http.set_header(req, 'Content-Length', length(data));
 -- Ask HTTP server to return "100 Continue" response
 utl_http.set_header(req, 'Expect', '100-continue');
 resp := utl_http.get_response(req, TRUE);

 -- Check for and dispose "100 Continue" response
 IF (resp.status_code <> 100) THEN
 utl_http.end_response(resp);
 raise_application_error(20000, 'Request rejected');
 END IF;
 utl_http.end_response(resp);

 -- Now, send the request body
 utl_http.write_text(req, data);

 -- Get the regular response
 resp := utl_http.get_response(req);
 utl_http.read_text(resp, data);

 utl_http.end_response(resp);

END;
```

## 262.9.27 GET\_RESPONSE\_ERROR\_CHECK Procedure

This procedure checks if the response error check is set or not.

### See Also:

[Session Settings](#) (page 262-21) and [Session Settings Subprograms](#) (page 262-22)

### Syntax

```
UTL_HTTP.GET_RESPONSE_ERROR_CHECK (
 enable OUT BOOLEAN);
```

## Parameters

**Table 262-40** GET\_RESPONSE\_ERROR\_CHECK Procedure Parameters

Parameter	Description
enable	TRUE if the response error check is set; otherwise FALSE

## 262.9.28 GET\_TRANSFER\_TIMEOUT Procedure

This procedure retrieves the default timeout value for all future HTTP requests.

**See Also:**

[Session Settings](#) (page 262-21) and [Session Settings Subprograms](#) (page 262-22)

### Syntax

```
UTL_HTTP.GET_TRANSFER_TIMEOUT (
 timeout OUT PLS_INTEGER);
```

### Parameters

**Table 262-41** GET\_TRANSFER\_TIMEOUT Procedure Parameters

Parameter	Description
timeout	The network transfer timeout value in seconds

## 262.9.29 READ\_LINE Procedure

This procedure reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer.

The end of line is as defined in the function `read_line` of `UTL_TCP`. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

**See Also:**

[HTTP Responses](#) (page 262-20) and [HTTP Responses Subprograms](#) (page 262-24)

### Syntax

```
UTL_HTTP.READ_LINE(
 r IN OUT NOCOPY resp,
```

```

data OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
remove_crlf IN BOOLEAN DEFAULT FALSE);

```

## Parameters

**Table 262-42 READ\_LINE Procedure Parameters**

Parameter	Description
<code>r</code>	The HTTP response
<code>data</code>	The HTTP response body in text form
<code>remove_crlf</code>	Removes the newline characters if set to <code>TRUE</code>

## Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_line` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_line` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

## 262.9.30 READ\_RAW Procedure

This procedure reads the HTTP response body in binary form and returns the output in the caller-supplied buffer.

The `end_of_body` exception is raised if the end of the HTTP response body is reached.

### See Also:

[HTTP Responses](#) (page 262-20) and [HTTP Responses Subprograms](#) (page 262-24)

## Syntax

```
UTL_HTTP.READ_RAW(
 r IN OUT NOCOPY resp,
 data OUT NOCOPY RAW,
 len IN PLS_INTEGER DEFAULT NULL);
```

## Parameters

**Table 262-43 READ\_RAW Procedure Parameters**

Parameter	Description
r	The HTTP response
data	The HTTP response body in binary form
len	The number of bytes of data to read. If len is NULL, this procedure will read as much input as possible to fill the buffer allocated in data. The actual amount of data returned may be less than that specified if not much data is available before the end of the HTTP response body is reached or the transfer_timeout amount of time has elapsed. The default is NULL

## Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_raw` waits for each data packet to be ready to read until timeout occurs. If it occurs, `read_raw` stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

## 262.9.31 READ\_TEXT Procedure

This procedure reads the HTTP response body in text form and returns the output in the caller-supplied buffer.

The `end_of_body` exception is raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

### See Also:

[HTTP Responses](#) (page 262-20) and [HTTP Responses Subprograms](#) (page 262-24)

## Syntax

```

UTL_HTTP.READ_TEXT(
 r IN OUT NOCOPY resp,
 data OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
 len IN PLS_INTEGER DEFAULT NULL);

```

## Parameters

**Table 262-44 READ\_TEXT Procedure Parameters**

Parameter	Description
r	The HTTP response
data	The HTTP response body in text form
len	The maximum number of characters of data to read. If len is NULL, this procedure will read as much input as possible to fill the buffer allocated in data. The actual amount of data returned may be less than that specified if little data is available before the end of the HTTP response body is reached or the <code>transfer_timeout</code> amount of time has elapsed. The default is NULL.

## Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_text` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_text` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

## 262.9.32 REQUEST Function

This function returns up to the first 2000 bytes of data retrieved from the given URL.

This function can be used directly in SQL queries. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[...]
```

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

### See Also:

[Simple HTTP Fetches](#) (page 262-19) and [Simple HTTP Fetches in a Single Call Subprograms](#) (page 262-22)

### Syntax

```
UTL_HTTP.REQUEST (
 url IN VARCHAR2,
 proxy IN VARCHAR2 DEFAULT NULL,
 wallet_path IN VARCHAR2 DEFAULT NULL,
 wallet_password IN VARCHAR2 DEFAULT NULL,
 https_host IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references (request, wnds, rnds, wnps, rnps);
```

### Parameters

**Table 262-45 REQUEST Function Parameters**

Parameter	Description
url	Uniform resource locator
proxy	(Optional) Specifies a proxy server to use when making the HTTP request. See <code>SET_PROXY</code> for the full format of the proxy setting.
wallet_path	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of <code>wallet_path</code> on a PC is, for example, <code>file:c:\WINNT\Profiles\username\WALLETS</code> , and in Unix is, for example, <code>file:/home/username/wallets</code> When the <code>UTL_HTTP</code> package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See <code>SET_WALLET</code> for a description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.

**Table 262-45 (Cont.) REQUEST Function Parameters**

Parameter	Description
wallet_password	(Optional) Specifies the password required to open the wallet
https_host	The host name to be matched against the common name (CN) of the remote server's certificate for an HTTPS request. It can also be a domain name like *.example.com. If NULL, the host name in the given URL will be used.

### Return Values

The return type is a string of length 2000 or less, which contains up to the first 2000 bytes of the HTML result returned from the HTTP request to the argument URL.

### Exceptions

INIT\_FAILED  
REQUEST\_FAILED

### Usage Notes

The URL passed as an argument to this function is not examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL\_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Please see the documentation of the function SET\_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document: http://home.nothing.comm.
<P>
Reason: Can't locate remote host: home.nothing.comm.
<P>
<P><HR>
<ADDRESS>
CERN-HTTPD3.0A</ADDRESS>
</BODY>
</HTML>
```

### Examples

```
SQL> SELECT UTL_HTTP.REQUEST('http://www.my-company.com/') FROM DUAL;
UTL_HTTP.REQUEST('HTTP://WWW.MY-COMPANY.COM/')
<html>
<head><title>My Company Home Page</title>
```

```
<!--changed Jan. 16, 19
1 row selected.
```

If you are behind a firewall, include the `proxy` parameter. For example, from within the Oracle firewall, where there might be a proxy server named `www-proxy.my-company.com`:

```
SQLPLUS> SELECT
UTL_HTTP.REQUEST('http://www.my-company.com', 'www-proxy.us.my-company.com') FROM
DUAL;
```

## 262.9.33 REQUEST\_PIECES Function

This function returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

### See Also:

[Simple HTTP Fetches](#) (page 262-19) and [Simple HTTP Fetches in a Single Call Subprograms](#) (page 262-22)

### Syntax

```
TYPE html_pieces IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
```

```
UTL_HTTP.REQUEST_PIECES (
 url IN VARCHAR2,
 max_pieces IN NATURAL DEFAULT 32767,
 proxy IN VARCHAR2 DEFAULT NULL,
 wallet_path IN VARCHAR2 DEFAULT NULL,
 wallet_password IN VARCHAR2 DEFAULT NULL,
 https_host IN VARCHAR2 DEFAULT NULL)
RETURN html_pieces;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES (request_pieces, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 262-46 REQUEST\_PIECES Function Parameters**

Parameter	Description
<code>url</code>	Uniform resource locator
<code>max_pieces</code>	(Optional) The maximum number of pieces (each 2000 characters in length, except for the last, which may be shorter), that <code>REQUEST_PIECES</code> should return. If provided, then that argument should be a positive integer.

**Table 262-46 (Cont.) REQUEST\_PIECES Function Parameters**

Parameter	Description
proxy	(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.
wallet_path	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request.  The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles\username\WALLETS, and in Unix is, for example, file:/home/username/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.  See SET_WALLET for the description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.
wallet_password	(Optional) Specifies the password required to open the wallet
https_host	The host name to be matched against the common name (CN) of the remote server's certificate for an HTTPS request. It can also be a domain name like *.example.com. If NULL, the host name in the given URL will be used.

### Return Values

REQUEST\_PIECES returns a PL/SQL table of type UTL\_HTTP.HTML\_PIECES. Each element of that PL/SQL table is a string of maximum length 2000. The elements of the PL/SQL table returned by REQUEST\_PIECES are successive pieces of the data obtained from the HTTP request to that URL.

### Exceptions

INIT\_FAILED  
REQUEST\_FAILED

### Usage Notes

The URL passed as an argument to this function will not be examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL\_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Each entry of the PL/SQL table (the "pieces") returned by this function may not be filled to their fullest capacity. The function may start filling the data in the next piece before the previous "piece" is totally full.

Please see the documentation of the function SET\_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```

<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document: http://home.nothing.comm.
<P>
Reason: Can't locate remote host: home.nothing.comm.
<P>
<P><HR>
<ADDRESS>
CERN-HTTPD3.0A</ADDRESS>
</BODY>
</HTML>

```

## Examples

```

SET SERVEROUTPUT ON

DECLARE
 x UTL_HTTP.HTML_PIECES;
 len PLS_INTEGER;
BEGIN
 x := UTL_HTTP.REQUEST_PIECES('http://www.oracle.com/', 100);
 DBMS_OUTPUT.PUT_LINE(x.count || ' pieces were retrieved. ');
 DBMS_OUTPUT.PUT_LINE('with total length ');
 IF x.count < 1 THEN
 DBMS_OUTPUT.PUT_LINE('0 ');
 ELSE
 len := 0;
 FOR i in 1..x.count LOOP
 len := len + length(x(i));
 END LOOP;
 DBMS_OUTPUT.PUT_LINE(len);
 END IF;
END;
/
-- Output
Statement processed.
4 pieces were retrieved.
with total length
7687

```

## 262.9.34 SET\_AUTHENTICATION Procedure

This procedure sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.

### See Also:

[HTTP Requests](#) (page 262-19) and [HTTP Requests Subprograms](#) (page 262-23)

## Syntax

```
UTL_HTTP.SET_AUTHENTICATION(
 r IN OUT NOCOPY req,
 username IN VARCHAR2,
 password IN VARCHAR2,
 scheme IN VARCHAR2 DEFAULT 'Basic',
 for_proxy IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 262-47 SET\_AUTHENTICATION Procedure Parameters**

Parameter	Description
r	HTTP request
username	Username for the HTTP authentication
password	Password for the HTTP authentication
scheme	HTTP authentication scheme. Either <code>Basic</code> for the HTTP basic or <code>AWS</code> for Amazon S3 authentication scheme. Default is <code>basic</code> .
for_proxy	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is <code>FALSE</code> .

## Usage Notes

The supported authentication schemes are HTTP basic and Amazon S3 authentication.

## 262.9.35 SET\_AUTHENTICATION\_FROM\_WALLET Procedure

This procedure sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.

### See Also:

[External Password Store](#) (page 262-21) on , and [HTTP Requests Subprograms](#) (page 262-23)

## Syntax

```
UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(
 r IN OUT NOCOPY req,
 alias IN VARCHAR2,
 scheme IN VARCHAR2 DEFAULT 'Basic',
 for_proxy IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 262-48 SET\_AUTHENTICATION\_FROM\_WALLET Procedure Parameters**

Parameter	Description
<code>r</code>	The HTTP request
<code>alias</code>	Alias to identify and retrieve the username and password credential stored in the Oracle wallet
<code>scheme</code>	HTTP authentication scheme. Either <code>Basic</code> for the HTTP basic or <code>AWS</code> for Amazon S3 authentication scheme. Default is <code>basic</code> .
<code>for_proxy</code>	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is <code>FALSE</code> .

## Usage Notes

- To use the password credentials in a wallet, the `UTL_HTTP` user must have the `use-passwords` privilege on the wallet.
- The supported authentication schemes are HTTP basic and Amazon S3 authentication schemes.

## Examples

### Creating a wallet and entering username and password in the wallet

```
> mkstore -wrl /oracle/wallets/test_wallet -create
Enter password: *****
Enter password again: *****
> mkstore -wrl /oracle/wallets/test_wallet -createCredential hr-access jsmith
Your secret/Password is missing in the command line
Enter your secret/Password: ****
Re-enter your secret/Password: ****
Enter wallet password: *****
```

### Granting the use-passwords privilege on the wallet to a user by the database administrator

```
BEGIN
 DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
 acl => 'wallet-acl.xml',
 description => 'Wallet ACL',
 principal => 'SCOTT',
 is_grant => TRUE,
 privilege => 'use-passwords');
 DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_acl(
 acl => 'wallet-acl.xml',
 wallet_path => 'file: /oracle/wallets/test_wallet');
END;
```

### Using username and password from the wallet

```
DECLARE
 req UTL_HTTP.req;
BEGIN
 UTL_HTTP.SET_WALLET(path => 'file:/oracle/wallets/test_wallet');
 req := UTL_HTTP.BEGIN_REQUEST(...);
```

```
UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(req, 'hr-access');
...
END;
```

## 262.9.36 SET\_BODY\_CHARSET Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

### See Also:

- [HTTP Responses](#) (page 262-20) and [HTTP Responses Subprograms](#) (page 262-24)
- [Session Settings](#) (page 262-21) and [Session Settings Subprograms](#) (page 262-22)

### Syntax

Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header. Following the HTTP protocol standard specification, if the media type of a request or a response is `text`, but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to `ISO-8859-1`. A response created for a request inherits the default body character set of the request instead of the body character set of the current session. The default body character set is `ISO-8859-1` in a database user session. The default body character set setting affects only future requests and has no effect on existing requests. After a request is created, the body character set can be changed by using the other `SET_BODY_CHARSET` procedure that operates on a request:

```
UTL_HTTP.SET_BODY_CHARSET (
 charset IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header. According to the HTTP protocol standard specification, if the media type of a request or a response is `"text"` but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to `"ISO-8859-1"`. Use this procedure to change the default body character set a request inherits from the session default setting:

```
UTL_HTTP.SET_BODY_CHARSET(
 r IN OUT NOCOPY req,
 charset IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the response body when the media type is `"text"` but the character set is not specified in the `Content-Type` header. For each the HTTP protocol standard specification, if the media type of a request or a response is `"text"` but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to `"ISO-8859-1"`. Use this procedure to change the default body character set a response inherits from the request:

```
UTL_HTTP.SET_BODY_CHARSET(
 r IN OUT NOCOPY resp,
 charset IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 262-49 SET\_BODY\_CHARSET Procedure Parameters**

Parameter	Description
r	The HTTP response.
charset	The default character set of the response body. The character set can be in Oracle or Internet Assigned Numbers Authority (IANA) naming convention. If charset is NULL, the database character set is assumed.

## 262.9.37 SET\_COOKIE\_SUPPORT Procedures

This overloaded procedure handles cookie support. The description of different functionality is located alongside the syntax declarations.

### See Also:

- [HTTP Requests](#) (page 262-19) and [HTTP Requests Subprograms](#) (page 262-23)
- [Session Settings](#) (page 262-21) and [Session Settings Subprograms](#) (page 262-22)

### Syntax

Enables or disables support for the HTTP cookies in the request. Use this procedure to change the cookie support setting a request inherits from the session default setting:

```
UTL_HTTP.SET_COOKIE_SUPPORT(
 r IN OUT NOCOPY REQ,
 enable IN BOOLEAN DEFAULT TRUE);
```

Sets whether or not future HTTP requests will support HTTP cookies, and the maximum number of cookies maintained in the current database user session:

```
UTL_HTTP.SET_COOKIE_SUPPORT (
 enable IN BOOLEAN,
 max_cookies IN PLS_INTEGER DEFAULT 300,
 max_cookies_per_site IN PLS_INTEGER DEFAULT 20);
```

### Parameters

**Table 262-50 SET\_COOKIE\_SUPPORT Procedure Parameters**

Parameter	Description
r	The HTTP request

**Table 262-50 (Cont.) SET\_COOKIE\_SUPPORT Procedure Parameters**

Parameter	Description
enable	Set enable to <code>TRUE</code> to enable HTTP cookie support; <code>FALSE</code> to disable
max_cookies	Sets the maximum total number of cookies maintained in the current session
max_cookies_per_site	Sets the maximum number of cookies maintained in the current session for each Web site

**Usage Notes**

If cookie support is enabled for an HTTP request, all cookies saved in the current session and applicable to the request are returned to the Web server in the request in accordance with HTTP cookie specification standards. Cookies set in the response to the request are saved in the current session for return to the Web server in the subsequent requests if cookie support is enabled for those requests. If the cookie support is disabled for an HTTP request, no cookies are returned to the Web server in the request and the cookies set in the response to the request are not saved in the current session, although the `Set-Cookie` HTTP headers can still be retrieved from the response.

Cookie support is enabled by default for all HTTP requests in a database user session. The default setting of the cookie support (enabled versus disabled) affects only the future requests and has no effect on the existing ones. After your request is created, the cookie support setting may be changed by using the other `SET_COOKIE_SUPPORT` procedure that operates on a request.

The default maximum number of cookies saved in the current session is 20 for each site and 300 total.

If you lower the maximum total number of cookies or the maximum number of cookies for each Web site, the oldest cookies will be purged first to reduce the number of cookies to the lowered maximum. HTTP cookies saved in the current session last for the duration of the database session only; there is no persistent storage for the cookies. Cookies saved in the current session are not cleared if you disable cookie support.

See "[Examples](#) (page 262-8)" for how to use `GET_COOKIES` and `ADD_COOKIES` to retrieve, save, and restore cookies.

## 262.9.38 SET\_DETAILED\_EXCP\_SUPPORT Procedure

This procedure sets the `UTL_HTTP` package to raise a detailed exception.

By default, `UTL_HTTP` raises the `request_failed` exception when an HTTP request fails. Use `GET_DETAILED_SQLCODE` and `GET_DETAILED_SQLERRM` for more detailed information about the error.

 **See Also:**

[Session Settings](#) (page 262-21) and [Session Settings Subprograms](#) (page 262-22)

**Syntax**

```
UTL_HTTP.SET_DETAILED_EXCP_SUPPORT (
 enable IN BOOLEAN DEFAULT FALSE);
```

**Parameters****Table 262-51 SET\_DETAILED\_EXCP\_SUPPORT Procedure Parameters**

Parameter	Description
enable	Asks UTL_HTTP to raise a detailed exception directly if set to TRUE; otherwise FALSE

## 262.9.39 SET\_FOLLOW\_REDIRECT Procedures

This procedure sets the maximum number of times UTL\_HTTP follows the HTTP redirect instruction in the HTTP response to this request, or future requests, in the GET\_RESPONSE function.

 **See Also:**

- [HTTP Requests](#) (page 262-19) and [HTTP Requests Subprograms](#) (page 262-23)
- [Session Settings](#) (page 262-21) and [Session Settings Subprograms](#) (page 262-22)

**Syntax**

Use this procedure to set the maximum number of redirections:

```
UTL_HTTP.SET_FOLLOW_REDIRECT (
 max_redirects IN PLS_INTEGER DEFAULT 3);
```

Use this procedure to change the maximum number of redirections a request inherits from the session default setting:

```
UTL_HTTP.SET_FOLLOW_REDIRECT(
 r IN OUT NOCOPY req,
 max_redirects IN PLS_INTEGER DEFAULT 3);
```

## Parameters

**Table 262-52 SET\_FOLLOW\_REDIRECT Procedure Parameters**

Parameter	Description
<code>r</code>	The HTTP request
<code>max_redirects</code>	The maximum number of redirects. Set to zero to disable redirects.

## Usage Notes

If `max_redirects` is set to a positive number, the [GET\\_RESPONSE Function](#) (page 262-47) will automatically follow the redirected URL for the HTTP response status code 301, 302, and 307 for the HTTP HEAD and GET methods, and 303 for all HTTP methods, and retry the HTTP request (the request method will be changed to HTTP GET for the status code 303) at the new location. It follows the redirection until the final, non-redirect location is reached, or an error occurs, or the maximum number of redirections has been reached (to prevent an infinite loop). The URL and method fields in the `REQ` record will be updated to the last redirected URL and the method used to access the URL. Set the maximum number of redirects to zero to disable automatic redirection.

While it is set not to follow redirect automatically in the current session, it is possible to specify individual HTTP requests to follow redirect instructions the function `FOLLOW_REDIRECT` and vice versa.

The default maximum number of redirections in a database user session is 3. The default value affects only future requests and has no effect on existing requests.

The `SET_FOLLOW_REDIRECT` procedure must be called before `GET_RESPONSE` for any redirection to take effect.

## 262.9.40 SET\_HEADER Procedure

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

### See Also:

[HTTP Requests](#) (page 262-19) and [HTTP Requests Subprograms](#) (page 262-23)

## Syntax

```
UTL_HTTP.SET_HEADER (
 r IN OUT NOCOPY req,
 name IN VARCHAR2,
 value IN VARCHAR2);
```

## Parameters

**Table 262-53 SET\_HEADER Procedure Parameters**

Parameter	Description
r	The HTTP request
name	The name of the HTTP request header
value	The value of the HTTP request header

## Usage Notes

Multiple HTTP headers with the same name are allowed in the HTTP protocol standard. Therefore, setting a header does not replace a prior header with the same name.

If the request is made using HTTP 1.1, `UTL_HTTP` sets the Host header automatically for you.

When you set the `Content-Type` header with this procedure, `UTL_HTTP` looks for the character set information in the header value. If the character set information is present, it is set as the character set of the request body. It can be overridden later by using the `SET_BODY_CHARSET` procedure.

When you set the Transfer-Encoding header with the value `chunked`, `UTL_HTTP` automatically encodes the request body written by the `WRITE_TEXT`, `WRITE_LINE` and `WRITE_RAW` procedures. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format.

## 262.9.41 SET\_PERSISTENT\_CONN\_SUPPORT Procedure

This overloaded procedure provides persistent connection support. Descriptions of the different functionality are given in the syntax declarations.

### See Also:

[HTTP Requests](#) (page 262-19) and [HTTP Requests Subprograms](#) (page 262-23)

## Syntax

Sets whether future HTTP requests should support the HTTP 1.1 persistent connection or not, and the maximum numbers of persistent connections to be maintained in the current database user session.

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
 enable IN BOOLEAN DEFAULT FALSE,
 max_conns IN PLS_INTEGER DEFAULT 0);
```

Enables or disables support for the HTTP 1.1 persistent-connection in the request.

```

UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
 r IN OUT NOCOPY req,
 enable IN BOOLEAN DEFAULT FALSE);

```

## Parameters

**Table 262-54 SET\_PERSISTENT\_CONN\_SUPPORT Procedure Parameters**

Parameter	Description
enable	TRUE to keep the network connection persistent. FALSE otherwise.
maximum_conns	Maximum number of connections
r	The HTTP request

## Usage Notes

If the persistent-connection support is enabled for an HTTP request, the package will keep the network connections to a Web server or the proxy server open in the package after the request is completed properly for a subsequent request to the same server to reuse for each HTTP 1.1 protocol specification. With the persistent connection support, subsequent HTTP requests may be completed faster because the network connection latency is avoided. If the persistent-connection support is disabled for a request, the package will always send the HTTP header "Connection: close" automatically in the HTTP request and close the network connection when the request is completed. This setting has no effect on HTTP requests that follows HTTP 1.0 protocol, for which the network connections will always be closed after the requests are completed.

When a request is being made, the package attempts to reuse an existing persistent connection to the target Web server (or proxy server) if one is available. If none is available, a new network connection will be initiated. The persistent-connection support setting for a request affects only whether the network connection should be closed after a request completes.

Use this procedure to change the persistent-connection support setting a request inherits from the session default setting.

Users should note that while the use of persistent connections in `UTL_HTTP` may reduce the time it takes to fetch multiple Web pages from the same server, it consumes precious system resources (network connections) in the database server. Also, excessive use of persistent connections may reduce the scalability of the database server when too many network connections are kept open in the database server. Network connections should be kept open only if they will be used immediately by subsequent requests and should be closed immediately when they are no longer needed. Set the default persistent connection support as disabled in the session, and enable persistent connection in individual HTTP requests as shown in "[Examples](#) (page 262-68)".

The default value of the maximum number of persistent connections in a database session is zero. To truly enable persistent connections, you must also set the maximum number of persistent connections to a positive value or no connections will be kept persistent.

Note that if you want to use persistent connections, you must call the overload that takes the `maximum_conns` parameter prior to calling the [BEGIN\\_REQUEST Function](#)

(page 262-31), otherwise persistent connections will not be enabled for the current request even if the other form of `SET_PERSISTENT_CONN_SUPPORT` is called.

## Examples

Using `SET_PERSISTENT_CONN_SUPPORT` in http requests at the session level, showing the active persistent connection after each request

```
DECLARE
 pieces utl_http.html_pieces;
 conns utl_http.connection_table;
BEGIN

 -- Turns on persistent connection support for the request_pieces call.
 utl_http.set_persistent_conn_support(true, 1);

 FOR i IN 1..10 LOOP

 pieces := utl_http.request_pieces('http://www.example.com/');

 -- Shows the active persistent connection
 utl_http.get_persistent_conns(conns);
 FOR j IN 1..conns.count LOOP
 dbms_output.put_line('Persistent connection '||j||': '||conns(j).host||':'||
conns(j).port);
 END LOOP;

 END LOOP;

 -- Turns off persistent connection support. Set active max persistent connection
 to 0 to close all active connections.
 utl_http.set_persistent_conn_support(false, 0);

END;
/
```

Using `SET_PERSISTENT_CONN_SUPPORT` in HTTP requests showing how to use persistent connection individually in each request to fetch multiple URLs at the same host

```
DECLARE
 -- Table to store the URLs
 TYPE vc2_table IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
 paths VC2_TABLE;

 PROCEDURE fetch_pages(paths IN vc2_table) AS
 req UTL_HTTP.REQ;
 resp UTL_HTTP.RESP;
 data VARCHAR2(1024);

 BEGIN

 -- Set the proxy server
 UTL_HTTP.SET_PROXY('www-proxy.example.com:80', '');

 FOR i IN 1..paths.count LOOP

 req := UTL_HTTP.BEGIN_REQUEST(paths(i));

 -- Use persistent connections except for the last request
```

```

IF (i < paths.count) THEN
 -- Use a persistent connection for the current request
 UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(req, TRUE);
END IF;

resp := UTL_HTTP.GET_RESPONSE(req);

-- Display the results of the response
DBMS_OUTPUT.PUT_LINE('-');
DBMS_OUTPUT.PUT_LINE('URL: ' || paths(i));
DBMS_OUTPUT.PUT_LINE('HTTP Response Status Code: ' || resp.status_code);
DBMS_OUTPUT.PUT_LINE('HTTP Response Reason Phrase: ' || resp.reason_phrase);
DBMS_OUTPUT.PUT_LINE('HTTP Response Version: ' || resp.http_version);

BEGIN
 LOOP
 UTL_HTTP.READ_TEXT(resp, data);
 -- do something with the data
 END LOOP;
EXCEPTION
 WHEN UTL_HTTP.END_OF_BODY THEN
 NULL;
END;
UTL_HTTP.END_RESPONSE(resp);
END LOOP;
END;

BEGIN
-- Set a maximum of 1 persistent connection, but start with persistent connections
-- off
 UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(FALSE, 1);

 -- Create a list of URLs
 paths(1) := 'http://www.example.com/technetwork/index.html';
 paths(2) := 'http://www.example.com/us/products/index.html';

 fetch_pages(paths);
END;
/

```

## 262.9.42 SET\_PROXY Procedure

This procedure sets the proxy to be used for requests of the HTTP or other protocols, excluding those for hosts that belong to the domain specified in `no_proxy_domains`.

`no_proxy_domains` is a comma-, semi-colon-, or space-separated list of domains or hosts for which HTTP requests should be sent directly to the destination HTTP server instead of going through a proxy server.

### See Also:

[Session Settings](#) (page 262-21) and [Session Settings Subprograms](#) (page 262-22)

**Syntax**

```
UTL_HTTP.SET_PROXY (
 proxy IN VARCHAR2,
 no_proxy_domains IN VARCHAR2);
```

**Parameters****Table 262-55 SET\_PROXY Procedure Parameters**

Parameter	Description
proxy	The proxy (host and an optional port number) to be used by the UTL_HTTP package
no_proxy_domains	The list of hosts and domains for which no proxy should be used for all requests

**Usage Notes**

The proxy may include an optional TCP/IP port number at which the proxy server listens. The syntax is `[http://]host[:port][/]`, for example, `www-proxy.my-company.com:80`. If the port is not specified for the proxy, port 80 is assumed.

Optionally, a port number can be specified for each domain or host. If the port number is specified, the no-proxy restriction is only applied to the request at the port of the particular domain or host, for example, `corp.my-company.com`, `eng.my-company.com:80`. When `no_proxy_domains` is `NULL` and the proxy is set, all requests go through the proxy. When the proxy is not set, `UTL_HTTP` sends requests to the target Web servers directly.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

If proxy settings are set when the database server instance is started, the proxy settings in the environment variables `http_proxy` and `no_proxy` are assumed. Proxy settings set by this procedure override the initial settings.

## 262.9.43 SET\_RESPONSE\_ERROR\_CHECK Procedure

This procedure sets whether or not `GET_RESPONSE` raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges.

For example, when the requested URL is not found in the destination Web server, a 404 (document not found) response status code is returned.

**See Also:**

[Session Settings](#) (page 262-21) and [Session Settings Subprograms](#) (page 262-22)

### Syntax

```
UTL_HTTP.SET_RESPONSE_ERROR_CHECK (
 enable IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 262-56 SET\_RESPONSE\_ERROR\_CHECK Procedure Parameters**

Parameter	Description
enable	TRUE to check for response errors; otherwise FALSE

### Usage Notes

If the status code indicates an error—a 4xx or 5xx code—and this procedure is enabled, `GET_RESPONSE` will raise the `HTTP_CLIENT_ERROR` or `HTTP_SERVER_ERROR` exception. If `SET_RESPONSE_ERROR_CHECK` is set to `FALSE`, `GET_RESPONSE` will not raise an exception when the status code indicates an error.

Response error check is turned off by default.

The `GET_RESPONSE` function can raise other exceptions when `SET_RESPONSE_ERROR_CHECK` is set to `FALSE`.

## 262.9.44 SET\_TRANSFER\_TIMEOUT Procedure

This procedure sets the default time out value for all future HTTP requests that the `UTL_HTTP` package should attempt while reading the HTTP response from the Web server or proxy server.

This time out value may be used to avoid the PL/SQL programs from being blocked by busy Web servers or heavy network traffic while retrieving Web pages from the Web servers.

#### See Also:

[Session Settings](#) (page 262-21) and [Session Settings Subprograms](#) (page 262-22)

### Syntax

```
UTL_HTTP.SET_TRANSFER_TIMEOUT (
 timeout IN PLS_INTEGER DEFAULT 60);
```

### Parameters

**Table 262-57 SET\_TRANSFER\_TIMEOUT Procedure Parameters**

Parameter	Description
timeout	The network transfer timeout value in seconds.

## Usage Notes

The default value of the time out is 60 seconds.

## 262.9.45 SET\_WALLET Procedure

This procedure sets the Oracle wallet used for all HTTP requests over Secured Socket Layer (SSL), namely HTTPS.

When the `UTL_HTTP` package communicates with an HTTP server over SSL, the HTTP server presents its digital certificate, which is signed by a certificate authority, to the `UTL_HTTP` package for identification purpose. The Oracle wallet contains the list of certificate authorities that are trusted by the user of the `UTL_HTTP` package. An Oracle wallet is required to make an HTTPS request.

### See Also:

- [Session Settings](#) (page 262-21) and [Session Settings Subprograms](#) (page 262-22)
- *Oracle Database Security Guide* managing fine-grained access

## Syntax

```
UTL_HTTP.SET_WALLET (
 path IN VARCHAR2,
 password IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 262-58 SET\_WALLET Procedure Parameters**

Parameter	Description
path	The directory path that contains the Oracle wallet. The format is <code>file:directory-path</code> .  The format of <code>wallet_path</code> on a PC is, for example, <code>file:c:\WINNT\Profiles\username\WALLETS</code> , and in Unix is, for example, <code>file:/home/username/wallets</code> . When the <code>UTL_HTTP</code> package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.
password	The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to <code>NULL</code> . See <i>Oracle Database Advanced Security Guide</i> for information about using Oracle Wallet Manager and the <code>ORAPKI</code> utility to create an auto-login wallet.

## Usage Notes

To set up an Oracle wallet, use the Oracle Wallet Manager to create a wallet. In order for the HTTPS request to succeed, the certificate authority that signs the certificate of the remote HTTPS Web server must be a trust point set in the wallet.

When a wallet is created, it is populated with a set of well-known certificate authorities as trust points. If the certificate authority that signs the certificate of the remote HTTPS Web server is not among the trust points, or the certificate authority has new root certificates, you should obtain the root certificate of that certificate authority and install it as a trust point in the wallet using Oracle Wallet Manager

 **See Also:**

*Oracle Database Advanced Security Guide* for more information on Wallet Manager

## 262.9.46 WRITE\_LINE Procedure

This procedure writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in `UTL_TCP`).

As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

 **See Also:**

[HTTP Requests](#) (page 262-19) and [HTTP Requests Subprograms](#) (page 262-23)

### Syntax

```
UTL_HTTP.WRITE_LINE(
 r IN OUT NOCOPY req,
 data IN VARCHAR2 CHARACTER SET ANY_CS);
```

### Parameters

**Table 262-59** WRITE\_LINE Procedure Parameters

Parameter	Description
r	The HTTP request
data	The text line to send in the HTTP request body

### Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. The `UTL_HTTP` package performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note

that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remote Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

## 262.9.47 WRITE\_RAW Procedure

This procedure writes some binary data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed.

### See Also:

[HTTP Requests](#) (page 262-19) and [HTTP Requests Subprograms](#) (page 262-23)

### Syntax

```
UTL_HTTP.WRITE_RAW(
 r IN OUT NOCOPY REQ,
 data IN RAW);
```

### Parameters

**Table 262-60** WRITE\_RAW Procedure Parameters

Parameter	Description
r	The HTTP request
data	The binary data to send in the HTTP request body

### Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding:chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request

body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

## 262.9.48 WRITE\_TEXT Procedure

This procedure writes some text data in the HTTP request body.

As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

### See Also:

[HTTP Requests](#) (page 262-19) and [HTTP Requests Subprograms](#) (page 262-23)

### Syntax

```
UTL_HTTP.WRITE_TEXT(
 r IN OUT NOCOPY REQ,
 data IN VARCHAR2 CHARACTER SET ANY_CS);
```

### Parameters

**Table 262-61** WRITE\_TEXT Procedure Parameters

Parameter	Description
r	The HTTP request
data	The text data to send in the HTTP request body

### Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remote Web server or CGI

programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

# UTL\_I18N

UTL\_I18N is a set of services that provides additional globalization functionality for applications written in PL/SQL.

## See Also:

*Oracle Database Globalization Support Guide*

The chapter contains the following topics:

- [Overview](#) (page 263-1)
- [Security Model](#) (page 263-2)
- [Constants](#) (page 263-2)
- [Summary of UTL\\_I18N Subprograms](#) (page 263-3)

## 263.1 UTL\_I18N Overview

UTL\_I18N services provide additional globalization functionality for applications written in PL/SQL.

The UTL\_I18N PL/SQL package consists of the following categories of services:

- String conversion functions for various datatypes.
- Functions that convert a text string to character references and vice versa.
- Functions that map between Oracle, Java, and ISO languages and territories.
- Functions that map between Oracle, Internet Assigned Numbers Authority (IANA), and e-mail safe character sets.
- A function that returns the Oracle character set name from an Oracle language name.
- A function that returns the maximum number of bytes for a character of an Oracle character set.
- A function that performs script transliteration.
- Functions that return the ISO currency code, local time zones, and local languages supported for a given territory.
- Functions that return the most appropriate linguistic sort, a listing of all the applicable linguistic sorts, and the local territories supported for a given language.
- Functions that map between the Oracle full and short language names.
- A function that returns the language translation of a given language and territory name.

- A function that returns a listing of the most commonly used time zones.

## 263.2 UTL\_I18N Security Model

The functions of the `UTL_I18N` package neither read database contents nor modify them. The functions operate on their arguments only and/or they retrieve static internationalization information from NLS Data files. The execution privilege for the package is granted to `PUBLIC` by default

## 263.3 UTL\_I18N Constants

`UTL_I18N` defines constants to use when specifying parameter values.

These constants are shown in the following table.

**Table 263-1 UTL\_I18N Constants**

Constant	Type	Value	Description
<code>GENERIC_CONTEXT</code>	<code>PLS_INTEGER</code>	0	Returns the default character set for general cases.
<code>MAIL_GENERIC</code>	<code>PLS_INTEGER</code>	0	Map from an Oracle character set name to an email safe character set name on a non-Windows platform.
<code>ORACLE_TO_IANA</code>	<code>PLS_INTEGER</code>	0	Map from an Oracle character set name to an IANA character set name.
<code>SHIFT_IN</code>	<code>PLS_INTEGER</code>	0	Used with <code>shift_status</code> . Must be set the first time it is called in piecewise conversion.
<code>IANA_TO_ORACLE</code>	<code>PLS_INTEGER</code>	1	Map from an IANA character set name to an Oracle character set name.
<code>MAIL_CONTEXT</code>	<code>PLS_INTEGER</code>	1	The mapping is between an Oracle character set name and an email safe character set name.
<code>MAIL_WINDOWS</code>	<code>PLS_INTEGER</code>	1	Map from an Oracle character set name to an email safe character set name on a Windows platform.
<code>SHIFT_OUT</code>	<code>PLS_INTEGER</code>	1	
<code>FWKATAKANA_HIRAGANA</code>	<code>VARCHAR2(30)</code>	'fwkatakana_hiragana'	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
<code>FWKATAKANA_HWKATAKANA</code>	<code>VARCHAR2(30)</code>	'fwkatakana_hwkatakana'	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
<code>HIRAGANA_FWKATAKANA</code>	<code>VARCHAR2(30)</code>	'hiragana_fwkatakana'	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.

**Table 263-1 (Cont.) UTL\_I18N Constants**

Constant	Type	Value	Description
HIRAGANA_HWKATAKANA	VARCHAR2(30)	'hiragana_hwkatakana'	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.
HWKATAKANA_FWKATAKANA	VARCHAR2(30)	'hwkatakana_fwkatakana'	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
HWKATAKANA_HIRAGANA	VARCHAR2(30)	'hwkatakana_hiragana'	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
KANA_FWKATAKANA	VARCHAR2(30)	'kana_fwkatakana'	Converts any type of Kana character to a fullwidth Katakana character.
KANA_HIRAGANA	VARCHAR2(30)	'kana_hiragana'	Converts any type of Kana character to a fullwidth Hiragana character.
KANA_HWKATAKANA	VARCHAR2(30)	'kana_hwkatakana'	Converts any type of Kana character to a halfwidth Katakana character.

## 263.4 Summary of UTL\_I18N Subprograms

This table lists the UTL\_I18N subprograms and briefly describes them.

**Table 263-2 UTL\_I18N Package Subprograms**

Procedure	Description
<a href="#">ESCAPE_REFERENCE Function</a> (page 263-4)	Converts a given text string to its character reference counterparts, for characters that fall outside the document character set.
<a href="#">GET_COMMON_TIME_ZONES Function</a> (page 263-5)	Returns the list of common time zone IDs that are independent of the locales.
<a href="#">GET_DEFAULT_CHARSET Function</a> (page 263-6)	Returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.
<a href="#">GET_DEFAULT_ISO_CURRENCY Function</a> (page 263-7)	Returns the default ISO 4217 currency code for the specified territory.
<a href="#">GET_DEFAULT_LINGUISTIC_SORT Function</a> (page 263-7)	Returns the default linguistic sort name for the specified language.
<a href="#">GET_LOCAL_LANGUAGES Function</a> (page 263-8)	Returns the local language names for the specified territory.
<a href="#">GET_LOCAL_LINGUISTIC_SORTS Function</a> (page 263-9)	Returns the local linguistic sort names for the specified language.
<a href="#">GET_LOCAL_TERRITORIES Function</a> (page 263-10)	Returns the local territory names for the specified language.
<a href="#">GET_LOCAL_TIME_ZONES Function</a> (page 263-10)	Returns the local time zone IDs for the specified territory.

**Table 263-2 (Cont.) UTL\_I18N Package Subprograms**

Procedure	Description
<a href="#">GET_MAX_CHARACTER_SIZE Function</a> (page 263-12)	Returns the maximum character size of a given character set.
<a href="#">GET_TRANSLATION Function</a> (page 263-13)	Returns the translation of the language and territory name in the specified translation language.
<a href="#">MAP_CHARSET Function</a> (page 263-14)	<ul style="list-style-type: none"> <li>Maps an Oracle character set name to an IANA character set name.</li> <li>Maps an IANA character set name to an Oracle character set name.</li> <li>Maps an Oracle character set name to an e-mail safe character set name.</li> </ul>
<a href="#">MAP_FROM_SHORT_LANGUAGE Function</a> (page 263-15)	Maps an Oracle short language name to an Oracle language name.
<a href="#">MAP_LANGUAGE_FROM_ISO Function</a> (page 263-16)	Returns an Oracle language name from an ISO locale name.
<a href="#">MAP_LOCALE_TO_ISO Function</a> (page 263-17)	Returns an ISO locale name from the Oracle language and territory name.
<a href="#">MAP_TERRITORY_FROM_ISO Function</a> (page 263-18)	Returns an Oracle territory name from an ISO locale name.
<a href="#">MAP_TO_SHORT_LANGUAGE Function</a> (page 263-18)	Maps an Oracle language name to an Oracle short language name.
<a href="#">RAW_TO_CHAR Functions</a> (page 263-19)	Converts RAW data that is not encoded in the database character set into a VARCHAR2 string
<a href="#">RAW_TO_NCHAR Functions</a> (page 263-21)	Converts RAW data that is not encoded in the national character set into an NVARCHAR2 string
<a href="#">STRING_TO_RAW Function</a> (page 263-23)	Converts a VARCHAR2 or NVARCHAR2 string to another character set. The result is returned as a RAW datatype.
<a href="#">TRANSLITERATE Function</a> (page 263-24)	Transliterates between Japanese hiragana and katakana.
<a href="#">UNESCAPE_REFERENCE Function</a> (page 263-25)	Converts an input string that contains character references to a text string.

## 263.4.1 ESCAPE\_REFERENCE Function

This function converts a text string to its character reference counterparts for characters that fall outside the character set used by the current document.

Character references are mainly used in HTML and XML documents to represent characters independently of the encoding of the document. Character references may appear in two forms, numeric character references and character entity references. Numeric character references specify the Unicode code point value of a character, while character entity references use symbolic names to refer to the same character. For example, `&#xe5;` is the numeric character reference for the small letter "a" with a ring above, whereas `&aring;` is the character entity reference for the same character. Character entity references are also used to escape special characters, as an example, `&lt;` represents the < (less than) sign. This is to avoid possible confusion with the beginning of a tag in Markup languages.

## Syntax

```

UTL_I18N.ESCAPE_REFERENCE(
 str IN VARCHAR2 CHARACTER SET ANY_CS,
 page_cs_name IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;

```

## Parameters

**Table 263-3 ESCAPE\_REFERENCE Function Parameters**

Parameter	Description
str	Specifies the input string
page_cs_name	Specifies the character set of the document. If page_cs_name is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data.

## Usage Notes

If the user specifies an invalid character set or a NULL string, then the function returns a NULL string.

## Examples

```
UTL_I18N.ESCAPE_REFERENCE('hello < '||chr(229),'us7ascii')
```

This returns 'hello &lt; &#xe5;'.

## 263.4.2 GET\_COMMON\_TIME\_ZONES Function

This function returns a listing of the most coemmonly used time zones. This list contains a subset of the time zones that are supported in the database.

## Syntax

```

UTL_I18N.GET_COMMON_TIME_ZONES
RETURN STRING_ARRAY;

```

## Examples

Returns the list of the most commonly used time zones.

```

DECLARE
 retval UTL_I18N.STRING_ARRAY;
BEGIN
 retval := UTL_I18N.GET_COMMON_TIME_ZONES;
END;
/

```

## 263.4.3 GET\_DEFAULT\_CHARSET Function

This function returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.

### See Also:

"[MAP\\_CHARSET Function](#) (page 263-14)" for an explanation of an e-mail safe character set

### Syntax

```
UTL_I18N.GET_DEFAULT_CHARSET(
 language IN VARCHAR2,
 context IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
 iswindows IN BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

### Parameters

**Table 263-4 GET\_DEFAULT\_CHARSET Function Parameters**

Parameter	Description
language	Specifies a valid Oracle language
context	GENERIC_CONTEXT   MAIL_CONTEXT GENERIC_CONTEXT: Returns the default character set for general cases MAIL_CONTEXT: Returns the default e-mail safe character set name
iswindows	If context is set as MAIL_CONTEXT, then iswindows should be set to TRUE if the platform is Windows and FALSE if the platform is not Windows. The default is FALSE. iswindows has no effect if context is set as GENERIC_CONTEXT.

### Usage Notes

If the user specifies an invalid language name or an invalid flag, then the function returns a NULL string.

### Examples

GENERIC\_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.GENERIC_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

MAIL\_CONTEXT, iswindows=TRUE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, TRUE)
```

This returns 'WE8MSWIN1252'.

MAIL\_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

## 263.4.4 GET\_DEFAULT\_ISO\_CURRENCY Function

This function returns the default ISO 4217 currency code for the specified territory.

### Syntax

```
UTL_I18N.GET_DEFAULT_ISO_CURRENCY (
 territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

### Parameters

**Table 263-5 GET\_DEFAULT\_ISO\_CURRENCY Function Parameters**

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

### Usage Notes

If the user specifies an invalid territory name, then the function returns a `NULL` string.

### Examples

Displays the default ISO currency code for China.

```
DECLARE
 retval VARCHAR2(50);
BEGIN
 retval := UTL_I18N.GET_DEFAULT_ISO_CURRENCY('CHINA');
 DBMS_OUTPUT.PUT_LINE(retval);
END;
/
```

## 263.4.5 GET\_DEFAULT\_LINGUISTIC\_SORT Function

This function returns the most commonly used Oracle linguistic sort for the specified language.

### Syntax

```
UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
 language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

### Parameters

**Table 263-6 GET\_DEFAULT\_LINGUISTIC\_SORT Function Parameters**

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

## Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

## Examples

Displays the name of the most appropriate linguistic sort name for the language used in the current SQL session.

```

DECLARE
 retval VARCHAR2(50);
BEGIN
 SELECT value INTO retval FROM nls_session_parameters
 WHERE parameter = 'NLS_LANGUAGE';
 retval := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT(retval);
 DBMS_OUTPUT.PUT_LINE(retval);
END;
/

```

## 263.4.6 GET\_LOCAL\_LANGUAGES Function

This function returns the local language names for the specified territory.

### Syntax

```

UTL_I18N.GET_LOCAL_LANGUAGES (
 territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;

```

### Parameters

**Table 263-7 GET\_LOCAL\_LANGUAGES Function Parameters**

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

### Usage Notes

If the user specifies an invalid territory name, then the function returns a `NULL` string.

### Examples

Returns the list of local languages used in Belgium.

```

DECLARE
 retval UTL_I18N.STRING_ARRAY;
 cnt INTEGER;
BEGIN
 retval := UTL_I18N.GET_LOCAL_LANGUAGES('BELGIUM');
 DBMS_OUTPUT.PUT('Count = ');
 DBMS_OUTPUT.PUT_LINE(retval.LAST);
 cnt := retval.FIRST;
 WHILE cnt IS NOT NULL LOOP
 DBMS_OUTPUT.PUT_LINE(retval(cnt));
 cnt := retval.NEXT(cnt);
 END LOOP;
END;

```

```

/
...
Count = 2
DUTCH
FRENCH

```

## 263.4.7 GET\_LOCAL\_LINGUISTIC\_SORTS Function

This function returns a list of the Oracle linguistic sort names that are appropriate for the specified language. A `BINARY` sort is included for all languages.

### Syntax

```

UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS (
 language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;

```

### Parameters

**Table 263-8 GET\_LOCAL\_LINGUISTIC\_SORTS Function Parameters**

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

### Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

### Examples

Displays the local linguistic sort names for `JAPANESE`.

```

DECLARE
 retval UTL_I18N.STRING_ARRAY;
 cnt INTEGER;
BEGIN
 retval := UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS('Japanese');
 DBMS_OUTPUT.PUT('Count = ');
 DBMS_OUTPUT.PUT_LINE(retval.COUNT);
 cnt := retval.FIRST;
 WHILE cnt IS NOT NULL LOOP
 DBMS_OUTPUT.PUT_LINE(retval(cnt));
 cnt := retval.NEXT(cnt);
 END LOOP;
END;
/

...
Count = 2
JAPANESE_M
BINARY

```

## 263.4.8 GET\_LOCAL\_TERRITORIES Function

This function returns the local territory names for the specified language.

### Syntax

```
UTL_I18N.GET_LOCAL_TERRITORIES (
 language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

### Parameters

**Table 263-9 GET\_LOCAL\_TERRITORIES Function Parameters**

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

### Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

### Examples

Returns the list of Oracle territories that use German as one of their local languages.

```
DECLARE
 retval UTL_I18N.STRING_ARRAY;
 cnt INTEGER;
BEGIN
 retval := UTL_I18N.GET_LOCAL_TERRITORIES('GERMAN');
 DBMS_OUTPUT.PUT('Count = ');
 DBMS_OUTPUT.PUT_LINE(retval.LAST);
 cnt := retval.FIRST;
 WHILE cnt IS NOT NULL LOOP
 DBMS_OUTPUT.PUT_LINE(retval(cnt));
 cnt := retval.NEXT(cnt);
 END LOOP;
END;
/
...
Count = 4
GERMANY
AUSTRIA
LUXEMBOURG
SWITZERLAND
```

## 263.4.9 GET\_LOCAL\_TIME\_ZONES Function

This function returns the local time zone IDs for the specified territory.

### Syntax

```
UTL_I18N.GET_LOCAL_TIME_ZONES (
 territory IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN STRING_ARRAY;
```

## Parameters

**Table 263-10 GET\_LOCAL\_TIME\_ZONES Function Parameters**

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

## Usage Notes

If the user specifies an invalid territory name, then the function returns a `NULL` string.

## Examples

Creates a function that returns the list of time zones locally used in the territory `AZERBAIJAN` followed by the general common time zones. This is useful for when the user's territory is known and the application still allows the user to choose other time zones as a user's preference.

```
CREATE OR REPLACE FUNCTION get_time_zones
(territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN utl_i18n.string_array
IS
 retval utl_i18n.string_array;
 retval2 utl_i18n.string_array;
 stpos INTEGER;
BEGIN
 retval := utl_i18n.get_local_time_zones(
 territory);
 retval2 := utl_i18n.get_common_time_zones;
 stpos := retval.LAST + 1;
 retval(stpos) := '-----'; -- a separator
 FOR i IN retval2.FIRST..retval2.LAST LOOP
 stpos := stpos + 1;
 retval(stpos) := retval2(i);
 END LOOP;
 RETURN retval;
END;
/
```

Returns the list of local time zones for `AZERBAIJAN` followed by the common time zones with a separator string of five dashes (-----).

```
DECLARE
 retval UTL_I18N.STRING_ARRAY;
 cnt INTEGER;
BEGIN
 DBMS_OUTPUT.ENABLE(100000);
 retval UTL_I18N.GET_TIME_ZONES('AZERBAIJAN');
 cnt := retval.FIRST;
 WHILE cnt IS NOT NULL LOOP
 DBMS_OUTPUT.PUT_LINE(retval(cnt));
 cnt := retval.NEXT(cnt);
 END LOOP;
END;
/
```

```
Asia/Baku

```

```
Pacific/Pago_Pago
Pacific/Honolulu
America/Anchorage
America/Vancouver
America/Los_Angeles
America/Tijuana
America/Edmonton
America/Denver
America/Phoenix
America/Mazatlan
America/Winnipeg
America/Regina
America/Chicago
America/Mexico_City
America/Guatemala
America/El_Salvador
America/Managua
America/Costa_Rica
America/Montreal
...
```

## 263.4.10 GET\_MAX\_CHARACTER\_SIZE Function

This function returns the maximum character size of a given character set.

### Syntax

```
UTL_I18N.GET_MAX_CHARACTER_SIZE(
 charset_name IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

### Parameters

**Table 263-11** GET\_MAX\_CHARACTER\_SIZE Function Parameters

Parameter	Description
charset_name	Specifies a valid character set name. It is case-insensitive.

### Usage Notes

For shift-sensitive character sets, the returned maximum character size will include the possible extra shift characters.

### Examples

```
UTL_I18N.GET_MAX_CHARACTER_SIZE('AL32UTF8');
```

This returns 4.

## 263.4.11 GET\_TRANSLATION Function

This function returns the translation of the language and territory name in the specified translation language.

### Syntax

```
UTL_I18N.GET_TRANSLATION (
 parameter IN VARCHAR2 CHARACTER SET ANY_CS,
 trans_language IN VARCHAR2 'AMERICAN',
 flag IN PLS_INTEGER DEFAULT LANGUAGE_TRANS)
RETURN VARCHAR2 CHARACTER SET parameter%CHARSET;
```

### Parameters

**Table 263-12** GET\_TRANSLATION Function Parameters

Parameter	Description
parameter	Specifies a valid language name, territory name, or a combined string in the form of <i>language_territory</i> . It is case-insensitive.
trans_language	Specifies a translation language name. For example, ITALIAN is for the Italian language. The default is AMERICAN, which indicates American English.
flag	Specifies the translation type: <ul style="list-style-type: none"> <li>LANGUAGE_TRANS: The function returns the language translation.</li> <li>TERRITORY_TRANS: The function returns the territory translation.</li> <li>LANGUAGE_TERRITORY_TRANS: The function returns the language and territory translation.</li> </ul> The default translation type is LANGUAGE_TRANS.

### Usage Notes

If VARCHAR2 is used as a parameter type, the returned translation text can be corrupted due to the conversion to the database character set. Using NVARCHAR2 as the parameter type will preserve the translation text because Unicode can encode all translated languages.

If the specified translation language is not available or an invalid name is provided, the default "American English" translations are returned. For example, Oracle does not provide GUJARATI translations, so the returned translation would be in American English.

### Examples

The following returns the names of all the Oracle-supported languages in Italian.

```
DECLARE
 CURSOR c1 IS
 SELECT value FROM V$NLS_VALID_VALUES
 WHERE parameter = 'LANGUAGE'
 ORDER BY value;
 retval NVARCHAR2(100);
BEGIN
 FOR item IN c1 LOOP
 retval := UTL_I18N.GET_TRANSLATION (TO_NCHAR(item.value), 'italian');
```

```

 END LOOP;
 END;

```

## 263.4.12 MAP\_CHARSET Function

This function maps a character set to another character set.

It maps the following:

- An Oracle character set name to an IANA character set name.
- An IANA character set name to an Oracle character set name.
- An Oracle character set to an e-mail safe character set name.

### Syntax

```

UTL_I18N.MAP_CHARSET(
 charset IN VARCHAR2,
 context IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
 flag IN PLS_INTEGER DEFAULT ORACLE_TO_IANA)
RETURN VARCHAR2;

```

### Parameters

**Table 263-13 MAP\_CHARSET Function Parameters**

Parameter	Description
charset	Specifies the character set name to be mapped. The mapping is case-insensitive.
context	<p>GENERIC_CONTEXT   MAIL_CONTEXT</p> <p>GENERIC_CONTEXT: The mapping is between an Oracle character set name and an IANA character set name. This is the default value.</p> <p>MAIL_CONTEXT: The mapping is between an Oracle character set name and an email safe character set name.</p>
flag	<ul style="list-style-type: none"> <li>• ORACLE_TO_IANA   IANA_TO_ORACLE if GENERIC_CONTEXT is set <p>ORACLE_TO_IANA: Map from an Oracle character set name to an IANA character set name. This is the default.</p> <p>IANA_TO_ORACLE: Map from an IANA character set name to an Oracle character set name.</p> </li> <li>• MAIL_GENERIC   MAIL_WINDOWS if MAIL_CONTEXT is set <p>MAIL_GENERIC: Map from an Oracle character set name to an email safe character set name on a non-Windows platform.</p> <p>MAIL_WINDOWS: Map from an Oracle character set name to an email safe character set name on a Windows platform.</p> </li> </ul>

### Usage Notes

An e-mail safe character set is an Oracle character set that is commonly used by applications when they submit e-mail messages. The character set is usually used to convert contents in the database character set to e-mail safe contents. To specify the character set name in the mail header, you should use the corresponding IANA character set name obtained by calling the `MAP_CHARSET` function with the `ORACLE_TO_IANA` option, providing the e-mail safe character set name as input.

For example, no e-mail client recognizes message contents in the WE8DEC character set, whose corresponding IANA name is DEC-MCS. If WE8DEC is passed to the MAP\_CHARSET function with the MAIL\_CONTEXT option, then the function returns WE8ISO8859P1. Its corresponding IANA name, ISO-8859-1, is recognized by most e-mail clients.

The steps in this example are as follows:

1. Call the MAP\_CHARSET function with the MAIL\_CONTEXT | MAIL\_GENERIC option with the database character set name, WE8DEC. The result is WE8ISO8859P1.
2. Convert the contents stored in the database to WE8ISO8859P1.
3. Call the MAP\_CHARSET function with the ORACLE\_TO\_IANA | GENERIC\_CONTEXT option with the e-mail safe character set, WE8ISO8859P1. The result is ISO-8859-1.
4. Specify ISO-8859-1 in the mail header when the e-mail message is submitted.

The function returns a character set name if a match is found. If no match is found or if the flag is invalid, then it returns NULL.

#### Note:

Many Oracle character sets can map to one e-mail safe character set. There is no function that maps an e-mail safe character set to an Oracle character set name.

## Examples

### Generic Context

```
UTL_I18N.MAP_CHARSET('iso-8859-1',UTL_I18N.GENERIC_CONTEXT,UTL_I18N.IANA_TO_ORACLE)
```

This returns 'WE8ISO8859P1'.

### Context

```
UTL_I18N.MAP_CHARSET('WE8DEC', utl_i18n.mail_context, utl_i18n.mail_generic)
```

This returns 'WE8ISO8859P1'.

#### See Also:

*Oracle Database Globalization Support Guide* for a list of valid Oracle character sets

## 263.4.13 MAP\_FROM\_SHORT\_LANGUAGE Function

This function maps an Oracle short language name to an Oracle language name.

### Syntax

```
UTL_I18N.MAP_FROM_SHORT_LANGUAGE (
 language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

## Parameters

**Table 263-14** MAP\_FROM\_SHORT\_LANGUAGE Function Parameters

Parameter	Description
language	Specifies a valid short language name. It is case-insensitive.

## Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

## Examples

Returns the default linguistic sort name for the customer with the ID of 9000. Note that the table `customers` is from the `oe` user in the Common Schema. Because the customer's language preference is stored using a short language name, you need to convert to a full language name by calling the `GET_DEFAULT_LINGUISTIC_SORT` procedure.

```
DECLARE
 short_n VARCHAR2(10);
 ling_n VARCHAR2(50);
BEGIN
 SELECT nls_language INTO short
 FROM customers WHERE customer_id = 9000;
 ling_n := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
 UTL_I18N.MAP_FROM_SHORT_LANGUAGE(short_n));
 DBMS_OUTPUT.PUT_LINE(ling_n);
END;
/
```

## 263.4.14 MAP\_LANGUAGE\_FROM\_ISO Function

This function returns an Oracle language name from an ISO locale name.

## Syntax

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO(
 isocale IN VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 263-15** MAP\_LANGUAGE\_FROM\_ISO Function Parameters

Parameter	Description
isocale	Specifies the ISO locale. The mapping is case-insensitive.

## Usage Notes

If the user specifies an invalid locale string, then the function returns a `NULL` string.

If the user specifies a locale string that includes only the language (for example, `en_` instead of `en_US`), then the function returns the default language name for the specified language (for example, `American`).

## Examples

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO('en_US')
```

This returns 'American'.

### See Also:

*Oracle Database Globalization Support Guide* for a list of valid Oracle languages

## 263.4.15 MAP\_LOCALE\_TO\_ISO Function

This function returns an ISO locale name from an Oracle language name and an Oracle territory name.

A valid string must include at least one of the following: a valid Oracle language name or a valid Oracle territory name.

### Syntax

```
UTL_I18N.MAP_LOCALE_TO_ISO (
 ora_language IN VARCHAR2,
 ora_territory IN VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 263-16** MAP\_LOCALE\_TO\_ISO Function Parameters

Parameter	Description
ora_language	Specifies an Oracle language name. It is case-insensitive.
ora_territory	Specifies an Oracle territory name. It is case-insensitive.

### Usage Notes

If the user specifies an invalid string, then the function returns a `NULL` string.

### Examples

```
UTL_I18N.MAP_LOCALE_TO_ISO('American','America')
```

This returns 'en\_US'.

### See Also:

*Oracle Database Globalization Support Guide* for a list of valid Oracle languages and territories

## 263.4.16 MAP\_TERRITORY\_FROM\_ISO Function

This function returns an Oracle territory name from an ISO locale.

### Syntax

```
UTL_I18N.MAP_TERRITORY_FROM_ISO (
 isocale IN VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 263-17** MAP\_TERRITORY\_FROM\_ISO Function Parameters

Parameter	Description
isocale	Specifies the ISO locale. The mapping is case-insensitive.

### Usage Notes

If the user specifies an invalid locale string, then the function returns a `NULL` string.

If the user specifies a locale string that includes only the territory (for example, `_fr` instead of `fr_fr`), then the function returns the default territory name for the specified territory (for example, `France`).

### Examples

```
UTL_I18N.MAP_TERRITORY_FROM_ISO('en_US')
```

This returns 'America'.

#### See Also:

*Oracle Database Globalization Support Guide* for a list of valid Oracle territories

## 263.4.17 MAP\_TO\_SHORT\_LANGUAGE Function

This function maps an Oracle language name to an Oracle short language name.

### Syntax

```
UTL_I18N.MAP_TO_SHORT_LANGUAGE (
 language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

## Parameters

**Table 263-18 MAP\_TO\_SHORT\_LANGUAGE Function Parameters**

Parameter	Description
language	Specifies a valid full language name. It is case-insensitive.

## Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

## Examples

Returns the short language name for the language.

```
DECLARE retval VARCHAR2(100);BEGIN retval :=
UTL_I18N.MAP_TO_SHORT_LANGUAGE('american'); DBMS_OUTPUT.PUT_LINE(retval);END;/US
```

## 263.4.18 RAW\_TO\_CHAR Functions

This function converts `RAW` data from a valid Oracle character set to a `VARCHAR2` string in the database character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

## Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_CHAR(
 data IN RAW,
 src_charset IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_CHAR (
 data IN RAW,
 src_charset IN VARCHAR2 DEFAULT NULL,
 scanned_length OUT PLS_INTEGER,
 shift_status IN OUT PLS_INTEGER)
RETURN VARCHAR2;
```

## Parameters

**Table 263-19 RAW\_TO\_CHAR Function Parameters**

Parameter	Description
data	Specifies the <code>RAW</code> data to be converted to a <code>VARCHAR2</code> string
src_charset	Specifies the character set that the <code>RAW</code> data was derived from. If <code>src_charset</code> is <code>NULL</code> , then the database character set is used.
scanned_length	Specifies the number of bytes of source data scanned

**Table 263-19 (Cont.) RAW\_TO\_CHAR Function Parameters**

Parameter	Description
shift_status	Specifies the shift status at the end of the scan. The user must set it to <code>SHIFT_IN</code> the first time it is called in piecewise conversion.  <b>Note:</b> ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. <code>shift_status</code> cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

### Usage Notes

If the user specifies an invalid character set, `NULL` data, or data whose length is 0, then the function returns a `NULL` string.

### Examples

#### Buffer Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'), 'utf8')
```

This returns the following string in the database character set:

```
'abcde' || chr(170)
```

#### Piecewise Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'),'utf8',shf,slen)
```

This expression returns the following string in the database character set:

```
'abcde' || chr(170)
```

It also sets `shf` to `SHIFT_IN` and `slen` to 8.

The following example converts data from the Internet piece by piece to the database character set.

```
rvalue RAW(1050);
nvalue VARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
converted_len PLS_INTEGER;
rtemp RAW(10) = '';
conn utl_tcp.connection;
tlen PLS_INTEGER;

...
conn := utl_tcp.open_connection (remote_host => 'localhost',
 remote_port => 2000);

LOOP
 tlen := utl_tcp.read_raw(conn, rvalue, 1024);
 rvalue := utl_raw.concat(rtemp, rvalue);
 nvalue := utl_i18n.raw_to_char(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
 if (converted_len < utl_raw.length(rvalue))
 then
```

```

 rtemp := utl_raw.substr(rvalue, converted_len+1);
 else
 rtemp := '';
 end if;
 /* do anything you want with nvalue */
 /* e.g htp.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
 WHEN utl_tcp.end_of_input THEN
 utl_tcp.close_connection(conn);
END;
```

## 263.4.19 RAW\_TO\_NCHAR Functions

This function converts `RAW` data from a valid Oracle character set to an `NVARCHAR2` string in the national character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

### Syntax

Buffer Conversion:

```

UTL_I18N.RAW_TO_NCHAR (
 data IN RAW,
 src_charset IN VARCHAR2 DEFAULT NULL)
RETURN NVARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```

UTL_I18N.RAW_TO_NCHAR (
 data IN RAW,
 src_charset IN VARCHAR2 DEFAULT NULL,
 scanned_length OUT PLS_INTEGER,
 shift_status IN OUT PLS_INTEGER)
RETURN NVARCHAR2;
```

### Parameters

**Table 263-20 RAW\_TO\_NCHAR Function Parameters**

Parameter	Description
<code>data</code>	Specifies the <code>RAW</code> data to be converted to an <code>NVARCHAR2</code> string
<code>src_charset</code>	Specifies the character set that the <code>RAW</code> data was derived from. If <code>src_charset</code> is <code>NULL</code> , then the database character set is used.
<code>scanned_length</code>	Specifies the number of bytes of source data scanned

**Table 263-20 (Cont.) RAW\_TO\_NCHAR Function Parameters**

Parameter	Description
shift_status	Specifies the shift status at the end of the scan. The user must set it to <code>SHIFT_IN</code> the first time it is called in piecewise conversion.  <b>Note:</b> ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. <code>shift_status</code> cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

### Usage Notes

If the user specifies an invalid character set, `NULL` data, or data whose length is 0, then the function returns a `NULL` string.

### Examples

#### Buffer Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8')
```

This returns the following string in the national character set:

```
'abcde' || chr(170)
```

#### Piecewise Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8', shf, slen)
```

This expression returns the following string in the national character set:

```
'abcde' || chr(170)
```

It also sets `shf` to `SHIFT_IN` and `slen` to 8.

The following example converts data from the Internet piece by piece to the national character set.

```
rvalue RAW(1050);
nvalue NVARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
converted_len PLS_INTEGER;
rtemp RAW(10) = '';
conn utl_tcp.connection;
tlen PLS_INTEGER;

...
conn := utl_tcp.open_connection (remote_host => 'localhost',
 remote_port => 2000);

LOOP
 tlen := utl_tcp.read_raw(conn, rvalue, 1024);
 rvalue := utl_raw.concat(rtemp, rvalue);
 nvalue := utl_i18n.raw_to_nchar(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
 if (converted_len < utl_raw.length(rvalue))
 then
```

```

 rtemp := utl_raw.substr(rvalue, converted_len+1);
 else
 rtemp := '';
 end if;
 /* do anything you want with nvalue */
 /* e.g htp.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
 WHEN utl_tcp.end_of_input THEN
 utl_tcp.close_connection(conn);
END;
```

## 263.4.20 STRING\_TO\_RAW Function

This function converts a `VARCHAR2` or `NVARCHAR2` string to another valid Oracle character set and returns the result as `RAW` data.

### Syntax

```

UTL_I18N.STRING_TO_RAW(
 data IN VARCHAR2 CHARACTER SET ANY_CS,
 dst_charset IN VARCHAR2 DEFAULT NULL)
RETURN RAW;
```

### Parameters

**Table 263-21** STRING\_TO\_RAW Function Parameters

Parameter	Description
<code>data</code>	Specifies the <code>VARCHAR2</code> or <code>NVARCHAR2</code> string to convert.
<code>dst_charset</code>	Specifies the destination character set. If <code>dst_charset</code> is <code>NULL</code> , then the database character set is used for <code>CHAR</code> data and the national character set is used for <code>NCHAR</code> data.

### Usage Notes

If the user specifies an invalid character set, a `NULL` string, or a string whose length is 0, then the function returns a `NULL` string.

### Examples

```

DECLARE
 r raw(50);
 s varchar2(20);
BEGIN
 s:='abcdef' || chr(170);
 r:=utl_i18n.string_to_raw(s,'utf8');
 dbms_output.put_line(rawtohex(r));
end;
```

This returns a hex value of '616263646566C2AA'.

## 263.4.21 TRANSLITERATE Function

This function performs script transliteration. In this release, the `TRANSLITERATE` function only supports Japanese Kana conversion.

### Syntax

```
UTL_I18N.TRANSLITERATE (
 data IN VARCHAR2 CHARACTER SET ANY_CS,
 name IN VARCHAR2)
RETURN VARCHAR2 CHARACTER SET data%CHARSET;
```

### Parameters

**Table 263-22 TRANSLITERATE Function Parameters**

Parameter	Description
<code>data</code>	Specifies the data to be converted. Either <code>CHAR</code> or <code>NCHAR</code> datatype can be specified.
<code>name</code>	Specifies the transliteration name string. For a list of valid names, see <a href="#">Table 263-23</a> (page 263-24).

### Constants

These options specify Japanese Kana conversions.

**Table 263-23 TRANSLITERATE Function Constants**

Constant Name	Value	Description
<code>KANA_FWKATAKANA</code>	<code>'kana_fwkatkana'</code>	Converts any type of Kana character to a fullwidth Katakana character.
<code>KANA_HWKATAKANA</code>	<code>'kana_hwkatakana'</code>	Converts any type of Kana character to a halfwidth Katakana character.
<code>KANA_HIRAGANA</code>	<code>'kana_hiragana'</code>	Converts any type of Kana character to a fullwidth Hiragana character.
<code>FWKATAKANA_HWKATAKANA</code>	<code>'fwkatakana_hwkatakana'</code>	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
<code>FWKATAKANA_HIRAGANA</code>	<code>'fwkatakana_hiragana'</code>	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
<code>HWKATAKANA_FWKATAKANA</code>	<code>'hwkatakana_fwkatkana'</code>	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
<code>HWKATAKANA_HIRAGANA</code>	<code>'hwkatakana_hiragana'</code>	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
<code>HIRAGANA_FWKATAKANA</code>	<code>'hiragana_fwkatkana'</code>	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.
<code>HIRAGANA_HWKATAKANA</code>	<code>'hiragana_hwkatakana'</code>	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.

## Usage Notes

The function returns the converted string.

## Examples

Given a table `japanese_emp`, containing an `NVARCHAR2` column `ename`, the following statement can be used to normalize all the kana names in `ename` to hiragana:

```
UPDATE japanese_emp
 SET ename = UTL_I18N.TRANSLITERATE (ename, 'kana_hiragana');
```

The following figure shows how this output might look.

**Figure 263-1 Loading Locale-Specific Data to the Database**

たなか  
たなか  
タナカ

↓

たなか  
たなか  
たなか

The following statement normalizes one kana name to hiragana:

```
DECLARE
 Name japanese_emp.ename%TYPE;
 Eno CONSTANT NUMBER(4) := 1;
BEGIN
 SELECT ename INTO name FROM japanese_emp WHERE enumber = eno;
 name := UTL_I18N.TRANSLITERATE(name, UTL_I18N.KANA_HIRAGANA);
 UPDATE japanese_emp SET ename = name WHERE enumber = eno;
EXCEPTION
 WHEN UTL_I18N.UNSUPPORTED_TRANSLITERATION THEN
 DBMS_OUTPUT.PUT_LINE('transliteration not supported');
END;
/
```

## 263.4.22 UNESCAPE\_REFERENCE Function

This function returns a string from an input string that contains character references. It decodes each character reference to the corresponding character value.

### See Also:

["ESCAPE\\_REFERENCE Function \(page 263-4\)"](#) for more information about escape sequences

## Syntax

```
UTL_I18N.UNESCAPE_REFERENCE (
 str IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

## Parameters

**Table 263-24 UNESCAPE\_REFERENCE Function Parameters**

Parameter	Description
str	Specifies the input string

## Usage Notes

If the user specifies a `NULL` string or a string whose length is 0, then the function returns a `NULL` string. If the function fails, then it returns the original string.

## Examples

```
UTL_I18N.UNESCAPE_REFERENCE('hello < å')
```

This returns 'hello <' || chr(229).

# UTL\_IDENT

The `UTL_IDENT` package specifies which Database or client PL/SQL is running.

This chapter contains the following topics:

- [Overview](#) (page 264-1)
- [Security Model](#) (page 264-1)
- [Constants](#) (page 264-1)

## 264.1 UTL\_IDENT Overview

The `UTL_IDENT` package is intended for use for conditional compilation of PL/SQL packages that are supported by Oracle, TimesTen Database, and clients such as Oracle Forms.

## 264.2 UTL\_IDENT Security Model

The `UTL_IDENT` package runs as the package owner `SYS`. The public synonym `UTL_IDENT`, and `EXECUTE` permission on this package is granted to `PUBLIC`.

## 264.3 UTL\_IDENT Constants

The `UTL_IDENT` package defines several constants to use when specifying parameter values.

These constants are shown in the following table.

**Table 264-1 UTL\_IDENT Constants**

Constant	Type	Value	Description
<code>IS_ORACLE_SERVER</code>	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Server or not
<code>IS_ORACLE_CLIENT</code>	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Client or not
<code>IS_TIMESTEN</code>	BOOLEAN	TRUE/FALSE	Stipulates if TimesTen or not
<code>IS_ORACLE_FORMS</code>	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Forms or not

# UTL\_INADDR

The `UTL_INADDR` package provides a PL/SQL procedures to support internet addressing. It provides an API to retrieve host names and IP addresses of local and remote hosts.

This chapter contains the following topics:

- [Security Model](#) (page 265-1)
- [Exceptions](#) (page 265-1)
- [Examples](#) (page 265-1)
- [Summary of UTL\\_INADDR Subprograms](#) (page 265-2)

## 265.1 UTL\_INADDR Security Model

This package is an invoker's rights package, which means that the invoking user must be granted the `connect` privilege in the access control list assigned to the remote network host to which he or she wishes to connect.

### Note:

For more information about managing fine-grained access, see *Oracle Database Security Guide*.

## 265.2 UTL\_INADDR Exceptions

This table describes exceptions raised by `UTL_INADDR` subprograms.

**Table 265-1** *Exception - Internet Address Package*

Number	Exception	Description
ORA-24247	NETWORK_ACCESS_DENIED	Access to network is denied.
ORA-29257	UNKNOWN_HOST	The host is unknown.

## 265.3 UTL\_INADDR Examples

This `UTL_INADDR` example retrieves the local host name and IP address.

```
SET serveroutput on
BEGIN
 DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_NAME); -- get local host name
 DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_ADDRESS); -- get local IP addr
```

```
END;
/
```

## 265.4 Summary of UTL\_INADDR Subprograms

This table lists the UTL\_INADDR subprograms and briefly describes them.

**Table 265-2 UTL\_INADDR Package Subprograms**

Subprogram	Description
<a href="#">GET_HOST_ADDRESS Function</a> (page 265-2)	Retrieves the IP address of the local or remote host given its name
<a href="#">GET_HOST_NAME Function</a> (page 265-3)	Retrieves the name of the local or remote host given its IP address

### 265.4.1 GET\_HOST\_ADDRESS Function

This function retrieves the IP address of the specified host.

#### Syntax

```
UTL_INADDR.GET_HOST_ADDRESS (
 host IN VARCHAR2 DEFAULT NULL)
RETURN host_address VARCHAR2;
```

#### Parameters

**Table 265-3 GET\_HOST\_ADDRESS Function Parameters**

Parameter	Description
host	The name of the host to retrieve the IP address.

#### Return Values

**Table 265-4 GET\_HOST\_ADDRESS Function Return Values**

Parameter	Description
host_address	The IP address of the specified host, or that of the local host if host is NULL.

#### Exceptions

UNKNOWN\_HOST: The specified IP address is unknown

#### Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the `resolve` privilege on `LOCALHOST`.

## 265.4.2 GET\_HOST\_NAME Function

This function retrieves the name of the local or remote host given its IP address.

### Syntax

```
UTL_INADDR.GET_HOST_NAME (
 ip IN VARCHAR2 DEFAULT NULL)
RETURN host_name VARCHAR2;
```

### Parameters

**Table 265-5 GET\_HOST\_NAME Function Parameters**

Parameter	Description
ip	The IP address of the host used to determine its host name. If ip is not NULL, the official name of the host with its domain name is returned. If this is NULL, the name of the local host is returned and the name does not contain the domain to which the local host belongs.

### Return Values

**Table 265-6 GET\_HOST\_NAME Function Return Values**

Parameter	Description
host_name	The name of the local or remote host of the specified IP address.

### Exceptions

UNKNOWN\_HOST: The specified IP address is unknown

### Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the `resolve` privilege granted through `DBMS_NETWORK_ACL_ADMIN` on `LOCALHOST`.

# 266

## UTL\_LMS

UTL\_LMS retrieves and formats error messages in different languages.

This chapter contains the following topics:

- [Security Model](#) (page 266-1)
- [Summary of UTL\\_LMS Subprograms](#) (page 266-1)

### See Also:

*Oracle Database Globalization Support Guide*

## 266.1 UTL\_LMS Security Model

This package must be created as the user SYS.

## 266.2 Summary of UTL\_LMS Subprograms

This table lists the UTL\_LMS subprograms and briefly describes them.

**Table 266-1 UTL\_LMS Package Subprograms**

Function	Description
<a href="#">FORMAT_MESSAGE Function</a> (page 266-1)	Formats a retrieved error message
<a href="#">GET_MESSAGE Function</a> (page 266-2)	Retrieves an error message based on error number, product, facility, language, and message specified

### 266.2.1 FORMAT\_MESSAGE Function

This function formats a message retrieved by the GET\_MESSAGE function and returns the formatted message. If the function fails, then it returns a NULL result.

The following table shows special characters that can be used in the format string.

Special Character	Description
'%s'	Substitute the next string argument
'%d'	Substitute the next integer argument
'%%'	Represents the special character %

## Syntax

```
UTL_LMS.FORMAT_MESSAGE (
 format IN VARCHAR2 CHARACTER SET ANY_CS,
 args IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN VARCHAR2 CHARACTER SET format%CHARSET;
```

## Parameters

**Table 266-2** FORMAT\_MESSAGE Procedure Parameters

Parameter	Description
format	Specifies the string to format
args	Specifies the list of arguments

## Examples

```
DECLARE
 s varchar2(200);
 i pls_integer;
BEGIN
 i:= utl_lms.get_message(26052, 'rdbms', 'ora', 'french', s);
 dbms_output.put_line('before format, message is: '||s);
 dbms_output.put_line('formatted message is: '||utl_lms.format_message(s, 9,
'my_column_name');
END;
/
```

The following is an unformatted message:

```
Type %d non pris en charge pour l'expression SQL sur la colonne %s.
```

The following is the formatted message:

```
Type 9 non pris en charge pour l'expression SQL sur la colonne my_column_name.
```

## 266.2.2 GET\_MESSAGE Function

This function retrieves an Oracle error message. The user can define user-specific error messages with the `lmsgen` utility.

It returns 0 when it is successful. It returns -1 when it fails.

### See Also:

*Oracle Database Globalization Support Guide* for more information about the `lmsgen` utility

## Syntax

```
UTL_LMS.GET_MESSAGE (
 errnum IN PLS_INTEGER,
 product IN VARCHAR2,
```

```

facility IN VARCHAR2,
language IN VARCHAR2,
message OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

## Parameters

**Table 266-3 GET\_MESSAGE Function Parameters**

Parameter	Description
errnum	Specifies the error number. Example: '972' (for ORA-00972)
product	Specifies the product to which the error message applies Example: 'rdbms'
facility	Specifies the error message prefix Example: 'ora'
language	Specifies the language of the message. The parameter is case-insensitive. The default is NULL, which causes GET_MESSAGE to use the value of the NLS_LANGUAGE session parameter.
message	Specifies the output buffer for the retrieved message

## Usage Notes

If the `language` parameter is set to NULL, then the value of the `NLS_LANGUAGE` session parameter is used as the default.

## Examples

```

DECLARE
 s varchar2(200);
 i pls_integer;
BEGIN
 i:=utl_lms.get_message(601, 'rdbms', 'oci', 'french', s);
 dbms_output.put_line('OCI--00601 is: '||s);
END
/
```

The following output results:

```
OCI--00601 is: Echec du processus de nettoyage.
```

# UTL\_MAIL

The `UTL_MAIL` package is a utility for managing email which includes commonly used email features, such as attachments, CC, and BCC.

This chapter contains the following topics:

- [Security Model](#) (page 267-1)
- [Operational Notes](#) (page 267-1)
- [Rules and Limits](#) (page 267-2)
- [Summary of UTL\\_MAIL Subprograms](#) (page 267-2)

## 267.1 UTL\_MAIL Security Model

`UTL_MAIL` is not installed by default because of the `SMTP_OUT_SERVER` configuration requirement and the security exposure this involves. In installing `UTL_MAIL`, you should take steps to prevent the port defined by `SMTP_OUT_SERVER` being swamped by data transmissions.

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

### Note:

For more information about managing fine-grained access, see *Oracle Database Security Guide*.

## 267.2 UTL\_MAIL Operational Notes

You must both install `UTL_MAIL` and define the `SMTP_OUT_SERVER`.

- To install `UTL_MAIL`:

```
sqlplus sys/<pwd>
SQL> @$ORACLE_HOME/rdbms/admin/utlmail.sql
SQL> @$ORACLE_HOME/rdbms/admin/prvtmail.plb
```

- You define the `SMTP_OUT_SERVER` parameter in the `init.ora` `rdbms` initialization file. However, if `SMTP_OUT_SERVER` is not defined, this invokes a default of `DB_DOMAIN` which is guaranteed to be defined to perform appropriately.

## 267.3 UTL\_MAIL Rules and Limits

Use `UTL_MAIL` only within the context of the ASCII (American Standard Code for Information Interchange) and EBCDIC (Extended Binary-Coded Decimal Interchange Code) codes.

## 267.4 Summary of UTL\_MAIL Subprograms

This table lists the `UTL_MAIL` subprograms and briefly describes them.

**Table 267-1 UTL\_MAIL Package Subprograms**

Subprogram	Description
<a href="#">SEND Procedure</a> (page 267-2)	Packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients
<a href="#">SEND_ATTACH_RAW Procedure</a> (page 267-3)	Represents the <code>SEND</code> Procedure overloaded for <code>RAW</code> attachments
<a href="#">SEND_ATTACH_VARCHAR2 Procedure</a> (page 267-4)	Represents the <code>SEND</code> Procedure overloaded for <code>VARCHAR2</code> attachments

### 267.4.1 SEND Procedure

This procedure packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients.

It hides the SMTP API and exposes a one-line email facility for ease of use.

#### Syntax

```
UTL_MAIL.SEND (
 sender IN VARCHAR2 CHARACTER SET ANY_CS,
 recipients IN VARCHAR2 CHARACTER SET ANY_CS,
 cc IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 bcc IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 subject IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 message IN VARCHAR2 CHARACTER SET ANY_CS,
 mime_type IN VARCHAR2 DEFAULT 'text/plain; charset=us-ascii',
 priority IN PLS_INTEGER DEFAULT 3,
 replyto IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

#### Parameters

**Table 267-2 SEND Procedure Parameters**

Parameter	Description
<code>sender</code>	Email address of the sender
<code>recipients</code>	Email addresses of the recipient(s), separated by commas

**Table 267-2 (Cont.) SEND Procedure Parameters**

Parameter	Description
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL
subject	String to be included as email subject string, default is NULL
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii'
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
replyto	Defines to whom the reply email is to be sent

## 267.4.2 SEND\_ATTACH\_RAW Procedure

This procedure is the `SEND` Procedure overloaded for `RAW` attachments.

### Syntax

```
UTL_MAIL.SEND_ATTACH_RAW (
 sender IN VARCHAR2 CHARACTER SET ANY_CS,
 recipients IN VARCHAR2 CHARACTER SET ANY_CS,
 cc IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 bcc IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 subject IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 message IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 mime_type IN VARCHAR2 DEFAULT CHARACTER SET ANY_CS
 DEFAULT 'text/plain; charset=us-ascii',
 priority IN PLS_INTEGER DEFAULT 3,
 attachment IN RAW,
 att_inline IN BOOLEAN DEFAULT TRUE,
 att_mime_type IN VARCHAR2 CHARACTER SET ANY_CS
 DEFAULT 'text/plain; charset=us-ascii',
 att_filename IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 replyto IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

### Parameters

**Table 267-3 SEND\_ATTACH\_RAW Procedure Parameters**

Parameter	Description
sender	Email address of the sender
recipients	Email addresses of the recipient(s), separated by commas
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL
subject	String to be included as email subject string, default is NULL

**Table 267-3 (Cont.) SEND\_ATTACH\_RAW Procedure Parameters**

Parameter	Description
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii'
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
attachment	RAW attachment
att_inline	Specifies whether the attachment is viewable inline with the message body, default is TRUE
att_mime_type	Mime type of the attachment, default is 'application/octet'
att_filename	String specifying a filename containing the attachment, default is NULL
replyto	Defines to whom the reply email is to be sent

### 267.4.3 SEND\_ATTACH\_VARCHAR2 Procedure

This procedure is the SEND Procedure overloaded for VARCHAR2 attachments.

#### Syntax

```

UTL_MAIL.SEND_ATTACH_VARCHAR2 (
 sender IN VARCHAR2 CHARACTER SET ANY_CS,
 recipients IN VARCHAR2 CHARACTER SET ANY_CS,
 cc IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 bcc IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 subject IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 message IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 mime_type IN VARCHAR2 CHARACTER SET ANY_CS
 DEFAULT 'text/plain; charset=us-ascii',
 priority IN PLS_INTEGER DEFAULT 3,
 attachment IN VARCHAR2 CHARACTER SET ANY_CS, ,
 att_inline IN BOOLEAN DEFAULT TRUE,
 att_mime_type IN VARCHAR2 CHARACTER SET ANY_CS
 DEFAULT 'text/plain; charset=us-ascii',
 att_filename IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
 replyto IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);

```

#### Parameters

**Table 267-4 SEND\_ATTACH\_VARCHAR2 Procedure Parameters**

Parameter	Description
sender	Email address of the sender
recipients	Email addresses of the recipient(s), separated by commas
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL

**Table 267-4 (Cont.) SEND\_ATTACH\_VARCHAR2 Procedure Parameters**

Parameter	Description
subject	String to be included as email subject string, default is NULL
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii'
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
attachment	Text attachment
att_inline	Specifies whether the attachment is inline, default TRUE
att_mime_type	Mime type of the attachment, default is 'text/plain; charset=us-ascii'
att_filename	String specifying a filename containing the attachment, default is NULL
replyto	Defines to whom the reply email is to be sent

## UTL\_MATCH

The `UTL_MATCH` package facilitates matching two records. This is typically used to match names, such as two First Names or two Last Names.

This chapter contains the following topics:

- [Overview](#) (page 268-1)
- [Security Model](#) (page 268-1)
- [Summary of UTL\\_MATCH Subprograms](#) (page 268-2)

### 268.1 UTL\_MATCH Overview

`UTL_MATCH` can use either the Edit Distance algorithm or Jaro-Winkler algorithm when determining matches.

Edit Distance, also known as Levenshtein Distance (named after the Russian scientist Vladimir Levenshtein, who devised the algorithm in 1965), is a measure of similarity between two strings,  $s_1$  and  $s_2$ . The distance is the number of insertions, deletions or substitutions required to transform  $s_1$  to  $s_2$ .

The Edit Distance between strings `shackleford` and `shackelford` = 2.

The "Jaro-Winkler algorithm" is another way of calculating Edit distance between two strings. This method, developed at the U.S. Census, is a String Comparator measure that gives values of partial agreement between two strings. The string comparator accounts for length of strings and partially accounts for typical human errors made in alphanumeric strings.

The following table shows similarity values returned by Jaro-Winkler and Edit Distance

**Table 268-1 Comparison between normalized values returned by Jaro-Winkler and Edit Distance algorithms**

String 1	String 2	Jaro Winkler	Edit Distance
Dunningham	Cunnigham	89	80
Abroms	Abrams	92	83
Lampley	Campley	90	86
Marhta	Martha	96	67
Jonathon	Jonathan	95	88
Jeraldine	Geraldine	92	89

### 268.2 UTL\_MATCH Security Model

The `UTL_MATCH` package runs with definer's rights. `UTL_MATCH` must be created under `SYS`. Operations provided by this package are performed with `SYS` privileges.

## 268.3 Summary of UTL\_MATCH Subprograms

This table lists the UTL\_MATCH subprograms and briefly describes them.

**Table 268-2 UTL\_MATCH Package Subprograms**

Subprogram	Description
<a href="#">EDIT_DISTANCE Function</a> (page 268-2)	Calculates the number of changes required to transform string-1 into string-2
<a href="#">EDIT_DISTANCE_SIMILARITY Function</a> (page 268-2)	Calculates the number of changes required to transform string-1 into string-2, returning a value between 0 (no match) and 100 (perfect match)
<a href="#">JARO_WINKLER Function</a> (page 268-3)	Calculates the measure of agreement between string-1 and string-2
<a href="#">JARO_WINKLER_SIMILARITY Function</a> (page 268-4)	Calculates the measure of agreement between string-1 and string-2, returning a value between 0 (no match) and 100 (perfect match)

### 268.3.1 EDIT\_DISTANCE Function

This function calculates the number of insertions, deletions or substitutions required to transform string-1 into string-2.

#### Syntax

```
UTL_MATCH.EDIT_DISTANCE (
 s1 IN VARCHAR2,
 s2 IN VARCHAR2)
RETURN PLS_INTEGER;
```

#### Parameters

**Table 268-3 EDIT\_DISTANCE Function Parameters**

Parameter	Description
s1	The string to be transformed
s2	The string into which s1 is to be transformed

#### Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE('shackleford', 'shackelford') FROM DUAL;

returns 2
```

### 268.3.2 EDIT\_DISTANCE\_SIMILARITY Function

This function calculates the number of insertions, deletions or substations required to transform string-1 into string-2, and returns the Normalized value of the Edit Distance between two strings.

The value is typically between 0 (no match) and 100 (perfect match).

### Syntax

```
UTL_MATCH.EDIT_DISTANCE_SIMILARITY (
 s1 IN VARCHAR2,
 s2 IN VARCHAR2)
RETURN PLS_INTEGER;
```

### Parameters

**Table 268-4 EDIT\_DISTANCE\_SIMILARITY Function Parameters**

Parameter	Description
s1	The string to be transformed
s2	The string into which s1 is to be transformed

### Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE_SIMILARITY('shackleford', 'shackelford') FROM DUAL;

returns 82
```

## 268.3.3 JARO\_WINKLER Function

This function calculates the measure of agreement between two strings.

### Syntax

```
UTL_MATCH.JARO_WINKLER (
 s1 IN VARCHAR2,
 s2 IN VARCHAR2)
RETURN BINARY_DOUBLE;
```

### Parameters

**Table 268-5 JARO\_WINKLER Function Parameters**

Parameter	Description
s1	Input
s2	input

### Examples

```
SELECT UTL_MATCH.JARO_WINKLER('shackleford', 'shackelford') FROM DUAL;

returns 9.818E-001
```

## 268.3.4 JARO\_WINKLER\_SIMILARITY Function

This function calculates the measure of agreement between two strings, and returns a score between 0 (no match) and 100 (perfect match).

### Syntax

```
UTL_MATCH.JARO_WINKLER_SIMILARITY (
 s1 IN VARCHAR2,
 s2 IN VARCHAR2)
RETURN PLS_INTEGER;
```

### Parameters

**Table 268-6 JARO\_WINKLER\_SIMILARITY Function Parameters**

Parameter	Description
s1	Input
s2	input

### Examples

```
SELECT UTL_MATCH.JARO_WINKLER_SIMILARITY('shackleford', 'shackelford') FROM DUAL;

returns 98
```

# UTL\_NLA

The `UTL_NLA` package exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as `VARRAYS`.

This chapter contains the following topics:

- [Overview](#) (page 269-1)
- [Rules and Limits](#) (page 269-2)
- [Security Model](#) (page 269-2)
- [Subprogram Groups](#) (page 269-2)
  - [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) (page 269-2)
  - [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#) (page 269-3)
  - [BLAS Level 3 \(Matrix-Matrix Operations\) Subprograms](#) (page 269-5)
  - [LAPACK Driver Routines \(Linear Equations\) Subprograms](#) (page 269-5)
  - [LAPACK Driver Routines \(LLS and Eigenvalue Problems\) Subprograms](#) (page 269-6)
- [Summary of UTL\\_NLA Subprograms](#) (page 269-7)

## 269.1 UTL\_NLA Overview

The `UTL_NLA` package exposes a subset of the BLAS (Basic Linear Algebra Subprograms) and LAPACK (Linear Algebra PACKage) (Version 3.0) operations on vectors and matrices represented as `VARRAYS`.

### Standards

For more information on the BLAS and LAPACK standards see

<http://www.netlib.org/blas/>

<http://www.netlib.org/lapack/>

### Required Expertise

Users of this package are expected to have a sound grasp of linear algebra in general and of the BLAS and LAPACK libraries in particular.

### Implementation

The mapping between BLAS and LAPACK procedures and their corresponding PL/SQL calls is one-to-one.

- All BLAS functions have the `BLAS_` prefix (for example, the [BLAS\\_ASUM Functions](#) (page 269-13)). The subroutines and functions in BLAS are mapped to PL/SQL procedures and functions, respectively.

- All LAPACK functions have the `LAPACK_` prefix (for example, the [LAPACK\\_GBSV Procedures](#) (page 269-62)). The subroutines in LAPACK are mapped to PL/SQL procedures. Procedures that perform the same operation but differ only on the datatype of the arguments have the same overloaded names.

The mapping between BLAS and LAPACK procedure parameters and those of their corresponding PL/SQL subprograms is almost one-to-one.

- Also in the PL/SQL interface for LAPACK, all `/work/` arguments have been removed. The `UTL_NLA` package manages the allocation and de-allocation of all work areas required by the libraries.
- A new optional parameter, `pack`, has been added to the end of each LAPACK procedure that specifies if the matrix has been linearized in the row-major or column-major (default) format.

## 269.2 UTL\_NLA Rules and Limits

Vectors and matrices are stored in `VARRAYS` with a maximum size of one million entries. Given this restriction, `UTL_NLA` vectors can be up to one million entries but matrices need to be of size  $R \times C \leq 1,000,000$ .

## 269.3 UTL\_NLA Security Model

The `UTL_NLA` package is owned by user `SYS` and is installed as part of database installation. Execution privilege on the package is granted to `public`. The routines in the package are run with invokers' rights (run with the privileges of the current user).

## 269.4 Subprogram Groups

The `UTL_NLA` package contains subprogram groups for BLAS and LAPACK operations.

- [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) (page 269-2)
- [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#) (page 269-3)
- [BLAS Level 3 \(Matrix-Matrix Operations\) Subprograms](#) (page 269-5)
- [LAPACK Driver Routines \(Linear Equations\) Subprograms](#) (page 269-5)
- [LAPACK Driver Routines \(LLS and Eigenvalue Problems\) Subprograms](#) (page 269-6)

### 269.4.1 UTL\_NLA BLAS Level 1 (Vector-Vector Operations) Subprograms

This table lists and briefly describes the `UTL_NLA` BLAS Level 1 Vector-Vector Operations subprograms.

**Table 269-1 BLAS Level 1 (Vector-Vector Operations) Subprograms**

Subprogram	Description
<a href="#">BLAS_ASUM Functions</a> (page 269-13)	Computes the sum of the absolute values of the vector components

**Table 269-1 (Cont.) BLAS Level 1 (Vector-Vector Operations) Subprograms**

Subprogram	Description
<a href="#">BLAS_AXPY Procedures</a> (page 269-14)	Copies $\alpha X + Y$ into vector $Y$
<a href="#">BLAS_COPY Procedures</a> (page 269-15)	Copies the contents of vector $X$ to vector $Y$
<a href="#">BLAS_DOT Functions</a> (page 269-16)	Returns the dot (scalar) product of two vectors $X$ and $Y$
<a href="#">BLAS_IAMAX Functions</a> (page 269-24)	Computes the index of the first element of a vector that has the largest absolute value
<a href="#">BLAS_NRM2 Functions</a> (page 269-25)	Computes the vector 2-norm (Euclidean norm)
<a href="#">BLAS_ROT Procedures</a> (page 269-26)	Returns the plane rotation of points
<a href="#">BLAS_ROTG Procedures</a> (page 269-27)	Returns the Givens rotation of points
<a href="#">BLAS_SCAL Procedures</a> (page 269-28)	Scales a vector by a constant
<a href="#">BLAS_SWAP Procedures</a> (page 269-35)	Swaps the contents of two vectors each of size $n$

## 269.4.2 UTL\_NLA BLAS Level 2 (Matrix-Vector Operations) Subprograms

This table lists and briefly describes the UTL\_NLA BLAS Level 2 Matrix-Vector Operations subprograms.

**Table 269-2 BLAS Level 2 (Matrix-Vector Operations) Subprograms**

Subprogram	Description
<a href="#">BLAS_GBMV Procedures</a> (page 269-17)	Performs the matrix-vector operation $y := \alpha A x + \beta y$ or $y := \alpha A' x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are vectors and $A$ is an $m$ by $n$ band matrix, with $k_l$ sub-diagonals and $k_u$ super-diagonals
<a href="#">BLAS_GEMV Procedures</a> (page 269-21)	Performs the matrix-vector operations $y := \alpha A x + \beta y$ or $y := \alpha A' x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are vectors and $A$ is an $m$ by $n$ matrix
<a href="#">BLAS_GER Procedures</a> (page 269-23)	Performs a rank 1 operation $A := \alpha x y' + A$ where $\alpha$ is a scalar, $x$ is an $m$ element vector, $y$ is an $n$ element vector and $A$ is an $m$ by $n$ matrix
<a href="#">BLAS_SBMV Procedures</a> (page 269-33)	Performs a matrix-vector operation $y := \alpha A x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric band matrix, with $k$ super-diagonals

**Table 269-2 (Cont.) BLAS Level 2 (Matrix-Vector Operations) Subprograms**

Subprogram	Description
<a href="#">BLAS_SPMV Procedures</a> (page 269-29)	Performs a matrix-vector operation $y := \alpha A x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form
<a href="#">BLAS_SPR Procedures</a> (page 269-30)	Performs a symmetric rank 1 operation $A := \alpha x x' + A$ where $\alpha$ is a real scalar, $x$ is an $n$ element vector, and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form
<a href="#">BLAS_SPR2 Procedures</a> (page 269-32)	Performs a symmetric rank 2 operation $A := \alpha x y' + \alpha y x' + A$ where $\alpha$ is a scalar, $x$ and $y$ are $n$ element vectors, and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form
<a href="#">BLAS_SBMV Procedures</a> (page 269-33)	Performs a matrix-vector operation $y := \alpha A x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric band matrix, with $k$ super-diagonals
<a href="#">BLAS_SYMV Procedures</a> (page 269-38)	Performs a matrix-vector operation $y := \alpha A x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric matrix
<a href="#">BLAS_SYR Procedures</a> (page 269-40)	Performs a symmetric rank 1 operation $A := \alpha x x' + A$ where $\alpha$ is a real scalar, $x$ is an $n$ element vector, and $A$ is an $n$ by $n$ symmetric matrix
<a href="#">BLAS_SYR2 Procedures</a> (page 269-41)	Performs a symmetric rank 2 operation $A := \alpha x y' + \alpha y x' + A$ where $\alpha$ is a scalar, $x$ and $y$ are $n$ element vectors, and $A$ is an $n$ by $n$ symmetric matrix
<a href="#">BLAS_TBMV Procedures</a> (page 269-47)	Performs a matrix-vector operation $x := A x$ or $A' x = b$ where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals
<a href="#">BLAS_TBSV Procedures</a> (page 269-49)	Solves one of the systems of equation $A x = b$ or $A' x = b$ where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals
<a href="#">BLAS_TPMV Procedures</a> (page 269-51)	Performs a matrix-vector operation $x := A x$ or $x := A' x$ where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix, supplied in packed form
<a href="#">BLAS_TPSV Procedures</a> (page 269-53)	Solves one of the systems of equation $A x = b$ or $A' x = b$ where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix, supplied in packed form
<a href="#">BLAS_TRMV Procedures</a> (page 269-56)	Performs a matrix-vector operation $x := A x$ or $x := A' x$ where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix
<a href="#">BLAS_TRSV Procedures</a> (page 269-60)	Solves one of the systems of equation $A x = b$ or $A' x = b$ where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix

## 269.4.3 UTL\_NLA BLAS Level 3 (Matrix-Matrix Operations) Subprograms

This table lists and briefly describes the UTL\_NLA BLAS Level 3 Matrix-Matrix Operations subprograms.

**Table 269-3 BLAS Level 3 (Matrix-Matrix Operations) Subprograms**

Subprogram	Description
<a href="#">BLAS_GEMM Procedures</a> (page 269-19)	Performs one of the matrix-vector operations $C := \alpha * \text{op}(A) * \text{op}(B) + \beta * C$ where $\text{op}(X)$ is one of $\text{op}(X) = X$ or $\text{op}(X) = X'$ where $\alpha$ and $\beta$ are scalars, and $A$ , $B$ and $C$ are matrices, with $\text{op}(A)$ an $m$ by $k$ matrix, $\text{op}(B)$ a $k$ by $n$ matrix and $C$ an $m$ by $n$ matrix
<a href="#">BLAS_SYMM Procedures</a> (page 269-36)	Performs one of the matrix-vector operations $C := \alpha * A * B + \beta * C$ or $C := \alpha * B * A + \beta * C$ where $\alpha$ and $\beta$ are scalars, $A$ is a symmetric matrix, and $B$ and $C$ are $m$ by $n$ matrices
<a href="#">BLAS_SYR2K Procedures</a> (page 269-43)	Performs one of the symmetric rank2 $k$ operations $C := \alpha * A * B' + \alpha * B * A' + \beta * C$ or $C := \alpha * A' * B + \alpha * B' * A + \beta * C$ where $\alpha$ and $\beta$ are scalars, $C$ is an $n$ by $n$ symmetric matrix and $A$ and $B$ are $n$ by $k$ matrices in the first case and $k$ by $n$ matrices in the second case
<a href="#">BLAS_SYRK Procedures</a> (page 269-45)	Performs one of the symmetric rank $k$ operations $C := \alpha * A * A' + \beta * C$ or $C := \alpha * A' * A + \beta * C$ where $\alpha$ and $\beta$ are scalars, $C$ is an $n$ by $n$ symmetric matrix and $A$ is an $n$ by $k$ matrix in the first case and a $k$ by $n$ matrix in the second case
<a href="#">BLAS_TRMM Procedures</a> (page 269-54)	Performs one of the matrix-vector operations $B := \alpha * \text{op}(A) * B$ or $B := \alpha * B * \text{op}(A)$ where $\alpha$ is a scalar, $B$ is an $m$ by $n$ matrix, $A$ is a unit, or non-unit, upper or lower triangular matrix and $\text{op}(A)$ is one of two alternatives
<a href="#">BLAS_TRSM Procedures</a> (page 269-58)	Performs one of the matrix-vector operations $\text{op}(A) * X = \alpha * B$ or $X * \text{op}(A) = \alpha * B$ where $\alpha$ is a scalar, $X$ and $B$ are $m$ by $n$ matrices, $A$ is a unit, or non-unit, upper or lower triangular matrix, $\text{op}(A)$ is one of two alternatives. The matrix $X$ is overwritten on $B$

## 269.4.4 UTL\_NLA LAPACK Driver Routines (Linear Equations) Subprograms

This table lists and briefly describes the LAPACK Driver Routines (Linear Equations) subprograms.

**Table 269-4 LAPACK Driver Routines (Linear Equations) Subprograms**

Subprogram	Description
<a href="#">LAPACK_GBSV Procedures</a> (page 269-62)	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor $A$ .
<a href="#">LAPACK_GESV Procedures</a> (page 269-69)	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor $A$ .
<a href="#">LAPACK_GTSV Procedures</a> (page 269-75)	This procedure solves the equation $a * x = b$ where $a$ is an $n$ by $n$ tridiagonal matrix, by Gaussian elimination with partial pivoting.
<a href="#">LAPACK_PBSV Procedures</a> (page 269-77)	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite band matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .
<a href="#">LAPACK_POSV Procedures</a> (page 269-79)	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .
<a href="#">LAPACK_PPSV Procedures</a> (page 269-80)	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite matrix stored in packed format and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .
<a href="#">LAPACK_PTSV Procedures</a> (page 269-82)	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite tridiagonal matrix, and $x$ and $b$ are $n$ by $nrhs$ matrices.
<a href="#">LAPACK_SPSV Procedures</a> (page 269-90)	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric matrix stored in packed format, and $x$ and $b$ are $n$ by $nrhs$ matrices. The diagonal pivoting method is used to factor $A$ .
<a href="#">LAPACK_SYSV Procedures</a> (page 269-97)	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric matrix, and $x$ and $b$ are $n$ by $nrhs$ matrices. The diagonal pivoting method is used to factor $A$ .

## 269.4.5 UTL\_NLA LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

This table lists and briefly describes the LAPACK Driver Routines (LLS and Eigenvalue) subprograms.

**Table 269-5 LAPACK Driver Routines (LLS and Eigenvalue Problems)**

Subprogram	Description
<a href="#">LAPACK_GEES Procedures</a> (page 269-63)	Computes for an $n$ by $n$ real nonsymmetric matrix $A$ , the eigenvalues, the real Schur form $T$ , and, optionally, the matrix of Schur vectors $Z$ . This gives the Schur factorization $A = Z^*T^*(Z^*T)$ .
<a href="#">LAPACK_GEEV Procedures</a> (page 269-73)	Computes for an $n$ by $n$ real nonsymmetric matrix $A$ , the eigenvalues and, optionally, the left and/or right eigenvectors.
<a href="#">LAPACK_GELS Procedures</a> (page 269-65)	Solves overdetermined or underdetermined real linear systems involving an $m$ by $n$ matrix $A$ , or its transpose, using a QR or LQ factorization of $A$ . It is assumed that $A$ has full rank.
<a href="#">LAPACK_GESDD Procedures</a> (page 269-67)	Computes the singular value decomposition (SVD) of a real $m$ by $n$ matrix $A$ , optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.
<a href="#">LAPACK_GESVD Procedures</a> (page 269-71)	Computes the singular value decomposition (SVD) of a real $m$ by $n$ matrix $A$ , optionally computing the left and/or right singular vectors. The SVD is written $A = U * SIGMA * transpose(V)$ .
<a href="#">LAPACK_SBEV Procedures</a> (page 269-83)	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix $A$ .
<a href="#">LAPACK_SBEVD Procedures</a> (page 269-85)	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
<a href="#">LAPACK_SPEV Procedures</a> (page 269-87)	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ in packed storage.
<a href="#">LAPACK_SPEVD Procedures</a> (page 269-88)	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
<a href="#">LAPACK_STEV Procedures</a> (page 269-92)	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix $A$ .
<a href="#">LAPACK_STEVD Procedures</a> (page 269-93)	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix $A$ . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
<a href="#">LAPACK_SYEV Procedures</a> (page 269-95)	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ .
<a href="#">LAPACK_SYEVD Procedures</a> (page 269-96)	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.

## 269.5 Summary of UTL\_NLA Subprograms

This table lists the UTL\_NLA subprograms and briefly describes them.

**Table 269-6 UTL\_NLA Package Subprograms**

Subprogram	Description	Group
<a href="#">BLAS_ASUM Functions</a> (page 269-13)	Computes the sum of the absolute values of the vector components	<a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> (page 269-2)
<a href="#">BLAS_AXPY Procedures</a> (page 269-14)	Copies $\alpha X + Y$ into vector $Y$	<a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> (page 269-2)
<a href="#">BLAS_COPY Procedures</a> (page 269-15)	Copies the contents of vector $X$ to vector $Y$	<a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> (page 269-2)
<a href="#">BLAS_DOT Functions</a> (page 269-16)	Returns the dot (scalar) product of two vectors $X$ and $Y$	<a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> (page 269-2)
<a href="#">BLAS_GBMV Procedures</a> (page 269-17)	Performs the matrix-vector operation $Y := \alpha A * X + \beta * Y$ or $Y := \alpha A' * X + \beta * Y$ where $\alpha$ and $\beta$ are scalars, $X$ and $Y$ are vectors and $A$ is an $m$ by $n$ band matrix, with $k_l$ sub-diagonals and $k_u$ super-diagonals	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> (page 269-3)
<a href="#">BLAS_GEMM Procedures</a> (page 269-19)	Performs one of the matrix-vector operations where $\alpha$ and $\beta$ are scalars, and $A$ , $B$ and $C$ are matrices, with $op(A)$ an $m$ by $k$ matrix, $op(B)$ a $k$ by $n$ matrix and $C$ an $m$ by $n$ matrix	<a href="#">BLAS Level 3 (Matrix-Matrix Operations) Subprograms</a> (page 269-5)
<a href="#">BLAS_GEMV Procedures</a> (page 269-21)	Performs the matrix-vector operations $Y := \alpha A * X + \beta * Y$ or $Y := \alpha A' * X + \beta * Y$ where $\alpha$ and $\beta$ are scalars, $X$ and $Y$ are vectors and $A$ is an $m$ by $n$ matrix	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> (page 269-3)
<a href="#">BLAS_GER Procedures</a> (page 269-23)	Performs a rank 1 operation $A := \alpha * X * Y' + A$ where $\alpha$ is a scalar, $X$ is an $m$ element vector, $Y$ is an $n$ element vector and $A$ is an $m$ by $n$ matrix	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> (page 269-3)
<a href="#">BLAS_IAMAX Functions</a> (page 269-24)	Computes the index of the first element of a vector that has the largest absolute value	<a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> (page 269-2)
<a href="#">BLAS_NRM2 Functions</a> (page 269-25)	Computes the vector 2-norm (Euclidean norm)	<a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> (page 269-2)

Table 269-6 (Cont.) UTL\_NLA Package Subprograms

Subprogram	Description	Group
<a href="#">BLAS_ROT Procedures</a> (page 269-26)	Returns the plane rotation of points	<a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> (page 269-2)
<a href="#">BLAS_ROTG Procedures</a> (page 269-27)	Returns the Givens rotation of points	<a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> (page 269-2)
<a href="#">BLAS_SBMV Procedures</a> (page 269-33)	Performs a matrix-vector operation $y := \alpha * A * x + \beta * y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric band matrix, with $k$ super-diagonals	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> (page 269-3)
<a href="#">BLAS_SCAL Procedures</a> (page 269-28)	Scales a vector by a constant	<a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> (page 269-2)
<a href="#">BLAS_SPMV Procedures</a> (page 269-29)	Performs a matrix-vector operation $y := \alpha * A * x + \beta * y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> (page 269-3)
<a href="#">BLAS_SPR Procedures</a> (page 269-30)	Performs a symmetric rank 1 operation $A := \alpha * x * x' + A$ where $\alpha$ is a real scalar, $x$ is an $n$ element vector, and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> (page 269-3)
<a href="#">BLAS_SPR2 Procedures</a> (page 269-32)	Performs a symmetric rank 2 operation where $\alpha$ is a scalar, $x$ and $y$ are $n$ element vectors, and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> (page 269-3)
<a href="#">BLAS_SWAP Procedures</a> (page 269-35)	Swaps the contents of two vectors each of size $n$	<a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> (page 269-2)
<a href="#">BLAS_SYMM Procedures</a> (page 269-36)	Performs one of the matrix-vector operations where $\alpha$ and $\beta$ are scalars, $A$ is a symmetric matrix, and $B$ and $C$ are $m$ by $n$ matrices	<a href="#">BLAS Level 3 (Matrix-Matrix Operations) Subprograms</a> (page 269-5)
<a href="#">BLAS_SYMV Procedures</a> (page 269-38)	Performs a matrix-vector operation where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric matrix	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> (page 269-3)

**Table 269-6 (Cont.) UTL\_NLA Package Subprograms**

Subprogram	Description	Group
<a href="#">BLAS_SYR Procedures</a> (page 269-40)	Performs a symmetric rank 1 operation where <code>alpha</code> is a real scalar, <code>x</code> is an <code>n</code> element vector, and <code>A</code> is an <code>n</code> by <code>n</code> symmetric matrix	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> (page 269-3)
<a href="#">BLAS_SYR2 Procedures</a> (page 269-41)	Performs a symmetric rank 2 operation where <code>alpha</code> is a scalar, <code>x</code> and <code>y</code> are <code>n</code> element vectors, and <code>A</code> is an <code>n</code> by <code>n</code> symmetric matrix	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> (page 269-3)
<a href="#">BLAS_SYR2K Procedures</a> (page 269-43)	Performs one of the symmetric rank2 <code>k</code> operations where <code>alpha</code> and <code>beta</code> are scalars, <code>C</code> is an <code>n</code> by <code>n</code> symmetric matrix and <code>A</code> and <code>B</code> are <code>n</code> by <code>k</code> matrices in the first case and <code>k</code> by <code>n</code> matrices in the second case	<a href="#">BLAS Level 3 (Matrix-Matrix Operations) Subprograms</a> (page 269-5)
<a href="#">BLAS_SYRK Procedures</a> (page 269-45)	Performs one of the symmetric rank <code>k</code> operations where <code>alpha</code> and <code>beta</code> are scalars, <code>C</code> is an <code>n</code> by <code>n</code> symmetric matrix and <code>A</code> is an <code>n</code> by <code>k</code> matrix in the first case and a <code>k</code> by <code>n</code> matrix in the second case	<a href="#">BLAS Level 3 (Matrix-Matrix Operations) Subprograms</a> (page 269-5)
<a href="#">BLAS_TBMV Procedures</a> (page 269-47)	Performs a matrix-vector operation where <code>x</code> is an <code>n</code> element vector and <code>A</code> is an <code>n</code> by <code>n</code> unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> (page 269-3)
<a href="#">BLAS_TBSV Procedures</a> (page 269-49)	Solves one of the systems of equation where <code>b</code> and <code>x</code> are <code>n</code> element vectors and <code>A</code> is an <code>n</code> by <code>n</code> unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> (page 269-3)
<a href="#">BLAS_TPMV Procedures</a> (page 269-51)	Performs a matrix-vector operation where <code>x</code> is an <code>n</code> element vector and <code>A</code> is an <code>n</code> by <code>n</code> unit, or non-unit, upper or lower triangular matrix, supplied in packed form	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> (page 269-3)
<a href="#">BLAS_TPSV Procedures</a> (page 269-53)	Solves one of the systems of equation where <code>b</code> and <code>x</code> are <code>n</code> element vectors and <code>A</code> is an <code>n</code> by <code>n</code> unit, or non-unit, upper or lower triangular matrix, supplied in packed form	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> (page 269-3)
<a href="#">BLAS_TRMM Procedures</a> (page 269-54)	Performs one of the matrix-vector operations where <code>alpha</code> is a scalar, <code>B</code> is an <code>m</code> by <code>n</code> matrix, <code>A</code> is a unit, or non-unit, upper or lower triangular matrix and <code>op(A)</code> is one of two alternatives	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> (page 269-3)
<a href="#">BLAS_TRMV Procedures</a> (page 269-56)	Performs a matrix-vector operation where <code>x</code> is an <code>n</code> element vector and <code>A</code> is an <code>n</code> by <code>n</code> unit, or non-unit, upper or lower triangular matrix	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> (page 269-3)

**Table 269-6 (Cont.) UTL\_NLA Package Subprograms**

Subprogram	Description	Group
<a href="#">BLAS_TRSM Procedures</a> (page 269-58)	Performs one of the matrix-vector operations $op(A) * X = alpha * B$ or $X * op(A) = alpha * B$ where alpha is a scalar, X and B are m by n matrices, A is a unit, or non-unit, upper or lower triangular matrix, op(A) is one of two alternatives. The matrix X is overwritten on B	<a href="#">BLAS Level 3 (Matrix-Matrix Operations) Subprograms</a> (page 269-5)
<a href="#">BLAS_TRSV Procedures</a> (page 269-60)	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix	<a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> (page 269-3)
<a href="#">LAPACK_GBSV Procedures</a> (page 269-62)	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n matrix and x and b are n by nrhs matrices. The LU decomposition with partial pivoting and row interchanges is used to factor A.	<a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a> (page 269-5)
<a href="#">LAPACK_GEES Procedures</a> (page 269-63)	Computes for an n by n real nonsymmetric matrix A, the eigenvalues, the real Schur form T, and, optionally, the matrix of Schur vectors Z. This gives the Schur factorization $A = Z * T * (Z ** T)$ .	<a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> (page 269-6)
<a href="#">LAPACK_GEEV Procedures</a> (page 269-73)	Computes for an n by n real nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors.	<a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> (page 269-6)
<a href="#">LAPACK_GELS Procedures</a> (page 269-65)	Solves overdetermined or underdetermined real linear systems involving an m by n matrix A, or its transpose, using a QR or LQ factorization of A. It is assumed that A has full rank.	<a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> (page 269-6)
<a href="#">LAPACK_GESD D Procedures</a> (page 269-67)	Computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.	<a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> (page 269-6)
<a href="#">LAPACK_GESV Procedures</a> (page 269-69)	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n matrix and x and b are n by nrhs matrices. The LU decomposition with partial pivoting and row interchanges is used to factor A.	<a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a> (page 269-5)
<a href="#">LAPACK_GESV D Procedures</a> (page 269-71)	Computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and/or right singular vectors. The SVD is written $A = U * SIGMA * transpose(V)$ .	<a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> (page 269-6)

Table 269-6 (Cont.) UTL\_NLA Package Subprograms

Subprogram	Description	Group
<a href="#">LAPACK_GTSV Procedures</a> (page 269-75)	This procedure solves the equation $a * x = b$ where $a$ is an $n$ by $n$ tridiagonal matrix, by Gaussian elimination with partial pivoting.	<a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a> (page 269-5)
<a href="#">LAPACK_PBSV Procedures</a> (page 269-77)	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite band matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .	<a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a> (page 269-5)
<a href="#">LAPACK_POSV Procedures</a> (page 269-79)	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .	<a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a> (page 269-5)
<a href="#">LAPACK_PPSV Procedures</a> (page 269-80)	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite matrix stored in packed format and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .	<a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a> (page 269-5)
<a href="#">LAPACK_PTSV Procedures</a> (page 269-82)	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite tridiagonal matrix, and $x$ and $b$ are $n$ by $nrhs$ matrices.	<a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a> (page 269-5)
<a href="#">LAPACK_SBEV Procedures</a> (page 269-83)	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix $A$ .	<a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> (page 269-6)
<a href="#">LAPACK_SBEVD Procedures</a> (page 269-85)	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	<a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> (page 269-6)
<a href="#">LAPACK_SPEV Procedures</a> (page 269-87)	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ in packed storage.	<a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> (page 269-6)
<a href="#">LAPACK_SPEVD Procedures</a> (page 269-88)	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	<a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> (page 269-6)

Table 269-6 (Cont.) UTL\_NLA Package Subprograms

Subprogram	Description	Group
<a href="#">LAPACK_SPSV Procedures</a> (page 269-90)	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric matrix stored in packed format, and $x$ and $b$ are $n$ by $nrhs$ matrices. The diagonal pivoting method is used to factor $A$ .	<a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a> (page 269-5)
<a href="#">LAPACK_STEV Procedures</a> (page 269-92)	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix $A$ .	<a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> (page 269-6)
<a href="#">LAPACK_STEVD Procedures</a> (page 269-93)	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix $A$ . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	<a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> (page 269-6)
<a href="#">LAPACK_SYEVD Procedures</a> (page 269-96)	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	<a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> (page 269-6)
<a href="#">LAPACK_SYSV Procedures</a> (page 269-97)	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric matrix, and $x$ and $b$ are $n$ by $nrhs$ matrices. The diagonal pivoting method is used to factor $A$ .	<a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a> (page 269-5)

## 269.5.1 BLAS\_ASUM Functions

This procedure computes the sum of the absolute values of the vector components.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) (page 269-2) for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_ASUM (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN)
RETURN BINARY_DOUBLE;
```

```
UTL_NLA.BLAS_ASUM (
 n IN POSITIVEN,
 alpha IN SCALAR_DOUBLE,
```

```
x IN UTL_NLA_ARRAY_FLT)
RETURN BINARY_FLOAT
```

## Parameters

**Table 269-7** BLAS\_ASUM Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) * \text{abs}( \text{incx} ) )$
incx	Specifies the increment for the elements of x. incx must not be zero.

## 269.5.2 BLAS\_AXPY Procedures

This procedure copies  $\text{alpha} * X + Y$  into vector Y.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) (page 269-2) for other subprograms in this group

## Syntax

```
UTL_NLA.BLAS_AXPY (
 n IN POSITIVEN,
 alpha IN SCALAR_DOUBLE,
 x IN UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN,
 y IN OUT UTL_NLA_ARRAY_DBL,
 incy IN POSITIVEN);
```

```
UTL_NLA.BLAS_AXPY (
 n IN POSITIVEN,
 alpha IN SCALAR_DOUBLE,
 x IN UTL_NLA_ARRAY_FLT,
 incx IN POSITIVEN,
 y IN OUT UTL_NLA_ARRAY_FLT,
 incy IN POSITIVEN);
```

## Parameters

**Table 269-8** BLAS\_AXPY Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.

**Table 269-8 (Cont.) BLAS\_AXPY Procedure Parameters**

Parameter	Description
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) * \text{abs}( \text{incx} ) )$
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least $( 1 + ( n - 1 ) * \text{abs}( \text{incy} ) )$
incy	Specifies the increment for the elements of y. incy must not be zero.

## 269.5.3 BLAS\_COPY Procedures

This procedure copies the contents of vector x to vector y.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) (page 269-2) for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_COPY (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN,
 y IN OUT UTL_NLA_ARRAY_DBL,
 incy IN POSITIVEN);
```

```
UTL_NLA.BLAS_COPY (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_FLT,
 incx IN POSITIVEN,
 y IN OUT UTL_NLA_ARRAY_FLT,
 incy IN POSITIVEN);
```

### Parameters

**Table 269-9 BLAS\_COPY Procedure Parameters**

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.

**Table 269-9 (Cont.) BLAS\_COPY Procedure Parameters**

Parameter	Description
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) * \text{abs}( \text{incx} ) )$
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) * \text{abs}( \text{incy} ) )$
incy	Specifies the increment for the elements of y. incy must not be zero.

## 269.5.4 BLAS\_DOT Functions

This function returns the dot (scalar) product of two vectors x and y.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) (page 269-2) for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_DOT (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN,
 y IN UTL_NLA_ARRAY_DBL,
 incy IN POSITIVEN)
RETURN BINARY_DOUBLE;
```

```
UTL_NLA.BLAS_DOT (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_FLT,
 incx IN POSITIVEN,
 y IN UTL_NLA_ARRAY_FLT,
 incy IN POSITIVEN)
RETURN BINARY_FLOAT;
```

### Parameters

**Table 269-10 BLAS\_DOT Function Parameters**

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.

**Table 269-10 (Cont.) BLAS\_DOT Function Parameters**

Parameter	Description
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) * \text{abs}( \text{incx} ) )$
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) * \text{abs}( \text{incy} ) )$
incy	Specifies the increment for the elements of y. incy must not be zero.

## 269.5.5 BLAS\_GBMV Procedures

This procedure performs one of the matrix-vector operations  $y := \alpha * A * x + \beta * y$  or  $y := \alpha * A' * x + \beta * y$ , where  $\alpha$  and  $\beta$  are scalars,  $x$  and  $y$  are vectors and  $A$  is an  $m$  by  $n$  band matrix, with  $k_l$  sub-diagonals and  $k_u$  super-diagonals.

### See Also:

[BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#) (page 269-3) for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_GBMV (
 trans IN flag,
 m IN POSITIVEN, n IN POSITIVEN,
 kl IN NATURALN,
 ku IN NATURALN,
 alpha IN SCALAR_DOUBLE,
 a IN UTL_NLA_ARRAY_DBL,
 lda IN POSITIVEN,
 x IN UTL_NLA_ARRAY_DBL,

 n IN POSITIVEN,
 kl IN NATURALN,
 ku IN NATURALN,
 alpha IN SCALAR_FLOAT,
 a IN UTL_NLA_ARRAY_FLT,
 lda IN POSITIVEN,
```

```
x IN UTL_NLA_ARRAY_FLT,
incx IN POSITIVEN,
beta IN SCALAR_FLOAT,
y IN OUT UTL_NLA_ARRAY_FLT,
incy IN POSITIVEN,
pack IN flag DEFAULT 'C');
```

## Parameters

**Table 269-11 BLAS\_GBMV Procedure Parameters**

Parameter	Description
trans	Specifies the operation to be performed: <ul style="list-style-type: none"> <li>trans = 'N' or 'n'y := alpha*A*x + beta*y</li> <li>trans = 'T' or 't'y := alpha*A'*x + beta*y</li> <li>trans = 'C' or 'c'y := alpha*A*x + beta*y</li> </ul>
m	Specifies the number of rows of the matrix A. m must be at least zero.
n	Specifies the number of columns of the matrix A. n must be at least zero.
kl	Specifies the number of sub-diagonals of the matrix A. kl must satisfy 0 .le. kl.
ku	Specifies the number of super-diagonals of the matrix A. ku must satisfy 0 .le. ku.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). Before entry, the leading (kl + ku + 1) by n part of the array A must contain the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (ku+1) of the array, the first super-diagonal starting at position 2 in row ku, the first sub-diagonal starting at position 1 in row(ku+2), and so on. Elements in the array A that do not correspond to elements in the band matrix (such as the top left ku by ku triangle) are not referenced.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (kl+ku+1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least ( 1 + ( n - 1 ) * abs( incx ) ) when trans = 'N' or 'n' and at least ( 1 + ( m - 1 ) * abs( incx ) ) otherwise. Before entry, the incremented array x must contain the vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.

**Table 269-11 (Cont.) BLAS\_GBMV Procedure Parameters**

Parameter	Description
y	<p>UTL_NLA_ARRAY_FLT/DBL of dimension at least</p> $(1 + (m - 1) * \text{abs}(\text{incy}))$ <p>when trans = 'N' or 'n' and at least</p> $(1 + (n - 1) * \text{abs}(\text{incy}))$ <p>otherwise. Before entry with beta nonzero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y.</p>
incy	Specifies the increment for the elements of y. Must not be zero.
pack	<p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## 269.5.6 BLAS\_GEMM Procedures

This procedure performs one of the matrix-matrix operations.

$$C := \text{alpha} * \text{op}(A) * \text{op}(B) + \text{beta} * C$$

where  $\text{op}(X)$  is one of

$$\text{op}(X) = X$$

or

$$\text{op}(X) = X'$$

where alpha and beta are scalars, and A, B and C are matrices, with  $\text{op}(A)$  an m by k matrix,  $\text{op}(B)$  a k by n matrix and C an m by n matrix.

### See Also:

 ldb IN POSITIVEN,
 beta IN SCALAR_FLOAT,
 c IN OUT UTL_NLA_ARRAY_FLT,
 ldc IN POSITIVEN,
 pack IN flag DEFAULT 'C');

```

### Parameters

**Table 269-12** BLAS\_GEMM Procedure Parameters

Parameter	Description
transa	Specifies the form of $op(A)$ to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> <li>transa = 'N' or 'n': <math>op(A) = A</math></li> <li>transa = 'T' or 't': <math>op(A) = A^T</math></li> <li>transa = 'C' or 'c': <math>op(A) = A^C</math></li> </ul>
transb	Specifies the form of $op(B)$ to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> <li>transb = 'N' or 'n': <math>op(B) = B</math></li> <li>transb = 'T' or 't': <math>op(B) = B^T</math></li> <li>transb = 'C' or 'c': <math>op(B) = B^C</math></li> </ul>
m	Specifies the number of rows of the matrix $op(A)$ and of the matrix C. m must be at least zero.
n	Specifies the number of columns of the matrix $op(B)$ and of the matrix C. n must be at least zero.
k	Specifies the rows of the matrix $op(A)$ and the number of columns of the matrix $op(B)$ . k must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where ka is k when transa = 'N' or 'n', and is m otherwise. Before entry with transa = 'N' or 'n', the leading m by k part of the array A must contain the matrix A, otherwise the leading k by m part of the array A must contain the matrix A.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When transa = 'N' or 'n', lda must be at least max(1,k).

**Table 269-12 (Cont.) BLAS\_GEMM Procedure Parameters**

Parameter	Description
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, kb) where kb is n when transb = 'N' or 'n', and is k otherwise. Before entry with transb = 'N' or 'n', the leading k by n part of the array b must contain the matrix B, otherwise the leading n by k part of the array b must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. When transb = 'N' or 'n', ldb must be at least max(1, n).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then c need not be set on input.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc, n). Before entry, the leading m by n part of the array c must contain the matrix C, except when beta is zero, in which case c need not be set on entry. On exit, the array c is overwritten by the m by n matrix (alpha*op(A)*op(B) + beta*C).
ldc	Specifies the first dimension of c as declared in the calling (sub) program. ldc must be at least max(1, m).
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## 269.5.7 BLAS\_GEMV Procedures

This procedure performs one of the matrix-vector operations:  $y := \alpha * A * x + \beta * y$  or  $y := \alpha * A' * x + \beta * y$  where alpha and beta are scalars, x and y are vectors and A is an m by n matrix.

### See Also:

 y IN OUT UTL_NLA_ARRAY_FLT,
 incy IN POSITIVEN,
 pack IN flag DEFAULT 'C');

```

## Parameters

**Table 269-13 BLAS\_GEMV Procedure Parameters**

Parameter	Description
trans	Specifies the operation to be performed: <ul style="list-style-type: none"> <li>trans = 'N' or 'n', <math>y := \alpha * A * x + \beta * y</math></li> <li>trans = 'T' or 't', <math>y := \alpha * A^T * x + \beta * y</math></li> <li>trans = 'C' or 'c', <math>y := \alpha * A^H * x + \beta * y</math></li> </ul>
m	Specifies the number of rows of the matrix A. m must be at least zero.
n	Specifies the number of columns of the matrix A. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading m by n part of the array a must contain the matrix of coefficients.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least $\max(1, m)$ .
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ when trans = 'N' or 'n' and at least $(1 + (m - 1) * \text{abs}(\text{incx}))$ otherwise. Before entry, the incremented array x must contain the vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.

**Table 269-13 (Cont.) BLAS\_GEMV Procedure Parameters**

Parameter	Description
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( m - 1 ) * \text{abs}( \text{incy} ) )$  when trans = 'N' or 'n' and at least $( 1 + ( n - 1 ) * \text{abs}( \text{incy} ) )$  otherwise. Before entry with beta nonzero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## 269.5.8 BLAS\_GER Procedures

This procedure performs the rank 1 operation:  $A := \text{alpha} * x * y' + A$  where alpha is a scalar, x is an m element vector, y is an n element vector and A is an m by n matrix.

### See Also:

[BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#) (page 269-3) for other subprograms in this group

### Syntax

```

UTL_NLA.BLAS_GER (
 m IN POSITIVEN,
 n IN POSITIVEN,
 alpha IN SCALAR_DBL,
 x IN OUT UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN,
 y IN UTL_NLA_ARRAY_DBL,
 incy IN POSITIVEN,
 a IN OUT UTL_NLA_ARRAY_DBL,
 lda IN POSITIVEN,
 pack IN flag DEFAULT 'C');

```

```

UTL_NLA.BLAS_GER (
 m IN POSITIVEN,
 n IN POSITIVEN,
 alpha IN SCALAR_FLT,
 x IN OUT UTL_NLA_ARRAY_FLT,
 incx IN POSITIVEN,
 y IN UTL_NLA_ARRAY_FLT,
 incy IN POSITIVEN,
 a IN OUT UTL_NLA_ARRAY_FLT,

```

```
lda IN POSITIVEN,
pack IN flag DEFAULT 'C');
```

## Parameters

**Table 269-14** BLAS\_GER Procedure Parameters

Parameter	Description
m	Specifies the number of rows of the matrix A. m must be at least zero.
n	Specifies the number of columns of the matrix A. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( m - 1 ) * \text{abs}( \text{incx} ) )$  Before entry, the incremented array x must contain the m element vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) * \text{abs}( \text{incy} ) )$  Before entry, the incremented array Y must contain the m element vector y.
incy	Specifies the increment for the elements of y. incx must not be zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading m by n part of the array a must contain the matrix of coefficients. On exit, a is overwritten by the updated matrix.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least $\text{max}( 1, m )$
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>• 'C': column-major (default)</li> <li>• 'R': row-major</li> </ul>

## 269.5.9 BLAS\_IAMAX Functions

This function computes the index of first element of a vector that has the largest absolute value.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) (page 269-2) for other subprograms in this group

**Syntax**

```

UTL_NLA.BLAS_IAMAX (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN,
 RETURN POSITIVEN;

```

```

UTL_NLA.BLAS_IAMAX (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_FLT,
 incx IN POSITIVEN,
 RETURN POSITIVEN;

```

**Parameters****Table 269-15** BLAS\_IAMAX Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors <i>x</i> and <i>y</i> . <i>n</i> must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least ( 1 + ( n - 1 ) * abs( incx ) )
incx	Specifies the increment for the elements of <i>x</i> . <i>incx</i> must not be zero.

## 269.5.10 BLAS\_NRM2 Functions

This function computes the vector 2-norm (Euclidean norm).

**See Also:**

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) (page 269-2) for other subprograms in this group

**Syntax**

```

UTL_NLA.BLAS_NRM2 (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN)
 RETURN BINARY_DOUBLE;

```

```

UTL_NLA.BLAS_NRM2 (
 n IN POSITIVEN,
 x IN UTL_NLA_ARRAY_FLT,
 incx IN POSITIVEN)
 RETURN BINARY_FLOAT;

```

## Parameters

**Table 269-16 BLAS\_NRM2 Function Parameters**

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) * \text{abs}( \text{incx} ) )$
incx	Specifies the increment for the elements of x. incx must not be zero.

## 269.5.11 BLAS\_ROT Procedures

This procedure returns the plane rotation of points.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) (page 269-2) for other subprograms in this group

## Syntax

```
UTL_NLA.BLAS_ROT (
 n IN POSITIVE_INTEGER,
 x IN OUT UTL_NLA_ARRAY_DBL,
 incx IN POSITIVE_INTEGER,
 y IN OUT UTL_NLA_ARRAY_DBL,
 incy IN POSITIVE_INTEGER,
 c IN SCALAR_DOUBLE,
 s IN SCALAR_DOUBLE);
```

```
UTL_NLA.BLAS_ROT (
 n IN POSITIVE_INTEGER,
 x IN OUT UTL_NLA_ARRAY_FLT,
 incx IN POSITIVE_INTEGER,
 y IN OUT UTL_NLA_ARRAY_FLT,
 incy IN POSITIVE_INTEGER,
 c IN SCALAR_DOUBLE,
 s IN SCALAR_DOUBLE);
```

## Parameters

**Table 269-17 BLAS\_ROT Procedure Parameters**

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.

**Table 269-17 (Cont.) BLAS\_ROT Procedure Parameters**

Parameter	Description
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1+(n-1) * \text{abs}(\text{incx}))$
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least $(1+(n-1) * \text{abs}(\text{incy}))$
incy	Specifies the increment for the elements of y. incy must not be zero.
c	SCALAR_FLOAT/DOUBLE. Specifies the scalar C.
s	SCALAR_FLOAT/DOUBLE. Specifies the scalar S.

## 269.5.12 BLAS\_ROTG Procedures

This procedure returns the Givens rotation of points.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) (page 269-2) for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_ROTG (
 a IN OUT SCALAR_DOUBLE,
 b IN OUT SCALAR_DOUBLE,
 c IN OUT SCALAR_DOUBLE,
 s IN OUT SCALAR_DOUBLE);
```

```
UTL_NLA.BLAS_ROTG (
 a IN OUT SCALAR_FLOAT,
 b IN OUT SCALAR_FLOAT,
 c IN OUT SCALAR_FLOAT,
 s IN OUT SCALAR_FLOAT);
```

### Parameters

**Table 269-18 BLAS\_ROTG Procedure Parameters**

Parameter	Description
a	SCALAR_FLOAT/DOUBLE. Specifies the scalar A.
b	SCALAR_FLOAT/DOUBLE. Specifies the scalar B.
c	SCALAR_FLOAT/DOUBLE. Specifies the scalar C.

**Table 269-18 (Cont.) BLAS\_ROTG Procedure Parameters**

Parameter	Description
s	SCALAR_FLOAT/DOUBLE. Specifies the scalar S.

## 269.5.13 BLAS\_SCAL Procedures

This procedure scales a vector by a constant.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) (page 269-2) for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_SCAL (
 n IN POSITIVEN,
 alpha IN SCALAR_DOUBLE,
 x IN OUT UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN);
```

```
UTL_NLA.BLAS_SCAL (
 n IN POSITIVEN,
 alpha IN SCALAR_FLOAT,
 x IN OUT UTL_NLA_ARRAY_FLT,
 incx IN POSITIVEN);
```

### Parameters

**Table 269-19 BLAS\_SCAL Procedure Parameters**

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1+(n-1)*abs(incx))$
incx	Specifies the increment for the elements of x. incx must not be zero.

## 269.5.14 BLAS\_SPMV Procedures

This procedure performs the matrix-vector operation  $y := \alpha A x + \beta y$ , where  $\alpha$  and  $\beta$  are scalars,  $x$  and  $y$  are  $n$  element vectors and  $A$  is an  $n$  by  $n$  symmetric matrix, supplied in packed form.

### See Also:

[BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#) (page 269-3) for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_SPMV (
 uplo IN flag,
 n IN POSITIVEN,
 alpha IN SCALAR_DOUBLE,
 ap IN UTL_NLA_ARRAY_DBL,
 x IN UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN,
 beta IN SCALAR_DOUBLE,
 y IN OUT UTL_NLA_ARRAY_DBL,
 incy IN POSITIVEN,
 pack IN flag DEFAULT 'C');
```

```
UTL_NLA.BLAS_SPMV (
 uplo IN flag,
 n IN POSITIVEN,
 alpha IN SCALAR_FLOAT,

 x IN UTL_NLA_ARRAY_FLT,
 incx IN POSITIVEN,
 beta IN SCALAR_FLOAT,
 y IN OUT UTL_NLA_ARRAY_FLT,
 incy IN POSITIVEN,
 pack IN flag DEFAULT 'C');
```

### Parameters

**Table 269-20** BLAS\_SPMV Procedure Parameters

Parameter	Description
uplo	Specifies the upper or lower triangular part of the matrix $A$ is supplied in the packed array $AP$ : <ul style="list-style-type: none"> <li>uplo = 'U' or 'u'. The upper triangular part of <math>A</math> is supplied in <math>AP</math>.</li> <li>uplo = 'L' or 'l'. The lower triangular part of <math>A</math> is supplied in <math>AP</math>.</li> </ul>
n	Specifies the order of the matrix $A$ . $n$ must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar $\alpha$ .

**Table 269-20 (Cont.) BLAS\_SPMV Procedure Parameters**

Parameter	Description
ap	<p>UTL_NLA_ARRAY_FLT/DBL of dimension at least</p> $((n*(n+1))/2)$ <p>Before entry with <code>uplo = 'U'</code> or <code>'u'</code>, the array <code>ap</code> must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that <code>ap(1)</code> contains <code>a(1,1)</code>, <code>ap(2)</code> and <code>ap(3)</code> contain <code>a(1,2)</code> and <code>a(2,2)</code> respectively, and so on.</p> <p>Before entry with <code>uplo = 'L'</code> or <code>'l'</code>, the array <code>ap</code> must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that <code>ap(1)</code> contains, <code>ap(2)</code> and <code>ap(3)</code> contain <code>a(2,1)</code> and <code>a(3,1)</code> respectively, and so on.</p>
x	<p>UTL_NLA_ARRAY_FLT/DBL of dimension at least</p> $(1+(n-1)*abs(incx))$ <p>Before entry, the incremented array <code>x</code> must contain the <code>n</code> element vector <code>x</code>.</p>
incx	Specifies the increment for the elements of <code>x</code> . Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar <code>beta</code> . When <code>beta</code> is supplied as zero then <code>Y</code> need not be set on input.
y	<p>UTL_NLA_ARRAY_FLT/DBL of dimension at least</p> $(1+(n-1)*abs(incy))$ <p>Before entry, the incremented array <code>Y</code> must contain the <code>n</code> element vector <code>y</code>. On exit, <code>Y</code> is overwritten by the updated vector <code>y</code>.</p>
incy	Specifies the increment for the elements of <code>y</code> . Must not be zero.
pack	<p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## 269.5.15 BLAS\_SPR Procedures

This procedure performs the rank 1 operation  $A := \alpha * x * x' + A$ , where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix, supplied in packed form.

### See Also:

## 269.5.18 BLAS\_SWAP Procedures

This procedure swaps the contents of two vectors each of size n.

### Syntax

```

UTL_NLA.BLAS_SWAP (
 n IN POSITIVEN,
 x IN OUT UTL_NLA_ARRAY_DBL,
 incx IN POSITIVEN,
 y IN OUT UTL_NLA_ARRAY_DBL,
 incy IN POSITIVEN);

```

```

UTL_NLA.BLAS_SWAP (
 n IN POSITIVEN,

```

```
x IN OUT UTL_NLA_ARRAY_FLT,
incx IN POSITIVEN,
y IN OUT UTL_NLA_ARRAY_FLT,
incy IN POSITIVEN);
```

## Parameters

**Table 269-24 BLAS\_SWAP Procedure Parameters**

Parameter	Description
n	Specifies the number of elements of the vectors <i>x</i> and <i>y</i> . <i>n</i> must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1+(n-1)*abs(incx))$
incx	Specifies the increment for the elements of <i>x</i> . <i>incx</i> must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least $(1+(n-1)*abs(incy))$
incy	Specifies the increment for the elements of <i>y</i> . <i>incy</i> must not be zero.

## 269.5.19 BLAS\_SYMM Procedures

This procedure performs one of the matrix-matrix operations  $C := \alpha * A * B + \beta * C$  or  $C := \alpha * B * A + \beta * C$ , where *alpha* and *beta* are scalars, *A* is a symmetric matrix, and *B* and *C* are *m* by *n* matrices.

```

## Parameters

**Table 269-25** BLAS\_SYMM Procedure Parameters

Parameter	Description
side	<p>Specifies whether the symmetric matrix <b>A</b> appears on the left or right in the operation:</p> <ul style="list-style-type: none"> <li>side = 'L' or 'l' : <math>C := \alpha * A * B + \beta * C</math></li> <li>side = 'R' or 'r' : <math>C := \alpha * B * A + \beta * C</math></li> </ul>
uplo	<p>Specifies whether the upper or lower triangular part of the array <b>A</b> is to be referenced:</p> <ul style="list-style-type: none"> <li>uplo = 'U' or 'u' : Only the upper triangular part of the symmetric matrix is to be referenced.</li> <li>uplo = 'L' or 'l' : Only the lower triangular part of the symmetric matrix is to be referenced.</li> </ul>
m	Specifies the number of rows of the matrix <b>C</b> . <b>m</b> must be at least zero.
n	Specifies the number of columns of the matrix <b>C</b> . <b>n</b> must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar <b>alpha</b> .
a	<p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,ka) where ka is m when side = 'L' or 'l', and is n otherwise.</p> <p>Before entry with side = 'L' or 'l', the leading m by m part of the array <b>A</b> must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading m by m upper triangular part of the array <b>A</b> must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of <b>A</b> is not referenced, and when uplo = 'L' or 'l', the leading m by m lower triangular part of the array <b>A</b> must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of <b>A</b> is not referenced.</p> <p>Before entry with side = 'R' or 'r', the n by n part of the array <b>A</b> must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading n by n upper triangular part of the array <b>A</b> must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of <b>A</b> is not referenced, and when uplo = 'L' or 'l', the leading n by n lower triangular part of the array <b>A</b> must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of <b>A</b> is not referenced.</p>

**Table 269-25 (Cont.) BLAS\_SYMM Procedure Parameters**

Parameter	Description
lda	Specifies the first dimension of <i>a</i> as declared in the calling (sub) program. When <i>side</i> = 'L' or 'l', <i>lda</i> must be at least $\max(1, m)$ , otherwise <i>lda</i> must be at least $\max(1, n)$ .
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION ( <i>ldb</i> , <i>n</i> ). Before entry, the leading <i>m</i> by <i>n</i> part of the array <i>B</i> must contain the matrix <i>B</i> .
ldb	Specifies the first dimension of <i>b</i> as declared in the calling (sub) program. <i>ldb</i> must be at least $\max(1, m)$ .
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar <i>beta</i> . When <i>beta</i> is supplied as zero then <i>c</i> need not be set on input.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION ( <i>ldc</i> , <i>n</i> ). Before entry, the leading <i>m</i> by <i>n</i> part of the array <i>C</i> must contain the matrix <i>C</i> , except when <i>beta</i> is zero, in which case <i>C</i> need not be set on entry. On exit, the array <i>C</i> is overwritten by the <i>m</i> by <i>n</i> updated matrix.
ldc	Specifies the first dimension of <i>C</i> as declared in the calling (sub) program. <i>ldc</i> must be at least $\max(1, m)$ .
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## 269.5.20 BLAS\_SYMV Procedures

This procedure performs the matrix-vector operation  $y := \alpha * A * x + \beta * y$ , where  $\alpha$  and  $\beta$  are scalars, *x* and *y* are *n* element vectors and *A* is an *n* by *n* symmetric matrix.

## Parameters

**Table 269-29 BLAS\_SYR2K Procedure Parameters**

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the array <i>c</i> is to be referenced: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u' : Only the upper triangular part of <i>c</i> is to be referenced.</li> <li>uplo = 'L' or 'l' : Only the lower triangular part of <i>c</i> is to be referenced.</li> </ul>
trans	Specifies the operations to be performed: <ul style="list-style-type: none"> <li>trans = 'N' or 'n': <math>C := \alpha * A * B + \alpha * B * A + \beta * C</math></li> <li>trans = 'T' or 't': <math>C := \alpha * A' * B + \alpha * B' * A + \beta * C</math></li> <li>trans = 'C' or 'c': <math>C := \alpha * A' * B + \alpha * B' * A + \beta * C</math></li> </ul>
n	Specifies the order of matrix <i>C</i> . <i>n</i> must be at least zero.
k	On entry with trans = 'N' or 'n', <i>k</i> specifies the number of columns of the matrices <i>A</i> and <i>B</i> . On entry with trans = 'T' or 't' or trans = 'C' or 'c', <i>k</i> specifies the number of rows of the matrices <i>A</i> and <i>B</i> . <i>k</i> must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,ka) where kb is <i>k</i> when trans = 'N' or 'n', and is <i>n</i> otherwise. Before entry with trans = 'N' or 'n', the leading <i>n</i> by <i>k</i> part of the array <i>A</i> must contain the matrix <i>A</i> , otherwise the leading <i>k</i> by <i>n</i> part of the array <i>A</i> must contain the matrix <i>A</i> .
lda	Specifies the first dimension of <i>a</i> as declared in the calling (sub) program. When trans = 'N' or 'n', <i>lda</i> must be at least $\max(1, n)$ , otherwise <i>lda</i> must be at least $\max(1, k)$ .
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,kb) where kb is <i>k</i> when trans = 'N' or 'n', and is <i>n</i> otherwise. Before entry with trans = 'N' or 'n', the leading <i>n</i> by <i>k</i> part of the array <i>B</i> must contain the matrix <i>B</i> , otherwise the leading <i>k</i> by <i>n</i> part of the array <i>B</i> must contain the matrix <i>B</i> .

**Table 269-29 (Cont.) BLAS\_SYR2K Procedure Parameters**

Parameter	Description
ldb	Specifies the first dimension of <i>b</i> as declared in the calling (sub) program. When <code>trans = 'N'</code> or <code>'n'</code> , <code>ldb</code> must be at least <code>max(1,n)</code> , otherwise <code>ldb</code> must be at least <code>max(1,k)</code> .
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar <code>beta</code> .
<i>c</i>	<p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (<code>ldc,n</code>).</p> <p>Before entry with <code>uplo = 'U'</code> or <code>'u'</code>, the leading <code>n</code> by <code>n</code> upper triangular part of the array <i>c</i> must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of <i>c</i> is not referenced. On exit, the upper triangular part of the array <i>c</i> is overwritten by the upper triangular part of the updated matrix.</p> <p>Before entry with <code>uplo = 'L'</code> or <code>'l'</code>, the leading <code>n</code> by <code>n</code> lower triangular part of the array <i>c</i> must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of <i>c</i> is not referenced. On exit, the lower triangular part of the array <i>c</i> is overwritten by the lower triangular part of the updated matrix.</p>
ldc	Specifies the first dimension of <i>c</i> as declared in the calling (sub) program. <code>ldc</code> must be at least <code>max(1,n)</code> .
pack	<p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## 269.5.24 BLAS\_SYRK Procedures

This procedure performs one of the symmetric rank *k* operations  $C := \alpha * A * A' + \beta * C$  OR  $C := \alpha * A' * A + \beta * C$ , where `alpha` and `beta` are scalars, *C* is an `n` by `n` symmetric matrix and *A* is an `n` by `k` matrix in the first case and a `k` by `n` matrix in the second case.

### Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

## 269.5.29 BLAS\_TRMM Procedures

This procedure performs a matrix-matrix operation.

It performs one of the following matrix-matrix operations:

`B := alpha*op( A )*B`

or

`B := alpha*B*op( A )`

where `alpha` is a scalar, `B` is an `m` by `n` matrix, `A` is a unit, or non-unit, upper or lower triangular matrix and `op(A)` is one of

`op( A ) = A`

or

`op( A ) = A'`

 **See Also:**

**Table 269-35** BLAS\_TRMM Procedure Parameters

Parameter	Description
side	Specifies whether the symmetric matrix A appears on the left or right in the operation: <ul style="list-style-type: none"> <li>side = 'L' or 'l' : B := alpha*op(A)*B</li> <li>side = 'R' or 'r' : B := alpha*B*op(A)</li> </ul>
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u' : A is an upper triangular matrix.</li> <li>uplo = 'L' or 'l' : A is a lower triangular matrix.</li> </ul>
transa	Specifies the form of op(A) to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> <li>transa = 'N' or 'n' : op(A) = A</li> <li>transa = 'T' or 't' : op(A) = A'</li> <li>transa = 'C' or 'c' : op(A) = A'</li> </ul>

**Table 269-35 (Cont.) BLAS\_TRMM Procedure Parameters**

Parameter	Description
diag	Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> <li>diag = 'U' or 'u'. A is assumed to be unit triangular.</li> <li>diag = 'N' or 'n'. A is not assumed to be unit triangular.</li> </ul>
m	Specifies the number of rows of the B. m must be at least zero.
n	Specifies the number of columns of B. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. When alpha is zero then A is not referenced and B need not be set before entry.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,k) where k is m when side = 'L' or 'l', and is n when side = 'R' or 'r'.  Before entry with uplo = 'U' or 'u', the leading k by k upper triangular part of the array A must contain the upper triangular matrix, and the strictly lower triangular part of A is not referenced.  Before entry with uplo = 'L' or 'l', the leading k by k lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced.  Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1,m), otherwise lda must be at least max(1,n).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb,n).  Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the transformed matrix.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1,m).
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## 269.5.30 BLAS\_TRMV Procedures

This procedure performs the matrix-vector operations  $x := A*x$  or  $x := A'*x$ , where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix.

Parameter	Description
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## 269.5.31 BLAS\_TRSM Procedures

This procedure performs a matrix-matrix operation.

It performs one of the matrix-matrix operations:

$$\text{op}( A ) * X = \text{alpha} * B$$

or

$$X * \text{op}( A ) = \text{alpha} * B$$

where  $\text{alpha}$  is a scalar,  $X$  and  $B$  are  $m$  by  $n$  matrices,  $A$  is a unit, or non-unit, upper or lower triangular matrix and  $\text{op}(A)$  is one of

$$\text{op}( A ) = A$$

or

$$\text{op}( A ) = A'$$

The matrix  $X$  is overwritten on  $B$ .

## Parameters

**Table 269-37 BLAS\_TRSM Procedure Parameters**

Parameter	Description
side	Specifies whether the symmetric matrix <b>A</b> appears on the left or right in the operation: <ul style="list-style-type: none"> <li>side = 'L' or 'l' : <math>op(A)*X = alpha*B</math></li> <li>side = 'R' or 'r' : <math>X*op(A) = alpha*B</math></li> </ul>
uplo	Specifies whether the upper or lower triangular part of the array <b>A</b> is to be referenced: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u' : <b>A</b> is an upper triangular matrix.</li> <li>uplo = 'L' or 'l' : <b>A</b> is a lower triangular matrix.</li> </ul>
transa	Specifies the form of $op(A)$ to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> <li>transa = 'N' or 'n' : <math>op(A) = A</math></li> <li>transa = 'T' or 't' : <math>op(A) = A'</math></li> <li>transa = 'C' or 'c' : <math>op(A) = A'</math></li> </ul>
diag	Specifies whether or not <b>A</b> is unit triangular: <ul style="list-style-type: none"> <li>diag = 'U' or 'u'. <b>A</b> is assumed to be unit triangular.</li> <li>diag = 'N' or 'n'. <b>A</b> is not assumed to be unit triangular.</li> </ul>
m	Specifies the number of rows of the <b>B</b> . <b>m</b> must be at least zero.
n	Specifies the number of columns of <b>B</b> . <b>n</b> must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar <b>alpha</b> . When <b>alpha</b> is zero then <b>A</b> is not referenced and <b>B</b> need not be set before entry.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION ( <b>lda</b> , <b>k</b> ) where <b>k</b> is <b>m</b> when <b>side</b> = 'L' or 'l', and is <b>n</b> when <b>side</b> = 'R' or 'r'.  Before entry with <b>uplo</b> = 'U' or 'u', the leading <b>k</b> by <b>k</b> upper triangular part of the array <b>A</b> must contain the upper triangular matrix, and the strictly lower triangular part of <b>A</b> is not referenced.  Before entry with <b>uplo</b> = 'L' or 'l', the leading <b>k</b> by <b>k</b> lower triangular part of the array <b>A</b> must contain the lower triangular matrix and the strictly upper triangular part of <b>A</b> is not referenced.  Note that when <b>diag</b> = 'U' or 'u', the diagonal elements of <b>A</b> are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of <b>a</b> as declared in the calling (sub) program. When <b>side</b> = 'L' or 'l', <b>lda</b> must be at least $\max(1, m)$ , otherwise <b>lda</b> must be at least $\max(1, n)$ .

**Table 269-37 (Cont.) BLAS\_TRSM Procedure Parameters**

Parameter	Description
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb, n). Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the solution matrix X.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least $\max(1, m)$ .
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## 269.5.32 BLAS\_TRSV Procedures

This procedure solves one of the systems of equations  $A*x = b$  or  $A'*x = b$ , where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix.

n	Specifies the order of the matrix A. n must be at least zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular matrix and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of A as declared in the calling (sub) program. lda must be at least $\max(1, n)$ .
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ Before entry, the incremented array x must contain the n element right-hand side vector b. On exit, x is overwritten with the solution vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>• 'C': column-major (default)</li> <li>• 'R': row-major</li> </ul>

## Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

## 269.5.33 LAPACK\_GBSV Procedures

This procedure computes the solution to a real system of linear equations  $a * x = b$ , where  $a$  is a band matrix of order  $n$  with  $k_l$  sub diagonals and  $k_u$  superdiagonals, and  $x$  and  $b$  are  $n$  by  $nrhs$  matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor  $A$  as

$$a = L * U$$

where  $L$  is a product of permutation and unit lower triangular matrices with  $k_l$  sub diagonals, and  $U$  is upper triangular with  $k_l+k_u$  superdiagonals. The factored form of  $a$  is then used to solve the system of equations

$$a * x = b$$

ldb	<p>The leading dimension of the array <math>b</math>.</p> $ldb \geq \max(1, n)$
info	<ul style="list-style-type: none"> <li><math>= 0</math> : successful exit</li> <li><math>&lt; 0</math> : if <math>info = -i</math>, the <math>i</math>-th argument had an illegal value</li> <li><math>&gt; 0</math> : if <math>info = i</math>, <math>U(i, i)</math> is exactly zero. The factorization has been completed, but the factor <math>U</math> is exactly singular, and the solution has not been computed</li> </ul>
pack	<p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## 269.5.34 LAPACK\_GEES Procedures

This procedure computes for an  $n$  by  $n$  real nonsymmetric matrix  $A$ , the eigenvalues, the real Schur form  $T$ , and, optionally, the matrix of Schur vectors  $Z$ .

This gives the Schur factorization  $A = Z*T*(Z**T)$ .

A matrix is in real Schur form if it is upper quasi-triangular with 1 by 1 and 2 by 2 blocks. 2 by 2 blocks will be standardized in the form

$$\begin{bmatrix} a & b \\ c & a \end{bmatrix}$$

where  $b*c < 0$ . The eigenvalues of such a block are  $a \pm \sqrt{bc}$ .

## 269.5.35 LAPACK\_GELS Procedures

This procedure solves overdetermined or underdetermined real linear systems involving an  $m$  by  $n$  matrix  $A$ , or its transpose, using a QR or LQ factorization of  $A$ . It is assumed that  $A$  has full rank.

The following options are provided:

- If TRANS = 'N' and  $m \geq n$ : find the least squares solution of an overdetermined system, that is, solve the least squares problem.  
minimize  $\| B - A * X \|^2$
- If TRANS = 'N' and  $m < n$ : find the minimum norm solution of an underdetermined system  $A * X = B$ .
- If TRANS = 'T' and  $m \geq n$ : find the minimum norm solution of an undetermined system  $A ** T * X = B$ .
- If TRANS = 'T' and  $m < n$ : find the least squares solution of an overdetermined system, that is, solve the least squares problem minimize  $\| B - A ** T * X \|^2$ .

## 269.5.36 LAPACK\_GESDD Procedures

This procedure computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.

The SVD is written

$$A = U * SIGMA * transpose(V)$$

where SIGMA is an m by n matrix which is zero except for its  $\min(m,n)$  diagonal elements, U is an m by m orthogonal matrix, and V is an n by n orthogonal matrix. The diagonal elements of SIGMA are the singular values of A, they are real and non-negative, and are returned in descending order. The first  $\min(m,n)$  columns of U and V are the left and right singular vectors of A.

Note that the routine returns V\*\*T, not V.

## 269.5.37 LAPACK\_GESV Procedure

This procedure computes the solution to a real system of linear equations  $a * x = b$ , where a is an n by n matrix and x and b are n by nrhs matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor A as

$$a = P * L * U$$

where  $P$  is a permutation matrix,  $L$  is unit lower triangular, and  $U$  is upper triangular. The factored form of  $a$  is then used to solve the system of equations

$$a * x = b$$

**See Also:**

## 269.5.38 LAPACK\_GESVD Procedures

This procedure computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and/or right singular vectors.

The SVD is written

$$A = U * SIGMA * transpose(V)$$

where SIGMA is an m by n matrix which is zero except for its  $\min(m,n)$  diagonal elements, U is an m by m orthogonal matrix, and V is an n by n orthogonal matrix. The diagonal elements of SIGMA are the singular values of A, they are real and non-negative, and are returned in descending order. The first  $\min(m,n)$  columns of U and V are the left and right singular vectors of A.

Note that the routine returns  $V^{*T}$ , not V.

## 269.5.39 LAPACK\_GEEV Procedures

This procedure computes for an  $n$  by  $n$  real nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors.

- The right eigenvector  $v(j)$  of A satisfies  $A * v(j) = \text{lambda}(j) * v(j)$  where  $\text{lambda}(j)$  is its eigenvalue.
- The left eigenvector  $u(j)$  of A satisfies  $u(j)^{*H} * A = \text{lambda}(j) * u(j)^{*H}$  where  $u(j)^{*H}$  denotes the conjugate transpose of  $u(j)$ .

The computed eigenvectors are normalized to have Euclidean norm equal to 1 and largest component real.

pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## 269.5.41 LAPACK\_PBSV Procedures

This procedure computes the solution to a real system of linear equations  $a * x = b$ , where a is an n by n symmetric positive definite band matrix and x and b are n by nrhs matrices.

The Cholesky decomposition is used to factor A as

$A = U^{**T} * U$  if UPLO = 'U'

or

$A = L * L^{**T}$  if UPLO = 'L'

where U is an upper triangular matrix and L is a lower triangular matrix. The factored form of A is then used to solve the system of equations  $A * X = B$ .

### 269.5.43 LAPACK\_PPSV Procedures

This procedure computes the solution to a real system of linear equations  $a * x = b$  where a is an n by n symmetric positive definite matrix stored in packed format and x and b are n by nrhs matrices.

The Cholesky decomposition is used to factor A as

$$A = U^{**T} * U \text{ if UPLO} = 'U'$$

or

$$A = L * L^{**T} \text{ if UPLO} = 'L'$$

where **U** is an upper triangular matrix and **L** is a lower triangular matrix. The factored form of **A** is then used to solve the system of equations  $A * X = B$ .

## 269.5.49 LAPACK\_SPSV Procedures

This procedure computes the solution to a real system of linear equations  $a * x = b$ , where a is an n by n symmetric matrix stored in packed format, and x and b are n by nrhs matrices.

The diagonal pivoting method is used to factor A as

$$A = U * D * U^{**T}, \text{ if UPLO} = 'U'$$

or

$$A = L * D * L^{**T}, \text{ if UPLO} = 'L'$$

where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of A is then used to solve the system of equations  $A * X = B$ .

ap	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n*(n+1)/2). On entry, the upper or lower triangle of the symmetric matrix A, packed columnwise in a linear array. The j-th column of A is stored in the array ap as follows: <ul style="list-style-type: none"> <li>uplo = 'U': AP(i + (j-1)*j/2) = A(i, j) for 1&lt;=i&lt;=j</li> <li>uplo = 'L' : AP(i + (j-1)*(2n-j)/2) = A(i, j) for j&lt;=i&lt;=n</li> </ul> See below for further details. On exit, the block diagonal matrix D and the multipliers used to obtain the factor U or L from the factorization A = U*D*U**T or A = L*D*L**T as computed by SSPTRF, stored as a packed triangular matrix in the same storage format as A.
ipiv	INTEGER array, DIMENSION (n). Details of the interchanges and the block structure of d, as determined by SSPTRF. <ul style="list-style-type: none"> <li>If ipiv(k) &gt; 0, then rows and columns k and ipiv(k) were interchanged, and d(k,k) is a 1 by1 diagonal block.</li> <li>If uplo = 'U' and ipiv(k) = ipiv(k-1) &lt; 0, then rows and columns k-1 and -ipiv(k) were interchanged and d(k-1:k,k-1:k) is a 2 by 2 diagonal block.</li> <li>If uplo = 'L' and ipiv(k) = ipiv(k+1) &lt; 0, then rows and columns k+1 and -ipiv(k) were interchanged and d(k:k+1,k:k+1) is a 2 by 2 diagonal block.</li> </ul>
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)

## 269.5.54 LAPACK\_SYSV Procedures

This procedure computes the solution to a real system of linear equations  $a * x = b$ , where a is an n by n symmetric matrix, and x and b are n by nrhs matrices.

The diagonal pivoting method is used to factor A as

$A = U * D * U^{**T}$ , if UPLO = 'U'

or

$A = L * D * L^{**T}$ , if UPLO = 'L'

where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of A is then used to solve the system of equations  $A * X = B$ .

**See Also:**

# 270

## UTL\_RAW

The `UTL_RAW` package provides SQL functions for manipulating `RAW` datatypes.

This chapter contains the following topics:

- [Overview](#) (page 270-1)
- [Operational Notes](#) (page 270-1)
- [Summary of UTL\\_RAW Subprograms](#) (page 270-1)

### 270.1 UTL\_RAW Overview

This package is necessary because normal SQL functions do not operate on `RAW`s, and PL/SQL does not allow overloading between a `RAW` and a `CHAR` datatype. `UTL_RAW` also includes subprograms that convert various COBOL number formats to, and from, `RAW`s.

`UTL_RAW` is not specific to the database environment, and it may actually be used in other environments. For this reason, the prefix `UTL` has been given to the package, instead of `DBMS`.

### 270.2 UTL\_RAW Operational Notes

`UTL_RAW` allows a `RAW` "record" to be composed of many elements. By using the `RAW` datatype, character set conversion will not be performed, keeping the `RAW` in its original format when being transferred through remote procedure calls.

With the `RAW` functions, you can manipulate binary data that was previously limited to the `hexraw` and `rawtohex` functions.

#### Note:

Notes on datatypes:

- The `PLS_INTEGER` and `BINARY_INTEGER` datatypes are identical. This document uses `BINARY_INTEGER` to indicate datatypes in reference information (such as for table types, record types, subprogram parameters, or subprogram return values), but may use either in discussion and examples.
- The `INTEGER` and `NUMBER(38)` datatypes are also identical. This document uses `INTEGER` throughout.

### 270.3 Summary of UTL\_RAW Subprograms

This table lists the `UTL_RAW` subprograms and briefly describes them.

**Table 270-1 UTL\_RAW Package Subprograms**

Subprogram	Description
<a href="#">BIT_AND Function</a> (page 270-3)	Performs bitwise logical "and" of the values in RAW <i>r1</i> with RAW <i>r2</i> and returns the "anded" result RAW
<a href="#">BIT_COMPLEMENT Function</a> (page 270-4)	Performs bitwise logical "complement" of the values in RAW <i>r</i> and returns the "complement'ed" result RAW
<a href="#">BIT_OR Function</a> (page 270-4)	Performs bitwise logical "or" of the values in RAW <i>r1</i> with RAW <i>r2</i> and returns the "or'd" result RAW
<a href="#">BIT_XOR Function</a> (page 270-5)	Performs bitwise logical "exclusive or" of the values in RAW <i>r1</i> with RAW <i>r2</i> and returns the "xor'd" result RAW
<a href="#">CAST_FROM_BINARY_DOUBLE Function</a> (page 270-6)	Returns the RAW binary representation of a BINARY_DOUBLE value
<a href="#">CAST_FROM_BINARY_FLOAT Function</a> (page 270-7)	Returns the RAW binary representation of a BINARY_FLOAT value
<a href="#">CAST_FROM_BINARY_INTEGER Function</a> (page 270-8)	Returns the RAW binary representation of a BINARY_INTEGER value
<a href="#">CAST_FROM_NUMBER Function</a> (page 270-9)	Returns the RAW binary representation of a NUMBER value
<a href="#">CAST_TO_BINARY_DOUBLE Function</a> (page 270-9)	Casts the RAW binary representation of a BINARY_DOUBLE into a BINARY_DOUBLE
<a href="#">CAST_TO_BINARY_FLOAT Function</a> (page 270-10)	Casts the RAW binary representation of a BINARY_FLOAT into a BINARY_FLOAT
<a href="#">CAST_TO_BINARY_INTEGER Function</a> (page 270-11)	Casts the RAW binary representation of a BINARY_INTEGER into a BINARY_INTEGER
<a href="#">CAST_TO_NUMBER Function</a> (page 270-12)	Casts the RAW binary representation of a NUMBER into a NUMBER
<a href="#">CAST_TO_NVARCHAR2 Function</a> (page 270-12)	Converts a RAW value into a VARCHAR2 value
<a href="#">CAST_TO_RAW Function</a> (page 270-13)	Converts a VARCHAR2 value into a RAW value
<a href="#">CAST_TO_VARCHAR2 Function</a> (page 270-14)	Converts a RAW value into a VARCHAR2 value
<a href="#">COMPARE Function</a> (page 270-15)	Compares RAW <i>r1</i> against RAW <i>r2</i>
<a href="#">CONCAT Function</a> (page 270-15)	Concatenates up to 12 RAWs into a single RAW
<a href="#">CONVERT Function</a> (page 270-16)	Converts RAW <i>r</i> from character set <i>from_charset</i> to character set <i>to_charset</i> and returns the resulting RAW
<a href="#">COPIES Function</a> (page 270-17)	Returns <i>n</i> copies of <i>r</i> concatenated together
<a href="#">LENGTH Function</a> (page 270-18)	Returns the length in bytes of a RAW <i>r</i>
<a href="#">OVERLAY Function</a> (page 270-19)	Overlays the specified portion of target RAW with overlay RAW, starting from byte position <i>pos</i> of target and proceeding for <i>len</i> bytes
<a href="#">REVERSE Function</a> (page 270-20)	Reverses a byte sequence in RAW <i>r</i> from end to end

**Table 270-1 (Cont.) UTL\_RAW Package Subprograms**

Subprogram	Description
<a href="#">SUBSTR Function</a> (page 270-21)	Returns <code>len</code> bytes, starting at <code>pos</code> from RAW <code>r</code>
<a href="#">TRANSLATE Function</a> (page 270-22)	Translates the bytes in the input RAW <code>r</code> according to the bytes in the translation RAWs <code>from_set</code> and <code>to_set</code>
<a href="#">TRANSLITERATE Function</a> (page 270-24)	Converts the bytes in the input RAW <code>r</code> according to the bytes in the transliteration RAWs <code>from_set</code> and <code>to_set</code>
<a href="#">XRANGE Function</a> (page 270-26)	Returns a RAW containing all valid 1-byte encodings in succession, beginning with the value <code>start_byte</code> and ending with the value <code>end_byte</code>

## 270.3.1 BIT\_AND Function

This function performs bitwise logical "and" of the values in RAW `r1` with RAW `r2` and returns the "anded" result RAW.

### Syntax

```
UTL_RAW.BIT_AND (
 r1 IN RAW,
 r2 IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(bit_and, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 270-2 BIT\_AND Function Parameters**

Parameter	Description
<code>r1</code>	RAW to "and" with <code>r2</code>
<code>r2</code>	RAW to "and" with <code>r1</code>

### Return Values

**Table 270-3 BIT\_AND Function Return Values**

Return	Description
RAW	Containing the "and" of <code>r1</code> and <code>r2</code>
NULL	Either <code>r1</code> or <code>r2</code> input parameter was NULL

### Usage Notes

If `r1` and `r2` differ in length, the and operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

## 270.3.2 BIT\_COMPLEMENT Function

This function performs bitwise logical "complement" of the values in RAW *r* and returns the complemented result RAW. The result length equals the input RAW *r* length.

### Syntax

```
UTL_RAW.BIT_COMPLEMENT (
 r IN RAW)
 RETURN RAW;
```

### Pragmas

```
pragma restrict_references(bit_complement, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 270-4 BIT\_COMPLEMENT Function Parameters**

Parameter	Description
<i>r</i>	RAW to perform "complement" operation

### Return Values

**Table 270-5 BIT\_COMPLEMENT Function Return Values**

Return	Description
RAW	The "complement" of <i>r1</i>
NULL	If <i>r</i> input parameter was NULL

## 270.3.3 BIT\_OR Function

This function performs bitwise logical "or" of the values in RAW *r1* with RAW *r2* and returns the or'd result RAW.

### Syntax

```
UTL_RAW.BIT_OR (
 r1 IN RAW,
 r2 IN RAW)
 RETURN RAW;
```

### Pragmas

```
pragma restrict_references(bit_or, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 270-6 BIT\_OR Function Parameters**

Parameters	Description
r1	RAW to "or" with r2
r2	RAW to "or" with r1

## Return Values

**Table 270-7 BIT\_OR Function Return Values**

Return	Description
RAW	Containing the "or" of r1 and r2
NULL	Either r1 or r2 input parameter was NULL

## Usage Notes

If r1 and r2 differ in length, then the "or" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

## 270.3.4 BIT\_XOR Function

This function performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the xor'd result RAW.

### Syntax

```
UTL_RAW.BIT_XOR (
 r1 IN RAW,
 r2 IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(bit_xor, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 270-8 BIT\_XOR Function Parameters**

Parameter	Description
r1	RAW to "xor" with r2
r2	RAW to "xor" with r1

## Return Values

**Table 270-9 BIT\_XOR Function Return Values**

Return	Description
RAW	Containing the "xor" of <code>r1</code> and <code>r2</code>
NULL	If either <code>r1</code> or <code>r2</code> input parameter was NULL

## Usage Notes

If `r1` and `r2` differ in length, then the "xor" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

## 270.3.5 CAST\_FROM\_BINARY\_DOUBLE Function

This function returns the RAW binary representation of a BINARY\_DOUBLE value.

### Syntax

```
UTL_RAW.CAST_FROM_BINARY_DOUBLE(
 n IN BINARY_DOUBLE,
 endianness IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(cast_from_binary_double, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 270-10 CAST\_FROM\_BINARY\_DOUBLE Function Parameters**

Parameter	Description
<code>n</code>	BINARY_DOUBLE value
<code>endianness</code>	A BINARY_INTEGER value indicating the endianness. The function recognizes the defined constants <code>big_endian</code> (1), <code>little_endian</code> (2), and <code>machine_endian</code> (3). The default is <code>big_endian</code> . A setting of <code>machine_endian</code> has the same effect as <code>big_endian</code> on a big endian machine, or the same effect as <code>little_endian</code> on a little endian machine.

### Return Values

The binary representation of the BINARY\_DOUBLE value, or NULL if the input is NULL.

### Usage Notes

- An 8-byte `binary_double` value maps to the IEEE 754 double-precision format as follows:

```
byte 0: bit 63 ~ bit 56
byte 1: bit 55 ~ bit 48
byte 2: bit 47 ~ bit 40
```

```
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit 8
byte 7: bit 7 ~ bit 0
```

- The parameter `endianess` describes how the bytes of `BINARY_DOUBLE` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb7` refer to the bytes in `raw` and `db0 ~ db7` refer to the bytes in `BINARY_DOUBLE`.

endianess	rb0	rb1	rb2	rb3	rb4	rb5	rb6	rb7
<code>big_endian</code>	db0	db1	db2	db3	db4	db5	db6	db7
<code>little_endian</code>	db7	db6	db5	db4	db3	db2	db1	db0

- In case of machine-endian, the 8 bytes of the `BINARY_DOUBLE` argument are copied straight across into the `RAW` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

## 270.3.6 CAST\_FROM\_BINARY\_FLOAT Function

This function returns the `RAW` binary representation of a `BINARY_FLOAT` value.

### Syntax

```
UTL_RAW.CAST_FROM_BINARY_FLOAT(
 n IN BINARY_FLOAT,
 endianess IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(cast_from_binary_float, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 270-11** CAST\_FROM\_BINARY\_FLOAT Function Parameters

Parameter	Description
<code>n</code>	<code>BINARY_FLOAT</code> value
<code>endianess</code>	A <code>BINARY_INTEGER</code> value indicating the endianess. The function recognizes the defined constants <code>big_endian</code> (1), <code>little_endian</code> (2), and <code>machine_endian</code> (3). The default is <code>big_endian</code> . A setting of <code>machine_endian</code> has the same effect as <code>big_endian</code> on a big endian machine, or the same effect as <code>little_endian</code> on a little endian machine.

### Return Values

The binary representation (`RAW`) of the `BINARY_FLOAT` value, or `NULL` if the input is `NULL`.

### Usage Notes

- A 4-byte `binary_float` value maps to the IEEE 754 single-precision format as follows:

byte 0: bit 31 ~ bit 24  
 byte 1: bit 23 ~ bit 16  
 byte 2: bit 15 ~ bit 8  
 byte 3: bit 7 ~ bit 0

- The parameter `endianess` describes how the bytes of `BINARY_FLOAT` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb3` refer to the bytes in `RAW` and `fb0 ~ fb3` refer to the bytes in `BINARY_FLOAT`.

Endianess	rb0	rb1	rb2	rb3
<code>big_endian</code>	fb0	fb1	fb2	fb3
<code>little_endian</code>	fb3	fb2	fb1	fb0

- In case of machine-endian, the 4 bytes of the `BINARY_FLOAT` argument are copied straight across into the `RAW` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

## 270.3.7 CAST\_FROM\_BINARY\_INTEGER Function

This function returns the `RAW` binary representation of a `BINARY_INTEGER` value.

### Syntax

```
UTL_RAW.CAST_FROM_BINARY_INTEGER (
 n IN BINARY_INTEGER
 endianess IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(cast_from_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 270-12 CAST\_FROM\_BINARY\_INTEGER Function Parameters**

Parameter	Description
<code>n</code>	<code>BINARY_INTEGER</code> value.
<code>endianess</code>	A <code>BINARY_INTEGER</code> value indicating the endianess. The function recognizes the defined constants <code>big_endian</code> (1), <code>little_endian</code> (2), and <code>machine_endian</code> (3). The default is <code>big_endian</code> . A setting of <code>machine_endian</code> has the same effect as <code>big_endian</code> on a big endian machine, or the same effect as <code>little_endian</code> on a little endian machine.

### Return Values

The binary representation of the `BINARY_INTEGER` value.

## 270.3.8 CAST\_FROM\_NUMBER Function

This function returns the RAW binary representation of a NUMBER value.

### Syntax

```
UTL_RAW.CAST_FROM_NUMBER (
 n IN NUMBER)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(cast_from_number, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 270-13** CAST\_FROM\_NUMBER Function Parameters

Parameter	Description
n	NUMBER value

### Return Values

The binary representation of the NUMBER value.

## 270.3.9 CAST\_TO\_BINARY\_DOUBLE Function

This function casts the RAW binary representation of a BINARY\_DOUBLE into a BINARY\_DOUBLE.

### Syntax

```
UTL_RAW.CAST_TO_BINARY_DOUBLE (
 r IN RAW
 endianess IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

### Pragmas

```
pragma restrict_references(cast_to_binary_double, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 270-14** CAST\_TO\_BINARY\_DOUBLE Function Parameters

Parameter	Description
r	Binary representation of a BINARY_DOUBLE
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

### Return Values

The BINARY\_DOUBLE value.

### Usage Notes

- If the `RAW` argument is more than 8 bytes, only the first 8 bytes are used and the rest of the bytes are ignored. If the result is `-0`, `+0` is returned. If the result is `NaN`, the value `BINARY_DOUBLE_NAN` is returned.
- If the `RAW` argument is less than 8 bytes, a `VALUE_ERROR` exception is raised.
- An 8-byte binary\_double value maps to the IEEE 754 double-precision format as follows:
 

```
byte 0: bit 63 ~ bit 56
byte 1: bit 55 ~ bit 48
byte 2: bit 47 ~ bit 40
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit 8
byte 7: bit 7 ~ bit 0
```
- The parameter `endianess` describes how the bytes of `BINARY_DOUBLE` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb7` refer to the bytes in `raw` and `db0 ~ db7` refer to the bytes in `BINARY_DOUBLE`.

Architecture	rb0	rb1	rb2	rb3	rb4	rb5	rb6	rb7
<code>big_endian</code>	db0	db1	db2	db3	db4	db5	db6	db7
<code>little_endian</code>	db7	db6	db5	db4	db3	db2	db1	db0

- In case of machine-endian, the 8 bytes of the `RAW` argument are copied straight across into the `BINARY_DOUBLE` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

## 270.3.10 CAST\_TO\_BINARY\_FLOAT Function

This function casts the `RAW` binary representation of a `BINARY_FLOAT` into a `BINARY_FLOAT`.

### Syntax

```
UTL_RAW.CAST_TO_BINARY_FLOAT (
 r IN RAW
 endianess IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_FLOAT;
```

### Pragmas

```
pragma restrict_references(cast_to_binary_float, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 270-15 CAST\_TO\_BINARY\_FLOAT Function Parameters**

Parameter	Description
<code>r</code>	Binary representation of a <code>BINARY_FLOAT</code>

**Table 270-15 (Cont.) CAST\_TO\_BINARY\_FLOAT Function Parameters**

Parameter	Description
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

**Return Values**

The BINARY\_FLOAT value.

**Usage Notes**

- If the RAW argument is more than 4 bytes, only the first 4 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY\_FLOAT\_NAN is returned.
- If the RAW argument is less than 4 bytes, a VALUE\_ERROR exception is raised.
- A 4-byte binary\_float value maps to the IEEE 754 single-precision format as follows:

```
byte 0: bit 31 ~ bit 24
byte 1: bit 23 ~ bit 16
byte 2: bit 15 ~ bit 8
byte 3: bit 7 ~ bit 0
```

- The parameter endianess describes how the bytes of BINARY\_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY\_FLOAT.

Endianness	rb0	rb1	rb2	rb3
big_endian	fb0	fb1	fb2	fb3
little_endian	fb3	fb2	fb1	fb0

- In case of machine-endian, the 4 bytes of the RAW argument are copied straight across into the BINARY\_FLOAT return value. The effect is the same if the user has passed big\_endian on a big-endian machine, or little\_endian on a little-endian machine.

## 270.3.11 CAST\_TO\_BINARY\_INTEGER Function

This function casts the RAW binary representation of a BINARY\_INTEGER into a BINARY\_INTEGER.

**Syntax**

```
UTL_RAW.CAST_TO_BINARY_INTEGER (
 r IN RAW
 endianess IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN BINARY_INTEGER;
```

**Pragmas**

```
pragma restrict_references(cast_to_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 270-16 CAST\_TO\_BINARY\_INTEGER Function Parameters**

Parameter	Description
<code>r</code>	Binary representation of a <code>BINARY_INTEGER</code>
<code>endianess</code>	A <code>PLS_INTEGER</code> representing big-endian or little-endian architecture. The default is big-endian.

## Return Values

The `BINARY_INTEGER` value

## 270.3.12 CAST\_TO\_NUMBER Function

This function casts the RAW binary representation of a `NUMBER` into a `NUMBER`.

### Syntax

```
UTL_RAW.CAST_TO_NUMBER (
 r IN RAW)
RETURN NUMBER;
```

### Pragmas

```
pragma restrict_references(cast_to_number, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 270-17 CAST\_TO\_NUMBER function Parameters**

Parameter	Description
<code>r</code>	Binary representation of a <code>NUMBER</code>

## Return Values

The `NUMBER` value.

## 270.3.13 CAST\_TO\_NVARCHAR2 Function

This function converts a `RAW` value represented using some number of data bytes into an `NVARCHAR2` value with that number of data bytes.

 **Note:**

When casting to a `NVARCHAR2`, the current Globalization Support character set is used for the characters within that `NVARCHAR2` value.

**Syntax**

```
UTL_RAW.CAST_TO_NVARCHAR2 (
 r IN RAW)
RETURN NVARCHAR2;
```

**Pragmas**

```
pragma restrict_references(cast_to_NVARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

**Parameters****Table 270-18 CAST\_TO\_NVARCHAR2 Function Parameters**

Parameter	Description
r	RAW (without leading length field) to be changed to a NVARCHAR2)

**Return Values****Table 270-19 CAST\_TO\_NVARCHAR2 Function Return Values**

Return	Description
NVARCHAR2	Containing having the same data as the input RAW
NULL	If r input parameter was NULL

## 270.3.14 CAST\_TO\_RAW Function

This function converts a VARCHAR2 value represented using some number of data bytes into a RAW value with that number of data bytes. The data itself is not modified in any way, but its datatype is recast to a RAW datatype.

**Syntax**

```
UTL_RAW.CAST_TO_RAW (
 c IN VARCHAR2)
RETURN RAW;
```

**Pragmas**

```
pragma restrict_references(cast_to_raw, WNDS, RNDS, WNPS, RNPS);
```

**Parameters****Table 270-20 CAST\_TO\_RAW Function Parameters**

Parameter	Description
c	VARCHAR2 to be changed to a RAW

## Return Values

**Table 270-21 CAST\_TO\_RAW Function Return Values**

Return	Description
RAW	Containing the same data as the input VARCHAR2 and equal byte length as the input VARCHAR2 and without a leading length field
NULL	If <i>c</i> input parameter was NULL

## 270.3.15 CAST\_TO\_VARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into a VARCHAR2 value with that number of data bytes.

### Note:

When casting to a VARCHAR2, the current Globalization Support character set is used for the characters within that VARCHAR2.

### Syntax

```
UTL_RAW.CAST_TO_VARCHAR2 (
 r IN RAW)
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references(cast_to_VARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 270-22 CAST\_TO\_VARCHAR2 Function Parameters**

Parameter	Description
<i>r</i>	RAW (without leading length field) to be changed to a VARCHAR2

## Return Values

**Table 270-23 CAST\_TO\_VARCHAR2 Function Return Values**

Return	Description
VARCHAR2	Containing having the same data as the input RAW
NULL	If <i>r</i> input parameter was NULL

## 270.3.16 COMPARE Function

This function compares two RAW values. If they differ in length, then the shorter is extended on the right according to the optional `pad` parameter.

### Syntax

```
UTL_RAW.COMPARE (
 r1 IN RAW,
 r2 IN RAW,
 pad IN RAW DEFAULT NULL)
RETURN NUMBER;
```

### Pragmas

```
pragma restrict_references(compare, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 270-24 COMPARE Function Parameters**

Parameter	Description
<code>r1</code>	1st RAW to be compared, may be NULL or 0 length
<code>r2</code>	2nd RAW to be compared, may be NULL or 0 length
<code>pad</code>	This is an optional parameter. Byte to extend whichever of <code>r1</code> or <code>r2</code> is shorter. The default: <code>x'00'</code>

### Return Values

**Table 270-25 COMPARE Function Return Values**

Return	Description
NUMBER	Equals 0 if RAW byte strings are both NULL or identical; or, Equals position (numbered from 1) of the first mismatched byte

## 270.3.17 CONCAT Function

This function concatenates up to 12 RAWs into a single RAW. If the concatenated size exceeds 32K, then an error is returned

### Syntax

```
UTL_RAW.CONCAT (
 r1 IN RAW DEFAULT NULL,
 r2 IN RAW DEFAULT NULL,
 r3 IN RAW DEFAULT NULL,
 r4 IN RAW DEFAULT NULL,
 r5 IN RAW DEFAULT NULL,
 r6 IN RAW DEFAULT NULL,
 r7 IN RAW DEFAULT NULL,
 r8 IN RAW DEFAULT NULL,
 r9 IN RAW DEFAULT NULL,
 r10 IN RAW DEFAULT NULL,
```

```
r11 IN RAW DEFAULT NULL,
r12 IN RAW DEFAULT NULL)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(concat, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

r1...r12 are the RAW items to concatenate.

### Return Values

**Table 270-26 CONCAT Function Return Values**

Return	Description
RAW	Containing the items concatenated

### Exceptions

There is an error if the sum of the lengths of the inputs exceeds the maximum allowable length for a RAW, which is 32767 bytes.

## 270.3.18 CONVERT Function

This function converts RAW *r* from character set *from\_charset* to character set *to\_charset* and returns the resulting RAW.

Both *from\_charset* and *to\_charset* must be supported character sets defined to the Oracle server.

### Syntax

```
UTL_RAW.CONVERT (
 r IN RAW,
 to_charset IN VARCHAR2,
 from_charset IN VARCHAR2)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(convert, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 270-27 CONVERT Function Parameters**

Parameter	Description
<i>r</i>	RAW byte-string to be converted
<i>to_charset</i>	Name of the character set to which <i>r</i> is converted
<i>from_charset</i>	Name of the character set in which <i>r</i> is supplied

## Return Values

**Table 270-28 CONVERT Function Return Values**

Return	Description
RAW	Byte string <i>r</i> converted according to the specified character sets.

## Exceptions

**Table 270-29 CONVERT Function Exceptions**

Error	Description
ORA-06502	PL/SQL: numeric or value error
ORA-12703	This character set conversion is not supported
ORA-12705	Cannot access NLS data files or invalid environment specified

## Usage Notes

- The NLS\_LANG parameter form *language\_territory.character set* is also accepted for *to\_charset* and *from\_charset*. However, this form is deprecated and should be avoided. Note that *language* and *territory* are ignored by this subprogram.
- The converted value is silently truncated if it exceeds the maximum length of a RAW value, which is 32767 bytes. Do not convert values longer than  $\text{floor}(32767/4) = 8191$  bytes if you want to avoid this truncation for all possible combinations of *to\_charset* and *from\_charset*. You can use the maximum character width of the target character set *to\_charset*, if known, to expand the limit to a less pessimistic value. For example, if the target character set is ZHS16GBK, the maximum safe source string length is  $\text{floor}(32767/2) = 16383$  bytes. For single-byte target character sets, no truncation is ever necessary.

## 270.3.19 COPIES Function

This function returns *n* copies of *r* concatenated together.

### Syntax

```
UTL_RAW.COPIES (
 r IN RAW,
 n IN NUMBER)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(copies, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 270-30 COPIES Function Parameters**

Parameters	Description
r	RAW to be copied
n	Number of times to copy the RAW (must be positive)

## Return Values

This returns the RAW copied n times.

## Exceptions

**Table 270-31 COPIES Function Exceptions**

Error	Description
VALUE_ERROR	Either: - r is missing, NULL or 0 length - n < 1 - Length of result exceeds maximum length of a RAW

## 270.3.20 LENGTH Function

This function returns the length in bytes of a RAW r.

### Syntax

```
UTL_RAW.LENGTH (
 r IN RAW)
RETURN NUMBER;
```

### Pragmas

```
pragma restrict_references(length, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 270-32 LENGTH Function Parameters**

Parameter	Description
r	RAW byte stream to be measured

## Return Values

**Table 270-33 LENGTH Function Return Values**

Return	Description
NUMBER	Current length of the RAW

## 270.3.21 OVERLAY Function

This function overlays the specified portion of target RAW with overlay\_str RAW, starting from byte position pos of target and proceeding for len bytes.

### Syntax

```
UTL_RAW.OVERLAY (
 overlay_str IN RAW,
 target IN RAW,
 pos IN BINARY_INTEGER DEFAULT 1,
 len IN BINARY_INTEGER DEFAULT NULL,
 pad IN RAW DEFAULT NULL)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(overlay, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 270-34 OVERLAY Function Parameters**

Parameters	Description
overlay_str	Byte-string used to overlay target
target	Byte-string which is to be overlaid
pos	Position in target (numbered from 1) to start overlay
len	The number of target bytes to overlay
pad	Pad byte used when overlay len exceeds overlay_str length or pos exceeds target length

### Defaults and Optional Parameters

**Table 270-35 OVERLAY Function Optional Parameters**

Optional Parameter	Description
pos	1
len	To the length of overlay_str
pad	x'00'

### Return Values

**Table 270-36 OVERLAY Function Return Values**

Return	Description
RAW	The target byte_string overlaid as specified.

### Usage Notes

If `overlay_str` has less than `len` bytes, then it is extended to `len` bytes using the `pad` byte. If `overlay_str` exceeds `len` bytes, then the extra bytes in `overlay_str` are ignored. If `len` bytes beginning at position `pos` of `target` exceeds the length of `target`, then `target` is extended to contain the entire length of `overlay_str`.

If `len` is specified, it must be greater than or equal to 0. If `pos` is specified, it must be greater than or equal to 1. If `pos` exceeds the length of `target`, then `target` is padded with `pad` bytes to position `pos`, and `target` is further extended with `overlay_str` bytes.

### Exceptions

**Table 270-37 OVERLAY Function Exceptions**

Error	Description
VALUE_ERROR	Either: <ul style="list-style-type: none"> <li>- <code>overlay_str</code> is NULL or has 0 length</li> <li>- Target is missing or undefined</li> <li>- Length of target exceeds maximum length of a RAW</li> <li>- <code>len</code> &lt; 0</li> <li>- <code>pos</code> &lt; 1</li> </ul>

## 270.3.22 REVERSE Function

This function reverses a byte sequence in RAW `r` from end to end.

For example, `x'0102F3'` would be reversed to `x'F30201'`, and `'xyz'` would be reversed to `'zyx'`. The result length is the same as the input RAW length.

### Syntax

```
UTL_RAW.REVERSE (
 r IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(reverse, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 270-38 REVERSE Function Parameters**

Parameter	Description
<code>r</code>	RAW to reverse

## Return Values

**Table 270-39 REVERSE Function Return Values**

Return	Description
RAW	Containing the "reverse" of <i>r</i>

## Exceptions

**Table 270-40 REVERSE Function Exceptions**

Error	Description
VALUE_ERROR	<i>r</i> IS NULL or has 0 length

## 270.3.23 SUBSTR Function

This function returns *len* bytes, starting at *pos* from RAW *r*.

### Syntax

```
UTL_RAW.SUBSTR (
 r IN RAW,
 pos IN BINARY_INTEGER,
 len IN BINARY_INTEGER DEFAULT NULL)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(substr, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 270-41 SUBSTR Function Parameters**

Parameter	Description
<i>r</i>	RAW byte-string from which a portion is extracted
<i>pos</i>	Byte position in <i>r</i> at which to begin extraction
<i>len</i>	Number of bytes from <i>pos</i> to extract from <i>r</i> (optional)

### Defaults and Optional Parameters

**Table 270-42 SUBSTR Function Optional Parameter**

Optional Parameter	Description
<i>len</i>	Position <i>pos</i> through to the end of <i>r</i>

## Return Values

**Table 270-43 SUBSTR Function Return Values**

Return	Description
portion of <i>r</i>	Beginning at <i>pos</i> for <i>len</i> bytes long
NULL	<i>r</i> input parameter was NULL

## Usage Notes

- If *pos* is positive, then `SUBSTR` counts from the beginning of *r* to find the first byte. If *pos* is negative, then `SUBSTR` counts backward from the end of the *r*. The value *pos* cannot be 0.
- If *len* is omitted, then `SUBSTR` returns all bytes to the end of *r*. The value *len* cannot be less than 1.

## Exceptions

**Table 270-44 SUBSTR Function Exceptions**

Error	Description
VALUE_ERROR	VALUE_ERROR is returned if: <ul style="list-style-type: none"> <li>• <i>pos</i> = 0 or &gt; length of <i>r</i></li> <li>• <i>len</i> &lt; 1 or &gt; length of <i>r</i> - (<i>pos</i>-1)</li> </ul>

## 270.3.24 TRANSLATE Function

This function translates the bytes in the input RAW *r* according to the bytes in the translation RAWs *from\_set* and *to\_set*.

If a byte in *r* has a matching byte in *from\_set*, then it is replaced by the byte in the corresponding position in *to\_set*, or deleted.

Bytes in *r*, but undefined in *from\_set*, are copied to the result. Only the first (leftmost) occurrence of a byte in *from\_set* is used. Subsequent duplicates are not scanned and are ignored.

### Syntax

```
UTL_RAW.TRANSLATE (
 r IN RAW,
 from_set IN RAW,
 to_set IN RAW)
RETURN RAW;
```

 **Note:**

Be aware that *to\_set* and *from\_set* are reversed in the calling sequence compared to `TRANSLITERATE`.

## Pragmas

```
pragma restrict_references(translate, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 270-45 TRANSLATE Function Parameters**

Parameter	Description
<code>r</code>	RAW source byte-string to be translated
<code>from_set</code>	RAW byte-codes to be translated, if present in <code>r</code>
<code>to_set</code>	RAW byte-codes to which corresponding <code>from_str</code> bytes are translated

## Return Values

**Table 270-46 TRANSLATE Function Return Values**

Return	Description
RAW	Translated byte-string

## Usage Notes

- If `to_set` is shorter than `from_set`, the extra `from_set` bytes have no corresponding translation bytes. Bytes from the input RAW that match any such `from_set` bytes are not translated or included in the result. They are effectively translated to NULL.
- If `to_set` is longer than `from_set`, the extra `to_set` bytes are ignored.
- If a byte value is repeated in `from_set`, the repeated occurrence is ignored.

 **Note:**

Differences from the [TRANSLITERATE Function](#) (page 270-24):

- The `from_set` parameter comes before the `to_set` parameter in the calling sequence.
- Bytes from `r` that appear in `from_set` but have no corresponding values in `to_set` are not translated or included in the result.
- The resulting RAW value may be shorter than the input RAW value.

Note that `TRANSLATE` and `TRANSLITERATE` only differ in functionality when `to_set` has fewer bytes than `from_set`.

## Exceptions

**Table 270-47 TRANSLATE Function Exceptions**

Error	Description
VALUE_ERROR	Either: <ul style="list-style-type: none"> <li>- <i>r</i> is NULL or has 0 length</li> <li>- <i>from_set</i> is NULL or has 0 length</li> <li>- <i>to_set</i> is NULL or has 0 length</li> </ul>

## 270.3.25 TRANSLITERATE Function

This function converts the bytes in the input RAW *r* according to the bytes in the transliteration RAWs *from\_set* and *to\_set*.

Successive bytes in *r* are looked up in the *from\_set*, and, if not found, copied unaltered to the result RAW. If found, then they are replaced in the result RAW by either corresponding bytes in the *to\_set*, or the *pad* byte when no correspondence exists.

Bytes in *r*, but undefined in *from\_set*, are copied to the result. Only the first (leftmost) occurrence of a byte in *from\_set* is used. Subsequent duplicates are not scanned and are ignored. The result RAW is always the same length as *r*.

### Syntax

```
UTL_RAW.TRANSLITERATE (
 r IN RAW,
 to_set IN RAW DEFAULT NULL,
 from_set IN RAW DEFAULT NULL,
 pad IN RAW DEFAULT NULL)
RETURN RAW;
```

**Note:**

Be aware that *to\_set* and *from\_set* are reversed in the calling sequence compared to TRANSLATE.

### Pragmas

```
pragma restrict_references(transliterate, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 270-48 TRANSLITERATE Function Parameters**

Parameter	Description
<i>r</i>	RAW input byte-string to be converted
<i>to_set</i>	RAW byte-codes to which corresponding <i>from_set</i> bytes are converted (any length)

**Table 270-48 (Cont.) TRANSLITERATE Function Parameters**

Parameter	Description
<code>from_set</code>	RAW byte-codes to be converted, if presenting <code>r</code> (any length)
<code>pad</code>	1 byte used when <code>to_set</code> is shorter than the <code>from_set</code>

### Defaults and Optional Parameters

**Table 270-49 TRANSLITERATE Function Optional Parameters**

Optional Parameter	Description
<code>to_set</code>	To the NULL string and effectively extended with <code>pad</code> to the length of <code>from_set</code> as necessary
<code>from_set</code>	<code>x'00'</code> through <code>x'fff'</code>
<code>pad</code>	<code>x'00'</code>

### Return Values

**Table 270-50 TRANSLITERATE Function Return Values**

Return	Description
RAW	Converted byte-string.

### Usage Notes

- If `to_set` is shorter than `from_set`, the extra `from_set` bytes have no corresponding conversion bytes. Bytes from the input RAW that match any such `from_set` bytes are converted in the result to the `pad` byte instead.
- If `to_set` is longer than `from_set`, the extra `to_set` bytes are ignored.
- If a byte value is repeated in `from_set`, the repeated occurrence is ignored.

#### Note:

Differences from the [TRANSLATE Function](#) (page 270-22):

- The `to_set` parameter comes before the `from_set` parameter in the calling sequence.
- Bytes from `r` that appear in `from_set` but have no corresponding values in `to_set` are replaced by `pad` in the result.
- The resulting RAW value always has the same length as the input RAW value.

Note that `TRANSLATE` and `TRANSLITERATE` only differ in functionality when `to_set` has fewer bytes than `from_set`.

## Exceptions

**Table 270-51** TRANSLITERATE Function Exceptions

Error	Description
VALUE_ERROR	R is NULL or has 0 length

## 270.3.26 XRANGE Function

This function returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-codes. The specified byte-codes must be single-byte RAW values. If the `start_byte` value is greater than the `end_byte` value, then the succession of resulting bytes begins with `start_byte`, wraps through `x'FF'` back to `x'00'`, then ends at `end_byte`.

### Syntax

```
UTL_RAW.XRANGE (
 start_byte IN RAW DEFAULT NULL,
 end_byte IN RAW DEFAULT NULL)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(xrange, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 270-52** XRANGE Function Parameters

Parameters	Description
<code>start_byte</code>	Beginning byte-code value of resulting sequence. The default is <code>x'00'</code> .
<code>end_byte</code>	Ending byte-code value of resulting sequence. The default is <code>x'FF'</code> .

### Return Values

**Table 270-53** XRANGE Function Return Values

Return	Description
RAW	Containing succession of 1-byte hexadecimal encodings

# 271

## UTL\_RECOMP

The UTL\_RECOMP package recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallel.

This chapter contains the following topics:

- [Overview](#) (page 271-1)
- [Operational Notes](#) (page 271-1)
- [Examples](#) (page 271-2)
- [Summary of UTL\\_RECOMP Subprograms](#) (page 271-2)

### 271.1 UTL\_RECOMP Overview

This script is particularly useful after a major-version upgrade that typically invalidates all PL/SQL and Java objects. Although invalid objects are recompiled automatically on use, it is useful to run this script prior to operation because this will either eliminate or minimize subsequent latencies due to on-demand automatic recompilation at runtime.

Parallel recompilation can exploit multiple CPUs to reduce the time taken to recompile invalid objects. The degree of parallelism is specified by the first argument to [RECOMP\\_PARALLEL Procedure](#) (page 271-2).

In general, a parallelism setting of one thread for each available CPU provides a good initial setting. However, please note that the process of recompiling an invalid object writes a significant amount of data to system tables and is fairly I/O intensive. A slow disk system may be a significant bottleneck and limit speedups available from a higher degree of parallelism.

### 271.2 UTL\_RECOMP Operational Notes

UTL\_RECOMP has several operational notes.

- This package uses the job queue for parallel recompilation.
- This package must be run using `SQL*PLUS`.
- You must be connected `AS SYSDBA` to run this script.
- This package expects the following packages to have been created with `VALID` status:
  - `STANDARD` (`standard.sql`)
  - `DBMS_STANDARD` (`dbmsstdx.sql`)
  - `DBMS_JOB` (`dbmsjob.sql`)
  - `DBMS_RANDOM` (`dbmsrand.sql`)
- There should be no other DDL on the database while running entries in this package. Not following this recommendation may lead to deadlocks.

## 271.3 UTL\_RECOMP Examples

These examples show various ways that UTL\_RECOMP can recompile objects.

- Recompile all objects sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL();
```

- Recompile objects in schema SCOTT sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL('SCOTT');
```

- Recompile all objects using 4 parallel threads:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(4);
```

- Recompile objects in schema JOE using the number of threads specified in the parameter JOB\_QUEUE\_PROCESSES:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(NULL, 'JOE');
```

## 271.4 Summary of UTL\_RECOMP Subprograms

This table lists the UTL\_RECOMP subprograms and briefly describes them.

**Table 271-1 UTL\_RECOMP Package Subprograms**

Subprogram	Description
<a href="#">RECOMP_PARALLEL Procedure</a> (page 271-2)	Recompiles invalid objects in a given schema, or all invalid objects in the database, in parallel
<a href="#">RECOMP_SERIAL Procedure</a> (page 271-3)	Recompiles invalid objects in a given schema or all invalid objects in the database

### 271.4.1 RECOMP\_PARALLEL Procedure

This procedure uses the information exposed in the DBA\_Dependencies view to recompile invalid objects in the database, or in a given schema, in parallel.

#### Syntax

```
UTL_RECOMP.RECOMP_PARALLEL(
 threads IN PLS_INTEGER DEFAULT NULL,
 schema IN VARCHAR2 DEFAULT NULL,
 flags IN PLS_INTEGER DEFAULT 0);
```

#### Parameters

**Table 271-2 RECOMP\_PARALLEL Procedure Parameters**

Parameter	Description
threads	The number of recompile threads to run in parallel. If NULL, use the value of 'job_queue_processes'.
schema	The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.

**Table 271-2 (Cont.) RECOMP\_PARALLEL Procedure Parameters**

Parameter	Description
flags	Flag values are intended for internal testing and diagnosability only.

**Usage Notes**

The parallel recompile exploits multiple CPUs to reduce the time taken to recompile invalid objects. However, please note that recompilation writes significant amounts of data to system tables, so the disk system may be a bottleneck and prevent significant speedups.

## 271.4.2 RECOMP\_SERIAL Procedure

This procedure recompiles invalid objects in a given schema or all invalid objects in the database.

**Syntax**

```
UTL_RECOMP.RECOMP_SERIAL(
 schema IN VARCHAR2 DEFAULT NULL,
 flags IN PLS_INTEGER DEFAULT 0);
```

**Parameters****Table 271-3 RECOMP\_SERIAL Procedure Parameters**

Parameter	Description
schema	The schema in which to recompile invalid objects. If <code>NULL</code> , all invalid objects in the database are recompiled.
flags	Flag values are intended for internal testing and diagnosability only.

# 272

## UTL\_REF

The `UTL_REF` package provides PL/SQL procedures to support reference-based operations. Unlike SQL, `UTL_REF` procedures enable you to write generic type methods without knowing the object table name.

This chapter contains the following topics:

- [Overview](#) (page 272-1)
- [Security Model](#) (page 272-1)
- [Types](#) (page 272-2)
- [Exceptions](#) (page 272-2)
- [Summary of UTL\\_REF Subprograms](#) (page 272-3)

### 272.1 UTL\_REF Overview

`UTL_REF` procedures enable you to write generic type methods without knowing the object table name.

Oracle supports user-defined composite type or object type. Any instance of an object type is called an object. An object type can be used as the type of a column or as the type of a table.

In an object table, each row of the table stores an object. You can uniquely identify an object in an object table with an object identifier.

A reference is a persistent pointer to an object, and each reference can contain an object identifier. The reference can be an attribute of an object type, or it can be stored in a column of a table. Given a reference, an object can be retrieved.

### 272.2 UTL\_REF Security Model

The procedural option is needed to use this package. This package must be created under `SYS` (`CONNECT /AS SYSDBA`). Operations provided by this package are performed under the current calling user, not under the package owner `SYS`.

You can use the `UTL_REF` package from stored PL/SQL procedures/packages on the server, as well as from client/side PL/SQL code.

When invoked from PL/SQL procedures/packages on the server, `UTL_REF` verifies that the invoker has the appropriate privileges to access the object pointed to by the `REF`.

 **Note:**

This is in contrast to PL/SQL packages/procedures on the server which operate with definer's privileges, where the package owner must have the appropriate privileges to perform the desired operations.

Thus, if `UTL_REF` is defined under user `SYS`, and user `A` invokes `UTL_REF.SELECT` to select an object from a reference, then user `A` (the invoker) requires the privileges to check.

When invoked from client-side PL/SQL code, `UTL_REF` operates with the privileges of the client session under which the PL/SQL execution is being done.

## 272.3 UTL\_REF Types

An object type is a composite datatype defined by the user or supplied as a library type.

You can create the object type `employee_type` using the following syntax:

```
CREATE TYPE employee_type AS OBJECT (
 name VARCHAR2(20),
 id NUMBER,

 member function GET_ID
 (name VARCHAR2)
 RETURN MEMBER);
```

The object type `employee_type` is a user-defined type that contains two attributes, `name` and `id`, and a member function, `GET_ID()`.

You can create an object table using the following SQL syntax:

```
CREATE TABLE employee_table OF employee_type;
```

## 272.4 UTL\_REF Exceptions

Exceptions can be returned during execution of `UTL_REF` functions for various reasons.

For example, the following scenarios would result in exceptions:

- The object selected does not exist. This could be because either:
  1. The object has been deleted, or the given reference is dangling (invalid).
  2. The object table was dropped or does not exist.
- The object cannot be modified or locked in a serializable transaction. The object was modified by another transaction after the serializable transaction started.
- You do not have the privilege to select or modify the object. The caller of the `UTL_REF` subprogram must have the proper privilege on the object that is being selected or modified.

**Table 272-1 UTL\_REF Exceptions**

Exceptions	Description
errnum == 942	Insufficient privileges.
errnum == 1031	Insufficient privileges.
errnum == 8177	Unable to serialize, if in a serializable transaction.
errnum == 60	Deadlock detected.
errnum == 1403	No data found (if the REF is NULL, and so on.).

The `UTL_REF` package does not define any named exceptions. You may define exception handling blocks to catch specific exceptions and to handle them appropriately.

## 272.5 Summary of UTL\_REF Subprograms

This table lists the `UTL_REF` subprograms and briefly describes them.

**Table 272-2 UTL\_REF Package Subprograms**

Subprogram	Description
<a href="#">DELETE_OBJECT Procedure</a> (page 272-3)	Deletes an object given a reference
<a href="#">LOCK_OBJECT Procedure</a> (page 272-5)	Locks an object given a reference
<a href="#">SELECT_OBJECT Procedure</a> (page 272-6)	Selects an object given a reference
<a href="#">UPDATE_OBJECT Procedure</a> (page 272-6)	Updates an object given a reference

### 272.5.1 DELETE\_OBJECT Procedure

This procedure deletes an object given a reference.

The semantic of this subprogram is similar to the following SQL statement:

```
DELETE FROM object_table
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

#### Syntax

```
UTL_REF.DELETE_OBJECT (
 reference IN REF "<typename>");
```

## Parameters

**Table 272-3 DELETE\_OBJECT Procedure Parameters**

Parameter	Description
reference	Reference of the object to delete.

## Exceptions

May be raised.

## Examples

The following example illustrates usage of the `UTL_REF` package to implement this scenario: if an employee of a company changes their address, their manager should be notified.

... declarations of `Address_t` and others...

```
CREATE OR REPLACE TYPE Person_t (
 name VARCHAR2(64),
 gender CHAR(1),
 address Address_t,
 MEMBER PROCEDURE setAddress(addr IN Address_t)
);

CREATE OR REPLACE TYPE BODY Person_t (
 MEMBER PROCEDURE setAddress(addr IN Address_t) IS
 BEGIN
 address := addr;
 END;
);

CREATE OR REPLACE TYPE Employee_t (
```

Under `Person_t`: Simulate implementation of inheritance using a `REF` to `Person_t` and delegation of `setAddress` to it.

```
 thePerson REF Person_t,
 empno NUMBER(5),
 deptREF Department_t,
 mgrREF Employee_t,
 reminders StringArray_t,
 MEMBER PROCEDURE setAddress(addr IN Address_t),
 MEMBER procedure addReminder(reminder VARCHAR2);
);

CREATE TYPE BODY Employee_t (
 MEMBER PROCEDURE setAddress(addr IN Address_t) IS
 myMgr Employee_t;
 meAsPerson Person_t;
 BEGIN
```

Update the address by delegating the responsibility to `thePerson`. Lock the `Person` object from the reference, and also select it:

```
UTL_REF.LOCK_OBJECT(thePerson, meAsPerson);
meAsPerson.setAddress(addr);
```

Delegate to thePerson:

```
UTL_REF.UPDATE_OBJECT(thePerson, meAsPerson);
if mgr is NOT NULL THEN
```

Give the manager a reminder:

```
 UTL_REF.LOCK_OBJECT(mgr);
 UTL_REF.SELECT_OBJECT(mgr, myMgr);
 myMgr.addReminder
 ('Update address in the employee directory for' ||
 thePerson.name || ', new address: ' || addr.asString);
 UTL_REF.UPDATE_OBJECT(mgr, myMgr);
END IF;
EXCEPTION
WHEN OTHERS THEN
errnum := SQLCODE;
errmsg := SUBSTR(SQLERRM, 1, 200);
```

## 272.5.2 LOCK\_OBJECT Procedure

This procedure locks an object given a reference. In addition, this procedure lets the program select the locked object.

The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
 INTO object
 FROM object_table t
 WHERE REF(t) = reference
 FOR UPDATE;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides. It is not necessary to lock an object before updating/deleting it.

### Syntax

```
UTL_REF.LOCK_OBJECT (
 reference IN REF "<typename>");
```

```
UTL_REF.LOCK_OBJECT (
 reference IN REF "<typename>",
 object IN OUT "<typename>");
```

### Parameters

**Table 272-4 LOCK\_OBJECT Procedure Parameters**

Parameter	Description
reference	Reference of the object to lock.
object	The PL/SQL variable that stores the locked object. This variable should be of the same object type as the locked object.

### Exceptions

May be raised.

## 272.5.3 SELECT\_OBJECT Procedure

This procedure selects an object given its reference. The selected object is retrieved from the database and its value is put into the PL/SQL variable 'object'.

The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
INTO object
FROM object_table t
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

### Syntax

```
UTL_REF.SELECT_OBJECT (
 reference IN REF "<typename>",
 object IN OUT "<typename>");
```

### Parameters

**Table 272-5 SELECT\_OBJECT Procedure Parameters**

Parameter	Description
reference	Reference to the object to select or retrieve.
object	The PL/SQL variable that stores the selected object; this variable should be of the same object type as the referenced object.

### Exceptions

May be raised.

## 272.5.4 UPDATE\_OBJECT Procedure

This procedure updates an object given a reference. The referenced object is updated with the value contained in the PL/SQL variable 'object'.

The semantic of this subprogram is similar to the following SQL statement:

```
UPDATE object_table t
SET VALUE(t) = object
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

### Syntax

```
UTL_REF.UPDATE_OBJECT (
 reference IN REF "<typename>",
 object IN "<typename>");
```

## Parameters

**Table 272-6 UPDATE\_OBJECT Procedure Parameters**

Parameter	Description
reference	Reference of the object to update.
object	The PL/SQL variable that contains the new value of the object. This variable should be of the same object type as the object to update.

## Exceptions

May be raised.

# UTL SMTP

The `UTL SMTP` package is designed for sending electronic mails (e-mails) over Simple Mail Transfer Protocol (SMTP) as specified by RFC821.

This chapter contains the following topics:

- [Overview](#) (page 273-1)
- [Security Model](#) (page 273-2)
- [Constants](#) (page 273-2)
- [Types](#) (page 273-2)
- [Reply Codes](#) (page 273-4)
- [UTL SMTP Operational Notes](#) (page 273-5)
- [Exceptions](#) (page 273-6)
- [Rules and Limits](#) (page 273-6)
- [Examples](#) (page 273-7)
- [Summary of UTL SMTP Subprograms](#) (page 273-7)

## See Also:

*Oracle Database Development Guide*

## 273.1 UTL SMTP Overview

The `UTL SMTP` protocol consists of a set of commands for an e-mail client to dispatch e-mails to an SMTP server. The `UTL SMTP` package provides interfaces to the SMTP commands.

For many of the commands, the package provides both a procedural and a functional interface. The functional form returns the reply from the server for processing by the client. The procedural form checks the reply and raises an exception if the reply indicates a transient (400-range reply code) or permanent error (500-range reply code). Otherwise, it discards the reply.

Note that the original SMTP protocol communicates using 7-bit ASCII. Using `UTL SMTP`, all text data (in other words, those in `VARCHAR2`) is converted to US7ASCII before it is sent to the server. Some implementations of SMTP servers that support SMTP extension 8BITMIME [RFC1652] support full 8-bit communication between client and server. The body of the `DATA` command can be transferred in full 8 bits, but the rest of the SMTP command and response must be in 7 bits. When the target SMTP server supports 8BITMIME extension, users of multibyte databases may convert their non-US7ASCII, multibyte `VARCHAR2` data to `RAW` and use the `WRITE_RAW_DATA` subprogram to send multibyte data using 8-bit MIME encoding.

UTL SMTP provides for SMTP communication as specified in RFC821, but does not provide an API to format the content of the message according to RFC 822 (for example, setting the subject of an electronic mail). You must format the message appropriately. In addition, UTL SMTP does not have the functionality to implement an SMTP server for an e-mail clients to send e-mails using SMTP.

## 273.2 UTL SMTP Security Model

This package is an invoker's rights package. The invoking user must have the `connect` privilege granted in the access control list assigned to the remote network host to which the user must connect.

### Note:

For more information on managing fine-grained access, see *Oracle Database Security Guide*

## 273.3 UTL SMTP Constants

UTL SMTP defines several constants to use when specifying parameter values.

These are shown in the following table.

**Table 273-1 UTL SMTP Constants**

Name	Type	Value	Description
ALL_SCHEMES	VARCHAR2(256)	'CRAM-MD5 PLAIN LOGIN'	List of all authentication schemes UTL SMTP supports, in order of their relative security strength. The subset of the schemes in ALL_SCHEMES (namely, PLAIN and LOGIN) in which cleartext passwords are sent over SMTP must be used only in SMTP connections that are secured by Secure Socket Layer / Transport Layer Security (SSL/TLS).
NON_CLEARTEXT_PASSWORD_SCHEMES	VARCHAR2(256)	'CRAM-MD5'	List of authentication schemes that UTL SMTP supports and in which no cleartext passwords are sent over SMTP. They can be used in SMTP connections that are not secured by SSL/TLS. Note that these schemes may still be weak when used in an insecure SMTP connection.

## 273.4 UTL SMTP Types

UTL SMTP uses a CONNECTION record type and REPLY\_REPLIES record types.

### CONNECTION Record Type

This is a PL/SQL record type used to represent an SMTP connection.

## Syntax

```

TYPE connection IS RECORD (
 host VARCHAR2(255),
 port PLS_INTEGER,
 tx_timeout PLS_INTEGER,
 private_tcp_con utl_tcp.connection,
 private_state PLS_INTEGER);

```

## Fields

**Table 273-2 CONNECTION Record Type Fields**

Field	Description
host	Name of the remote host when connection is established. NULL when no connection is established.
port	Port number of the remote SMTP server connected. NULL when no connection is established.
tx_timeout	Time in seconds that the <code>UTL_SMTP</code> package waits before timing out in a read or write operation in this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.
private_tcp_con	Private, for implementation use only. You should not modify this field.
private_state	Private, for implementation use only. You should not modify this field.

## Usage Notes

The read-only fields in a connection record are used to return information about the SMTP connection after the connection is successfully made with the [OPEN\\_CONNECTION Functions](#) (page 273-18). Changing the values of these fields has no effect on the connection. The fields `private_tcp_con` and `private_state` for implementation use only. You should not modify these fields.

## REPLY\_REPLIES Record Types

These are PL/SQL record types used to represent an SMTP reply line. Each SMTP reply line consists of a reply code followed by a text message. While a single reply line is expected for most SMTP commands, some SMTP commands expect multiple reply lines. For those situations, a PL/SQL table of reply records is used to represent multiple reply lines.

## Syntax

```

TYPE reply IS RECORD (
 code PLS_INTEGER,
 text VARCHAR2(508));

TYPE replies IS TABLE OF reply INDEX BY BINARY_INTEGER;

```

**Fields****Table 273-3 REPLY, REPLIES Record Type Fields**

Field	Description
code	3-digit reply code
text	Text message of the reply

## 273.5 UTL\_SMTP Reply Codes

SMTP servers send reply codes that indicate message or server status.

The following is a list of the SMTP reply codes.

**Table 273-4 SMTP Reply Codes**

Reply Code	Meaning
211	System status, or system help reply
214	Help message [Information on how to use the receiver or the meaning of a particular non-standard command; this reply is useful only to the human user]
220	<domain> Service ready
221	<domain> Service closing transmission channel
250	Requested mail action okay, completed
251	User not local; forwards to <forward-path>
252	OK, pending messages for node <node> started. Cannot VERIFY user (for example, info is not local), but takes message for this user and attempts delivery.
253	OK, <messages> pending messages for node <node> started
354	Start mail input; end with <CRLF.CRLF>
355	Octet-offset is the transaction offset
421	<domain> Service not available, closing transmission channel (This can be a reply to any command if the service knows it must shut down.)
450	Requested mail action not taken: mailbox unavailable [for example, mailbox busy]
451	Requested action terminated: local error in processing
452	Requested action not taken: insufficient system storage
453	You have no mail.
454	TLS not available due to temporary reason. Encryption required for requested authentication mechanism.
458	Unable to queue messages for node <node>
459	Node <node> not allowed: reason
500	Syntax error, command unrecognized (This may include errors such as command line too long.)
501	Syntax error in parameters or arguments

**Table 273-4 (Cont.) SMTP Reply Codes**

Reply Code	Meaning
502	Command not implemented
503	Bad sequence of commands
504	Command parameter not implemented
521	<Machine> does not accept mail.
530	Must issue a STARTTLS command first. Encryption required for requested authentication mechanism.
534	Authentication mechanism is too weak.
538	Encryption required for requested authentication mechanism.
550	Requested action not taken: mailbox unavailable [for, mailbox not found, no access]
551	User not local; please try <forward-path>
552	Requested mail action terminated: exceeded storage allocation
553	Requested action not taken: mailbox name not allowed [for example, mailbox syntax incorrect]
554	Transaction failed

## 273.6 UTL\_SMTP Operational Notes

An SMTP connection is initiated by a call to `OPEN_CONNECTION` Functions which returns a SMTP connection.

After a connection is established, the following calls are required to send a mail:

[HELO Function and Procedure](#) (page 273-15) - identify the domain of the sender

[MAIL Function and Procedure](#) (page 273-16)- start a mail, specify the sender

[RCPT Function](#) (page 273-21) - specify the recipient

[OPEN\\_DATA Function and Procedure](#) (page 273-20)- start the mail body

[WRITE\\_RAW\\_DATA Procedure](#) (page 273-26) - write the mail body (multiple calls allowed)

[CLOSE\\_DATA Function and Procedure](#) (page 273-10) - close the mail body and send the mail

The SMTP connection is closed by calling the `QUIT` Function and Procedure.

### Related Topics:

- [OPEN\\_CONNECTION Functions](#) (page 273-18)  
These functions open a connection to an SMTP server.
- [QUIT Function and Procedure](#) (page 273-21)  
This subprogram terminates an SMTP session and disconnects from the server.

## 273.7 UTL\_SMTP Exceptions

This table lists the exceptions that can be raised by the interface of the `UTL_SMTP` package.

The network error is transferred to a reply code of 421- service not available.

**Table 273-5 UTL\_SMTP Exceptions**

Exception	Description
<code>INVALID_OPERATION</code>	Raised when an invalid operation is made. In other words, calling API other than the <a href="#">WRITE_DATA Procedure</a> (page 273-25), the <a href="#">WRITE_RAW_DATA Procedure</a> (page 273-26) or the <a href="#">CLOSE_DATA Function and Procedure</a> (page 273-10) after the <a href="#">OPEN_DATA Function and Procedure</a> (page 273-20) is called, or calling <code>WRITE_DATA</code> , <code>WRITE_RAW_DATA</code> or <code>CLOSE_DATA</code> without first calling <code>OPEN_DATA</code> .
<code>TRANSIENT_ERROR</code>	Raised when receiving a reply code in 400 range
<code>PERMANENT_ERROR</code>	Raised when receiving a reply code in 500 range

## 273.8 UTL\_SMTP Rules and Limits

The API imposes no imitation or range-checking. However, you must be aware of the limitations on various elements of SMTP. Sending data that exceed these limits may result in errors returned by the server.

The following table describes the size limitations encountered by the `UTL_SMTP` subprograms.

**Table 273-6 SMTP Size Limitation**

Element	Size Limitation
<code>user</code>	Maximum total length of a user name is 64 characters
<code>domain</code>	Maximum total length of a domain name or number is 64 characters
<code>path</code>	Maximum total length of a reverse-path or forward-path is 256 characters (including the punctuation and element separators)
<code>command line</code>	Maximum total length of a command line including the command word and the <code>&lt;CRLF&gt;</code> is 512 characters
<code>reply line</code>	Maximum total length of a reply line including the reply code and the <code>&lt;CRLF&gt;</code> is 512 characters
<code>text line</code>	Maximum total length of a text line including the <code>&lt;CRLF&gt;</code> is 1000 characters (but not counting the leading dot duplicated for transparency)
<code>recipients buffer</code>	Maximum total number of recipients that must be buffered is 100 recipients

## 273.9 UTL\_SMTP Examples

This example illustrates how UTL\_SMTP is used by an application to send e-mail. The application connects to an SMTP server at port 25 and sends a simple text message.

```

DECLARE
 c UTL_SMTP.CONNECTION;

PROCEDURE send_header(name IN VARCHAR2, header IN VARCHAR2) AS
BEGIN
 UTL_SMTP.WRITE_DATA(c, name || ': ' || header || UTL_TCP.CRLF);
END;

BEGIN
 c := UTL_SMTP.OPEN_CONNECTION('smtp-server.acme.com');
 UTL_SMTP.HELO(c, 'foo.com');
 UTL_SMTP.MAIL(c, 'sender@foo.com');
 UTL_SMTP.RCPT(c, 'recipient@foo.com');
 UTL_SMTP.OPEN_DATA(c);
 send_header('From', '"Sender" <sender@foo.com>');
 send_header('To', '"Recipient" <recipient@foo.com>');
 send_header('Subject', 'Hello');
 UTL_SMTP.WRITE_DATA(c, UTL_TCP.CRLF || 'Hello, world!');
 UTL_SMTP.CLOSE_DATA(c);
 UTL_SMTP.QUIT(c);
EXCEPTION
 WHEN utl_smtp.transient_error OR utl_smtp.permanent_error THEN
 BEGIN
 UTL_SMTP.QUIT(c);
 EXCEPTION
 WHEN UTL_SMTP.TRANSIENT_ERROR OR UTL_SMTP.PERMANENT_ERROR THEN
 NULL; -- When the SMTP server is down or unavailable, we don't have
 -- a connection to the server. The QUIT call raises an
 -- exception that we can ignore.
 END;
 raise_application_error(-20000,
 'Failed to send mail due to the following error: ' || sqlerrm);
END;

```

## 273.10 Summary of UTL\_SMTP Subprograms

This table lists the UTL\_SMTP subprograms and briefly describes them.

**Table 273-7 UTL\_SMTP Package Subprograms**

Subprogram	Description
<a href="#">AUTH Function and Procedure</a> (page 273-8)	Sends the AUTH command to authenticate to the SMTP server
<a href="#">CLOSE_CONNECTION Procedure</a> (page 273-10)	Closes the SMTP connection, causing the current SMTP operation to terminate
<a href="#">CLOSE_DATA Function and Procedure</a> (page 273-10)	Closes the data session

**Table 273-7 (Cont.) UTL\_SMTP Package Subprograms**

Subprogram	Description
<a href="#">COMMAND Function and Procedure</a> (page 273-11)	Performs a generic SMTP command
<a href="#">COMMAND_REPLIES Function</a> (page 273-12)	Performs a generic SMTP command and retrieves multiple reply lines
<a href="#">DATA Function and Procedure</a> (page 273-13)	Sends the e-mail body
<a href="#">EHLO Function and Procedure</a> (page 273-14)	Performs the initial handshake with SMTP server using the <code>EHLO</code> command
<a href="#">HELO Function and Procedure</a> (page 273-15)	Performs the initial handshake with SMTP server using the <code>HELO</code> command
<a href="#">HELP Function</a> (page 273-16)	Sends <code>HELP</code> command
<a href="#">MAIL Function and Procedure</a> (page 273-16)	Initiates an e-mail transaction with the server, the destination is a mailbox
<a href="#">NOOP Function and Procedure</a> (page 273-17)	<code>NULL</code> command
<a href="#">OPEN_CONNECTION Functions</a> (page 273-18)	Opens a connection to an SMTP server
<a href="#">OPEN_DATA Function and Procedure</a> (page 273-20)	Sends the <code>DATA</code> command
<a href="#">QUIT Function and Procedure</a> (page 273-21)	Terminates an SMTP session and disconnects from the server
<a href="#">RCPT Function</a> (page 273-21)	Specifies the recipient of an e-mail message
<a href="#">RSET Function and Procedure</a> (page 273-22)	Terminates the current e-mail transaction
<a href="#">STARTTLS Function and Procedure</a> (page 273-23)	Sends <code>STARTTLS</code> command to secure the SMTP connection using SSL/TLS
<a href="#">VRFY Function</a> (page 273-24)	Verifies the validity of a destination e-mail address
<a href="#">WRITE_DATA Procedure</a> (page 273-25)	Writes a portion of the e-mail message
<a href="#">WRITE_RAW_DATA Procedure</a> (page 273-26)	Writes a portion of the e-mail message with <code>RAW</code> data

## 273.10.1 AUTH Function and Procedure

This subprogram sends the `AUTH` command to authenticate to the SMTP server. The `UTL_SMTP` package goes through the user's choices of authentication schemes, skips any that is not supported by the SMTP server and uses the first supported.

To determine the schemes the SMTP server supports from its `EHLO` reply, the user must call the [EHLO Function and Procedure](#) (page 273-14). Otherwise, `UTL_SMTP` uses the first scheme in the list.

## Syntax

```
UTL_SMTP.AUTH (
 c IN OUT NOCOPY connection,
 username IN VARCHAR2,
 password IN VARCHAR2,
 schemes IN VARCHAR2 DEFAULT NON_CLEARTXT_PASSWORD_SCHEMES)
RETURN reply;
```

```
UTL_SMTP.AUTH (
 c IN OUT NOCOPY connection,
 username IN VARCHAR2,
 password IN VARCHAR2,
 schemes IN VARCHAR2 DEFAULT NON_CLEARTXT_PASSWORD_SCHEMES);
```

## Parameters

**Table 273-8 AUTH Function and Procedure Parameters**

Parameter	Description
c	SMTP connection
username	Username
password	Password
schemes	Space-separated list of authentication schemes UTL_SMTP is allowed to use in the preferred order. See the ALL_SCHEMES and NON_CLEARTXT_PASSWORD_SCHEMES constants for suggestions.

## Return Values

**Table 273-9 AUTH Function and Procedure Function Return Values**

Return Value	Description
reply	Reply of the command (see REPLY_REPLIES Record Types in <a href="#">UTL_SMTP Types</a> (page 273-2)). In cases where there are multiple replies, the last reply is returned.

## Usage Notes

- Currently only PLAIN, LOGIN and CRAM-MD5 authentication schemes are supported by UTL\_SMTP.
- Since the SMTP server may change the authentication schemes it supports after the SMTP connection is secured by SSL/TLS after the STARTTLS command (for example, adding PLAIN and LOGIN), the caller must call the [EHLO Function and Procedure](#) (page 273-14) again for UTL\_SMTP to update the list after the [STARTTLS Function and Procedure](#) (page 273-23) is called.

## Examples

```
DECLARE
 c utl_smtp.connection;
BEGIN
 c := utl_smtp.open_connection(
 host => 'smtp.example.com',
```

```

port => 25,
wallet_path => 'file:/oracle/wallets/smtp_wallet',
wallet_password => 'password',
secure_connection_before_smtp => FALSE);
UTL_SMTP.STARTTLS(c);
UTL_SMTP.AUTH(
 c => c,
 username => 'scott',
 password => 'password'
 schemes => utl_smtp.all_schemes);
END;
```

## 273.10.2 CLOSE\_CONNECTION Procedure

This procedure closes the SMTP connection, causing the current SMTP operation to terminate. Use this procedure only to cancel an e-mail in the middle of the data session.

To end the SMTP connection properly, use the [QUIT Function and Procedure](#) (page 273-21).

### Syntax

```

UTL_SMTP.CLOSE_CONNECTION (
 c IN OUT NOCOPY connection);
```

### Parameters

**Table 273-10** CLOSE\_CONNECTION Procedure Parameters

Parameter	Description
c	SMTP connection

## 273.10.3 CLOSE\_DATA Function and Procedure

This subprogram ends the e-mail message by sending the sequence <CR><LF>.<CR><LF> (a single period at the beginning of a line).

### Syntax

```

UTL_SMTP.CLOSE_DATA (
 c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.CLOSE_DATA (
 c IN OUT NOCOPY connection);
```

### Parameters

**Table 273-11** CLOSE\_DATA Function and Procedure Parameters

Parameter	Description
c	SMTP connection

## Return Values

**Table 273-12 CLOSE\_DATA Function and Procedure Return Values**

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTL_SMTP Types</a> (page 273-2)). In cases where there are multiple replies, the last reply is returned.

## Usage Notes

The calls to `OPEN_DATA`, `WRITE_DATA`, `WRITE_RAW_DATA` and `CLOSE_DATA` must be made in the right order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.

`CLOSE_DATA` must be called only after `OPEN_CONNECTION`, `HELO` or `EHLO`, `MAIL`, and `RCPT` have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of `WRITE_DATA` because the SMTP server does not respond until the data-terminator is sent during the call to `CLOSE_DATA`.

## 273.10.4 COMMAND Function and Procedure

This subprogram performs a generic SMTP command.

### Syntax

```
UTL_SMTP.COMMAND (
 c IN OUT NOCOPY connection,
 cmd IN VARCHAR2,
 arg IN VARCHAR2 DEFAULT NULL)
RETURN reply;
```

```
UTL_SMTP.COMMAND (
 c IN OUT NOCOPY connection,
 cmd IN VARCHAR2,
 arg IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 273-13 COMMAND Function and Procedure Parameters**

Parameter	Description
c	SMTP connection
cmd	SMTP command to send to the server
arg	Optional argument to the SMTP argument. A space is inserted between <code>cmd</code> and <code>arg</code> .

## Return Values

**Table 273-14** COMMAND Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTI_SMTP Types</a> (page 273-2)). In cases where there are multiple replies, the last reply is returned.

## Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

## 273.10.5 COMMAND\_REPLIES Function

This function performs a generic SMTP command and retrieves multiple reply lines.

### Syntax

```
UTL_SMTP.COMMAND_REPLIES (
 c IN OUT NOCOPY connection,
 cmd IN VARCHAR2,
 arg IN VARCHAR2 DEFAULT NULL)
RETURN replies;
```

### Parameters

**Table 273-15** COMMAND\_REPLIES Function Parameters

Parameter	Description
c	SMTP connection
cmd	SMTP command to send to the server
arg	Optional argument to the SMTP argument. A space is inserted between <code>cmd</code> and <code>arg</code> .

## Return Values

**Table 273-16** COMMAND\_REPLIES Function Return Values

Return Value	Description
replies	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTI_SMTP Types</a> (page 273-2))

## Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

## 273.10.6 DATA Function and Procedure

This subprogram specifies the body of an e-mail message.

### Syntax

```
UTL_SMTP.DATA (
 c IN OUT NOCOPY connection
 body IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN reply;
```

```
UTL_SMTP.DATA (
 c IN OUT NOCOPY connection
 body IN VARCHAR2 CHARACTER SET ANY_CS);
```

### Parameters

**Table 273-17 DATA Function and Procedure Parameters**

Parameter	Description
c	SMTP Connection
body	Text of the message to be sent, including headers, in [RFC822] format

### Return Values

**Table 273-18 DATA Function and Procedure Return Values**

Return Value	Description
reply	Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in <a href="#">UTL_SMTP Types</a> (page 273-2)). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine terminates the message with a `<CR><LF>.<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF>.<CR><LF>` (single period) in body to `<CR><LF>..<CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

The `DATA` subprogram must be called only after `OPEN_CONNECTION`, `HELO` or `EHLO`, `MAIL` and `RCPT` have been called. The connection to the SMTP server must be open, and a mail transaction must be active when this routine is called.

The expected response from the server is a message beginning with status code 250. The 354 response received from the initial `DATA` command is not returned to the caller.

## 273.10.7 EHLO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the `EHLO` command.

### Syntax

```
UTL_SMTP.EHLO (
 c IN OUT NOCOPY connection,
 domain IN)
RETURN replies;

UTL_SMTP.EHLO (
 c IN OUT NOCOPY connection,
 domain IN);
```

### Parameters

**Table 273-19 EHLO Function and Procedure Parameters**

Parameter	Description
<code>c</code>	SMTP connection
<code>domain</code>	Domain name of the local (sending) host. Used for identification purposes.

### Return Values

**Table 273-20 EHLO Function and Procedure Return Values**

Return Value	Description
<code>replies</code>	Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in <a href="#">UTL_SMTP Types</a> (page 273-2)).

### Usage Notes

The `EHLO` interface is identical to `HELO` except that it allows the server to return more descriptive information about its configuration. [RFC1869] specifies the format of the information returned, which the PL/SQL application can retrieve using the functional form of this call. For compatibility with `HELO`, each line of text returned by the server begins with status code 250.

### Related Functions

[HELO Function and Procedure](#) (page 273-15)

## 273.10.8 HELO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the `HELO` command.

### Syntax

```
UTL_SMTP.HELO (
 c IN OUT NOCOPY connection,
 domain IN VARCHAR2)
RETURN reply;
```

```
UTL_SMTP.HELO (
 c IN OUT NOCOPY connection,
 domain IN VARCHAR2);
```

### Parameters

**Table 273-21 HELO Function and Procedure Parameters**

Parameter	Description
<code>c</code>	SMTP connection
<code>domain</code>	Domain name of the local (sending) host. Used for identification purposes.

### Return Values

**Table 273-22 HELO Function and Procedure Return Values**

Return Value	Description
<code>reply</code>	Reply of the command (see <code>REPLY_REPLIES</code> Record Types in <a href="#">UTL_SMTP Types</a> (page 273-2)). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

RFC 821 specifies that the client must identify itself to the server after connecting. This routine performs that identification. The connection must have been opened through a call to [OPEN\\_CONNECTION Functions](#) (page 273-18) before calling this routine.

The expected response from the server is a message beginning with status code 250.

### Related Functions

[EHLO Function and Procedure](#) (page 273-14)

## 273.10.9 HELP Function

This function sends the `HELP` command.

### Syntax

```
UTL_SMTP.HELP (
 c IN OUT NOCOPY connection,
 command IN VARCHAR2 DEFAULT NULL)
RETURN replies;
```

### Parameters

**Table 273-23 HELP Function Parameters**

Parameter	Description
c	SMTP connection
command	Command to get the help message

### Return Values

**Table 273-24 HELP Function Return Values**

Return Value	Description
replies	Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in <a href="#">UTL_SMTP Types</a> (page 273-2))

## 273.10.10 MAIL Function and Procedure

This subprogram initiate a mail transaction with the server. The destination is a mailbox.

### Syntax

```
UTL_SMTP.MAIL (
 c IN OUT NOCOPY connection,
 sender IN VARCHAR2,
 parameters IN VARCHAR2 DEFAULT NULL)
RETURN reply;
```

```
UTL_SMTP.MAIL (
 c IN OUT NOCOPY connection,
 sender IN VARCHAR2,
 parameters IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 273-25 MAIL Function and Procedure Parameters**

Parameter	Description
c	SMTP connection

**Table 273-25 (Cont.) MAIL Function and Procedure Parameters**

Parameter	Description
sender	E-mail address of the user sending the message.
parameters	Additional parameters to mail command as defined in Section 6 of [RFC1869]. It must follow the format of "XXX=XXX (XXX=XXX ...)".

**Return Values**

**Table 273-26 MAIL Function and Procedure Return Values**

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTL_SMTP Types</a> (page 273-2)). In cases where there are multiple replies, the last reply is returned.

**Usage Notes**

This command does not send the message; it simply begins its preparation. It must be followed by calls to RCPT and DATA to complete the transaction. The connection to the SMTP server must be open and a HELO or EHLO command must have already been sent.

The expected response from the server is a message beginning with status code 250.

## 273.10.11 NOOP Function and Procedure

This subprogram issues the NULL command.

**Syntax**

```
UTL_SMTP.NOOP (
 c IN OUT NOCOPY connection)
RETURN reply;
```

```
UTL_SMTP.NOOP (
 c IN OUT NOCOPY connection);
```

**Parameter**

**Table 273-27 NOOP Function and Procedure Parameters**

Parameter	Description
c	SMTP connection

## Return Values

**Table 273-28 NOOP Function and Procedure Return Values**

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTI_SMTP Types</a> (page 273-2)). In cases where there are multiple replies, the last reply is returned.

## Usage Notes

- This command has no effect except to elicit a successful reply from the server. It can be issued at any time after the connection to the server has been established with `OPEN_CONNECTION`. The `NOOP` command can be used to verify that the server is still connected and is listening properly.
- This command replies with a single line beginning with status code 250.

## 273.10.12 OPEN\_CONNECTION Functions

These functions open a connection to an SMTP server.

### Syntax

```
UTL_SMTP.OPEN_CONNECTION (
 host IN VARCHAR2,
 port IN PLS_INTEGER DEFAULT 25,
 c OUT connection,
 tx_timeout IN PLS_INTEGER DEFAULT NULL,
 wallet_path IN VARCHAR2 DEFAULT NULL,
 wallet_password IN VARCHAR2 DEFAULT NULL,
 secure_connection_before_smtp IN BOOLEAN DEFAULT FALSE)
RETURN reply;
```

```
UTL_SMTP.OPEN_CONNECTION (
 host IN VARCHAR2,
 port IN PLS_INTEGER DEFAULT 25,
 tx_timeout IN PLS_INTEGER DEFAULT NULL,
 wallet_path IN VARCHAR2 DEFAULT NULL,
 wallet_password IN VARCHAR2 DEFAULT NULL,
 secure_connection_before_smtp IN BOOLEAN DEFAULT FALSE)
RETURN connection;
```

### Parameters

**Table 273-29 OPEN\_CONNECTION Functions Parameters**

Parameter	Description
host	Name of the SMTP server host
port	Port number on which SMTP server is listening (usually 25)
c	SMTP connection

**Table 273-29 (Cont.) OPEN\_CONNECTION Functions Parameters**

Parameter	Description
tx_timeout	Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation for this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.
wallet_path	Directory path that contains the Oracle wallet for SSL/TLS. The format is file: <directory-path>
wallet_password	Password to open the wallet. When the wallet is auto-login enabled, the password can be set to NULL.
secure_connection_before_smtp	If TRUE, a secure connection with SSL/TLS is made before SMTP communication. If FALSE, no connection is made.

### Return Values

**Table 273-30 OPEN\_CONNECTION Functions Return Values**

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTL_SMTP Types</a> (page 273-2)). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

- The expected response from the server is a message beginning with status code 220.
- The version of OPEN\_CONNECTION that returns UTL\_SMTP.CONNECTION record checks the reply code returned by an SMTP server when the connection is first established. It raises an exception when the reply indicates an error. Otherwise, it discards the reply. If you want to examine the reply, invoke the version of OPEN\_CONNECTION that returns REPLY.
- tx\_timeout is intended to govern both the read operations and the write operations. However, an implementation restriction prevents tx\_timeout from governing write operations in the current release.

### Examples

```

DECLARE
 c utl_smtp.connection;
BEGIN
 c := UTL_SMTP.OPEN_CONNECTION(
 host => 'smtp.example.com',
 port => 465,
 wallet_path => 'file:/oracle/wallets/smtp_wallet',
 wallet_password => 'password',
 secure_connection_before_smtp => TRUE);
END;
```

## 273.10.13 OPEN\_DATA Function and Procedure

This subprogram sends the `DATA` command after which you can use `WRITE_DATA` and `WRITE_RAW_DATA` to write a portion of the e-mail message.

### Syntax

```
UTL_SMTP.OPEN_DATA (
 c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.OPEN_DATA (
 c IN OUT NOCOPY connection);
```

### Parameters

**Table 273-31 OPEN\_DATA Function and Procedure Parameters**

Parameter	Description
c	SMTP connection
data	Portion of the text of the message to be sent, including headers, in RFC822 format.

### Return Values

**Table 273-32 OPEN\_DATA Function and Procedure Function Return Values**

Return Value	Description
reply	Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in <a href="#">UTL_SMTP Types</a> (page 273-2)). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

- The calls to `OPEN_DATA`, `WRITE_DATA`, `WRITE_RAW_DATA` and `CLOSE_DATA` must be made in the right order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.
- `OPEN_DATA` must be called only after `OPEN_CONNECTION`, `HELO` or `EHLO`, `MAIL`, and `RCPT` have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

## 273.10.14 QUIT Function and Procedure

This subprogram terminates an SMTP session and disconnects from the server.

### Syntax

```
UTL_SMTP.QUIT (
 c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.QUIT (
 c IN OUT NOCOPY connection);
```

### Parameter

**Table 273-33 QUIT Function and Procedure Parameters**

Parameter	Description
c	SMTP connection

### Return Values

**Table 273-34 QUIT Function and Procedure Function Return Values**

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTL_SMTP Types</a> (page 273-2)). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

The `QUIT` command informs the SMTP server of the client's intent to terminate the session. It then closes the connection established by `OPEN_CONNECTION` which must have been called before executing this command. If a mail transaction is in progress when `QUIT` is issued, it is canceled in the same manner as `RSET`.

The function form of this command returns a single line beginning with the status code 221 on successful termination. In all cases, the connection to the SMTP server is closed. The fields `REMOTE_HOST` and `REMOTE_PORT` of `c` are reset.

### Related Functions

[RSET Function and Procedure](#) (page 273-22)

## 273.10.15 RCPT Function

This subprogram specifies the recipient of an e-mail message.

### Syntax

```
UTL_SMTP.RCPT (
 c IN OUT NOCOPY connection,
 recipient IN VARCHAR2,
```

```

 parameters IN VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.RCPT (
 c IN OUT NOCOPY connection,
 recipient IN VARCHAR2,
 parameters IN VARCHAR2 DEFAULT NULL);

```

**Table 273-35 RCPT Function and Procedure Parameters**

Parameter	Description
c	SMTP connection
recipient	E-mail address of the user to which the message is being sent
parameters	Additional parameters to RCPT command as defined in Section 6 of [RFC1869]. It must follow the format of "XXX=XXX (XXX=XXX ...)".

### Return Values

**Table 273-36 RCPT Function and Procedure Function Return Values**

Return Value	Description
reply	Reply of the command (see <a href="#">REPLY_ REPLIES Record Types in UTL_SMTP Types</a> (page 273-2)). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

To send a message to multiple recipients, call this routine multiple times. Each invocation schedules delivery to a single e-mail address. The message transaction must have been begun by a prior call to `MAIL`, and the connection to the mail server must have been opened and initialized by prior calls to `OPEN_CONNECTION` and `HELO` or `EHLO` respectively.

The expected response from the server is a message beginning with status code 250 or 251.

## 273.10.16 RSET Function and Procedure

This subprogram terminates the current mail transaction.

### Syntax

```

UTL_SMTP.RSET (
 c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.RSET (
 c IN OUT NOCOPY connection);

```

## Parameters

**Table 273-37 RSET Function and Procedure Parameters**

Parameter	Description
c	SMTP connection

## Return Values

**Table 273-38 RSET Function and Procedure Return Values**

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTL_SMTP Types</a> (page 273-2)). In cases where there are multiple replies, the last reply is returned.

## Usage Notes

- This command allows the client to cancel an e-mail message it was in the process of composing. No mail is sent. The client can call `RSET` at any time after the connection to the SMTP server has been opened by means of `OPEN_CONNECTION` until `DATA` or `OPEN_DATA` is called. Once the e-mail data has been sent, it is too late to prevent the e-mail from being sent.
- The server responds to `RSET` with a message beginning with status code 250.

## Related Functions

[QUIT Function and Procedure](#) (page 273-21)

## 273.10.17 STARTTLS Function and Procedure

This subprogram sends the `STARTTLS` command to secure the SMTP connection using SSL/TLS.

SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the [OPEN\\_CONNECTION Functions](#) (page 273-18).

### Syntax

```
UTL_SMTP.STARTTLS (
 c IN OUT NOCOPY connection)
RETURN reply;
```

```
UTL_SMTP.STARTTLS (
 c IN OUT NOCOPY connection);
```

## Parameters

**Table 273-39 STARTTLS Function and Procedure Parameters**

Parameter	Description
c	SMTP connection

## Return Values

**Table 273-40 STARTTLS Function and Procedure Return Values**

Return Value	Description
reply	SMTP reply

## Usage Notes

The `STARTTLS` command must only be issued on an unencrypted connection and when the SMTP server indicates the support of the command in the reply of the `EHLO` command. The wallet to be used for encryption must have been specified when the initial SMTP connection was opened by the `OPEN_CONNECTION` function.

## Examples

```
DECLARE
 c utl_smtp.connection;
BEGIN
 c := utl_smtp.open_connection(
 host => 'smtp.example.com',
 port => 25,
 wallet_path => 'file:/oracle/wallets/smtp_wallet',
 wallet_password => 'password',
 secure_connection_before_smtp => FALSE);
 utl_smtp.starttls(c);
END
```

## 273.10.18 VRFY Function

This function verifies the validity of a destination e-mail address.

### Syntax

```
UTL_SMTP.VRFY (
 c IN OUT NOCOPY connection
 recipient IN VARCHAR2)
RETURN reply;
```

## Parameters

**Table 273-41 VRFY Function Parameters**

Parameter	Description
c	SMTP connection

**Table 273-41 (Cont.) VRFY Function Parameters**

Parameter	Description
recipient	E-mail address to be verified

**Return Values**

**Table 273-42 VRFY Function Return Values**

Return Value	Description
reply	Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTL_SMTP Types</a> (page 273-2)). In cases where there are multiple replies, the last reply is returned.

**Usage Notes**

The server attempts to resolve the destination address `recipient`. If successful, it returns the recipient's full name and fully qualified mailbox path. The connection to the server must have already been established by means of `OPEN_CONNECTION` and `HELO` or `EHLO` before making this request.

Successful verification returns one or more lines beginning with status code 250 or 251.

## 273.10.19 WRITE\_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to `WRITE_DATA` appends data to the e-mail message.

**Syntax**

```
UTL_SMTP.WRITE_DATA (
 c IN OUT NOCOPY connection,
 data IN VARCHAR2 CHARACTER SET ANY_CS);
```

**Parameters**

**Table 273-43 WRITE\_DATA Procedure Parameters**

Parameter	Description
c	SMTP connection
data	Portion of the text of the message to be sent, including headers, in [RFC822] format

**Usage Notes**

- The calls to the [OPEN\\_DATA Function and Procedure](#) (page 273-20), [WRITE\\_DATA Procedure](#) (page 273-25), [WRITE\\_RAW\\_DATA Procedure](#) (page 273-26) and [CLOSE\\_DATA Function and Procedure](#) (page 273-10) must be made in the correct order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly

to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.

- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine terminates the message with a `<CR><LF>.<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF>.<CR><LF>` (single period) in the body to `<CR><LF>..<CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.
- The [OPEN\\_DATA Function and Procedure](#) (page 273-20), [WRITE\\_DATA Procedure](#) (page 273-25), [WRITE\\_RAW\\_DATA Procedure](#) (page 273-26) and [CLOSE\\_DATA Function and Procedure](#) (page 273-10) must be called only after [OPEN\\_CONNECTION Functions](#) (page 273-18), [HELO Function and Procedure](#) (page 273-15), or [EHLO Function and Procedure](#) (page 273-14), [MAIL Function and Procedure](#) (page 273-16), and [RCPT Function](#) (page 273-21) have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
- Note that there is no function form of the [WRITE\\_DATA Procedure](#) (page 273-25) because the SMTP server does not respond until the data-terminator is sent during the call to [CLOSE\\_DATA Function and Procedure](#) (page 273-10).
- Text (`VARCHAR2`) data sent using `WRITE_DATA` is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a '?' character. If 8BITMIME extension is negotiated with the SMTP server using the `EHLO` subprogram, multibyte `VARCHAR2` data can be sent by first converting the text to `RAW` using the `UTL_RAW` package, and then sending the `RAW` data using `WRITE_RAW_DATA`.

## 273.10.20 WRITE\_RAW\_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to `WRITE_RAW_DATA` appends data to the e-mail message.

### Syntax

```
UTL_SMTP.WRITE_RAW_DATA (
 c IN OUT NOCOPY connection
 data IN RAW);
```

### Parameters

**Table 273-44** WRITE\_RAW\_DATA Procedure Parameters

Parameter	Description
c	SMTP connection
data	Portion of the text of the message to be sent, including headers, in [RFC822] format

### Usage Notes

- The calls to the [OPEN\\_DATA Function and Procedure](#) (page 273-20), [WRITE\\_DATA Procedure](#) (page 273-25), [WRITE\\_RAW\\_DATA Procedure](#)

(page 273-26) and [CLOSE\\_DATA Function and Procedure](#) (page 273-10) must be made in the correct order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.

- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine terminates the message with a `<CR><LF>.<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF>.<CR><LF>` (single period) in the body to `<CR><LF>..<CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.
- The [OPEN\\_DATA Function and Procedure](#) (page 273-20), [WRITE\\_DATA Procedure](#) (page 273-25), [WRITE\\_RAW\\_DATA Procedure](#) (page 273-26) and [CLOSE\\_DATA Function and Procedure](#) (page 273-10) must be called only after [OPEN\\_CONNECTION Functions](#) (page 273-18), [HELO Function and Procedure](#) (page 273-15), or [EHLO Function and Procedure](#) (page 273-14), [MAIL Function and Procedure](#) (page 273-16), and [RCPT Function](#) (page 273-21) have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
- Note that there is no function form of the [WRITE\\_DATA Procedure](#) (page 273-25) because the SMTP server does not respond until the data-terminator is sent during the call to [CLOSE\\_DATA Function and Procedure](#) (page 273-10).

# UTL\_SPADV

The `UTL_SPADV` package, one of a set of Oracle Streams packages, provides subprograms to collect and analyze statistics for the Oracle Streams components in a distributed database environment. This package uses the Oracle Streams Performance Advisor to gather statistics.

This chapter contains the following topic:

- [Overview](#) (page 274-1)
- [Security Model](#) (page 274-1)
- [Operational Notes](#) (page 274-2)
- [Summary of UTL\\_SPADV Subprograms](#) (page 274-11)

 **See Also:**

*Oracle Streams Concepts and Administration* for more information about this package and the Oracle Streams Performance Advisor

## 274.1 UTL\_SPADV Overview

This package enables you to collect and analyze statistics about the performance or Oracle Streams components. You can either collect statistics on demand or you can create a monitoring job that continually monitors Oracle Streams performance.

When this package is used on an Oracle Database 11g Release 2 (11.2) database, it can monitor Oracle Database 10g Release 2 (10.2) and later databases. It cannot monitor databases before release 10.2.

 **See Also:**

*Oracle Streams Concepts and Administration*

## 274.2 DBMS\_COMPARISON Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

 **See Also:**

*Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

## 274.3 UTL\_SPADV Operational Notes

To use this package, you must connect to an Oracle database as an Oracle Streams administrator and run the `utlspadv.sql` script in the `rdbms/admin` directory in `ORACLE_HOME`.

The `utlspadv.sql` script creates the following tables:

- [STREAMS\\$\\_PA\\_COMPONENT Table](#) (page 274-2)
- [STREAMS\\$\\_PA\\_COMPONENT\\_LINK Table](#) (page 274-3)
- [STREAMS\\$\\_PA\\_COMPONENT\\_PROP Table](#) (page 274-4)
- [STREAMS\\$\\_PA\\_COMPONENT\\_STAT Table](#) (page 274-5)
- [STREAMS\\$\\_PA\\_CONTROL Table](#) (page 274-6)
- [STREAMS\\$\\_PA\\_DATABASE Table](#) (page 274-6)
- [STREAMS\\$\\_PA\\_DATABASE\\_PROP Table](#) (page 274-7)
- [STREAMS\\$\\_PA\\_MONITORING Table](#) (page 274-7)
- [STREAMS\\$\\_PA\\_PATH\\_BOTTLENECK Table](#) (page 274-7)
- [STREAMS\\$\\_PA\\_PATH\\_STAT Table](#) (page 274-8)
- [STREAMS\\$\\_PA\\_SHOW\\_COMP\\_STAT Table](#) (page 274-9)
- [STREAMS\\$\\_PA\\_SHOW\\_PATH\\_STAT Table](#) (page 274-10)

The Oracle Streams Performance Advisor populates these tables when it is run.

 **See Also:**

*Oracle Streams Concepts and Administration*

### STREAMS\$\_PA\_COMPONENT Table

The `STREAMS$_PA_COMPONENT` table displays information about the Oracle Streams components at each database.

**Table 274-1 STREAMS\$\_PA\_COMPONENT Table**

Column	Datatype	NULL	Description
COMPONENT_ID	NUMBER	NOT NULL	Identification number assigned to the component by the Oracle Streams Performance Advisor
COMPONENT_NAME	VARCHAR2(194)		Name of the component
COMPONENT_DB	VARCHAR2(128)		Name of the database that contains the component
COMPONENT_TYPE	VARCHAR2(20)		Type of the component The following types are possible: <ul style="list-style-type: none"> <li>• CAPTURE for a capture process</li> <li>• PROPAGATION_SENDER for a propagation sender</li> <li>• PROPAGATION_RECEIVER for a propagation receiver</li> <li>• APPLY for an apply process</li> <li>• QUEUE for a queue</li> </ul>
COMPONENT_CHANGED_TIME	DATE		Time when the component was last changed

**STREAMS\$\_PA\_COMPONENT\_LINK Table**

The `STREAMS$_PA_COMPONENT_LINK` table displays information about how information flows between Oracle Streams components.

**Table 274-2 STREAMS\$\_PA\_COMPONENT\_LINK Table**

Column	Datatype	NULL	Description
PATH_ID	NUMBER	NOT NULL	Identification number assigned to the path by the Oracle Streams Performance Advisor
PATH_KEY	VARCHAR2(4000)		Unique key assigned to the path by the Oracle Streams Performance Advisor
SOURCE_COMPONENT_ID	NUMBER	NOT NULL	Source component ID for the path The path starts with this component.
DESTINATION_COMPONENT_ID	NUMBER	NOT NULL	Destination component ID for the path The path ends with this component.
POSITION	NUMBER		Position of the component in the path

### STREAMS\$\_PA\_COMPONENT\_PROP Table

The STREAMS\$\_PA\_COMPONENT\_PROP table displays information about capture processes and apply processes necessary for analysis by the Streams Performance Advisor.

**Table 274-3 STREAMS\$\_PA\_COMPONENT\_PROP Table**

Column	Datatype	NULL	Description
COMPONENT_ID	NUMBER	NOT NULL	Identification number assigned to the component by the Oracle Streams Performance Advisor
PROP_NAME	VARCHAR2 ( 30 )		Property name For a capture process, the component properties include the following: <ul style="list-style-type: none"> <li>• SOURCE_DATABASE - The source database for the changes captured by the capture process</li> <li>• PARALLELISM - The setting for the parallelism capture process parameter</li> <li>• OPTIMIZATION_MODE - Indicates whether the capture process uses combined capture and apply (greater than zero) or does not use combined capture and apply (0)</li> </ul> For an apply process, the component properties include the following: <ul style="list-style-type: none"> <li>• SOURCE_DATABASE - The source database for the messages applied by the apply process</li> <li>• PARALLELISM - The setting for the parallelism apply process parameter</li> <li>• APPLY_CAPTURED - Indicates whether the apply process applies captured messages (YES) persistent messages (NO)</li> <li>• MESSAGE_DELIVERY_MODE - Either buffered or persistent</li> </ul>
PROP_VALUE	VARCHAR2 ( 30 )		Property value

**STREAMS\$\_PA\_COMPONENT\_STAT Table**

The `STREAMS$_PA_COMPONENT_STAT` table displays performance statistics and session statistics about each Oracle Streams component.

**Table 274-4 STREAMS\$\_PA\_COMPONENT\_STAT Table**

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was run for the advisor run ID
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Streams Performance Advisor
STATISTIC_TIME	DATE		Time when the statistic was recorded
STATISTIC_NAME	VARCHAR2(64)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2(64)		Unit of measurement for the statistic
SUB_COMPONENT_TYPE	VARCHAR2(64)		Type of the subcomponent Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible: <ul style="list-style-type: none"> <li>LOGMINER READER for a builder server of a capture process</li> <li>LOGMINER PREPARER for a preparer server of a capture process</li> <li>LOGMINER BUILDER for a reader server of a capture process</li> <li>CAPTURE SESSION for a capture process session</li> </ul> The following apply process subcomponent types are possible: <ul style="list-style-type: none"> <li>PROPAGATION SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database</li> <li>APPLY READER for a reader server of an apply process</li> <li>APPLY COORDINATOR for a coordinator process of an apply process</li> <li>APPLY SERVER for a reader server of an apply process</li> </ul>

**Table 274-4 (Cont.) STREAMS\$\_PA\_COMPONENT\_STAT Table**

Column	Datatype	NULL	Description
SESSION_ID	NUMBER		Identification number of the session for the component. Query the V\$SESSION view for information about the session.
SESSION_SERIAL#	NUMBER		Session serial number of the session for the component. Query the V\$SESSION view for information about the session.

**STREAMS\$\_PA\_CONTROL Table**

The `STREAMS$_PA_CONTROL` table displays the parameters set for the `COLLECT_STATS` procedure in this package. The parameters control the monitoring behavior.

**Table 274-5 STREAMS\$\_PA\_CONTROL Table**

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was last run
PARAM_NAME	VARCHAR2(30)		The name of the parameter
PARAM_VALUE	VARCHAR2(4000)		The value set for the parameter
PARAM_UNIT	VARCHAR2(30)		The unit of the parameter

**STREAMS\$\_PA\_DATABASE Table**

The `STREAMS$_PA_DATABASE` table displays information about each database that contains Oracle Streams components.

**Table 274-6 STREAMS\$\_PA\_DATABASE Table**

Column	Datatype	NULL	Description
GLOBAL_NAME	VARCHAR2(128)	NOT NULL	Global name of the database analyzed by the Oracle Streams Performance Advisor
LAST_QUERIED	DATE		The time when the Performance Advisor successfully collected information from a database in its last run
ERROR_NUMBER	NUMBER		The error number of the error encountered when the database was last queried
ERROR_MESSAGE	VARCHAR2(4000)		The error message of the error encountered when the database was last queried

**STREAMS\$\_PA\_DATABASE\_PROP Table**

The `STREAMS$_PA_DATABASE_PROP` table displays Oracle Streams database property information necessary for analysis by the Streams Performance Advisor.

**Table 274-7 STREAMS\$\_PA\_DATABASE\_PROP Table**

Column	Datatype	NULL	Description
GLOBAL_NAME	VARCHAR2(128)	NOT NULL	Global name of the database analyzed by the Oracle Streams Performance Advisor
PROP_NAME	VARCHAR2(30)		Property name The database properties include the following: <ul style="list-style-type: none"> <li>• VERSION</li> <li>• COMPATIBILITY</li> <li>• MANAGEMENT_PACK_ACCESS</li> <li>• DB_UNIQUE_NAME</li> </ul>
PROP_VALUE	VARCHAR2(30)		Property value

**STREAMS\$\_PA\_MONITORING Table**

The `STREAMS$_PA_MONITORING` table displays information about each monitoring job running in a database.

**Table 274-8 STREAMS\$\_PA\_MONITORING Table**

Column	Datatype	NULL	Description
JOB_NAME	VARCHAR2(30)	NOT NULL	Name of the monitoring job
CLIENT_NAME	VARCHAR2(30)		Name of the client that submitted the job <b>See Also:</b> " <a href="#">Full Monitoring Job Names</a> (page 274-22)"
QUERY_USER_NAME	VARCHAR2(30)		User granted privileges to view the monitoring results
SHOW_STATS_TABLE	VARCHAR2(30)		Name of the table used by the <code>SHOW_STATS</code> procedure to display statistics
STARTED_TIME	TIMESTAMP		Time the monitoring job started
STOPPED_TIME	TIMESTAMP		Time the monitoring job last stopped
ALTERED_TIME	TIMESTAMP		Time the monitoring job was last altered
STATE	VARCHAR2(30)		State of the monitoring job, either <code>ENABLED</code> or <code>STOPPED</code>

**STREAMS\$\_PA\_PATH\_BOTTLENECK Table**

The `STREAMS$_PA_PATH_BOTTLENECK` table displays information about Oracle Streams components that might be slowing down the flow of messages.

**Table 274-9 STREAMS\$\_PA\_PATH\_BOTTLENECK Table**

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was last run
ADVISOR_RUN_REASON	VARCHAR2(4000)		Reason for the bottleneck
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Streams Performance Advisor
PATH_KEY	VARCHAR2(4000)		Unique key assigned to the path by the Oracle Streams Performance Advisor
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Streams Performance Advisor
TOP_SESSION_ID	NUMBER		Session ID of the top component. Query the V\$SESSION view for information about the session.
TOP_SESSION_SERIAL#	NUMBER		Session serial number of the top component. Query the V\$SESSION view for information about the session.
ACTION_NAME	VARCHAR2(32)		Action name for the top session
BOTTLENECK_IDENTIFIED	VARCHAR2(30)		Whether a bottleneck was identified

**STREAMS\$\_PA\_PATH\_STAT Table**

The `STREAMS$_PA_PATH_STAT` table displays performance statistics about each stream path.

**Table 274-10 STREAMS\$\_PA\_PATH\_STAT Table**

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was run for the advisor run ID
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Streams Performance Advisor
PATH_KEY	VARCHAR2(4000)		Unique key assigned to the path by the Oracle Streams Performance Advisor
STATISTIC_TIME	DATE		Time when the statistic was recorded
STATISTIC_NAME	VARCHAR2(64)		Name of the statistic

**Table 274-10 (Cont.) STREAMS\$\_PA\_PATH\_STAT Table**

Column	Datatype	NULL	Description
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2(64)		Unit of measurement for the statistic

**STREAMS\$\_PA\_SHOW\_COMP\_STAT Table**

The `STREAMS$_PA_SHOW_COMP_STAT` table displays statistics for Oracle Streams components.

**Table 274-11 STREAMS\$\_PA\_SHOW\_COMP\_STAT Table**

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was last run
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Streams Performance Advisor
POSITION	NUMBER		Position of the component in the path
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Streams Performance Advisor
COMPONENT_NAME	VARCHAR2(194)		Name of the component
COMPONENT_TYPE	VARCHAR2(30)		Type of the component The following types are possible: <ul style="list-style-type: none"> <li>• <code>CAPTURE</code> for a capture process</li> <li>• <code>PROPAGATION SENDER</code> for a propagation sender</li> <li>• <code>PROPAGATION RECEIVER</code> for a propagation receiver</li> <li>• <code>APPLY</code> for an apply process</li> <li>• <code>QUEUE</code> for a queue</li> </ul>

**Table 274-11 (Cont.) STREAMS\$\_PA\_SHOW\_COMP\_STAT Table**

Column	Datatype	NULL	Description
SUB_COMPONENT_TYP E	VARCHAR2(30)		Type of the subcomponent Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible: <ul style="list-style-type: none"> <li>LOGMINER READER for a builder server of a capture process</li> <li>LOGMINER PREPARER for a preparer server of a capture process</li> <li>LOGMINER BUILDER for a reader server of a capture process</li> <li>CAPTURE SESSION for a capture process session</li> </ul> The following apply process subcomponent types are possible: <ul style="list-style-type: none"> <li>PROPAGATION SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database</li> <li>APPLY READER for a reader server of an apply process</li> <li>APPLY COORDINATOR for a coordinator process of an apply process</li> <li>APPLY SERVER for a reader server of an apply process</li> </ul>
SESSION_ID	NUMBER		Identification number of the session for the component. Query the V\$SESSION view for information about the session.
SESSION_SERIAL#	NUMBER		Session serial number of the session for the component. Query the V\$SESSION view for information about the session.
STATISTIC_ALIAS	VARCHAR2(30)		Name of the statistic
STATISTIC_NAME	VARCHAR2(128)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2(128)		Unit of measurement for the statistic

**STREAMS\$\_PA\_SHOW\_PATH\_STAT Table**

The STREAMS\$\_PA\_SHOW\_PATH\_STAT table displays statistics for the stream paths in an Oracle Streams configuration. A monitoring job uses this table as the default table for the statistics collected for stream paths.

**Table 274-12 STREAMS\$\_PA\_SHOW\_PATH\_STAT Table**

Column	Datatype	NULL	Description
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Streams Performance Advisor
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was last run
SETTING	VARCHAR2(2000)		Setting for the Oracle Streams Performance Advisor Run
STATISTICS	VARCHAR2(4000)		Component-level statistics
SESSION_STATISTICS	VARCHAR2(4000)		Session-level statistics
OPTIMIZATION	NUMBER		Whether the path uses the combined capture and apply optimization  0 (zero) means that the path does not use the combined capture and apply optimization.  1 means that the path uses the combined capture and apply optimization.

## 274.4 Summary of UTL\_SPADV Subprograms

This table lists the UTL\_SPADV subprograms and briefly describes them.

**Table 274-13 UTL\_SPADV Package Subprograms**

Subprogram	Description
<a href="#">ALTER_MONITORING Procedure</a> (page 274-12)	Alters the monitoring job submitted by the current user.
<a href="#">COLLECT_STATS Procedure</a> (page 274-13)	Uses the Oracle Streams Performance Advisor to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.
<a href="#">IS_MONITORING Function</a> (page 274-15)	Checks whether a monitoring job is currently running.
<a href="#">SHOW_STATS Procedure</a> (page 274-15)	Generates output that includes the statistics gathered by the COLLECT_STATS procedure.
<a href="#">SHOW_STATS_HTML Procedure</a> (page 274-18)	Generates HTML output that includes the statistics gathered by the COLLECT_STATS procedure.
<a href="#">START_MONITORING Procedure</a> (page 274-20)	Starts a monitoring job.
<a href="#">STOP_MONITORING Procedure</a> (page 274-22)	Stops a monitoring job.

## 274.4.1 ALTER\_MONITORING Procedure

This procedure alters the monitoring job submitted by the current user.

### Syntax

```
UTL_SPADV.ALTER_MONITORING(
 interval IN NUMBER DEFAULT NULL,
 top_event_threshold IN NUMBER DEFAULT NULL,
 bottleneck_idle_threshold IN NUMBER DEFAULT NULL,
 bottleneck_flowctrl_threshold IN NUMBER DEFAULT NULL,
 retention_time IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 274-14 ALTER\_MONITORING Procedure Parameters**

Parameter	Description
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds.  If NULL, then the current value is not changed.
top_event_threshold	A percentage that determines whether a top wait event statistic is collected.  The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.  If NULL, then the current value is not changed.
bottleneck_idle_threshold	A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its IDLE percentage.  The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.  If NULL, then the current value is not changed.
bottleneck_flowctrl_threshold	A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage.  The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.  If NULL, then the current value is not changed.
retention_time	The number of hours to retain monitoring results.  If NULL, then the current value is not changed.

## Exceptions

**Table 274-15 ALTER\_MONITORING Procedure Exceptions**

Exception	Description
ORA-20113	no active monitoring job found

## 274.4.2 COLLECT\_STATS Procedure

This procedure uses the Oracle Streams Performance Advisor to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.

### Note:

This procedure commits.

### See Also:

*Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

## Syntax

```
UTL_SPADV.COLLECT_STATS(
 interval IN NUMBER DEFAULT 60,
 num_runs IN NUMBER DEFAULT 10,
 comp_stat_table IN VARCHAR2 DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
 path_stat_table IN VARCHAR2 DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
 top_event_threshold IN NUMBER DEFAULT 15,
 bottleneck_idle_threshold IN NUMBER DEFAULT 50,
 bottleneck_flowctrl_threshold IN NUMBER DEFAULT 50);
```

## Parameters

**Table 274-16 COLLECT\_STATS Procedure Parameters**

Parameter	Description
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds.
num_runs	The number of times that the Oracle Streams Performance Advisor is run by the procedure.

**Table 274-16 (Cont.) COLLECT\_STATS Procedure Parameters**

Parameter	Description
comp_stat_table	<p>The name of the table that stores the statistics collected for Oracle Streams components and subcomponents. Specify the table name as <code>[schema_name].object_name</code>. If the schema is not specified, then the current user is the default.</p> <p>The procedure creates the specified table if it does not exist.</p> <p>Oracle recommends that you use the default table <code>STREAMS\$_ADVISOR_COMP_STAT</code>.</p> <p>See "<a href="#">Usage Notes (page 274-15)</a>" for more information about this parameter.</p>
path_stat_table	<p>The name of the table that stores the statistics collected for stream paths. Specify the table name as <code>[schema_name].object_name</code>. If the schema is not specified, then the current user is the default.</p> <p>The procedure creates the specified table if it does not exist.</p> <p>Oracle recommends that you use the default table <code>STREAMS\$_ADVISOR_PATH_STAT</code>.</p> <p>See "<a href="#">Usage Notes (page 274-15)</a>" for more information about this parameter.</p>
top_event_threshold	<p>A percentage that determines whether a top wait event statistic is collected.</p> <p>The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.</p>
bottleneck_idle_threshold	<p>A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its <code>IDLE</code> percentage.</p> <p>The <code>IDLE</code> percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.</p>
bottleneck_flowctrl_threshold	<p>A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its <code>FLOW CONTROL</code> percentage.</p> <p>The <code>FLOW CONTROL</code> percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.</p>

### Usage Notes

The table specified in the `path_stat_table` parameter stores stream path statistics. This table also concatenates the component and subcomponent statistics stored in the table specified in the `comp_stat_table` parameter. The `SHOW_STATS` procedure in this package shows only the statistics stored in the table specified in the `path_stat_table` parameter.

## 274.4.3 IS\_MONITORING Function

This function checks whether a monitoring job is currently running. This function either returns `TRUE` if a monitoring job is currently running or `FALSE` if a monitoring job is not currently running.

A monitoring job is submitted using the `START_MONITORING` procedure.

### See Also:

["START\\_MONITORING Procedure \(page 274-20\)"](#)

### Syntax

```
UTL_SPADV.IS_MONITORING(
 job_name IN VARCHAR2 DEFAULT 'STREAMS$_MONITORING_JOB',
 client_name IN VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

### Parameters

**Table 274-17 IS\_MONITORING Function Parameters**

Parameter	Description
<code>job_name</code>	The name of the job for which to check.
<code>client_name</code>	The name of the client that submitted the job.

## 274.4.4 SHOW\_STATS Procedure

This procedure generates output that includes the statistics gathered by the `COLLECT_STATS` and `START_MONITORING` procedures.

The output is formatted so that it can be imported into a spreadsheet for analysis.

### Note:

This procedure does not commit.

 See Also:

- ["COLLECT\\_STATS Procedure \(page 274-13\)"](#)
- ["START\\_MONITORING Procedure \(page 274-20\)"](#)
- *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

### Syntax

```
UTL_SPADV.SHOW_STATS(
 path_stat_table IN VARCHAR2 DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
 path_id IN NUMBER DEFAULT NULL,
 bgn_run_id IN NUMBER DEFAULT -1,
 end_run_id IN NUMBER DEFAULT -10,
 show_path_id IN BOOLEAN DEFAULT TRUE,
 show_run_id IN BOOLEAN DEFAULT TRUE,
 show_run_time IN BOOLEAN DEFAULT TRUE,
 show_optimization IN BOOLEAN DEFAULT TRUE,
 show_setting IN BOOLEAN DEFAULT FALSE,
 show_stat IN BOOLEAN DEFAULT TRUE,
 show_sess IN BOOLEAN DEFAULT FALSE,
 show_legend IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 274-18** *SHOW\_STATS Procedure Parameters*

Parameter	Description
path_stat_table	<p>The name of the table that contains the stream path statistics. Specify the table name as <i>[schema_name].object_name</i>. If the schema is not specified, then the current user is the default.</p> <p>When you gather statistics using the <code>COLLECT_STATS</code> procedure, this table is specified in the <code>path_stat_table</code> parameter in the <code>COLLECT_STATS</code> procedure. The default table is <code>STREAMS\$_ADVISOR_PATH_STAT</code>.</p> <p>When you gather statistics using the <code>START_MONITORING</code> procedure, you can determine the name for this table by querying the <code>SHOW_STATS_TABLE</code> column in the <code>STREAMS\$_PA_MONITORING</code> view. The default table for a monitoring job is <code>STREAMS\$_PA_SHOW_PATH_STAT</code>.</p>
path_id	<p>A stream path ID.</p> <p>If non-NULL, then the procedure shows output for the specified stream path only.</p> <p>If NULL, then the procedure shows output for all active stream paths.</p>
bgn_run_id	<p>The first Oracle Streams Performance Advisor run ID to show in the range of runs.</p> <p>See <a href="#">"Usage Notes (page 274-17)"</a> for more information about this parameter.</p>

**Table 274-18 (Cont.) SHOW\_STATS Procedure Parameters**

Parameter	Description
end_run_id	The last Oracle Streams Performance Advisor run ID to show in the range of runs. See " <a href="#">Usage Notes</a> (page 274-17)" for more information about this parameter.
show_path_id	If TRUE, then the path ID for each stream path is included in the output. If FALSE, then the path ID for each stream path is not included in the output.
show_run_id	If TRUE, then the Oracle Streams Performance Advisor run ID is included in the output. If FALSE, then the Oracle Streams Performance Advisor run ID is not included in the output.
show_run_time	If TRUE, then the Oracle Streams Performance Advisor run time is included in the output. If FALSE, then the Oracle Streams Performance Advisor run time is not included in the output.
show_optimization	If TRUE, then path output includes information pertaining to the combined capture and apply optimization. If FALSE, then path output does not include information pertaining to the combined capture and apply optimization.
show_setting	If TRUE, then the settings for the threshold parameters are included in the output. The threshold parameters are the <code>top_event_threshold</code> , <code>bottleneck_idle_threshold</code> , and <code>bottleneck_flowctrl_threshold</code> parameters in the <code>COLLECT_STATS</code> procedure. If FALSE, then the settings for the threshold parameters are not included in the output.
show_stat	If TRUE, then the component-level and subcomponent-level statistics are included in the output. These components include capture processes, queues, propagation senders, propagation receivers, and apply processes. The subcomponents are the subcomponents for capture processes and apply processes. If FALSE, then the component-level and subcomponent-level statistics are not included in the output.
show_sess	If TRUE, then the session-level statistics are included in the output. Session-level statistics include <code>IDLE</code> , <code>FLOW CONTROL</code> , and <code>EVENT</code> statistics. If FALSE, then the session-level statistics are not included in the output.
show_legend	If TRUE, then the legend is included in the output. The legend describes the abbreviations used in the output. If FALSE, then the legend is not included in the output.

**Usage Notes**

Use the `bgn_run_id` and `end_run_id` together to specify the range of Oracle Streams Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if `bgn_run_id` is set to 1 and `end_run_id` is set to 10, then the procedure shows statistics for the first ten Oracle Streams Performance Advisor runs.

However, if `bgn_run_id` is set to -1 and `end_run_id` is set to -10, then the procedure shows statistics for the last ten Oracle Streams Performance Advisor runs.

 **See Also:**

*Oracle Streams Concepts and Administration* for information about the combined capture and apply optimization

## 274.4.5 SHOW\_STATS\_HTML Procedure

This procedure generates HTML output that includes the statistics gathered by the `COLLECT_STATS` and `START_MONITORING` procedures.

 **Note:**

This procedure does not commit.

 **See Also:**

- "[COLLECT\\_STATS Procedure](#) (page 274-13)"
- "[START\\_MONITORING Procedure](#) (page 274-20)"
- *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

### Syntax

```
UTL_SPADV.SHOW_STATS_HTML(
 directory IN VARCHAR2,
 reportname IN VARCHAR2 DEFAULT 'SPADVREPORT.HTML',
 comp_stat_table IN VARCHAR2 DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
 path_id IN NUMBER DEFAULT NULL,
 bgn_run_id IN NUMBER DEFAULT -1,
 end_run_id IN NUMBER DEFAULT -10,
 detailed IN BOOLEAN DEFAULT TRUE);
```

## Parameters

Table 274-19 SHOW\_STATS\_HTML Procedure Parameters

Parameter	Description
directory	The directory object for the directory on the local computer system into which the generated HTML report is placed The specified directory object must be created using the SQL statement <code>CREATE DIRECTORY</code> , and the user who invokes the procedure must have <code>READ</code> and <code>WRITE</code> privilege on each one.
reportname	The name of the HTML report
comp_stat_table	The name of the table that stores the statistics collected for Oracle Streams components and subcomponents. Specify the table name as <code>[schema_name].object_name</code> . If the schema is not specified, then the current user is the default. When you gather statistics using the <code>COLLECT_STATS</code> procedure, this table is specified in the <code>comp_stat_table</code> parameter in the <code>COLLECT_STATS</code> procedure. The default table is <code>STREAMS\$_ADVISOR_COMP_STAT</code> . When you gather statistics using the <code>START_MONITORING</code> procedure, you can determine the name for this table by querying the <code>SHOW_STATS_TABLE</code> column in the <code>STREAMS\$_PA_MONITORING</code> view. The default table for a monitoring job is <code>STREAMS\$_PA_SHOW_PATH_STAT</code> . Oracle recommends that you start a monitoring job with the <code>START_MONITORING</code> procedure in this package and use the appropriate the <code>STREAMS\$_PA_SHOW_PATH_STAT</code> table.
path_id	A stream path ID. If non-NULL, then the procedure shows output for the specified stream path only. If NULL, then the procedure shows output for all active stream paths.
bgn_run_id	The first Oracle Streams Performance Advisor run ID to show in the range of runs. See " <a href="#">Usage Notes</a> (page 274-19)" for more information about this parameter.
end_run_id	The last Oracle Streams Performance Advisor run ID to show in the range of runs. See " <a href="#">Usage Notes</a> (page 274-19)" for more information about this parameter.
detailed	If <code>TRUE</code> , then the procedure generates component-level statistics. If <code>FALSE</code> , then the procedure does not generate component-level statistics.

## Usage Notes

Use the `bgn_run_id` and `end_run_id` together to specify the range of Oracle Streams Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if `bgn_run_id` is set to 1 and `end_run_id` is set to 10, then the procedure shows statistics for the first ten Oracle Streams Performance Advisor runs.

However, if `bgn_run_id` is set to -1 and `end_run_id` is set to -10, then the procedure shows statistics for the last ten Oracle Streams Performance Advisor runs.

## 274.4.6 START\_MONITORING Procedure

This procedure starts a monitoring job.

This procedure runs the `COLLECT_STATS` procedure to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.

### Note:

This procedure commits.

### See Also:

- "[COLLECT\\_STATS Procedure](#) (page 274-13)"
- *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

### Syntax

```
UTL_SPADV.START_MONITORING(
 job_name IN VARCHAR2 DEFAULT 'STREAMS$_MONITORING_JOB',
 client_name IN VARCHAR2 DEFAULT NULL,
 query_user_name IN VARCHAR2 DEFAULT NULL,
 interval IN NUMBER DEFAULT 60,
 top_event_threshold IN NUMBER DEFAULT 15,
 bottleneck_idle_threshold IN NUMBER DEFAULT 50,
 bottleneck_flowctrl_threshold IN NUMBER DEFAULT 50,
 retention_time IN NUMBER DEFAULT 24);
```

### Parameters

**Table 274-20 START\_MONITORING Procedure Parameters**

Parameter	Description
<code>job_name</code>	The name of the monitoring job to create.
<code>client_name</code>	The name of the client.
<code>query_user_name</code>	The user who will query the result tables. This procedure grants privileges to the specified user to enable the user to query the result tables.
<code>interval</code>	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. The specified interval is used for the interval parameter in the <code>COLLECT_STATS</code> procedure.

**Table 274-20 (Cont.) START\_MONITORING Procedure Parameters**

Parameter	Description
top_event_threshold	A percentage that determines whether a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.
bottleneck_idle_threshold	A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.
bottleneck_flowctrl_threshold	A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.
retention_time	The number of hours to retain monitoring results.

### Exceptions

**Table 274-21 START\_MONITORING Procedure Exceptions**

Exception	Description
ORA-20111	cannot start monitoring due to active EM monitoring job Stop the Oracle Enterprise Manager (EM) monitoring job, and run the START_MONITORING procedure again.
ORA-20112	cannot start monitoring due to active Streams monitoring job Stop the Streams monitoring job, and run the START_MONITORING procedure again.

### Usage Notes

The following are usage notes for the START\_MONITORING procedure:

- [Requirements for the User Running the Procedure](#) (page 274-21)
- [Full Monitoring Job Names](#) (page 274-22)
- [Restrictions on Monitoring Jobs](#) (page 274-22)

Requirements for the User Running the Procedure

The user who runs the `START_MONITORING` procedure must meet the following requirements:

- The user must have access to a database link to each database that contains Oracle Streams components.
- The user must have been granted privileges using the `DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE` procedure, and each database link must connect to a user at the remote database that has been granted privileges using the `DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE` procedure.

#### Full Monitoring Job Names

When you submit a monitoring job, the client name and job name are concatenated to form the full monitoring job name. You specify the client name using the `client_name` parameter and the job name using the `job_name` parameter when you run the `START_MONITORING` procedure. The client name for a monitoring job submitted by Oracle Enterprise Manager is always `EM`.

The following table show examples of full monitoring job names:

Setting for <code>client_name</code> Parameter	Setting for <code>job_name</code> parameter	Full Monitoring Job Name
NULL	STREAMS\$_MONITORING_JOB	STREAMS\$_MONITORING_JOB
EM	STREAMS\$_MONITORING_JOB	EMSTREAMS\$_MONITORING_JOB
strm	STREAMS\$_MONITORING_JOB	strmSTREAMS\$_MONITORING_JOB
strm	mjob1	strmmjob1

#### Restrictions on Monitoring Jobs

The following restrictions apply to monitoring jobs:

- The limit for the length of the full monitoring job name is 30 bytes.
- Two monitoring jobs cannot have the same full monitoring job name, even if the monitoring jobs were submitted by different schemas. The name check is not case-sensitive. For example, `strmSTREAMS$_MONITORING_JOB` and `STRMSTREAMS$_MONITORING_JOB` are considered to be the same name.
- Oracle Enterprise Manager can have at most one monitoring job for each database.
- Each schema can have at most one monitoring job.

## 274.4.7 STOP\_MONITORING Procedure

This procedure stops a monitoring job that was submitted by the current user.

#### Syntax

```
UTL_SPADV.STOP_MONITORING(
 purge IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 274-22 STOP\_MONITORING Procedure Parameters**

Parameter	Description
purge	If <code>TRUE</code> , then the procedure purges information about the monitoring job from the result tables. If <code>FALSE</code> , then the procedure retains information about the monitoring job in the result tables.

# 275

## UTL\_TCP

With the `UTL_TCP` package and its procedures and functions, PL/SQL applications can communicate with external TCP/IP-based servers using TCP/IP. Because many Internet application protocols are based on TCP/IP, this package is useful to PL/SQL applications that use Internet protocols and e-mail.

This chapter contains the following topics:

- [Overview](#) (page 275-1)
- [Security Model](#) (page 275-1)
- [Types](#) (page 275-1)
- [Exceptions](#) (page 275-3)
- [Rules and Limits](#) (page 275-3)
- [Examples](#) (page 275-4)
- [Summary of UTL\\_TCP Subprograms](#) (page 275-5)

### 275.1 UTL\_TCP Overview

The `UTL_TCP` package provides TCP/IP client-side access functionality in PL/SQL.

### 275.2 UTL\_TCP Security Model

This package is an invoker's rights package and the invoking user needs the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

 **Note:**

For more information about managing fine-grained access, see *Oracle Database Security Guide*

### 275.3 UTL\_TCP Types

The `UTL_TCP` package includes a `CONNECTION` type and a carriage-return line-feed (CRLF) type.

#### **CONNECTION Type**

This is a PL/SQL record type used to represent a TCP/IP connection.

## Syntax

```

TYPE connection IS RECORD (
 remote_host VARCHAR2(255),
 remote_port PLS_INTEGER,
 local_host VARCHAR2(255),
 local_port PLS_INTEGER,
 charset VARCHAR2(30),
 newline VARCHAR2(2),
 tx_timeout PLS_INTEGER,
 private_sd PLS_INTEGER);

```

## Fields

**Table 275-1 Connection Record Type Fields**

Field	Description
remote_host	Name of the remote host when connection is established. NULL when no connection is established.
remote_port	Port number of the remote host connected. NULL when no connection is established.
local_host	Name of the local host used to establish the connection. NULL when no connection is established.
local_port	Port number of the local host used to establish the connection. NULL when no connection is established.
charset	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network.
newline	Newline character sequence. This newline character sequence is appended to the text line sent by WRITE_LINE API.
tx_timeout	Time in seconds that the UTL_TCP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

## Usage Notes

The fields in a connection record are used to return information about the connection, which is often made using `OPEN_CONNECTION`. Changing the values of those fields has no effect on the connection. The fields `private_XXXX` are for implementation use only. You should not modify the values.

In the current release of the UTL\_TCP package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields are not set in the connection record returned by the function.

Time out on write operations is not supported in the current release of the UTL\_TCP package.

### CRLF

The character sequence carriage-return line-feed. It is the newline sequence commonly used by many communication standards.

### Syntax

```
CRLF CONSTANT VARCHAR2(2 CHAR);
```

### Usage Notes

This package variable defines the newline character sequence commonly used in many Internet protocols. This is the default value of the newline character sequence for `WRITE_LINE`, specified when a connection is opened. While such protocols use `<CR><LF>` to denote a new line, some implementations may choose to use just line-feed to denote a new line. In such cases, users can specify a different newline character sequence when a connection is opened.

## 275.4 UTL\_TCP Exceptions

UTL\_TCP will raise an exception when it encounters a processing issue.

The exceptions raised by the TCP/IP package are listed in the following table.

**Table 275-2 TCP/IP Exceptions**

Exception	Description
BUFFER_TOO_SMALL	Buffer is too small for input that requires look-ahead
END_OF_INPUT	Raised when no more data is available to read from the connection
NETWORK_ERROR	Generic network error
BAD_ARGUMENT	Bad argument passed in an API call (for example, a negative buffer size)
TRANSFER_TIMEOUT	No data is read and a read time out occurred
PARTIAL_MULTIBYTE_CHAR	No complete character is read and a partial multibyte character is found at the end of the input

## 275.5 UTL\_TCP Rules and Limits

The interface provided in the package only allows connections to be initiated by the PL/SQL program. It does not allow the PL/SQL program to accept connections initiated outside the program.

## 275.6 UTL\_TCP Examples

Some possible uses for `UTL_TCP` include retrieving a Web page over HTTP or sending an e-mail.

The following code example illustrates how the TCP/IP package can be used to retrieve a Web page over HTTP. It connects to a Web server listening at port 80 (standard port for HTTP) and requests the root document.

```
DECLARE
 c utl_tcp.connection; -- TCP/IP connection to the Web server
 ret_val pls_integer;
BEGIN
 c := utl_tcp.open_connection(remote_host => 'www.acme.com',
 remote_port => 80,
 charset => 'US7ASCII'); -- open connection
 ret_val := utl_tcp.write_line(c, 'GET / HTTP/1.0'); -- send HTTP request
 ret_val := utl_tcp.write_line(c);
 BEGIN
 LOOP
 dbms_output.put_line(utl_tcp.get_line(c, TRUE)); -- read result
 END LOOP;
 EXCEPTION
 WHEN utl_tcp.end_of_input THEN
 NULL; -- end of input
 END;
 utl_tcp.close_connection(c);
END;
```

The following code example illustrates how the TCP/IP package can be used by an application to send e-mail (also known as email from PL/SQL). The application connects to an SMTP server at port 25 and sends a simple text message.

```
PROCEDURE send_mail (sender IN VARCHAR2,
 recipient IN VARCHAR2,
 message IN VARCHAR2) IS
 mailhost VARCHAR2(30) := 'mailhost.mydomain.com';
 smtp_error EXCEPTION;
 mail_conn utl_tcp.connection;
 PROCEDURE smtp_command(command IN VARCHAR2,
 ok IN VARCHAR2 DEFAULT '250')
 IS
 response varchar2(3);
 len pls_integer;
 BEGIN
 len := utl_tcp.write_line(mail_conn, command);
 response := substr(utl_tcp.get_line(mail_conn), 1, 3);
 IF (response <> ok) THEN
 RAISE smtp_error;
 END IF;
 END;
END;

BEGIN
 mail_conn := utl_tcp.open_connection(remote_host => mailhost,
 remote_port => 25,
 charset => 'US7ASCII');

 smtp_command('HELO ' || mailhost);
 smtp_command('MAIL FROM: ' || sender);
 smtp_command('RCPT TO: ' || recipient);
```

```

smtp_command('DATA', '354');
smtp_command(message);
smtp_command('QUIT', '221');
utl_tcp.close_connection(mail_conn);
EXCEPTION
 WHEN OTHERS THEN
 -- Handle the error
END;
```

## 275.7 Summary of UTL\_TCP Subprograms

This table lists the UTL\_TCP subprograms and briefly describes them.

**Table 275-3 UTL\_TCP Package Subprograms**

Subprogram	Description
<a href="#">AVAILABLE Function</a> (page 275-6)	Determines the number of bytes available for reading from a TCP/IP connection
<a href="#">CLOSE_ALL_CONNECTIONS Procedure</a> (page 275-7)	Closes all open TCP/IP connections
<a href="#">CLOSE_CONNECTION Procedure</a> (page 275-7)	Closes an open TCP/IP connection
<a href="#">FLUSH Procedure</a> (page 275-8)	Transmits immediately to the server all data in the output buffer, if a buffer is used
<a href="#">GET_LINE Function</a> (page 275-8)	Returns the line of data read
<a href="#">GET_LINE_NCHAR Function</a> (page 275-9)	Returns the line of data read in NCHAR form
<a href="#">GET_RAW Function</a> (page 275-10)	Return the data read instead of the amount of data read
<a href="#">GET_TEXT Function</a> (page 275-10)	Returns the text data read
<a href="#">GET_TEXT_NCHAR Function</a> (page 275-11)	Returns the text data read in NCHAR form
<a href="#">OPEN_CONNECTION Function</a> (page 275-12)	Opens a TCP/IP connection to a specified service
<a href="#">READ_LINE Function</a> (page 275-14)	Receives a text line from a service on an open connection
<a href="#">READ_RAW Function</a> (page 275-15)	Receives binary data from a service on an open connection
<a href="#">READ_TEXT Function</a> (page 275-16)	Receives text data from a service on an open connection
<a href="#">SECURE_CONNECTION Procedure</a> (page 275-18)	Secures a TCP/IP connection using SSL/TLS
<a href="#">WRITE_LINE Function</a> (page 275-18)	Transmits a text line to a service on an open connection
<a href="#">WRITE_RAW Function</a> (page 275-19)	Transmits a binary message to a service on an open connection

**Table 275-3 (Cont.) UTL\_TCP Package Subprograms**

Subprogram	Description
<a href="#">WRITE_TEXT Function</a> (page 275-19)	Transmits a text message to a service on an open connection

## 275.7.1 AVAILABLE Function

This function determines the number of bytes available for reading from a TCP/IP connection. It is the number of bytes that can be read immediately without blocking. Determines if data is ready to be read from the connection.

### Syntax

```
UTL_TCP.AVAILABLE (
 c IN OUT NOCOPY connection,
 timeout IN PLS_INTEGER DEFAULT 0)
RETURN PLS_INTEGER;
```

### Parameters

**Table 275-4 AVAILABLE Function Parameters**

Parameter	Description
c	TCP connection to determine the amount of data that is available to be read
timeout	Time in seconds to wait before giving up and reporting that no data is available. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

### Return Values

The number of bytes available for reading without blocking

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Users may use this API to determine if data is available to be read before calling the read API so that the program are not blocked because data is not ready to be read from the input.

The number of bytes available for reading returned by this function may be less than what is actually available. On some platforms, this function may only return 1, to indicate that some data is available. If you are concerned about the portability of your application, then assume that this function returns a positive value when data is available for reading, and 0 when no data is available. This function returns a positive value when all the data at a particular connection has been read and the next read result in the `END_OF_INPUT` exception.

The following example illustrates using this function in a portable manner:

```
DECLARE
 c utl_tcp.connection
 data VARCHAR2(256);
```

```

len PLS_INTEGER;
BEGIN
 c := utl_tcp.open_connection(...);
 LOOP
 IF (utl_tcp.available(c) > 0) THEN
 len := utl_tcp.read_text(c, data, 256);
 ELSE
 ---do some other things

 END IF
 END LOOP;
END;
```

## 275.7.2 CLOSE\_ALL\_CONNECTIONS Procedure

This procedure closes all open TCP/IP connections.

### Syntax

```
UTL_TCP.CLOSE_ALL_CONNECTIONS;
```

### Usage Notes

This call is provided to close all connections before a PL/SQL program ends to avoid dangling connections.

## 275.7.3 CLOSE\_CONNECTION Procedure

This procedure closes an open TCP/IP connection.

### Syntax

```
UTL_TCP.CLOSE_CONNECTION (
 c IN OUT NOCOPY connection);
```

### Parameters

**Table 275-5 CLOSE\_CONNECTION Procedure Parameters**

Parameter	Description
c	TCP connection to close

### Usage Notes

Connection must have been opened by a previous call to `OPEN_CONNECTION`. The fields `remote_host`, `remote_port`, `local_host`, `local_port` and `charset` of `c` are reset after the connection is closed.

An open connection must be closed explicitly. An open connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

## 275.7.4 FLUSH Procedure

This procedure transfers immediately to the server all data in the output buffer, if a buffer is used.

### Syntax

```
UTL_TCP.FLUSH (
 c IN OUT NOCOPY connection);
```

### Parameters

**Table 275-6 FLUSH Procedure Parameters**

Parameter	Description
c	TCP connection to which to send data

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

## 275.7.5 GET\_LINE Function

This function returns the line of data read.

### Syntax

```
UTL_TCP.GET_LINE (
 c IN OUT NOCOPY connection,
 remove_crlf IN BOOLEAN DEFAULT FALSE,
 peek IN BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

### Parameters

**Table 275-7 GET\_LINE Function Parameters**

Parameter	Description
c	TCP connection from which to receive data
remove_crlf	If <code>TRUE</code> , then one or more trailing CRLF characters are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

**Return Values**

The text line read

**Usage Notes**

- The connection must have already been opened through a call to `OPEN_CONNECTION`.
- See `READ_LINE` for the read time out, character set conversion, buffer size, and multibyte character issues.

## 275.7.6 GET\_LINE\_NCHAR Function

This function returns the line of data read in NCHAR form.

**Syntax**

```
UTL_TCP.GET_LINE_NCHAR (
 c IN OUT NOCOPY connection,
 remove_crlf IN BOOLEAN DEFAULT FALSE,
 peek IN BOOLEAN DEFAULT FALSE)
RETURN NVARCHAR2;
```

**Parameters****Table 275-8 GET\_LINE\_NCHAR Function Parameters**

Parameter	Description
c	TCP connection from which to receive data
remove_crlf	If <code>TRUE</code> , then one or more trailing CRLF characters are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

**Return Values**

The text line read

**Usage Notes**

- The connection must have already been opened through a call to `OPEN_CONNECTION`.
- See `READ_LINE` for the read time out, character set conversion, buffer size, and multibyte character issues.

## 275.7.7 GET\_RAW Function

This function returns the data read instead of the amount of data read.

### Syntax

```
UTL_TCP.GET_RAW (
 c IN OUT NOCOPY connection,
 len IN PLS_INTEGER DEFAULT 1,
 peek IN BOOLEAN DEFAULT FALSE)
RETURN RAW;
```

### Parameters

**Table 275-9 GET\_RAW Function Parameters**

Parameter	Description
c	TCP connection from which to receive data
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If <code>TRUE</code> , then one or more trailing CRLF characters are removed from the received message.

### Return Values

The binary data read

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

For all the `get_*` APIs described in this section, see the corresponding `read_*` API for the read time out issue. For `GET_TEXT` and `GET_LINE`, see the corresponding `read_*` API for character set conversion, buffer size, and multibyte character issues.

## 275.7.8 GET\_TEXT Function

This function returns the text data read.

### Syntax

```
UTL_TCP.GET_TEXT (
 c IN OUT NOCOPY connection,
 len IN PLS_INTEGER DEFAULT 1,
 peek IN BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

## Parameters

**Table 275-10 GET\_TEXT Function Parameters**

Parameter	Description
c	TCP connection from which to receive data
len	Number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, then one or more trailing CRLF characters are removed from the received message.

## Return Values

The text data read

## Usage Notes

The connection must have already been opened through a call to OPEN\_CONNECTION.

For all the get\_\* APIs described in this section, see the corresponding read\_\* API for the read time out issue. For GET\_TEXT and GET\_LINE, see the corresponding READ\_\* API for character set conversion, buffer size, and multibyte character issues.

## 275.7.9 GET\_TEXT\_NCHAR Function

This function returns the text data read in NCHAR form.

### Syntax

```
UTL_TCP.GET_TEXT_NCHAR (
 c IN OUT NOCOPY connection,
 len IN PLS_INTEGER DEFAULT 1,
 peek IN BOOLEAN DEFAULT FALSE)
RETURN NVARCHAR2;
```

## Parameters

**Table 275-11 GET\_TEXT\_NCHAR Function Parameters**

Parameter	Description
c	TCP connection from which to receive data
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.

**Table 275-11 (Cont.) GET\_TEXT\_NCHAR Function Parameters**

Parameter	Description
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If <code>TRUE</code> , then one or more trailing CRLF characters are removed from the received message.

**Return Values**

The text data read

**Usage Notes**

The connection must have already been opened through a call to `OPEN_CONNECTION`.

For all the `get_*` APIs described in this section, see the corresponding `read_*` API for the read time out issue. For `GET_TEXT` and `GET_LINE`, see the corresponding `READ_*` API for character set conversion, buffer size, and multibyte character issues.

## 275.7.10 OPEN\_CONNECTION Function

This function opens a TCP/IP connection to a specified service.

**Syntax**

```
UTL_TCP.OPEN_CONNECTION (
 remote_host IN VARCHAR2,
 remote_port IN PLS_INTEGER,
 local_host IN VARCHAR2 DEFAULT NULL,
 local_port IN PLS_INTEGER DEFAULT NULL,
 in_buffer_size IN PLS_INTEGER DEFAULT NULL,
 out_buffer_size IN PLS_INTEGER DEFAULT NULL,
 charset IN VARCHAR2 DEFAULT NULL,
 newline IN VARCHAR2 DEFAULT CRLF,
 tx_timeout IN PLS_INTEGER DEFAULT NULL,
 wallet_path IN VARCHAR2 DEFAULT NULL,
 wallet_password IN VARCHAR2 DEFAULT NULL,
 RETURN connection;
```

**Parameters**

**Table 275-12 OPEN\_CONNECTION Function Parameters**

Parameter	Description
remote_host	Name of the host providing the service. When <code>remote_host</code> is <code>NULL</code> , it connects to the local host.

**Table 275-12 (Cont.) OPEN\_CONNECTION Function Parameters**

Parameter	Description
remote_port	Port number on which the service is listening for connections
local_host	Name of the host providing the service. NULL means does not care.
local_port	Port number on which the service is listening for connections. NULL means don't care.
in_buffer_size	The size of input buffer. The use of an input buffer can speed up execution performance in receiving data from the server. The appropriate size of the buffer depends on the flow of data between the client and the server, and the traffic/latency on the network. A zero value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the input buffer is 32767 bytes.
out_buffer_size	The size of output buffer. The use of an output buffer can speed up execution performance in sending data to the server. The appropriate size of buffer depends on the flow of data between the client and the server, and the network condition. A zero value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the output buffer is 32767 bytes.
charset	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network using READ_TEXT, READ_LINE, WRITE_TEXT and WRITE_LINE. Set this parameter to NULL when no conversion is needed.
newline	Newline character sequence. This newline character sequence is appended to the text line sent by WRITE_LINE API.
tx_timeout	Time in seconds that the UTL_TCP package should wait before giving up in a read or write operations in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.
wallet_path	Directory path that contains the Oracle wallet for SSL/TLS. The format is <i>file:directory-path</i>
wallet_password	Password to open the wallet. When the wallet is auto-login enabled, the password may be set to NULL.

**Return Values**

A connection to the targeted TCP/IP service

**Usage Notes**

- Note that connections opened by this UTL\_TCP package can remain open and be passed from one database call to another in a shared server configuration.

However, the connection must be closed explicitly. The connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

- In the current release of the `UTL_TCP` package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields is not set in the connection record returned by the function.
- `tx_timeout` is intended to govern both the read operations and the write operations. However, an implementation restriction prevents `tx_timeout` from governing write operations in the current release.

### Examples

```
DECLARE
 c UTL_TCP.CONNECTION;
BEGIN
 c := UTL_TCP.OPEN_CONNECTION(
 host => 'www.example.com',
 port => 443,
 wallet_path => 'file:/oracle/wallets/smtp_wallet',
 wallet_password => '****');
 UTL_TCP.SECURE_CONNECTION (c => c);
END;
```

## 275.7.11 READ\_LINE Function

This function receives a text line from a service on an open connection.

A line is terminated by a line-feed, a carriage-return or a carriage-return followed by a line-feed.

### Syntax

```
UTL_TCP.READ_LINE (
 c IN OUT NOCOPY connection,
 data IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
 peek IN BOOLEAN DEFAULT FALSE)
RETURN PLS_INTEGER;
```

### Parameters

**Table 275-13 READ\_LINE Function Parameters**

Parameter	Description
<code>c</code>	TCP connection from which to receive data
<code>data</code>	Data received.
<code>remove_crlf</code>	If <code>TRUE</code> , then one or more trailing CRLF characters are removed from the received message.

**Table 275-13 (Cont.) READ\_LINE Function Parameters**

Parameter	Description
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

**Return Values**

The number of characters of data received

**Usage Notes**

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the end-of-line have been reached, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

## 275.7.12 READ\_RAW Function

This function receives binary data from a service on an open connection.

**Syntax**

```
UTL_TCP.READ_RAW (
 c IN OUT NOCOPY connection,
 data IN OUT NOCOPY RAW,
 len IN PLS_INTEGER DEFAULT 1,
 peek IN BOOLEAN DEFAULT FALSE)
RETURN PLS_INTEGER;
```

## Parameters

**Table 275-14 READ\_RAW Function Parameters**

Parameter	Description
c	TCP connection from which to receive data
data (IN OUT COPY)	Data received
len	Number of bytes of data to receive
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

## Return Values

The number of bytes of data received

## Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the specified number of bytes have been read, or the end of input has been reached.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

## 275.7.13 READ\_TEXT Function

This function receives text data from a service on an open connection.

### Syntax

```
UTL_TCP.READ_TEXT (
 c IN OUT NOCOPY connection,
 data IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
 len IN PLS_INTEGER DEFAULT 1,
 peek IN BOOLEAN DEFAULT FALSE)
RETURN PLS_INTEGER;
```

## Parameters

**Table 275-15 READ\_TEXT Function Parameters**

Parameter	Description
c	TCP connection from which to receive data

**Table 275-15 (Cont.) READ\_TEXT Function Parameters**

Parameter	Description
data	Data received
len	Number of characters of data to receive
peek	Normally, users want to read the data and remove it from the input queue, that is, consume it. In some situations, users may just want to look ahead at the data without removing it from the input queue so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and an input buffer must be set up when the connection is opened. The amount of data that you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

### Return Values

The number of characters of data received

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the specified number of characters has been read, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

Unless explicitly overridden, the size of a `VARCHAR2` buffer is specified in terms of bytes, while the parameter `len` refers to the maximum number of characters to be read. When the database character set is multibyte, where a single character may consist of more than 1 byte, you should ensure that the buffer can hold the maximum of characters. In general, the size of the `VARCHAR2` buffer should equal the number of characters to be read, multiplied by the maximum number of bytes of a character of the database character set.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

## 275.7.14 SECURE\_CONNECTION Procedure

This procedure secures a TCP/IP connection using SSL/TLS.

SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the [OPEN\\_CONNECTION Function](#) (page 275-12).

### Syntax

```
UTL_TCP.SECURE_CONNECTION (
 c IN OUT NOCOPY connection);
```

### Parameters

**Table 275-16 SECURE\_CONNECTION Procedure Parameters**

Parameter	Description
c	TCP connection from which to receive data

## 275.7.15 WRITE\_LINE Function

This function transmits a text line to a service on an open connection. The `newline` character sequence is appended to the message before it is transmitted.

### Syntax

```
UTL_TCP.WRITE_LINE (
 c IN OUT NOCOPY connection,
 data IN VARCHAR2 DEFAULT NULL CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

### Parameters

**Table 275-17 WRITE\_LINE Function Parameters**

Parameter	Description
c	TCP connection to which to send data
data	Buffer containing the data to be sent

### Return Values

The actual number of characters of data transmitted

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

## 275.7.16 WRITE\_RAW Function

This function transmits a binary message to a service on an open connection. The function does not return until the specified number of bytes have been written.

### Syntax

```
UTL_TCP.WRITE_RAW (
 c IN OUT NOCOPY connection,
 data IN RAW,
 len IN PLS_INTEGER DEFAULT NULL)
RETURN PLS_INTEGER;
```

### Parameters

**Table 275-18 WRITE\_RAW Function Parameters**

Parameter	Description
c	TCP connection to which to send data
data	Buffer containing the data to be sent
len	The number of bytes of data to transmit. When len is NULL, the whole length of data is written.

### Return Values

The number of bytes of data transmitted

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

## 275.7.17 WRITE\_TEXT Function

This function transmits a text message to a service on an open connection.

### Syntax

```
UTL_TCP.WRITE_TEXT (
 c IN OUT NOCOPY connection,
 data IN VARCHAR2 CHARACTER SET ANY_CS,
 len IN PLS_INTEGER DEFAULT NULL)
RETURN num_chars PLS_INTEGER;
```

### Parameters

**Table 275-19 WRITE\_TEXT Function Parameters**

Parameter	Description
c	TCP connection to which to send data
data	Buffer containing the data to be sent

**Table 275-19 (Cont.) WRITE\_TEXT Function Parameters**

<b>Parameter</b>	<b>Description</b>
len	The number of characters of data to transmit. When len is NULL, the whole length of data is written. The actual amount of data written may be less because of network condition.

**Return Values**

The actual number of characters of data transmitted

**Usage Notes**

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

# UTL\_URL

The `UTL_URL` package has two functions: `ESCAPE` and `UNESCAPE`.

This chapter contains the following topics:

- [Overview](#) (page 276-1)
- [Exceptions](#) (page 276-2)
- [Examples](#) (page 276-2)
- [Summary of UTL\\_URL Subprograms](#) (page 276-2)

**See Also:**

[UTL\\_HTTP](#) (page 262-1)

## 276.1 UTL\_URL Overview

A Uniform Resource Locator (URL) is a string that identifies a Web resource, such as a page or a picture. Use a URL to access such resources by way of the HyperText Transfer Protocol (HTTP).

For example, the URL for Oracle's Web site is:

```
http://www.oracle.com
```

Normally, a URL contains English alphabetic characters, digits, and punctuation symbols. These characters are known as the *unreserved characters*. Any other characters in URLs, including multibyte characters or binary octet codes, must be escaped to be accurately processed by Web browsers or Web servers. Some punctuation characters, such as dollar sign (\$), question mark (?), colon (:), and equals sign (=), are reserved as delimiters in a URL. They are known as the *reserved characters*. To literally process these characters, instead of treating them as delimiters, they must be escaped.

The unreserved characters are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (\_), period (.), exclamation point (!), tilde (~), asterisk (\*), accent (^), left parenthesis ( ( ), right parenthesis ( ) )

The reserved characters are:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign (\$), percentage sign (%), and comma (,)

The `UTL_URL` package has two functions that provide escape and unescape mechanisms for URL characters. Use the escape function to escape a URL before the

URL is used to fetch a Web page by way of the `UTL_HTTP` package. Use the `unescape` function to unescape an escaped URL before information is extracted from the URL.

For more information, refer to the Request For Comments (RFC) document RFC2396. Note that this URL escape and unescape mechanism is different from the `x-www-form-urlencoded` encoding mechanism described in the HTML specification:

```
http://www.w3.org/TR/html
```

## 276.2 UTL\_URL Exceptions

`UTL_URL` raises an exception when it encounters a processing issue.

The following table lists the exceptions that can be raised when the `UTL_URL` package API is invoked.

**Table 276-1 UTL\_URL Exceptions**

Exception	Error Code	Reason
<code>BAD_URL</code>	29262	The URL contains badly formed escape code sequences
<code>BAD_FIXED_WIDTH_CHARSET</code>	29274	Fixed-width multibyte character set is not allowed as a URL character set.

## 276.3 UTL\_URL Examples

`UTL_URL` can be used for encoding and decoding.

You can implement the `x-www-form-urlencoded` encoding using the `UTL_URL.ESCAPE` function as follows:

```
CREATE OR REPLACE FUNCTION form_url_encode (
 data IN VARCHAR2,
 charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
 RETURN utl_url.escape(data, TRUE, charset); -- note use of TRUE
END;
```

For decoding data encoded with the `form-URL-encode` scheme, the following function implements the decoding scheme:

```
CREATE OR REPLACE FUNCTION form_url_decode(
 data IN VARCHAR2,
 charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
 RETURN utl_url.unescape(
 replace(data, '+', ' '),
 charset);
END;
```

## 276.4 Summary of UTL\_URL Subprograms

This table lists and briefly describes the `UTL_URL` subprograms.

**Table 276-2 UTL\_URL Package Subprograms**

Subprogram	Description
<a href="#">ESCAPE Function</a> (page 276-3)	Returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format
<a href="#">UNESCAPE Function</a> (page 276-4)	Unescapes the escape character sequences to their original forms in a URL. Convert the %XX escape character sequences to the original characters

## 276.4.1 ESCAPE Function

This function returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format.

### Syntax

```
UTL_URL.ESCAPE (
 url IN VARCHAR2 CHARACTER SET ANY_CS,
 escape_reserved_chars IN BOOLEAN DEFAULT FALSE,
 url_charset IN VARCHAR2 DEFAULT utl_http.body_charset)
RETURN VARCHAR2;
```

### Parameters

**Table 276-3 ESCAPE Function Parameters**

Parameter	Description
url	The original URL
escape_reserved_chars	Indicates whether the URL reserved characters should be escaped. If set to <code>TRUE</code> , both the reserved and illegal URL characters are escaped. Otherwise, only the illegal URL characters are escaped. The default value is <code>FALSE</code> .
url_charset	When escaping a character (single-byte or multibyte), determine the target character set that character should be converted to before the character is escaped in %hex-code format. If <code>url_charset</code> is <code>NULL</code> , the database charset is assumed and no character set conversion will occur. The default value is the current default body character set of the <code>UTL_HTTP</code> package, whose default value is <code>ISO-8859-1</code> . The character set can be named in Internet Assigned Numbers Authority (IANA) or in the Oracle naming convention.

### Usage Notes

Use this function to escape URLs that contain illegal characters as defined in the URL specification RFC 2396. The legal characters in URLs are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (\_), period (.), exclamation point (!), tilde (~), asterisk (\*), accent (^), left parenthesis ( ( ), right parenthesis ( ) )

The reserved characters consist of:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign (\$), and comma (,)

Many of the reserved characters are used as delimiters in the URL. You should escape characters beyond those listed here by using `escape_url`. Also, to use the reserved characters in the name-value pairs of the query string of a URL, those characters must be escaped separately. An `escape_url` cannot recognize the need to escape those characters because once inside a URL, those characters become indistinguishable from the actual delimiters. For example, to pass a name-value pair `$logon=scott/tiger` into the query string of a URL, escape the `$` and `/` separately as `%24logon=scott%2Ftiger` and use it in the URL.

Normally, you will escape the entire URL, which contains the reserved characters (delimiters) that should not be escaped. For example:

```
utl_url.escape('http://www.acme.com/a url with space.html')
```

Returns:

```
http://www.acme.com/a%20url%20with%20space.html
```

In other situations, you may want to send a query string with a value that contains reserved characters. In that case, escape only the value fully (with `escape_reserved_chars` set to `TRUE`) and then concatenate it with the rest of the URL. For example:

```
url := 'http://www.acme.com/search?check=' || utl_url.escape
('Is the use of the "$" sign okay?', TRUE);
```

This expression escapes the question mark (?), dollar sign (\$), and space characters in 'Is the use of the "\$" sign okay?' but not the ? after search in the URL that denotes the use of a query string.

The Web server that you intend to fetch Web pages from may use a character set that is different from that of your database. In that case, specify the `url_charset` as the Web server character set so that the characters that need to be escaped are escaped in the target character set. For example, a user of an EBCDIC database who wants to access an ASCII Web server should escape the URL using `US7ASCII` so that a space is escaped as `%20` (hex code of a space in ASCII) instead of `%40` (hex code of a space in EBCDIC).

This function does not validate a URL for the proper URL format.

## 276.4.2 UNESCAPE Function

This function unescapes the escape character sequences to its original form in a URL, to convert the `%XX` escape character sequences to the original characters.

### Syntax

```
UTL_URL.UNESCAPE (
 url IN VARCHAR2 CHARACTER SET ANY_CS,
 url_charset IN VARCHAR2 DEFAULT utl_http.body_charset)
RETURN VARCHAR2;
```

## Parameters

**Table 276-4 UNESCAPE Function Parameters**

Parameter	Description
url	The URL to unescape
url_charset	After a character is unescaped, the character is assumed to be in the <code>source_charset</code> character set and it will be converted from the <code>source_charset</code> to the database character set before the URL is returned. If <code>source_charset</code> is <code>NULL</code> , the database charset is assumed and no character set conversion occurred. The default value is the current default body character set of the <code>UTL_HTTP</code> package, whose default value is "ISO-8859-1". The character set can be named in Internet Assigned Numbers Authority (IANA) or Oracle naming convention.

## Usage Notes

The Web server that you receive the URL from may use a character set that is different from that of your database. In that case, specify the `url_charset` as the Web server character set so that the characters that need to be unescaped are unescaped in the source character set. For example, a user of an EBCDIC database who receives a URL from an ASCII Web server should unescape the URL using `US7ASCII` so that `%20` is unescaped as a space (0x20 is the hex code of a space in ASCII) instead of a ? (because 0x20 is not a valid character in EBCDIC).

This function does not validate a URL for the proper URL format.

# WPG\_DOCLOAD

The `WPG_DOCLOAD` package provides an interface to download files, BLOBs and BFILES.

## See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Constants](#) (page 277-1)
- [Summary of WPG\\_DOCLOAD Subprograms](#) (page 277-2)

## 277.1 WPG\_DOCLOAD Constants

`WPG_DOCLOAD` defines several constants to use when specifying parameter values.

The `WPG_DOCLOAD` constants are listed below:

- `NAME_COL_LEN`
- `MIMET_COL_LEN`
- `MAX_DOCTABLE_NAME_LEN`

### **NAME\_COL\_LEN**

The `NAME` column in your document table must be the same as the value of `name_col_len`.

```
name_col_len CONSTANT pls_integer := 64;
```

### **MIMET\_COL\_LEN**

The `MIME_TYPE` column in your document table must be the same as the value of `mimet_col_len`.

```
mimet_col_len CONSTANT pls_integer := 48;
```

### **MAX\_DOCTABLE\_NAME\_LEN**

The name length of your document table must be less than `max_doctable_name_len`.

```
max_doctable_name_len CONSTANT pls_integer := 256;
```

## 277.2 Summary of WPG\_DOCLOAD Subprograms

The WPG\_DOCLOAD package uses one subprogram, the `DOWNLOAD_FILE` procedure.

**Table 277-1 WPG\_DOCLOAD Package Subprograms**

Subprogram	Description
<a href="#">DOWNLOAD_FILE Procedures</a> (page 277-2)	Downloads files, BLOBS and BFILES

### 277.2.1 DOWNLOAD\_FILE Procedures

There are three versions of this download file procedure.

- The first version downloads files and is invoked from within a document download procedure to signal the PL/SQL Gateway that `p_filename` is to be downloaded from the document table to the client's browser.
- The second version can be called from within any procedure to signal the PL/SQL Gateway that `p_blob` is to be downloaded to the client's browser.
- The third version can be called from within any procedure to signal the PL/SQL Gateway that `p_bfile` is to be downloaded to the client's browser.

#### Syntax

```
WPG_DOCLOAD.DOWNLOAD_FILE(
 p_filename IN VARCHAR2,
 p_bcaching IN BOOLEAN DEFAULT TRUE);
```

```
WPG_DOCLOAD.DOWNLOAD_FILE(
 p_blob IN OUT NOCOPY BLOB);
```

```
WPG_DOCLOAD.DOWNLOAD_FILE(
 p_bfile IN OUT BFILE);
```

#### Parameters

**Table 277-2 DOWNLOAD\_FILE Procedure Parameters**

Parameter	Description
<code>p_filename</code>	The file to download from the document table.
<code>p_blob</code>	The BLOB to download.
<code>p_bfile</code>	The BFILE to download (see <a href="#">Usage Notes</a> (page 277-2)).
<code>p_bcaching</code>	Whether browser caching is enabled (see <a href="#">Usage Notes</a> (page 277-2)).

#### Usage Notes

- Normally, a document will be downloaded to the browser unless the browser sends an 'If-Modified-Since' header to the gateway indicating that it has the requested document in its cache. In that case, the gateway will determine if the

browser's cached copy is up to date, and if it is, it will send an HTTP 304 status message to the browser indicating that the browser should display the cached copy. However, because a document URL and a document do not necessarily have a one-to-one relationship in the PL/SQL Web Gateway, in some cases it may be undesirable to have the cached copy of a document displayed. In those cases, the `p_bcaching` parameter should be set to `FALSE` to indicate to the gateway to ignore the 'If-Modified-Since' header, and download the document.

- `p_bfile` and `p_blob` are declared as `IN OUT` because the locator is initially opened to check for file accessibility and existence. The open operation can only be performed if the locator is writable and readable.

# ANYDATA TYPE

An `ANYDATA` TYPE contains an instance of a given type, plus a description of the type. In this sense, an `ANYDATA` is self-describing. An `ANYDATA` can be persistently stored in the database.

This chapter contains the following topics:

- [Restrictions](#) (page 278-1)
- [Operational Notes](#) (page 278-1)
- [Summary of ANYDATA Subprograms](#) (page 278-2)

## 278.1 ANYDATA TYPE Restrictions

Persistent storage of `ANYDATA` instances whose type contains embedded LOBs other than `BFILES` is not currently supported.

## 278.2 ANYDATA TYPE Operational Notes

This section contains notes related to `ANYDATA` TYPE construction and access.

### Construction

There are 2 ways to construct an `ANYDATA`. The `CONVERT*` calls enable construction of the `ANYDATA` in its entirety with a single call. They serve as explicit `CAST` functions from any type in the Oracle ORDBMS to `ANYDATA`.

```

STATIC FUNCTION ConvertBDouble(dbl IN BINARY_DOUBLE) return ANYDATA,
STATIC FUNCTION ConvertBfile(b IN BFILE) RETURN ANYDATA,
STATIC FUNCTION ConvertBFloat(fl IN BINARY_FLOAT) return ANYDATA,
STATIC FUNCTION ConvertBlob(b IN BLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertChar(c IN CHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertClob(c IN CLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertCollection(col IN "collection_type") RETURN ANYDATA,
STATIC FUNCTION ConvertDate(dat IN DATE) RETURN ANYDATA,
STATIC FUNCTION ConvertIntervalDS(inv IN INTERVAL DAY TO SECOND) return ANYDATA,
STATIC FUNCTION ConvertIntervalYM(inv IN INTERVAL YEAR TO MONTH) return ANYDATA,
STATIC FUNCTION ConvertNchar(nc IN NCHAR) return ANYDATA,
STATIC FUNCTION ConvertNClob(nc IN NCLOB) return ANYDATA,
STATIC FUNCTION ConvertNumber(num IN NUMBER) RETURN ANYDATA,
STATIC FUNCTION ConvertNVarchar2(nc IN NVARCHAR2) return ANYDATA,
STATIC FUNCTION ConvertObject(obj IN "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertRaw(r IN RAW) RETURN ANYDATA,
STATIC FUNCTION ConvertRef(rf IN REF "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertTimestamp(ts IN TIMESTAMP) return ANYDATA,
STATIC FUNCTION ConvertTimestampTZ(ts IN TIMESTAMP WITH TIMEZONE) return ANYDATA,
STATIC FUNCTION ConvertTimestampLTZ(ts IN TIMESTAMP WITH LOCAL TIMEZONE) return
ANYDATA,
STATIC FUNCTION ConvertURowid(rid IN UROWID) return ANYDATA,
STATIC FUNCTION ConvertVarchar(c IN VARCHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertVarchar2(c IN VARCHAR2) RETURN ANYDATA,

```

The second way to construct an ANYDATA is a piece by piece approach. The [BEGINCREATE Static Procedure](#) (page 278-3) call begins the construction process and [ENDCREATE Member Procedure](#) (page 278-4) call finishes the construction process. In between these two calls, the individual attributes of an object type or the elements of a collection can be set using SET\* calls. For piece by piece access of the attributes of objects and elements of collections, the [PIECEWISE Member Procedure](#) (page 278-8) should be invoked prior to GET\* calls.

Note: The ANYDATA has to be constructed or accessed sequentially starting from its first attribute (or collection element). The BEGINCREATE call automatically begins the construction in a piece-wise mode. There is no need to call PIECEWISE immediately after BEGINCREATE. ENDCREATE should be called to finish the construction process (before which any access calls can be made).

### Access

Access functions are available based on SQL. These functions do not throw exceptions on type-mismatch. Instead, they return NULL if the type of the ANYDATA does not correspond to the type of access. If you wish to use only ANYDATA functions of the appropriate types returned in a query, you should use a WHERE clause which uses GETTYPENAME and choose the type you are interested in (say "SYS.NUMBER"). Each of these functions returns the value of a specified datatype inside a SYS.ANYDATA wrapper.

```
MEMBER FUNCTION AccessBDouble(self IN ANYDATA) return BINARY_DOUBLE
 DETERMINISTIC,
MEMBER FUNCTION AccessBfile(self IN ANYDATA) return BFILE,
MEMBER FUNCTION AccessBFloat(self IN ANYDATA) return BINARY_FLOAT
 DETERMINISTIC,
MEMBER FUNCTION AccessBlob(self IN ANYDATA) return BLOB,
MEMBER FUNCTION AccessChar(self IN ANYDATA) return CHAR,
MEMBER FUNCTION AccessClob(self IN ANYDATA) return CLOB,
MEMBER FUNCTION AccessDate(self IN ANYDATA) return DATE,
MEMBER FUNCTION AccessIntervalYM(self IN ANYDATA) return INTERVAL YEAR TO MONTH,
MEMBER FUNCTION AccessIntervalDS(self IN ANYDATA) return INTERVAL DAY TO SECOND,
MEMBER FUNCTION AccessNchar(self IN ANYDATA) return NCHAR,
MEMBER FUNCTION AccessNClob(self IN ANYDATA) return NCLOB,
MEMBER FUNCTION AccessNumber(self IN ANYDATA) return NUMBER,
MEMBER FUNCTION AccessNVarchar2(self IN ANYDATA) return NVARCHAR2,
MEMBER FUNCTION AccessRaw(self IN ANYDATA) return RAW,
MEMBER FUNCTION AccessTimestamp(self IN ANYDATA) return TIMESTAMP,
MEMBER FUNCTION AccessTimestampLTZ(self IN ANYDATA) return TIMESTAMP WITH LOCAL
 TIMEZONE,
MEMBER FUNCTION AccessTimestampTZ(self IN ANYDATA) return TIMESTAMP WITH
 TIMEZONE,
MEMBER FUNCTION AccessUrowid(self IN ANYDATA) return UROWID DETERMINISTIC
MEMBER FUNCTION AccessVarchar(self IN ANYDATA) return VARCHAR,
MEMBER FUNCTION AccessVarchar2(self IN ANYDATA) return VARCHAR2,
```

## 278.3 Summary of ANYDATA Subprograms

This table lists the ANYDATA subprograms in alphabetical order and briefly describes them.

**Table 278-1 ANYDATA Type Subprograms**

Subprogram	Description
<a href="#">BEGINCREATE Static Procedure</a> (page 278-3)	Begins creation process on a new ANYDATA
<a href="#">ENDCREATE Member Procedure</a> (page 278-4)	Ends creation of an ANYDATA
<a href="#">GET* Member Functions</a> (page 278-4)	Gets the current data value (which should be of appropriate type)
<a href="#">GETTYPE Member Function</a> (page 278-7)	Gets the Type of the ANYDATA
<a href="#">GETTYPENAME Member Function</a> (page 278-7)	Get the fully qualified type name for the ANYDATA
<a href="#">PIECEWISE Member Procedure</a> (page 278-8)	Sets the <code>MODE</code> of access of the current data value to be an attribute at a time (if the data value is of <code>TYPECODE_OBJECT</code> )
<a href="#">SET* Member Procedures</a> (page 278-8)	Sets the current data value.

### 278.3.1 BEGINCREATE Static Procedure

This procedure begins the creation process on a new ANYDATA.

#### Syntax

```
STATIC PROCEDURE BeginCreate(
 dtype IN OUT NOCOPY AnyType,
 adata OUT NOCOPY ANYDATA);
```

#### Parameters

**Table 278-2 BEGINCREATE Procedure Parameters**

Parameter	Description
<code>dtype</code>	The type of the ANYDATA. (Should correspond to <code>OCI_TYPECODE_OBJECT</code> or a Collection typecode.)
<code>adata</code>	ANYDATA being constructed.

#### Exception

`DBMS_TYPES.INVALID_PARAMETERS`: `dtype` is invalid (not fully constructed, and similar deficits.)

#### Usage Notes

There is no need to call `PIECEWISE` immediately after this call. The construction process begins in a piece-wise manner automatically.

## 278.3.2 ENDCREATE Member Procedure

This procedure ends creation of an ANYDATA. Other creation functions cannot be called after this call.

### Syntax

```
MEMBER PROCEDURE EndCreate(
 self IN OUT NOCOPY ANYDATA);
```

### Parameters

**Table 278-3 ENDCREATE Procedure Parameter**

Parameter	Description
self	An ANYDATA.

## 278.3.3 GET\* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the MODE by which it is accessed (depending on whether the PIECEWISE call is invoked).

If PIECEWISE has NOT been called, the ANYDATA is accessed in its entirety and the type of the data value should match the type of the ANYDATA.

If PIECEWISE has been called, the ANYDATA is accessed piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

### Syntax

```
MEMBER FUNCTION GetBDouble(
 self IN ANYDATA,
 dbl OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GetBfile(
 self IN ANYDATA,
 b OUT NOCOPY BFILE)
RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GetBFloat(
 self IN ANYDATA,
 fl OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GetBlob(
 self IN ANYDATA,
 b OUT NOCOPY BLOB)
RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GetChar(
 self IN ANYDATA,
 c OUT NOCOPY CHAR)
```

```
RETURN PLS_INTEGER;

MEMBER FUNCTION GetClob(
 self IN ANYDATA,
 c OUT NOCOPY CLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetCollection(
 self IN ANYDATA,
 col OUT NOCOPY "<collection_type>")
RETURN PLS_INTEGER;

MEMBER FUNCTION GetDate(
 self IN ANYDATA,
 dat OUT NOCOPY DATE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetIntervalsD(
 self IN ANYDATA,
 inv OUT NOCOPY INTERVAL DAY TO SECOND)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetIntervalYM(
 self IN ANYDATA,
 inv OUT NOCOPY INTERVAL YEAR TO MONTH)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetNchar(
 self IN ANYDATA,
 nc OUT NOCOPY NCHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetNClob(
 self IN ANYDATA,
 nc OUT NOCOPY NCLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetNumber(
 self IN ANYDATA,
 num OUT NOCOPY NUMBER)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetNVarchar2(
 self IN ANYDATA,
 nc OUT NOCOPY NVARCHAR2)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetObject(
 self IN ANYDATA,
 obj OUT NOCOPY "<object_type>")
RETURN PLS_INTEGER;

MEMBER FUNCTION GetRaw(
 self IN ANYDATA,
 r OUT NOCOPY RAW)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetRef(
 self IN ANYDATA,
 rf OUT NOCOPY REF "<object_type>")
RETURN PLS_INTEGER;
```

```

MEMBER FUNCTION GetTimestamp(
 self IN ANYDATA,
 ts OUT NOCOPY TIMESTAMP)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampTZ(
 self IN ANYDATA,
 ts OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampLTZ(
 self IN ANYDATA,
 ts OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetVarchar(
 self IN ANYDATA,
 c OUT NOCOPY VARCHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetVarchar2(
 self IN ANYDATA,
 c OUT NOCOPY VARCHAR2)
RETURN PLS_INTEGER;

```

## Parameters

**Table 278-4 GET\* Function Parameter**

Parameter	Description
self	An ANYDATA.
num	The number to be obtained.

## Return Values

DBMS\_TYPES.SUCCESS OR DBMS\_TYPES.NO\_DATA

The return value is relevant only if `PIECEWISE` has been already called (for a collection). In such a case, `DBMS_TYPES.NO_DATA` signifies the end of the collection when all elements have been accessed.

## Exceptions

DBMS\_TYPES.TYPE\_MISMATCH: When the expected type is different from the passed in type.

DBMS\_TYPES.INVALID\_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS\_TYPES.INCORRECT\_USAGE: Incorrect usage.

## 278.3.4 GETTYPE Member Function

This function gets the typecode of the `ANYDATA`.

### Syntax

```
MEMBER FUNCTION GETTYPE(
 self IN ANYDATA,
 typ OUT NOCOPY AnyType)
RETURN PLS_INTEGER;
```

### Parameters

**Table 278-5** GETTYPE Function Parameter

Parameter	Description
<code>self</code>	An <code>ANYDATA</code> .
<code>typ</code>	The <code>AnyType</code> corresponding to the <code>ANYDATA</code> . May be <code>NULL</code> if it does not represent a user-defined type.

### Return Values

The typecode corresponding to the type of the `ANYDATA`.

## 278.3.5 GETTYPENAME Member Function

This function gets the fully qualified type name for the `ANYDATA`.

If the `ANYDATA` is based on a built-in type, this function will return `NUMBER` and other relevant information.

If it is based on a user defined type, this function will return `schema_name.type_name`, for example, `SCOTT.FOO`.

If it is based on a transient anonymous type, this function will return `NULL`.

### Syntax

```
MEMBER FUNCTION GETTYPENAME(
 self IN ANYDATA)
RETURN VARCHAR2;
```

### Parameters

**Table 278-6** GETTYPENAME Function Parameter

Parameter	Description
<code>self</code>	An <code>ANYDATA</code> .

### Return Values

Type name of the `ANYDATA`.

## 278.3.6 PIECEWISE Member Procedure

This procedure sets the **MODE** of access of the current data value to be an attribute at a time (if the data value is of `TYPECODE_OBJECT`).

It sets the **MODE** of access of the data value to be a collection element at a time (if the data value is of collection type). Once this call has been made, subsequent calls to `SET*` and `GET*` will sequentially obtain individual attributes or collection elements.

### Syntax

```
MEMBER PROCEDURE PIECEWISE(
 self IN OUT NOCOPY ANYDATA);
```

### Parameters

**Table 278-7** PIECEWISE Procedure Parameters

Parameter	Description
self	The current data value.

### Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`
- `DBMS_TYPES.INCORRECT_USAGE`: On incorrect usage.

### Usage Notes

The current data value must be of an `OBJECT` or `COLLECTION` type before this call can be made.

Piece-wise construction and access of nested attributes that are of object or collection types is not supported.

## 278.3.7 SET\* Member Procedures

This procedure sets the current data value.

This is a list of procedures that should be called depending on the type of the current data value. The type of the data value should be the type of the attribute at the current position during the piece-wise construction process.

### Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
 self IN OUT NOCOPY ANYDATA,
 dbl IN BINARY_DOUBLE,
 last_elem IN boolean DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETBFILE(
 self IN OUT NOCOPY ANYDATA,
 b IN BFILE,
 last_elem IN boolean DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETBFLOAT(
```

```

self IN OUT NOCOPY ANYDATA,
fl IN BINARY_FLOAT,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
self IN OUT NOCOPY ANYDATA,
b IN BLOB,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
self IN OUT NOCOPY ANYDATA,
c IN CHAR,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
self IN OUT NOCOPY ANYDATA,
c IN CLOB,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
self IN OUT NOCOPY ANYDATA,
col IN "<collection_type>",
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
self IN OUT NOCOPY ANYDATA,
dat IN DATE,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALS(
self IN OUT NOCOPY ANYDATA,
inv IN INTERVAL DAY TO SECOND,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
self IN OUT NOCOPY ANYDATA,
inv IN INTERVAL YEAR TO MONTH,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNCHAR(
self IN OUT NOCOPY ANYDATA,
nc IN NCHAR,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
self IN OUT NOCOPY ANYDATA,
nc IN NClob,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
self IN OUT NOCOPY ANYDATA,
num IN NUMBER,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
self IN OUT NOCOPY ANYDATA,
nc IN NVARCHAR2,
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
self IN OUT NOCOPY ANYDATA,

```

```

obj IN "<object_type>",
last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
 self IN OUT NOCOPY ANYDATA,
 r IN RAW,
 last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
 self IN OUT NOCOPY ANYDATA,
 rf IN REF "<object_type>",
 last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
 self IN OUT NOCOPY ANYDATA,
 ts IN TIMESTAMP,
 last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPTZ(self IN OUT NOCOPY ANYDATA,
 ts IN TIMESTAMP WITH TIME ZONE,
 last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPPLTZ(
 self IN OUT NOCOPY ANYDATA,
 ts IN TIMESTAMP WITH LOCAL TIME ZONE,
 last_elem IN boolean DEFAULT FALSE),

MEMBER PROCEDURE SETVARCHAR(
 self IN OUT NOCOPY ANYDATA,
 c IN VARCHAR,
 last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
 self IN OUT NOCOPY ANYDATA,
 c IN VARCHAR2,
 last_elem IN boolean DEFAULT FALSE);

```

## Parameters

**Table 278-8 SET\* Procedure Parameters**

Parameter	Description
self	An ANYDATA.
num	The number, and associated information, that is to be set.
last_elem	Relevant only if ANYDATA represents a collection. Set to TRUE if it is the last element of the collection, FALSE otherwise.

## Exceptions

- DBMS\_TYPES.INVALID\_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).
- DBMS\_TYPES.INCORRECT\_USAGE: Incorrect usage.
- DBMS\_TYPES.TYPE\_MISMATCH: When the expected type is different from the passed in type.

### Usage Notes

When `BEGINCREATE` is called, construction has already begun in a piece-wise fashion. Subsequent calls to `SET*` will set the successive attribute values.

If the `ANYDATA` is a standalone collection, the `SET*` call will set the successive collection elements.

# ANYDATASET TYPE

An `ANYDATASET TYPE` contains a description of a given type plus a set of data instances of that type. An `ANYDATASET` can be persistently stored in the database if desired, or it can be used as interface parameters to communicate self-descriptive sets of data, all of which belong to a certain type.

This chapter contains the following topics:

- [Construction](#) (page 279-1)
- [Summary of ANYDATASET TYPE Subprograms](#) (page 279-1)

## 279.1 ANYDATASET TYPE Construction

The `ANYDATASET` needs to be constructed value by value, sequentially.

For each data instance (of the type of the `ANYDATASET`), the `ADDINSTANCE` function must be invoked. This adds a new data instance to the `ANYDATASET`. Subsequently, `SET*` can be called to set each value in its entirety.

The `MODE` of construction/access can be changed to attribute/collection element wise by making calls to `PIECEWISE`.

- If the type of the `ANYDATASET` is `TYPECODE_OBJECT`, individual attributes will be set with subsequent `SET*` calls. Likewise on access.
- If the type of the current data value is a collection type individual collection elements will be set with subsequent `SET*` calls. Likewise on access. This call is very similar to `ANYDATA.PIECEWISE` call defined for the type `ANYDATA`.

Note that there is no support for piece-wise construction and access of nested (not top level) attributes that are of object types or collection types.

`ENDCREATE` should be called to finish the construction process (before which no access calls can be made).

## 279.2 Summary of ANYDATASET TYPE Subprograms

This table lists the `ANYDATASET` Type subprograms and briefly describes them.

**Table 279-1** *ANYDATASET Type Subprograms*

Subprogram	Description
<a href="#">ADDINSTANCE Member Procedure</a> (page 279-2)	Adds a new data instance to an <code>ANYDATASET</code> .
<a href="#">BEGINCREATE Static Procedure</a> (page 279-3)	Creates a new <code>ANYDATASET</code> which can be used to create a set of data values of the given <code>ANYTYPE</code> .
<a href="#">ENDCREATE Member Procedure</a> (page 279-3)	Ends Creation of a <code>ANYDATASET</code> . Other creation functions cannot be called after this call.

**Table 279-1 (Cont.) ANYDATASET Type Subprograms**

Subprogram	Description
<a href="#">GET* Member Functions</a> (page 279-3)	Gets the current data value (which should be of appropriate type).
<a href="#">GETCOUNT Member Function</a> (page 279-6)	Gets the number of data instances in an ANYDATASET.
<a href="#">GETINSTANCE Member Function</a> (page 279-7)	Gets the next instance in an ANYDATASET.
<a href="#">GETTYPE Member Function</a> (page 279-7)	Gets the ANYTYPE describing the type of the data instances in an ANYDATASET. current data value (which should be of appropriate type).
<a href="#">GETTYPENAME Member Function</a> (page 279-8)	Gets the AnyType describing the type of the data instances in an ANYDATASET.
<a href="#">PIECEWISE Member Procedure</a> (page 279-8)	Sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).
<a href="#">SET* Member Procedures</a> (page 279-9)	Sets the current data value.

## 279.2.1 ADDINSTANCE Member Procedure

This procedure adds a new data instance to an ANYDATASET.

### Syntax

```
MEMBER PROCEDURE AddInstance(
 self IN OUT NOCOPY ANYDATASET);
```

### Parameters

**Table 279-2 ADDINSTANCE Procedure Parameter**

Parameter	Description
self	The ANYDATASET being constructed.

### Exceptions

DBMS\_TYPES.invalid\_parameters: Invalid parameters.  
DBMS\_TYPES.incorrect\_usage: On incorrect usage.

### Usage Notes

The data instances have to be added sequentially. The previous data instance must be fully constructed (or set to NULL) before a new one can be added.

This call DOES NOT automatically set the mode of construction to be piece-wise. The user has to explicitly call `PIECEWISE` if a piece-wise construction of the instance is intended.

## 279.2.2 BEGINCREATE Static Procedure

This procedure creates a new `ANYDATASET` which can be used to create a set of data values of the given `ANYTYPE`.

### Syntax

```
STATIC PROCEDURE BeginCreate(
 typecode IN PLS_INTEGER,
 rtype IN OUT NOCOPY AnyType,
 aset OUT NOCOPY ANYDATASET);
```

### Parameters

**Table 279-3 BEGINCREATE Procedure Parameter**

Parameter	Description
<code>typecode</code>	The typecode for the type of the <code>ANYDATASET</code> .
<code>dtype</code>	The type of the data values. This parameter is a must for user-defined types like <code>TYPECODE_OBJECT</code> , Collection typecodes, and similar others.
<code>aset</code>	The <code>ANYDATASET</code> being constructed.

### Exceptions

`DBMS_TYPES.invalid_parameters`: `dtype` is invalid (not fully constructed, and like errors.)

## 279.2.3 ENDCREATE Member Procedure

This procedure ends creation of a `ANYDATASET`. Other creation functions cannot be called after this call.

### Syntax

```
MEMBER PROCEDURE ENDCREATE(
 self IN OUT NOCOPY ANYDATASET);
```

### Parameters

**Table 279-4 ENDCREATE Procedure Parameter**

Parameter	Description
<code>self</code>	The <code>ANYDATASET</code> being constructed.

## 279.2.4 GET\* Member Functions

These functions get the current data value (which should be of the appropriate type).

The type of the current data value depends on the `MODE` used for accessing it (depending on how the `PIECEWISE` call is invoked). If `PIECEWISE` has not been called, the

instance is accessed in its entirety, and the type of the data value should match the type of the ANYDATASET.

If `PIECEWISE` has been called, the instance is accessed piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

### Syntax

```
MEMBER FUNCTION GETBDOUBLE(
 self IN ANYDATASET,
 dbl OUT NOCOPY BINARY_DOUBLE)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETBFLOAT(
 self IN ANYDATASET,
 fl OUT NOCOPY BINARY_FLOAT)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETBFILE(
 self IN ANYDATASET,
 b OUT NOCOPY BFILE)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETBLOB(
 self IN ANYDATASET,
 b OUT NOCOPY BLOB)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETCHAR(
 self IN ANYDATASET,
 c OUT NOCOPY CHAR)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETCLOB(
 self IN ANYDATASET,
 c OUT NOCOPY CLOB)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETCOLLECTION(
 self IN ANYDATASET,
 col OUT NOCOPY "<collection_type>")
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETDATE(
 self IN ANYDATASET,
 dat OUT NOCOPY DATE)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETINTERVALDS(
 self IN ANYDATASET,
 inv IN OUT NOCOPY INTERVAL DAY TO SECOND)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETINTERVALYM(
 self IN ANYDATASET,
 inv IN OUT NOCOPY INTERVAL YEAR TO MONTH)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETNCHAR(
 self IN ANYDATASET,
```

```
 nc OUT NOCOPY NCHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCLOB(
 self IN ANYDATASET,
 nc OUT NOCOPY NCLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNUMBER(
 self IN ANYDATASET,
 num OUT NOCOPY NUMBER)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNVARCHAR2(
 self IN ANYDATASET,
 nc OUT NOCOPY NVARCHAR2)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETOBJECT(
 self IN ANYDATASET,
 obj OUT NOCOPY "<object_type>")
RETURN PLS_INTEGER;

MEMBER FUNCTION GETRAW(
 self IN ANYDATASET,
 r OUT NOCOPY RAW)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETREF(
 self IN ANYDATASET,
 rf OUT NOCOPY REF "<object_type>")
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMP(
 self IN ANYDATASET,
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPPLTZ(
 self IN ANYDATASET,
 ts OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPPTZ(
 self IN ANYDATASET,
 ts OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN PLS_INTEGER,

MEMBER FUNCTION GETUROWID(
 self IN ANYDATASET,
 rid OUT NOCOPY UROWID)
RETURN PLS_INTEGER

MEMBER FUNCTION GETVARCHAR(
 self IN ANYDATASET,
 c OUT NOCOPY VARCHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETVARCHAR2(
 self IN ANYDATASET,
 c OUT NOCOPY VARCHAR2)
RETURN PLS_INTEGER;
```

## Parameters

**Table 279-5 GET\* Function Parameters**

Parameter	Description
self	The ANYDATASET being accessed.
num	The number, and associated information., that is to be obtained.

## Return Values

DBMS\_TYPES.SUCCESS OR DBMS\_TYPES.NO\_DATA

The return value is relevant only if `PIECEWISE` has been already called (for a collection). In such a case, `DBMS_TYPES.NO_DATA` signifies the end of the collection when all elements have been accessed.

## Exceptions

`DBMS_TYPES.INVALID_PARAMETERS`: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

`DBMS_TYPES.INCORRECT_USAGE`: Incorrect usage

`DBMS_TYPES.TYPE_MISMATCH`: When the expected type is different from the passed in type.

## 279.2.5 GETCOUNT Member Function

This function gets the number of data instances in an `ANYDATASET`.

### Syntax

```
MEMBER FUNCTION GetCount(
 self IN ANYDATASET)
RETURN PLS_INTEGER;
```

### Parameter

**Table 279-6 GETCOUNT Function Parameter**

Parameter	Description
self	The ANYDATASET being accessed.

## Return Values

The number of data instances.

## 279.2.6 GETINSTANCE Member Function

This function gets the next instance in an `ANYDATASET`. Only sequential access to the instances in an `ANYDATASET` is allowed.

After this function has been called, the `GET*` functions can be invoked on the `ANYDATASET` to access the current instance. If `PIECEWISE` is called before doing the `GET*` calls, the individual attributes (or collection elements) can be accessed.

It is an error to invoke this function before the `ANYDATASET` is fully created.

### Syntax

```
MEMBER FUNCTION GETINSTANCE(
 self IN OUT NOCOPY ANYDATASET)
 RETURN PLS_INTEGER;
```

### Parameters

**Table 279-7** GETINSTANCE Function Parameter

Parameter	Description
<code>self</code>	The <code>ANYDATASET</code> being accessed.

### Return Values

`DBMS_TYPES.SUCCESS` or `DBMS_TYPES.NO_DATA`

`DBMS_TYPES.NO_DATA` signifies the end of the `ANYDATASET` (all instances have been accessed).

### Usage Notes

This function should be called even before accessing the first instance.

## 279.2.7 GETTYPE Member Function

This function gets the `AnyType` describing the type of the data instances in an `ANYDATASET`.

### Syntax

```
MEMBER FUNCTION GETTYPE(
 self IN ANYDATASET,
 typ OUT NOCOPY AnyType)
 RETURN PLS_INTEGER;
```

### Parameters

**Table 279-8** GETTYPE Function Parameter

Parameter	Description
<code>self</code>	The <code>ANYDATASET</code> .

**Table 279-8 (Cont.) GETTYPE Function Parameter**

Parameter	Description
typ	The ANYTYPE corresponding to the AnyData. May be NULL if it does not represent a user-defined function.

#### Return Values

The typecode corresponding to the type of the ANYDATA.

## 279.2.8 GETTYPENAME Member Function

This procedure gets the fully qualified type name for the ANYDATASET.

If the ANYDATASET is based on a built-in, this function will return NUMBER and associated information.

If it is based on a user defined type, this function will return *schema\_name.type\_name*. for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

#### Syntax

```
MEMBER FUNCTION GETTYPENAME(
 self IN ANYDATASET)
RETURN VARCHAR2;
```

#### Parameter

**Table 279-9 GETTYPENAME Function Parameter**

Parameter	Description
self	The ANYDATASET being constructed.

#### Return Values

Type name of the ANYDATASET.

## 279.2.9 PIECEWISE Member Procedure

This procedure sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE\_OBJECT).

It sets the MODE of construction, access of the data value to be a collection element at a time (if the data value is of a collection TYPE). Once this call has been made, subsequent SET\* and GET\* calls will sequentially obtain individual attributes or collection elements.

#### Syntax

```
MEMBER PROCEDURE PIECEWISE(
 self IN OUT NOCOPY ANYDATASET);
```

## Parameters

**Table 279-10** PIECEWISE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

## Exceptions

DBMS\_TYPES.INVALID\_PARAMETERS: Invalid parameters.

DBMS\_TYPES.INCORRECT\_USAGE: On incorrect usage.

## Usage Notes

The current data value must be of an object or collection type before this call can be made. There is no support for piece-wise construction or access of embedded object type attributes or nested collections.

## 279.2.10 SET\* Member Procedures

This procedure sets the current data value.

The type of the current data value depends on the `MODE` with which we are constructing (depending on how we have invoked the `PIECEWISE` call). The type of the current data should be the type of the `ANYDATASET` if `PIECEWISE` has NOT been called. The type should be the type of the attribute at the current position if `PIECEWISE` has been called.

## Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
 self IN OUT NOCOPY ANYDATASET,
 dbl IN BINARY_DOUBLE,
 last_elem IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETBFLOAT(
 self IN OUT NOCOPY ANYDATASET,
 fl IN BINARY_FLOAT,
 last_elem IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETBFILE(
 self IN OUT NOCOPY ANYDATASET,
 b IN BFILE,
 last_elem IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETBLOB(
 self IN OUT NOCOPY ANYDATASET,
 b IN BLOB,
 last_elem IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETCHAR(
 self IN OUT NOCOPY ANYDATASET,
 c IN CHAR,
 last_elem IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETCLOB(
 self IN OUT NOCOPY ANYDATASET,
```

```

 c IN CLOB,
 last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
 self IN OUT NOCOPY ANYDATASET,
 col IN "<collection_type>",
 last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
 self IN OUT NOCOPY ANYDATASET,
 dat IN DATE,
 last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
 self IN OUT NOCOPY ANYDATASET,
 inv IN INTERVAL DAY TO SECOND,
 last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
 self IN OUT NOCOPY ANYDATASET,
 inv IN INTERVAL YEAR TO MONTH,
 last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCHAR(
 self IN OUT NOCOPY ANYDATASET,
 nc IN NCHAR,
 last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
 self IN OUT NOCOPY ANYDATASET,
 nc IN NClob,
 last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
 self IN OUT NOCOPY ANYDATASET,
 num IN NUMBER,
 last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
 self IN OUT NOCOPY ANYDATASET,
 nc IN NVARCHAR2,
 last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
 self IN OUT NOCOPY ANYDATASET,
 obj IN "<object_type>",
 last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
 self IN OUT NOCOPY ANYDATASET,
 r IN RAW,
 last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
 self IN OUT NOCOPY ANYDATASET,
 rf IN REF "<object_type>",
 last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
 self IN OUT NOCOPY ANYDATASET,
 ts IN TIMESTAMP,

```

```

last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP_LTZ(
 self IN OUT NOCOPY ANYDATASET,
 ts IN TIMESTAMP WITH LOCAL TIME_ZONE,
 last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP_TZ(
 self IN OUT NOCOPY ANYDATASET,
 ts IN TIMESTAMP WITH TIME_ZONE,
 last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETUROWID(
 self IN OUT NOCOPY ANYDATASET,
 rid IN UROWID,
 last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARIABLE(
 self IN OUT NOCOPY ANYDATASET,
 c IN VARCHAR,
 last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARIABLE2(
 self IN OUT NOCOPY ANYDATASET,
 c IN VARCHAR2,
 last_elem IN BOOLEAN DEFAULT FALSE);

```

## Parameters

**Table 279-11 SET\* Procedure Parameters**

Parameter	Description
self	The ANYDATASET being accessed.
num	The number, and associated information, that is to be set.
last_elem	Relevant only if <code>PIECEWISE</code> has been already called (for a collection). Set to <code>TRUE</code> if it is the last element of the collection, <code>FALSE</code> otherwise.

## Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`: Invalid parameters (if it is not appropriate to add a number at this point in the creation process).
- `DBMS_TYPES.INCORRECT_USAGE`: Incorrect usage.
- `DBMS_TYPES.TYPE_MISMATCH`: When the expected type is different from the passed in type.

# ANYTYPE TYPE

An `ANYTYPE` `TYPE` can contain a type description of any persistent SQL type, named or unnamed, including object types and collection types. It can also be used to construct new transient type descriptions.

New persistent types can only be created using the `CREATE TYPE` statement. Only new transient types can be constructed using the `ANYTYPE` interfaces.

This chapter discusses the following:

- [Summary of ANYTYPE Subprograms](#) (page 280-1)

## 280.1 Summary of ANYTYPE Subprograms

This table lists the `ANYTYPE` subprograms in alphabetical order and briefly describes them.

**Table 280-1** *ANYTYPE Subprograms*

Subprogram	Description
<a href="#">BEGINCREATE Static Procedure</a> (page 280-1)	Creates a new instance of <code>ANYTYPE</code> which can be used to create a transient type description.
<a href="#">SETINFO Member Procedure</a> (page 280-2)	Sets any additional information required for constructing a <code>COLLECTION</code> or builtin type.
<a href="#">ADDATTR Member Procedure</a> (page 280-3)	Adds an attribute to an <code>ANYTYPE</code> (of typecode <code>DBMS_TYPES.TYPECODE_OBJECT</code> ).
<a href="#">ENDCREATE Member Procedure</a> (page 280-4)	Ends creation of a transient <code>ANYTYPE</code> . Other creation functions cannot be called after this call.
<a href="#">GETPERSISTENT Static Function</a> (page 280-5)	Returns an <code>ANYTYPE</code> corresponding to a persistent type created earlier using the <code>CREATE TYPE</code> SQL statement.
<a href="#">GETINFO Member Function</a> (page 280-5)	Gets the type information for the <code>ANYTYPE</code> .
<a href="#">GETATTRELEMINFO Member Function</a> (page 280-6)	Gets the type information for an attribute of the type (if it is of <code>TYPECODE_OBJECT</code> ). Gets the type information for a collection's element type if the <i>self</i> parameter is of a collection type.

### 280.1.1 BEGINCREATE Static Procedure

This procedure creates a new instance of `ANYTYPE` which can be used to create a transient type description.

#### Syntax

```

STATIC PROCEDURE BEGINCREATE(
 typecode IN PLS_INTEGER,
 atype OUT NOCOPY ANYTYPE);

```

## Parameters

**Table 280-2 BEGINCREATE Procedure Parameters**

Parameter	Description
typecode	Use a constant from DBMS_TYPES package. Typecodes for user-defined type: <ul style="list-style-type: none"> <li>DBMS_TYPES.TYPECODE_OBJECT</li> <li>DBMS_TYPES.TYPECODE_VARRAY OF</li> <li>DBMS_TYPES.TYPECODE_TABLE</li> </ul> Typecodes for builtin types: <ul style="list-style-type: none"> <li>DBMS_TYPES.TYPECODE_NUMBER, and similar types.</li> </ul>
atype	ANYTYPE for a transient type

## 280.1.2 SETINFO Member Procedure

This procedure sets any additional information required for constructing a COLLECTION or builtin type.

### Syntax

```
MEMBER PROCEDURE SETINFO(
 self IN OUT NOCOPY ANYTYPE,
 prec IN PLS_INTEGER,
 scale IN PLS_INTEGER,
 len IN PLS_INTEGER,
 csid IN PLS_INTEGER,
 csfrm IN PLS_INTEGER,
 atype IN ANYTYPE DEFAULT NULL,
 elem_tc IN PLS_INTEGER DEFAULT NULL,
 elem_count IN PLS_INTEGER DEFAULT 0);
```

### Parameters

**Table 280-3 SETINFO Procedure Parameters**

Parameter	Description
self	The transient ANYTYPE that is being constructed.
prec	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
scale	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
len	Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid	Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.
csfrm	Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.

**Table 280-3 (Cont.) SETINFO Procedure Parameters**

Parameter	Description
atype	Optional. Required if collection element typecode is a user-defined type such as TYPECODE_OBJECT, and similar others. It is also required for a built-in type that needs user-defined type information such as TYPECODE_REF. This parameter is not needed otherwise.

The Following Parameters Are Required For Collection Types

**Table 280-4 SETINFO Procedure Parameters - Collection Types**

Parameter	Description
elem_tc	Must be of the collection element's typecode (from DBMS_TYPES package).
elem_count	Pass 0 for elem_count if the self represents a nested table (TYPECODE_TABLE). Otherwise pass the collection count if self represents a VARRAY.

### Exceptions

- DBMS\_TYPES.INVALID\_PARAMETER: Invalid Parameters (typecode, typeinfo)
- DBMS\_TYPES.INCORRECT\_USAGE: Incorrect usage (cannot call after calling ENDCREATE, and similar actions.)

### Usage Notes

It is an error to call this function on an ANYTYPE that represents a persistent user defined type.

## 280.1.3 ADDATTR Member Procedure

This procedure adds an attribute to an ANYTYPE (of typecode DBMS\_TYPES.TYPECODE\_OBJECT).

### Syntax

```
MEMBER PROCEDURE ADDATTR(
 self IN OUT NOCOPY ANYTYPE,
 aname IN VARCHAR2,
 typecode IN PLS_INTEGER,
 prec IN PLS_INTEGER,
 scale IN PLS_INTEGER,
 len IN PLS_INTEGER,
 csid IN PLS_INTEGER,
 csfrm IN PLS_INTEGER,
 attr_type IN ANYTYPE DEFAULT NULL);
```

## Parameters

**Table 280-5 ADDATTR Procedure Parameters**

Parameter	Description
self	The transient ANYTYPE that is being constructed. Must be of type <code>DBMS_TYPES.TYPECODE_OBJECT</code> .
aname	Optional. Attribute's name. Could be <code>NULL</code> .
typecode	Attribute's typecode. Can be built-in or user-defined typecode (from <code>DBMS_TYPES</code> package).
prec	Optional. Required if typecode represents a <code>NUMBER</code> . Give precision and scale. Ignored otherwise.
scale	Optional. Required if typecode represents a <code>NUMBER</code> . Give precision and scale. Ignored otherwise.
len	Optional. Required if typecode represents a <code>RAW</code> , <code>CHAR</code> , <code>VARCHAR</code> , or <code>VARCHAR2</code> type. Give length.
csid	Optional. Required if typecode represents a type requiring character information, such as <code>CHAR</code> , <code>VARCHAR</code> , or <code>VARCHAR2</code> .
csfrm	Optional. Required if typecode represents a type requiring character information, such as <code>CHAR</code> , <code>VARCHAR</code> , or <code>VARCHAR2</code> .
attr_type	Optional. ANYTYPE corresponding to a user-defined type. This parameter is required if the attribute is a user defined type.

## Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`: Invalid Parameters (typecode, typeinfo)
- `DBMS_TYPES.INCORRECT_USAGE`: Incorrect usage (cannot call after calling `EndCreate`, and similar actions.)

## 280.1.4 ENDCREATE Member Procedure

This procedure ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.

### Syntax

```
MEMBER PROCEDURE ENDCREATE(
 self IN OUT NOCOPY ANYTYPE);
```

### Parameter

**Table 280-6 ENDCREATE Procedure Parameter**

Parameter	Description
self	The transient ANYTYPE that is being constructed.

## 280.1.5 GETPERSISTENT Static Function

This procedure returns an ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

### Syntax

```
STATIC FUNCTION GETPERSISTENT(
 schema_name IN VARCHAR2,
 type_name IN VARCHAR2,
 version IN VARCHAR2 DEFAULT NULL)
RETURN ANYTYPE;
```

### Parameters

**Table 280-7** GETPERSISTENT Function Parameters

Parameter	Description
schema_name	Schema name of the type.
type_name	Type name.
version	Type version.

### Return Values

An ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

## 280.1.6 GETINFO Member Function

This function gets the type information for the ANYTYPE.

### Syntax

```
MEMBER FUNCTION GETINFO (
 self IN ANYTYPE,
 prec OUT PLS_INTEGER,
 scale OUT PLS_INTEGER,
 len OUT PLS_INTEGER,
 csid OUT PLS_INTEGER,
 csfrm OUT PLS_INTEGER,
 schema_name OUT VARCHAR2,
 type_name OUT VARCHAR2,
 version OUT varchar2,
 numelems OUT PLS_INTEGER)
RETURN PLS_INTEGER;
```

### Parameters

**Table 280-8** GETINFO Function Parameters

Parameter	Description
self	The ANYTYPE.

**Table 280-8 (Cont.) GETINFO Function Parameters**

Parameter	Description
prec	If typecode represents a number. Gives precision and scale. Ignored otherwise.
scale	If typecode represents a number. Gives precision and scale. Ignored otherwise.
len	If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2.
schema_name	Type's schema (if persistent).
type_name	Type's typename.
version	Type's version.
numelems	If <i>self</i> is a TYPECODE_VARRAY, this gives the VARRAY count. If <i>self</i> is of TYPECODE_OBJECT, this gives the number of attributes.

**Return Values**

The typecode of *self*.

**Exceptions**

- DBMS\_TYPES.INVALID\_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly Constructed).

## 280.1.7 GETATTRELEMINFO Member Function

This function gets the type information for an attribute of the type (if it is of TYPECODE\_OBJECT). Gets the type information for a collection's element type if the *self* parameter is of a collection type.

**Syntax**

```
MEMBER FUNCTION GETATTRELEMINFO (
 self IN ANYTYPE,
 pos IN PLS_INTEGER,
 prec OUT PLS_INTEGER,
 scale OUT PLS_INTEGER,
 len OUT PLS_INTEGER,
 csid OUT PLS_INTEGER,
 csfrm OUT PLS_INTEGER,
 attr_elt_type OUT ANYTYPE
 aname OUT VARRCHAR2)
RETURN PLS_INTEGER;
```

## Parameters

**Table 280-9 GETATTRELEMINFO Function Parameters**

Parameter	Description
self	The ANYTYPE.
pos	If self is of TYPECODE_OBJECT, this gives the attribute position (starting at 1). It is ignored otherwise.
prec	If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.
scale	If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.
len	If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid, csfrm	If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2. Gives character set ID, character set form.
attr_elt_type	If attribute/collection element typecode represents a user-defined type, this returns the ANYTYPE corresponding to it. User can subsequently describe the <i>attr_elt_type</i> .
aname	Attribute name (if it is an attribute of an object type, NULL otherwise).

## Return Values

The typecode of the attribute or collection element.

## Exceptions

DBMS\_TYPES.INVALID\_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly constructed).

# 281

## Oracle Database Advanced Queuing (AQ) Types

This chapter describes the types used with Oracle Database Advanced Queuing (AQ) packages for PL/SQL, `DBMS_AQ`, and `DBMS_AQADM`.

This chapter contains the following topics:

- [Security Model](#) (page 281-1)
- [Summary of Types](#) (page 281-1)

### See Also:

*Oracle Database Advanced Queuing User's Guide* for information about using Oracle Database Advanced Queuing.

### 281.1 Advanced Queuing (AQ) Types Security Model

`PUBLIC` is granted `EXECUTE` privilege on the types described in this chapter.

### 281.2 Oracle Database Advanced Queuing (AQ) Types — Summary of Types

Oracle Database Advanced Queuing (AQ) uses types to specify certain types of information.

- [AQ\\$\\_AGENT Type](#) (page 281-2)
- [AQ\\$\\_AGENT\\_LIST\\_T Type](#) (page 281-2)
- [AQ\\$\\_DESCRIPTOR Type](#) (page 281-3)
- [AQ\\$\\_NTFN\\_DESCRIPTOR Type](#) (page 281-3)
- [AQ\\$\\_NTFN\\_MSGID\\_ARRAY Type](#) (page 281-4)
- [AQ\\$\\_POST\\_INFO Type](#) (page 281-4)
- [AQ\\$\\_POST\\_INFO\\_LIST Type](#) (page 281-5)
- [AQ\\$\\_PURGE\\_OPTIONS\\_T Type](#) (page 281-5)
- [AQ\\$\\_RECIPIENT\\_LIST\\_T Type](#) (page 281-6)
- [AQ\\$\\_REG\\_INFO Type](#) (page 281-6)
- [AQ\\$\\_REG\\_INFO\\_LIST Type](#) (page 281-9)
- [AQ\\$\\_SUBSCRIBER\\_LIST\\_T Type](#) (page 281-9)

- [DEQUEUE\\_OPTIONS\\_T Type](#) (page 281-9)
- [ENQUEUE\\_OPTIONS\\_T Type](#) (page 281-12)
- [QUEUE\\_PROPS\\_T Type](#) (page 281-13)
- [SYS.MSG\\_PROP\\_T Type](#) (page 281-13)
- [MESSAGE\\_PROPERTIES\\_T Type](#) (page 281-16)
- [MESSAGE\\_PROPERTIES\\_ARRAY\\_T Type](#) (page 281-19)
- [MSGID\\_ARRAY\\_T Type](#) (page 281-20)

## 281.2.1 AQ\$\_AGENT Type

This type identifies a producer or a consumer of a message.

### Syntax

```
TYPE SYS.AQ$_AGENT IS OBJECT (
 name VARCHAR2(512),
 address VARCHAR2(1024),
 protocol NUMBER);
```

### Attributes

**Table 281-1 AQ\$\_AGENT Attributes**

Attribute	Description
name	Name of a producer or consumer of a message. The name must follow object name guidelines in the <i>Oracle Database SQL Language Reference</i> with regard to reserved characters.
address	Protocol-specific address of the recipient. If the protocol is 0, then the address is of the form <code>[schema.]queue[@dblink]</code> . For example, a queue named <code>emp_messages</code> in the HR queue at the site <code>dbs1.net</code> has the address: <code>hr.emp_messages@dbs1.net</code>
protocol	Protocol to interpret the address and propagate the message. Protocols 1-127 are reserved for internal use. If the protocol number is in the range 128 - 255, the address of the recipient is not interpreted by Oracle Database Advanced Queuing.

## 281.2.2 AQ\$\_AGENT\_LIST\_T Type

This type identifies the list of agents for which `DBMS_AQ.LISTEN` listens.

### See Also:

["AQ\\$\\_AGENT Type](#) (page 281-2)"

### Syntax

```
TYPE SYS.AQ$_AGENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY_INTEGER;
```

## 281.2.3 AQ\$\_DESCRIPTOR Type

This type specifies the Oracle Database Advanced Queuing descriptor received by the AQ PL/SQL callbacks upon notification.

**See Also:**

["MESSAGE\\_PROPERTIES\\_T Type \(page 281-16\)"](#)

### Syntax

```
TYPE SYS.AQ$_DESCRIPTOR IS OBJECT (
 queue_name VARCHAR2(261),
 consumer_name VARCHAR2(512),
 msg_id RAW(16),
 msg_prop MSG_PROP_T,
 gen_desc AQ$_NTFN_DESCRIPTOR,
 msgid_array SYS.AQ$_NTFN_MSGID_ARRAY,
 ntfnsRecdInGrp NUMBER);
```

### Attributes

**Table 281-2 AQ\$\_DESCRIPTOR Attributes**

Attribute	Description
queue_name	Name of the queue in which the message was enqueued which resulted in the notification
consumer_name	Name of the consumer for the multiconsumer queue
msg_id	Identification number of the message
msg_prop	Message properties specified by the MSG_PROP_T type
gen_desc	Indicates the timeout specifications
msgid_array	Group notification message ID list
ntfnsRecdInGrp	Notifications received in group

## 281.2.4 AQ\$\_NTFN\_DESCRIPTOR Type

This type is for storing a generic notification descriptor regarding PL/SQL notification flags.

### Syntax

```
TYPE SYS.AQ$_NTFN_DESCRIPTOR IS OBJECT(ntfn_flags NUMBER)
```

## Attributes

**Table 281-3 AQ\$\_NTFN\_DESCRIPTOR Attributes**

Attribute	Description
ntfn_flags	Set to 1 if the notifications are already removed after a stipulated timeout. Set 2 to denote grouping. Default is 0.

## 281.2.5 AQ\$\_NTFN\_MSGID\_ARRAY Type

This type is for storing grouping notification data for AQ namespace, value 2<sup>30</sup> which is the max varray size.

### Syntax

```
TYPE SYS.AQ$_NTFN_MSGID_ARRAY AS VARRAY(1073741824)OF RAW(16);
```

## 281.2.6 AQ\$\_POST\_INFO Type

This type specifies anonymous subscriptions to which you want to post messages.

### Syntax

```
TYPE SYS.AQ$_POST_INFO IS OBJECT (
 name VARCHAR2(512),
 namespace NUMBER,
 payload RAW(32767));
```

## Attributes

**Table 281-4 AQ\$\_POST\_INFO Attributes**

Attribute	Description
name	Name of the anonymous subscription to which you want to post
namespace	To receive notifications from other applications through DBMS_AQ.POST or OCISubscriptionPost(), the namespace must be DBMS_AQ.NAMESPACE_ANONYMOUS
payload	The payload to be posted to the anonymous subscription

## 281.2.7 AQ\$\_POST\_INFO\_LIST Type

This type identifies the list of anonymous subscriptions to which you want to post messages.

**See Also:**

[AQ\\$\\_POST\\_INFO Type \(page 281-4\)](#)

### Syntax

```
TYPE SYS.AQ$_POST_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_POST_INFO;
```

## 281.2.8 AQ\$\_PURGE\_OPTIONS\_T Type

This type specifies the options available for purging a queue table.

**See Also:**

[PURGE\\_QUEUE\\_TABLE Procedure \(page 22-34\)](#).

### Syntax

```
TYPE AQ$_PURGE_OPTIONS_T is RECORD (
 block BOOLEAN DEFAULT FALSE
 delivery_mode PLS_INTEGER DEFAULT PERSISTENT);
```

**Table 281-5 AQ\$\_PURGE\_OPTIONS\_T Type Attributes**

Attribute	Description
block	TRUE/FALSE. <ul style="list-style-type: none"> <li>If <code>block</code> is <code>TRUE</code>, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueueers and dequeuers to block while the queue table is purged. The purge call always succeeds if <code>block</code> is <code>TRUE</code>.</li> <li>The default for <code>block</code> is <code>FALSE</code>. This will not block enqueueers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.</li> </ul>
delivery_mode	Kind of messages to purge, either <code>DBMS_AQ.BUFFERED</code> or <code>DBMS_AQ.PERSISTENT</code>

## 281.2.9 AQ\$\_RECIPIENT\_LIST\_T Type

Identifies the list of agents that receive the message. This type can be used only when the queue is enabled for multiple dequeues.

### See Also:

"AQ\$\_AGENT Type (page 281-2)"

### Syntax

```
TYPE SYS.AQ$_RECIPIENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY_INTEGER;
```

## 281.2.10 AQ\$\_REG\_INFO Type

This type identifies a producer or a consumer of a message.

### Syntax

```
TYPE SYS.AQ$_REG_INFO IS OBJECT (
 name VARCHAR2(512),
 namespace NUMBER,
 callback VARCHAR2(4000),
 context RAW(2000) DEFAULT NULL,
 anyctx ANYDATA,
 ctxtype NUMBER,
 payloadcbk VARCHAR2(4000),
 timeout NUMBER,
 ntfn_grouping_class NUMBER,
 ntfn_grouping_value NUMBER DEFAULT 600,
 ntfn_grouping_type NUMBER,
 ntfn_grouping_start_time TIMESTAMP(6) WITH TIME ZONE,
 ntfn_grouping_repeat_count NUMBER);
```

### Attributes

**Table 281-6 AQ\$\_REG\_INFO Type Attributes**

Attribute	Description
name	Specifies the name of the subscription. The subscription name is of the form <i>schema.queue</i> if the registration is for a single consumer queue or <i>schema.queue:consumer_name</i> if the registration is for a multiconsumer queues.

Table 281-6 (Cont.) AQ\$\_REG\_INFO Type Attributes

Attribute	Description
namespace	Specifies the namespace of the subscription. To receive notification from Oracle Database Advanced Queuing queues, the namespace must be <code>DBMS_AQ.NAMESPACE_AQ</code> . To receive notifications from other applications through <code>DBMS_AQ.POST</code> or <code>OCISubscriptionPost()</code> , the namespace must be <code>DBMS_AQ.NAMESPACE_ANONYMOUS</code> .
callback	Specifies the action to be performed on message notification. For HTTP notifications, use <code>http://www.company.com:8080</code> . For e-mail notifications, use <code>mailto://xyz@company.com</code> . For raw message payload for the <code>PLSQLCALLBACK</code> procedure, use <code>plsql://schema.procedure?PR=0</code> . For user-defined type message payload converted to XML for the <code>PLSQLCALLBACK</code> procedure, use <code>plsql://schema.procedure?PR=1</code> .
context	Specifies the context that is to be passed to the callback function
timeout	Specifies the time in seconds
ntfn_grouping_class	Currently, only the following flag can be set to specify criterion for grouping. The default value will be 0. If <code>ntfn_grouping_class</code> is 0, all other notification grouping attributes must be 0. <ul style="list-style-type: none"> <li><code>NTFN_GROUPING_CLASS_TIME</code> - Notifications grouped by time, that is, the user specifies a time value and a single notification gets published at the end of that time.</li> </ul>
ntfn_grouping_value	Time-period of grouping notifications specified in seconds, meaning the time after which grouping notification would be sent periodically until <code>ntfn_grouping_repeat_count</code> is exhausted.
ntfn_grouping_type	<ul style="list-style-type: none"> <li><code>NTFN_GROUPING_TYPE_SUMMARY</code> - Summary of all notifications that occurred in the time interval. (Default)</li> <li><code>NTFN_GROUPING_TYPE_LAST</code> - Last notification that occurred in the interval.</li> </ul>
ntfn_grouping_start_time	Notification grouping start time. Notification grouping can start from a user-specified time that should a valid timestamp with time zone. If <code>ntfn_grouping_start_time</code> is not specified when using grouping, the default is to current timestamp with time zone

**Table 281-6 (Cont.) AQ\$\_REG\_INFO Type Attributes**

Attribute	Description
ntfn_grouping_repeat_count	<p>Grouping notifications will be sent as many times as specified by the notification grouping repeat count and after that revert to regular notifications. The ntnfn_grouping_repeat_count, if not specified, will default to</p> <ul style="list-style-type: none"> <li>• NTFN_GROUPING_FOREVER - Keep sending grouping notifications forever.</li> </ul>

**Usage Notes**

You can use the following notification mechanisms:

- OCI callback
- e-mail callback
- PL/SQL callback

[Table 281-7](#) (page 281-8) shows the actions performed for nonpersistent queues for different notification mechanisms when RAW presentation is specified. [Table 281-8](#) (page 281-8) shows the actions performed when XML presentation is specified.

**Table 281-7 Actions Performed for Nonpersistent Queues When RAW Presentation Specified**

Queue Payload Type	OCI Callback	E-mail	PL/SQL Callback
RAW	OCI callback receives the RAW data in the payload.	Not supported	PL/SQL callback receives the RAW data in the payload.
Oracle object type	Not supported	Not supported	Not supported

**Table 281-8 Actions Performed for Nonpersistent Queues When XML Presentation Specified**

Queue Payload Type	OCI Callback	E-mail	PL/SQL Callback
RAW	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.
Oracle object type	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.

## 281.2.11 AQ\$\_REG\_INFO\_LIST Type

Identifies the list of registrations to a queue.

**See Also:**

"AQ\$\_REG\_INFO Type (page 281-6)"

### Syntax

```
TYPE SYS.AQ$_REG_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_REG_INFO;
```

## 281.2.12 AQ\$\_SUBSCRIBER\_LIST\_T Type

This type identifies the list of subscribers that subscribe to a queue.

**See Also:**

"AQ\$\_AGENT Type (page 281-2)"

### Syntax

```
TYPE SYS.AQ$_SUBSCRIBER_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY_INTEGER;
```

## 281.2.13 DEQUEUE\_OPTIONS\_T Type

DEQUEUE\_OPTIONS\_T specifies the options available for the dequeue operation.

### Syntax

```
TYPE DEQUEUE_OPTIONS_T IS RECORD (
 consumer_name VARCHAR2(30) DEFAULT NULL,
 dequeue_mode BINARY_INTEGER DEFAULT REMOVE,
 navigation BINARY_INTEGER DEFAULT NEXT_MESSAGE,
 visibility BINARY_INTEGER DEFAULT ON_COMMIT,
 wait BINARY_INTEGER DEFAULT FOREVER,
 msgid RAW(16) DEFAULT NULL,
 correlation VARCHAR2(128) DEFAULT NULL,
 deq_condition VARCHAR2(4000) DEFAULT NULL,
 signature aq$_sig_prop DEFAULT NULL,
 transformation VARCHAR2(61) DEFAULT NULL,
 delivery_mode PLS_INTEGER DEFAULT PERSISTENT);
```

## Attributes

**Table 281-9 DEQUEUE\_OPTIONS\_T Attributes**

Attribute	Description
consumer_name	<p>Name of the consumer. Only those messages matching the consumer name are accessed. If a queue is not set up for multiple consumers, then this field should be set to NULL.</p> <p>For secure queues, consumer_name must be a valid AQ agent name, mapped to the database user performing the dequeue operation, through dbms_aqadm.enable_db_access procedure call.</p>
dequeue_mode	<p>Specifies the locking behavior associated with the dequeue. Possible settings are:</p> <p><b>BROWSE:</b> Read the message without acquiring any lock on the message. This specification is equivalent to a select statement.</p> <p><b>LOCKED:</b> Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement.</p> <p><b>REMOVE:</b> Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties.</p> <p><b>REMOVE_NODATA:</b> Mark the message as updated or deleted. The message can be retained in the queue table based on the retention properties.</p>
navigation	<p>Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Possible settings are:</p> <p><b>NEXT_MESSAGE:</b> Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then AQ retrieves the next available message that matches the search criteria and belongs to the message group. This setting is the default.</p> <p><b>NEXT_TRANSACTION:</b> Skip the remainder of the current transaction group (if any) and retrieve the first message of the next transaction group. This setting can only be used if message grouping is enabled for the current queue.</p> <p><b>FIRST_MESSAGE:</b> Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue.</p> <p><b>FIRST_MESSAGE_MULTI_GROUP:</b> indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will reset the position to the beginning of the queue and dequeue messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups.</p> <p><b>NEXT_MESSAGE_MULTI_GROUP:</b> indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will dequeue the next set of messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups.</p>

Table 281-9 (Cont.) DEQUEUE\_OPTIONS\_T Attributes

Attribute	Description
visibility	<p>Specifies whether the new message is dequeued as part of the current transaction. The visibility parameter is ignored when using the <code>BROWSE</code> dequeue mode. Possible settings are:</p> <p><code>ON_COMMIT</code>: The dequeue will be part of the current transaction. This setting is the default.</p> <p><code>IMMEDIATE</code>: The dequeue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation.</p>
wait	<p>Specifies the wait time if there is currently no message available which matches the search criteria. Possible settings are:</p> <p><code>FOREVER</code>: Wait forever. This setting is the default.</p> <p><code>NO_WAIT</code>: Do not wait.</p> <p>number: Wait time in seconds.</p>
msgid	Specifies the message identifier of the message to be dequeued.
correlation	Specifies the correlation identifier of the message to be dequeued. Special pattern matching characters, such as the percent sign (%) and the underscore (_) can be used. If more than one message satisfies the pattern, then the order of dequeuing is undetermined.
deq_condition	<p>A conditional expression based on the message properties, the message data properties, and PL/SQL functions.</p> <p>A <code>deq_condition</code> is specified as a Boolean expression using syntax similar to the <code>WHERE</code> clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the <code>WHERE</code> clause of a SQL query). Message properties include <code>priority</code>, <code>corrid</code> and other columns in the queue table</p> <p>To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with <code>tab.user_data</code> as a qualifier to indicate the specific column of the queue table that stores the payload. The <code>deq_condition</code> parameter cannot exceed 4000 characters. If more than one message satisfies the dequeue condition, then the order of dequeuing is undetermined.</p>
signature	Currently not implemented
transformation	Specifies a transformation that will be applied after dequeuing the message. The source type of the transformation must match the type of the queue.
delivery_mode	The dequeuer specifies the delivery mode of the messages it wishes to dequeue in the dequeue options. It can be <code>BUFFERED</code> or <code>PERSISTENT</code> or <code>PERSISTENT_OR_BUFFERED</code> . The message properties of the dequeued message indicate the delivery mode of the dequeued message. Array dequeue is only supported for buffered messages with an array size of '1'.

## 281.2.14 ENQUEUE\_OPTIONS\_T Type

ENQUEUE\_OPTIONS\_T Type specifies the options available for the enqueue operation.

### Syntax

```
TYPE SYS.ENQUEUE_OPTIONS_T IS RECORD (
 visibility BINARY_INTEGER DEFAULT ON_COMMIT,
 relative_msgid RAW(16) DEFAULT NULL,
 sequence_deviation BINARY_INTEGER DEFAULT NULL,
 transformation VARCHAR2(61) DEFAULT NULL,
 delivery_mode PLS_INTEGER NOT NULL DEFAULT PERSISTENT);
```

### Attributes

**Table 281-10 ENQUEUE\_OPTIONS\_T Attributes**

Attribute	Description
visibility	Specifies the transactional behavior of the enqueue request. Possible settings are:  ON_COMMIT: The enqueue is part of the current transaction. The operation is complete when the transaction commits. This setting is the default.  IMMEDIATE: The enqueue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation. This is the only value allowed when enqueueing to a non-persistent queue.
relative_msgid	Specifies the message identifier of the message which is referenced in the sequence deviation operation. This field is valid only if BEFORE is specified in sequence_deviation. This parameter is ignored if sequence deviation is not specified.
sequence_deviation	Specifies whether the message being enqueued should be dequeued before other messages already in the queue. Possible settings are:  BEFORE: The message is enqueued ahead of the message specified by relative_msgid.  TOP: The message is enqueued ahead of any other messages.
transformation	Specifies a transformation that will be applied before enqueueing the message. The return type of the transformation function must match the type of the queue.
delivery_mode	The enqueuer specifies the delivery mode of the messages it wishes to enqueue in the enqueue options. It can be BUFFERED or PERSISTENT. The message properties of the enqueued message indicate the delivery mode of the enqueued message. Array enqueue is only supported for buffered messages with an array size of '1'.

## 281.2.15 QUEUE\_PROPS\_T Type

This type specifies the Oracle Database Advanced Queuing descriptor received by the AQ PL/SQL callbacks upon notification.

### Syntax

```
TYPE QUEUE_PROPS_T IS RECORD (
 retry_delay NUMBER DEFAULT 0,
 retention_time NUMBER DEFAULT 0,
 sort_list VARCHAR2(30) DEFAULT NULL,
 cache_hint BINARY_INTEGER DEFAULT AUTO
);
```

### Attributes

**Table 281-11** QUEUE\_PROPS\_T Attributes

Attribute	Description
retry_delay	Specifies the number of seconds after which this message is scheduled for processing again after an application rollback
retention_time	Specifies the number of seconds a message is retained in the queue table after being dequeued from the queue
sort_list	Sharded queues can be sorted by ENQ_TIME or PRIORITY, ENQ_TIME .
cache_hint	Specifies a hint to sharded queue whether to cache messages or not. User can specify following: <ul style="list-style-type: none"> <li>UNCACHED: Message cache will not cache messages</li> <li>CACHED: Message cache will cache messages and give preference to those queues with CACHED hint.</li> <li>AUTO: Message cache does best effort based on available memory</li> </ul>

## 281.2.16 SYS.MSG\_PROP\_T Type

This type is used in PL/SQL notification, as one field in `aq$_descriptor`, to pass message properties of an AQ message to the PL/SQL notification client callback.

### Syntax

```
CREATE or replace TYPE sys.msg_prop_t AS OBJECT (
 priority NUMBER,
 delay NUMBER,
 expiration NUMBER,
 correlation VARCHAR2(128),
 attempts NUMBER,
 exception_queue VARCHAR2(51),
 enqueue_time DATE,
 state NUMBER,
 sender_id aq$_agent,
 original_msgid RAW(16),
 delivery_mode NUMBER);
```

## Parameters

Table 281-12 SYS.MSG\_PROP\_T Type Attributes

Parameter	Description
priority	Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.
delay	<p>Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by <code>msgid</code> overrides the delay specification. A message enqueued with <code>delay</code> set is in the <code>WAITING</code> state, and when the delay expires, the message goes to the <code>READY</code> state. <code>DELAY</code> processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message.</p> <p>The possible settings follow:</p> <p><code>NO_DELAY</code>: The message is available for immediate dequeuing</p> <p>number: The number of seconds to delay the message</p>
expiration	<p>Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed.</p> <p>The possible settings follow:</p> <p><code>NEVER</code>: The message does not expire</p> <p>number: The number of seconds message remains in <code>READY</code> state. If the message is not dequeued before it expires, then it is moved to the exception queue in the <code>EXPIRED</code> state.</p>
correlation	Returns the identifier supplied by the producer of the message at enqueue time.
attempts	Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.

Table 281-12 (Cont.) SYS.MSG\_PROP\_T Type Attributes

Parameter	Description
exception_queue	<p>Specifies the name of the queue into which the message is moved if it cannot be processed successfully.</p> <p>Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases:</p> <ul style="list-style-type: none"> <li>RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation.</li> </ul> <p>For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view.</p> <p>If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.</p> <ul style="list-style-type: none"> <li>A message was not dequeued before the expiration time elapsed.</li> <li>Message propagation to the specified destination queue failed with one of the following errors: <ul style="list-style-type: none"> <li>* There were no recipients for the multiconsumer destination queue.</li> <li>* Recipients were specified for a single-consumer destination queue.</li> <li>* Destination queue was an exception queue</li> <li>* There was an error when applying transformation.</li> </ul> </li> </ul> <p>The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time.</p>
enqueue_time	<p>Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.</p>
state	<p>Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:</p> <ul style="list-style-type: none"> <li>DBMS_AQ.READY: The message is ready to be processed.</li> <li>DBMS_AQ.WAITING: The message delay has not yet been reached.</li> <li>DBMS_AQ.PROCESSED: The message has been processed and is retained.</li> <li>DBMSAQ.EXPIRED: The message has been moved to the exception queue.</li> </ul>

**Table 281-12 (Cont.) SYS.MSG\_PROP\_T Type Attributes**

Parameter	Description
sender_id	The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq\$_agent. Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified. The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]
original_msgid	This parameter is used by Oracle Database Advanced Queuing for propagating messages.
delivery_mode	DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT.

## 281.2.17 MESSAGE\_PROPERTIES\_T Type

This type is defined inside the DBMS\_AQ package, and describes the information that AQ uses to convey the state of individual messages. These are set at enqueue time, and their values are returned at dequeue time.

**See Also:**

[AQ\\$\\_RECIPIENT\\_LIST\\_T Type \(page 281-6\)](#)

### Syntax

```

TYPE message_properties_t IS RECORD (
 priority BINARY_INTEGER NOT NULL DEFAULT 1,
 delay BINARY_INTEGER NOT NULL DEFAULT NO_DELAY,
 expiration BINARY_INTEGER NOT NULL DEFAULT NEVER,
 correlation VARCHAR2(128) DEFAULT NULL,
 attempts BINARY_INTEGER,
 recipient_list AQ$_RECIPIENT_LIST_T,
 exception_queue VARCHAR2(61) DEFAULT NULL,
 enqueue_time DATE,
 state BINARY_INTEGER,
 sender_id SYS.AQ$_AGENT DEFAULT NULL,
 original_msgid RAW(16) DEFAULT NULL,
 signature aq$_sig_prop DEFAULT NULL,
 transaction_group VARCHAR2(30) DEFAULT NULL,
 user_property SYS.ANYDATA DEFAULT NULL,
 delivery_mode PLS_INTEGER NOT NULL DEFAULT DBMS_AQ.PERSISTENT);

```

## Attributes

**Table 281-13 MESSAGE\_PROPERTIES\_T Attributes**

Attribute	Description
priority	Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.
delay	Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by <code>msgid</code> overrides the delay specification. A message enqueued with <code>delay</code> set is in the <code>WAITING</code> state, and when the delay expires, the message goes to the <code>READY</code> state. <code>DELAY</code> processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: <code>NO_DELAY</code> : The message is available for immediate dequeuing number: The number of seconds to delay the message
expiration	Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed. The possible settings follow: <code>NEVER</code> : The message does not expire number: The number of seconds message remains in <code>READY</code> state. If the message is not dequeued before it expires, then it is moved to the exception queue in the <code>EXPIRED</code> state.
correlation	Returns the identifier supplied by the producer of the message at enqueue time.
attempts	Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.
recipient_list	This parameter is only valid for queues that allow multiple consumers. The default recipients are the queue subscribers. This parameter is not returned to a consumer at dequeue time. For type definition, see the " <a href="#">AQ\$_AGENT Type</a> (page 281-2)".

**Table 281-13 (Cont.) MESSAGE\_PROPERTIES\_T Attributes**

Attribute	Description
exception_queue	<p>Specifies the name of the queue into which the message is moved if it cannot be processed successfully.</p> <p>Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases:</p> <ul style="list-style-type: none"> <li>• <code>RETRY_COUNT</code>, the number of unsuccessful dequeue attempts, has exceeded the specification for the <code>MAX_RETRIES</code> parameter in the <code>DBMS_AQADM.CREATE_QUEUE</code> procedure during queue creation. For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the <code>MAX_RETRIES</code> parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than <code>MAX_RETRIES</code>. You can view <code>MAX_RETRIES</code> for a queue in the <code>ALL_QUEUES</code> data dictionary view.</li> <li>• If a dequeue transaction fails because the server process dies (including <code>ALTER SYSTEM KILL SESSION</code>) or <code>SHUTDOWN ABORT</code> on the instance, then <code>RETRY_COUNT</code> is not incremented.</li> <li>• A message was not dequeued before the expiration time elapsed.</li> <li>• Message propagation to the specified destination queue failed with one of the following errors: <ul style="list-style-type: none"> <li>* There were no recipients for the multiconsumer destination queue.</li> <li>* Recipients were specified for a single-consumer destination queue.</li> <li>* Destination queue was an exception queue</li> <li>* There was an error when applying transformation.</li> </ul> </li> </ul> <p>The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a <code>NULL</code> value at dequeue time.</p>
enqueue_time	<p>Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.</p>
state	<p>Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:</p> <ul style="list-style-type: none"> <li>• <code>DBMS_AQ.READY</code>: The message is ready to be processed.</li> <li>• <code>DBMS_AQ.WAITING</code>: The message delay has not yet been reached.</li> <li>• <code>DBMS_AQ.PROCESSED</code>: The message has been processed and is retained.</li> <li>• <code>DBMSAQ.EXPIRED</code>: The message has been moved to the exception queue.</li> </ul>

**Table 281-13 (Cont.) MESSAGE\_PROPERTIES\_T Attributes**

Attribute	Description
sender_id	<p>The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq\$_agent.</p> <p>Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through <code>dbms_aqadm.enable_db_access</code> procedure call. Sender address and protocol should not be specified.</p> <p>The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the <code>source_queue</code>, source database name if it was a remote database [format <code>source_queue@source_database_name</code>]</p>
original_msgid	This parameter is used by Oracle Database Advanced Queuing for propagating messages.
signature	Currently not implemented
transaction_group	Specifies the <code>transaction_group</code> for the dequeued message. Messages belonging to the same transaction group will have the same value for this attribute. This attribute is only set by the <code>DBMS_AQ.DEQUEUE_ARRAY</code> . This attribute cannot be used to set the transaction group of a message through <code>DBMS_AQ.ENQUEUE</code> or <code>DBMS_AQ.ENQUEUE_ARRAY</code> calls.
user_property	This optional attribute is used to store additional information about the payload.
delivery_mode	The message publisher specifies the delivery mode in the <code>message_properties</code> . This can be <code>DBMS_AQ.BUFFERED</code> or <code>DBMS_AQ.PERSISTENT</code> . Array enqueue is only supported for buffered messages with an array size of '1'.

## 281.2.18 MESSAGE\_PROPERTIES\_ARRAY\_T Type

This type is used by `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message properties.

Each element in the `payload_array` should have a corresponding element in the `MESSAGE_PROPERTIES_ARRAY_T` VARRAY.

**See Also:**

["MESSAGE\\_PROPERTIES\\_T Type \(page 281-16\)"](#)

### Syntax

```
TYPE MESSAGE_PROPERTIES_ARRAY_T IS VARRAY (2147483647)
OF MESSAGE_PROPERTIES_T;
```

## 281.2.19 MSGID\_ARRAY\_T Type

The `msgid_array_t` type is used in `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message IDs that correspond to the enqueued or dequeued messages.

### Syntax

```
TYPE MSGID_ARRAY_T IS TABLE OF RAW(16) INDEX BY BINARY_INTEGER
```

# DBFS Content Interface Types

DBFS Content Interface Types are public types that support the `DBMS_DBFS_CONTENT` interface.

This chapter contains the following topics:

- [Overview](#) (page 282-1)
- [Security Model](#) (page 282-1)
- [Data Structures](#) (page 282-1)

## Related Topics:

- [DBMS\\_DBFS\\_CONTENT](#) (page 48-1)  
The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

## 282.1 DDBFS Content Interface Types Overview

The type definitions described in this chapter support the `DBMS_DBFS_CONTENT` interface in implementing metadata tables, packages, views, dependent application-side entities, and service-provider entities.

## 282.2 DBFS Content Interface Types Security Model

The user can access the content operational and administrative interfaces (packages, types, tables, and so on) with the `DBFS_ROLE`. This role can be granted to users as needed.

## 282.3 DBFS Content Interface Types —Data Structures

Types that support the `DBMS_DBFS_CONTENT` interface include both Object and Table types.

### Object Types

- [DBMS\\_DBFS\\_CONTENT\\_CONTEXT\\_T Object Type](#) (page 282-2)
- [DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEM\\_T Object Type](#) (page 282-2)
- [DBMS\\_DBFS\\_CONTENT\\_PROPERTY\\_T Object Type](#) (page 282-3)

### Table Types

- [DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEMS\\_T Table Type](#) (page 282-3)
- [DBMS\\_DBFS\\_CONTENT\\_PROPERTIES\\_T Table Type](#) (page 282-4)
- [DBMS\\_DBFS\\_CONTENT\\_RAW\\_T Table Type](#) (page 282-4)

## 282.3.1 DBMS\_DBFS\_CONTENT\_CONTEXT\_T Object Type

This type describes the execution context for the providers. It provides the user performing the operation with the Access Control List, the owner of the item(s), a timestamp for doing `asof` queries, and whether or not the item(s) are `read_only`. This type can be used both as input, in the case of path item creation functions, and output, in the case of path item query, or both.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_context_t
 AUTHID DEFINER
AS OBJECT (
 principal VARCHAR2(32),
 acl VARCHAR2(1024),
 owner VARCHAR2(32),
 asof TIMESTAMP,
 read_only INTEGER);
```

### Fields

**Table 282-1 DBMS\_DBFS\_CONTENT\_CONTEXT\_T Fields**

Field	Description
<code>principal</code>	File system user
<code>acl</code>	Access control list
<code>owner</code>	Path item owner
<code>asof</code>	Timestamp
<code>read_only</code>	Nonzero if the path item is read-only

## 282.3.2 DBMS\_DBFS\_CONTENT\_LIST\_ITEM\_T Object Type

This type describes a type to assist in listing the contents of a directory.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_item_t
 AUTHID DEFINER
AS OBJECT (
 path VARCHAR2(1024),
 item_name VARCHAR2(256),
 item_type INTEGER);
```

### Fields

**Table 282-2 DBMS\_DBFS\_CONTENT\_LIST\_ITEM\_T Fields**

Field	Description
<code>path</code>	Path to the path item
<code>item_name</code>	Name of the path item
<code>item_type</code>	Type of path item. (See <a href="#">Table 48-4</a> (page 48-3))

### 282.3.3 DBMS\_DBFS\_CONTENT\_PROPERTY\_T Object Type

This type describes a single (`name`, `value`, `typecode`) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

The type is used by both the client-facing interfaces and by store providers for the `DBMS_DBFS_CONTENT` interface.

#### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_property_t
 AUTHID DEFINER
AS OBJECT (
 propname VARCHAR2(32),
 propvalue VARCHAR2(1024),
 typecode INTEGER);
```

#### Fields

**Table 282-3** DBMS\_DBFS\_CONTENT\_PROPERTY\_T Fields

Field	Description
<code>prop_name</code>	Name of property
<code>prop_value</code>	Value of property
<code>typecode</code>	Property type (See Constants in <code>DBMS_TYPES</code> )

### 282.3.4 DBMS\_DBFS\_CONTENT\_LIST\_ITEMS\_T Table Type

This type is a variable-sized array of `DBMS_DBFS_CONTENT_LIST_ITEM_T` Object Type. It is used by both the client-facing interfaces and by store providers for the `DBMS_DBFS_CONTENT` interface.

#### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_items_t AS
 TABLE OF dbms_dbfs_content_list_item_t;
```

#### Related Topics:

- [DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEM\\_T Object Type](#) (page 282-2)  
This type describes a type to assist in listing the contents of a directory.
- [DBMS\\_DBFS\\_CONTENT](#) (page 48-1)  
The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

## 282.3.5 DBMS\_DBFS\_CONTENT\_PROPERTIES\_T Table Type

This type is a variable-sized array of property tuples of `DBMS_DBFS_CONTENT_PROPERTY_T` Object Type. It is used by both the client-facing interfaces and by store providers for the `DBMS_DBFS_CONTENT` interface.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_properties_t AS
 TABLE OF dbms_dbfs_content_property_t;
```

### Related Topics:

- [DBMS\\_DBFS\\_CONTENT\\_PROPERTY\\_T Object Type](#) (page 282-3)  
This type describes a single (name, value, typecode) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

## 282.3.6 DBMS\_DBFS\_CONTENT\_RAW\_T Table Type

This type is an array of `RAW`. It is to enable `RAW` data transport for batch interfaces in the `DBMS_DBFS_CONTENT` interface.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_raw_t AS
 TABLE OF RAW(32767);
```

### Related Topics:

- [DBMS\\_DBFS\\_CONTENT](#) (page 48-1)  
The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

## Database URI TYPES

Oracle supports the `UriType` family of types that can be used to store and query Uri-refs inside the database. The `UriType` itself is an abstract object type and the `HTTPURITYPE`, `XDBURITYPE` and `DBURITYPE` are subtypes of it.

You can create a `UriType` column and store instances of the `DBURITYPE`, `XDBURITYPE` or the `HTTPURITYPE` inside of it. You can also define your own subtypes of the `UriType` to handle different URL protocols.

Oracle also provides a `UriFactory` package that can be used as a factory method to automatically generate various instances of these `UriTypes` by scanning the prefix, such as `http://` or `/oradb`. You can also register your subtype and provide the prefix that you support. For instance, if you have written a subtype to handle the gopher protocol, you can register the prefix `gopher://` to be handled by your subtype. The `UriFactory` will then generate your subtype instance for any URL starting with that prefix.

This chapter contains the following topics:

### 283.1 Summary of URITYPE Supertype Subprograms

The `UriType` is the abstract super type. It provides a standard set of functions to get the value pointed to by the URI. The actual implementation of the protocol must be defined by the subtypes of this type.

Instances of this type cannot be created directly. However, you can create columns of this type and store subtype instances in it, and also select from columns without knowing the instance of the URL stored.

**Table 283-1 URITYPE Type Subprograms**

Method	Description
<a href="#">GETBLOB</a> (page 283-2)	Returns the <code>BLOB</code> located at the address specified by the URL.

**Table 283-1 (Cont.) URITYPE Type Subprograms**

Method	Description
<a href="#">GETCLOB</a> (page 283-3)	Returns the CLOB located at the address specified by the URL.
<a href="#">GETCONTENTTYPE</a> (page 283-3)	Returns the URL, in escaped format, stored inside the UriType instance.
<a href="#">GETEXTERNALURL</a> (page 283-3)	Returns the URL, in escaped format, stored inside the UriType instance.
<a href="#">GETURL</a> (page 283-4)	Returns the URL, in non-escaped format, stored inside the UriType instance.
<a href="#">GETXML</a> (page 283-4)	Returns the XMLType located at the address specified by the URL.

## 283.1.1 UriType Supertype GETBLOB

This function returns the BLOB located at the address specified by the URL.

This function can be overridden in the subtype instances. The options are described below.

This function returns the BLOB located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getBlob()
 RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
 RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL in the specified character set.

### Syntax

```
FUNCTION getBlob(csid IN NUMBER)
 RETURN BLOB;
```

**Table 283-2 UriType Supertype GETBLOB Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error

## 283.1.2 UriType Supertype GETCLOB

This function returns the CLOB located at the address specified by the URL.

This function can be overridden in the subtype instances. This function returns either a permanent CLOB or a temporary CLOB. If a temporary CLOB is returned, it must be freed. The options are described below.

This function returns the CLOB located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getClob()
 RETURN CLOB;
```

This function returns the CLOB located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
 RETURN CLOB;
```

**Table 283-3** UriType Supertype GETCLOB Parameters

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

## 283.1.3 UriType Supertype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

This function can be overridden in the subtype instances. This function returns the content type as VARCHAR2.

### Syntax

```
MEMBER FUNCTION getContent_type()
 RETURN VARCHAR2;
```

## 283.1.4 UriType Supertype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the UriType instance.

The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the UriType instance.

### Syntax

```
MEMBER FUNCTION getExternalUrl()
 RETURN varchar2;
```

## 283.1.5 UriType Supertype GETURL

This function returns the URL, in non-escaped format, stored inside the `UriType` instance.

The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the `UriType` instance.

### Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

## 283.1.6 UriType Supertype GETXML

This function returns the `XMLType` located at the address specified by the URL.

This function can be overridden in the subtype instances. The options are described below.

This function returns the `XMLType` located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getXML()
RETURN XMLType;
```

This function returns the `XMLType` located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)
RETURN XMLType;
```

**Table 283-4 UriType Supertype GETXML Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

## 283.2 Summary of HTTPURITYPE Subtype Subprograms

The `HTTPURITYPE` is a subtype of the `UriType` that provides support for the HTTP protocol. This uses the `UTL_HTTP` package underneath to access the HTTP URLs. Proxy and secure wallets are not supported in this release.

**Table 283-5 HTTPURITYPE Type Subprorgams**

Method	Description
<a href="#">CREATEURI</a> (page 283-5)	Creates an instance of HTTPURITYPE from the given URI.
<a href="#">GETBLOB</a> (page 283-5)	Returns the BLOB located at the address specified by the URL.
<a href="#">GETCLOB</a> (page 283-6)	Returns the CLOB located at the address specified by the URL.
<a href="#">GETCONTENTTYPE</a> (page 283-7)	Returns the content type of the document pointed to by the URI.
<a href="#">GETEXTERNALURL</a> (page 283-7)	Returns the URL, in escaped format, stored inside the UriType instance.
<a href="#">GETURL</a> (page 283-4)	Returns the URL, in non-escaped format, stored inside the UriType instance.
<a href="#">GETXML</a> (page 283-7)	Returns the XMLType located at the address specified by the URL
<a href="#">HTTPURITYPE</a> (page 283-8)	Creates an instance of HTTPURITYPE from the given URI.

## 283.2.1 HttpUriType Subtype CREATEURI

This static function constructs a HTTPURITYPE instance. The HTTPURITYPE instance does not contain the prefix `http://` in the stored URL.

### Syntax

```
STATIC FUNCTION createUri(
 url IN varchar2)
RETURN HTTPURITYPE;
```

**Table 283-6 HttpUriType Subtype CREATEURI Parameters**

Parameter	IN / OUT	Description
<code>url</code>	(IN)	The URL string containing a valid HTTP URL; escaped format.

## 283.2.2 HttpUriType Subtype GETBLOB

This function returns the BLOB located at the address specified by the HTTP URL.

The subprograms of the URI Subtype ATTPURITYPE member subprogram GETBLOB are described below.

This function returns the BLOB located at the address specified by the HTTP URL.

### Syntax

```
MEMBER FUNCTION getBlob()
RETURN BLOB;
```

This function returns the BLOB located at the address specified by the HTTP URL and the content type.

### Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
 RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL in the specified character set.

### Syntax

```
FUNCTION getBlob(csId IN NUMBER)
 RETURN BLOB;
```

**Table 283-7 HttpUriType Subtype GETBLOB Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

## 283.2.3 HttpUriType Subtype GETCLOB

This function returns the `CLOB` located by the HTTP URL address. If a temporary `CLOB` is returned, it must be freed.

The subprograms of the URI Subtype HTTPURITYPE member subprogram GETCLOB are described below.

Returns the `CLOB` located at the address specified by the HTTP URL.

### Syntax

```
MEMBER FUNCTION getClob()
 RETURN CLOB;
```

Returns the `CLOB` located at the address specified by the HTTP URL and the content type.

### Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
 RETURN CLOB;
```

**Table 283-8 HttpUriType Subtype GETCLOB Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

## 283.2.4 HttpUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

### Syntax

```
MEMBER FUNCTION getContentTypes()
RETURN VARCHAR2;
```

## 283.2.5 HttpUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `HTTPURITYPE` instance. The subtype instances override this member function.

The `HTTPURITYPE` function does not store the prefix `http://`, but generates it for the external URL.

### Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

## 283.2.6 HttpUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the `HTTPURITYPE` instance.

### Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

## 283.2.7 HttpUriType Subtype GETXML

This function returns the `XMLType` located at the address specified by the URL. An error is thrown if the address does not point to a valid XML document.

The subprograms of the URI Subtype `HttpUriType` member subprogram `GETXML` are described below.

This function returns the `XMLType` located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getXML()
RETURN XMLType;
```

This function returns the `XMLType` located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)
RETURN XMLType;
```

**Table 283-9 HttpUriType Subtype GETXML Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

## 283.2.8 HttpUriType Subtype HTTPURITYPE

This constructs a `HTTPURITYPE` instance. The `HTTPURITYPE` instance does not contain the prefix `http://` in the stored URL.

### Syntax

```
CONSTRUCTOR FUNCTION HTTPURITYPE(
 url IN VARCHAR2);
```

**Table 283-10 HttpUriType Subtype HTTPURITYPE Parameters**

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid HTTP URL. The URL string is expected in escaped format. For example, non-url characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

## 283.3 Summary of DBURITYPE Subtype Subprograms

The `DBURITYPE` is a subtype of the `UriType` that provides support for `DBUri`-refs. A `DBUri`-ref is an intra-database URL that can be used to reference any row or row-column data in the database.

The URL is specified as an XPath expression over a XML visualization of the database. The schemas become elements which contain tables and views. These tables and views further contain the rows and columns inside them.

**Table 283-11 DBURITYPE Type Subprograms**

Method	Description
<a href="#">CREATEURI</a> (page 283-9)	Constructs a <code>DBURITYPE</code> instance.
<a href="#">DBURITYPE</a> (page 283-9)	Creates an instance of <code>DBURITYPE</code> from the given URI.
<a href="#">GETBLOB</a> (page 283-9)	Returns the <code>BLOB</code> located at the address specified by the <code>DBURITYPE</code> instance.
<a href="#">GETCLOB</a> (page 283-10)	Returns the <code>CLOB</code> located at the address specified by the <code>DBURITYPE</code> instance.
<a href="#">GETCONTENTTYPE</a> (page 283-11)	Returns the content type of the document pointed to by the URI.
<a href="#">GETEXTERNALURL</a> (page 283-11)	Returns the URL, in escaped format, stored inside the <code>DBURITYPE</code> instance.
<a href="#">GETURL</a> (page 283-11)	Returns the URL, in non-escaped format, stored inside the <code>DBURITYPE</code> instance.

**Table 283-11 (Cont.) DBURITYPE Type Subprograms**

Method	Description
<a href="#">GETXML</a> (page 283-11)	Returns the <code>XMLType</code> located at the address specified by the URL

### 283.3.1 DBUriType Subtype CREATEURI

This static function constructs a `DBURITYPE` instance. Parses the URL given and creates a `DBURITYPE` instance.

#### Syntax

```
STATIC FUNCTION createUri(
 url IN varchar2)
RETURN DBURITYPE;
```

**Table 283-12 DBUriType Subtype CREATEURI Parameters**

Parameter	IN / OUT	Description
<code>url</code>	(IN)	The URL string, in escaped format, containing a valid <code>DBURITYPE</code> .

### 283.3.2 DBUriType Subtype DBURITYPE

This constructs a `DBURITYPE` instance.

#### Syntax

```
CONSTRUCTOR FUNCTION DBURITYPE(
 url IN varchar2);
```

**Table 283-13 DBUriType Subtype DBURITYPE Parameters**

Parameter	IN / OUT	Description
<code>url</code>	(IN)	The URL string containing a valid <code>DBURITYPE</code> . The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

### 283.3.3 DBUriType Subtype GETBLOB

This function returns the `BLOB` located at the address specified by the URL.

The subprograms of the URI Subtype `DBURITYPE` member subprogram `GETBLOB` are described below. The options are described in the following table.

This function returns the `BLOB` located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getBlob()
 RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
 RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL in the specified character set.

### Syntax

```
FUNCTION getBlob(csid IN NUMBER)
 RETURN BLOB;
```

**Table 283-14 DBUriType Subtype GETBLOB Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

## 283.3.4 DBUriType Subtype GETCLOB

This function returns the `CLOB` located at the address specified by the `DBURITYPE` instance.

If a temporary `CLOB` is returned, it must be freed. The document returned may be an XML document or a text document. When the `DBUri-ref` identifies an element in the XPath, the result is a well-formed XML document. On the other hand, if it identifies a text node, then what is returned is only the text content of the column or attribute. The options are described below.

The following function returns the `CLOB` located at the address specified by the `DBURITYPE` instance.

### Syntax

```
MEMBER FUNCTION getClob()
 RETURN CLOB;
```

The following function returns the `CLOB` located at the address specified by the `DBURITYPE` instance and the content type.

### Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
 RETURN CLOB;
```

**Table 283-15 DBUriType Subtype GETCLOB Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

### 283.3.5 DBUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

#### Syntax

```
MEMBER FUNCTION getContentTypes()
RETURN VARCHAR2;
```

### 283.3.6 DBUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `DBURITYPE` instance. The `DBUri` servlet URL that processes the `DBURITYPE` has to be appended before using the escaped URL in Web pages.

#### Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

### 283.3.7 DBUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the `DBURITYPE` instance.

#### Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

### 283.3.8 DBUriType Subtype GETXML

This function returns the `XMLType` located at the address specified by the URL.

The subprograms of the URI Subtype `DBPURITYPE` member subprogram `GETXML` are described below. The options are described in the following table.

This function returns the `XMLType` located at the address specified by the URL.

#### Syntax

```
MEMBER FUNCTION getXML()
RETURN XMLType;
```

This function returns the `XMLType` located at the address specified by the URL and the content type.

**Syntax**

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)
 RETURN XMLType;
```

**Table 283-16 DBUriType Subtype GETXML Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

## 283.4 Summary of XDBURITYPE Subtype Subprograms

XDBURITYPE is a new subtype of URITYPE. It provides a way to expose documents in the Oracle XML DB hierarchy as URIs that can be embedded in any URITYPE column in a table.

The URL part of the URI is the hierarchical name of the XML document it refers to. The optional fragment part uses the XPath syntax, and is separated from the URL part by '#'. The more general XPointer syntax for specifying a fragment is not currently supported.

**Table 283-17 XDBURITYPE Type Subprograms**

Method	Description
<a href="#">CREATEURI</a> (page 283-12)	Returns the <code>UriType</code> corresponding to the specified URL.
<a href="#">GETBLOB</a> (page 283-13)	Returns the <code>BLOB</code> corresponding to the contents of the document specified by the <code>XDBURITYPE</code> instance.
<a href="#">GETCLOB</a> (page 283-10)	Returns the <code>CLOB</code> corresponding to the contents of the document specified by the <code>XDBURITYPE</code> instance.
<a href="#">GETCONTENTTYPE</a> (page 283-14)	Returns the content type of the document pointed to by the URI.
<a href="#">GETEXTERNALURL</a> (page 283-11)	Returns the URL, in escaped format, stored inside the <code>XDBURITYPE</code> instance.
<a href="#">GETURL</a> (page 283-11)	Returns the URL, in non-escaped format, stored inside the <code>XDBURITYPE</code> instance.
<a href="#">GETXML</a> (page 283-14)	Returns the <code>XMLType</code> corresponding to the contents of the document specified by the URL.
<a href="#">XDBURITYPE</a> (page 283-15)	Creates an instance of <code>XDBURITYPE</code> from the given URI.

### 283.4.1 XDBUriType Subtype CREATEURI

This static function constructs a `XDBURITYPE` instance. It parses the given URL and creates a `XDBURITYPE` instance.

**Syntax**

```
STATIC FUNCTION createUri(
 url IN varchar2)
 RETURN XDBURITYPE
```

Parameter	IN / OUT	Description
url	(IN)	The URL string, in escaped format, containing a valid XDBURITYPE.

## 283.4.2 XDBUriType Subtype GETBLOB

This function returns the BLOB located at the address specified by the XDBURITYPE instance.

The subprograms of the URI Subtype XDBURITYPE member subprogram GETBLOB are described below. The options are described in the following table.

This function returns the BLOB located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getBlob()
 RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
 RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL in the specified character set.

### Syntax

```
FUNCTION getBlob(csid IN NUMBER)
 RETURN BLOB;
```

**Table 283-18 XDBUriType Subtype GETBLOB Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

## 283.4.3 XDBUriType Subtype GETCLOB

This function returns the CLOB located at the address specified by the XDBURITYPE instance. If a temporary CLOB is returned, it must be freed.

The subprograms of the URI Subtype XDBURITYPE member subprogram GETCLOB are described below. The options are described in the following table.

Returns the CLOB located at the address specified by the XDBUriType instance.

### Syntax

```
MEMBER FUNCTION getClob()
RETURN CLOB;
```

Returns the CLOB located at the address specified by the XDBUriType instance and the content type.

### Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
RETURN CLOB;
```

**Table 283-19 XDBUriType Subtype GETCLOB Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

## 283.4.4 XDBUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function returns the content type as VARCHAR2.

### Syntax

```
MEMBER FUNCTION getContentTypes()
RETURN VARCHAR2;
```

## 283.4.5 XDBUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the XDBURITYPE instance.

### Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

## 283.4.6 XDBUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the XDBURITYPE instance.

### Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

## 283.4.7 XDBUriType Subtype GETXML

This function returns the XMLType located at the address specified by the URL.

The subprograms of the URI Subtype XDBURITYPE member subprogram GETXML are described below. The options are described in the following table.

This function returns the `XMLType` located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getXML()
 RETURN XMLType;
```

This function returns the `XMLType` located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)
 RETURN XMLType;
```

**Table 283-20 XDBUriType Subtype GETXML Parameters**

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

## 283.4.8 XDBUriType subtype XDBURITYPE

This constructs a `XDBURITYPE` instance.

### Syntax

```
CONSTRUCTOR FUNCTION XDBURITYPE(
 url IN VARCHAR2,
 flags IN RAW := NULL)
 RETURN self AS RESULT;
```

**Table 283-21 XDBUriType subtype XDBURITYPE Parameters**

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid <code>XDBUriType</code> . The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.
flags	(IN)	Possible values are: <ul style="list-style-type: none"> <li>1 - Expand all <code>XInclude</code> elements before returning the result contents. If any <code>XInclude</code> element cannot be successfully resolved according to the <code>XInclude</code> fallback semantics, then an error is raised.</li> <li>2 - Indicates that any errors during document retrieval should be suppressed</li> <li>3 - Both flag bits (1, 2) are enabled</li> </ul>

## 283.5 Summary of URIFACTORY Package Subprograms

The `UriFactory` package contains factory methods that can be used to generate the appropriate instance of the URI types without having to hard code the implementation in the program.

The `UriFactory` package also provides the ability to register new subtypes of the `UriType` to handle various other protocols. For example, you can invent a new protocol `ecom://` and define a subtype of the `UriType` to handle that protocol and register it with `UriFactory`. After that any factory method would generate the new subtype instance if it sees the `ecom://` prefix.

**Table 283-22 URIFACTORY Type Subprograms**

Method	Description
<a href="#">GETURI</a> (page 283-16)	Returns the correct URL handler for the given URL string.
<a href="#">ESCAPEURI</a> (page 283-17)	Returns a URL in escaped format.
<a href="#">UNESCAPEURI</a> (page 283-17)	Returns a URL in unescaped format.
<a href="#">REGISTERURLHANDLER</a> (page 283-17)	Registers a particular type name for handling a particular URL.
<a href="#">UNREGISTERURLHANDLER</a> (page 283-18)	Unregisters a URL handler.

### 283.5.1 UriFactory Package GETURI

This factory method returns the correct URI handler for the given URI string.

It returns a subtype instance of the `UriType` that can handle the protocol. By default, it always creates an `XDBURITYPE` instance, if it cannot resolve the URL. A URL handler can be registered for a particular prefix using the [REGISTERURLHANDLER](#) (page 283-17) function. If the prefix matches, [GETURI](#) (page 283-16) would then use that subtype.

#### Syntax

```
FUNCTION getUri(
 url IN Varchar2)
RETURN UriType;
```

**Table 283-23 UriFactory Package GETURI Parameters**

Parameter	IN / OUT	Description
<code>uri</code>	(IN)	The URL string, in escaped format, containing a valid HTTP URL.

## 283.5.2 UriFactory Package ESCAPEURI

This function returns a URL in escaped format.

The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the [GETEXTERNALURL](#) (page 283-14) function or the [GETURI](#) (page 283-16) function to get to the URL value instead of using the attribute present in the `UriType`.

### Syntax

```
MEMBER FUNCTION escapeUri()
RETURN varchar2;
```

**Table 283-24** UriFactory Package ESCAPEURI Parameters

Parameter	IN / OUT	Description
<code>url</code>	(IN)	The URL string to be returned in escaped format.

## 283.5.3 UriFactory Package UNESCAPEURI

This function returns a URL in unescaped format.

This function is the reverse of the [ESCAPEURI](#) (page 283-17) function. This function scans the string and converts any non-URL hexadecimal characters into the equivalent UTF-8 characters. Since the return type is a `VARCHAR2`, the characters would be converted into the equivalent characters as defined by the database character set.

### Syntax

```
FUNCTION unescapeUri()
RETURN varchar2;
```

**Table 283-25** UriFactory Package UNESCAPEURI Parameters

Parameter	IN / OUT	Description
<code>url</code>	(IN)	The URL string to be returned in unescaped format.

## 283.5.4 UriFactory Package REGISTERURLHANDLER

This package registers a particular type name for handling a particular URL.

The type specified must be valid and must be a subtype of the `UriType` or one of its subtypes. It must also implement the `createUrl` static member function. This function is called by the [GETURI](#) (page 283-16) function to generate an instance of the type. The `striprefix` parameter indicates that the prefix must be stripped off before calling this function.

### Syntax

```
PROCEDURE registerUrlHandler(
 prefix IN varchar2,
```

```

schemaName IN varchar2,
typename IN varchar2,
ignoreCase IN boolean := true,
stripprefix IN boolean := true);

```

**Table 283-26 UriFactory Package REGISTERURLHANDLER Parameters**

Parameter	IN / OUT	Description
prefix	(IN)	The prefix to handle; for example, <code>http://</code> .
schemaName	(IN)	Name of the schema where the type resides; case sensitive.
typename	(IN)	The name of the type to handle the URL; case sensitive.
ignoreCase	(IN)	Ignore case when matching prefixes.
stripprefix	(IN)	Strip prefix before generating the instance of the type.

## 283.5.5 UriFactory Package UNREGISTERURLHANDLER

This procedure unregisters a URL handler. This only unregisters user registered handler prefixes and not predefined system prefixes such as `http://`.

### Syntax

```

PROCEDURE unregisterUrlHandler(
 prefix IN VARCHAR2);

```

**Table 283-27 UriFactory Package UNREGISTERURLHANDLER Parameters**

Parameter	IN / OUT	Description
prefix	(IN)	The prefix to be unregistered.

# JMS Types

PL/SQL users can use the `DBMS_AQ` package to enqueue and dequeue messages from JMS queues.

The JMS types member and static functions and procedures in this chapter are needed to populate JMS messages for enqueueing or to interpret a dequeued JMS message.

This chapter contains these topics:

- [Overview](#) (page 284-1)
- [Security Model](#) (page 284-2)
- [Java Versus PL/SQL Datatypes](#) (page 284-2)
- [More on Bytes\\_ Stream and Map Messages](#) (page 284-3)
- [Upcasting and Downcasting Between General and Specific Messages](#) (page 284-6)
- [JMS Types Error Reporting](#) (page 284-7)
- [Oracle JMS Type Constants](#) (page 284-8)
- [JMS Types Error Reporting](#) (page 284-7)
- [Oracle JMS Type Constants](#) (page 284-8)
- [CONVERT\\_JMS\\_SELECTOR](#) (page 284-9)
- [Summary of JMS Types](#) (page 284-10)

## 284.1 JMS Types Overview

Java Message Service (JMS) is a well known public standard interface for accessing messaging systems. Oracle JMS (OJMS) implements JMS based on Oracle Streams Advanced Queuing (AQ) and a relational database system (RDBMS). Messages are stored in queues as OJMS specific ADTs. Java clients use OJMS packages to enqueue, dequeue, and manipulate these messages.

PL/SQL users, on the other hand, use the `DBMS_AQ` package to enqueue and dequeue JMS messages and the member functions in this chapter to populate and interpret them. Oracle Database Advanced Queuing offers such member functions for the following JMS ADTs:

- `aq$_jms_header`
- `aq$_jms_message`
- `aq$_jms_text_message`
- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

In addition to these populating and interpreting member functions, Oracle Database Advanced Queuing offers:

- Casting between `aq$_jms_message` and other message ADTs.
- PL/SQL stored procedures for converting JMS selectors to equivalent Oracle Database Advanced Queuing rules

## 284.2 JMS Types Security Model

`PUBLIC` is granted `EXECUTE` privilege in these JMS types.

- `SYS.AQ$_JMS_MESSAGE` Type
- `SYS.AQ$_JMS_TEXT_MESSAGE` Type
- `SYS.AQ$_JMS_BYTES_MESSAGE` Type
- `SYS.AQ$_JMS_MAP_MESSAGE` Type
- `SYS.AQ$_JMS_STREAM_MESSAGE` Type
- `SYS.AQ$_JMS_OBJECT_MESSAGE` Type
- `SYS.AQ$_JMS_NAMEARRAY` Type
- `SYS.AQ$_JMS_VALUE` Type
- `SYS.AQ$_JMS_EXCEPTION` Type

## 284.3 Java Versus PL/SQL Datatypes

Datatypes do not map one-to-one between PL/SQL and Java.

Some Java types, such as `BYTE` and `SHORT`, are not present in PL/SQL. PL/SQL type `INT` was chosen to represent these types. If a PL/SQL `INT` value intended to hold a Java `BYTE` or `SHORT` value exceeds the corresponding range Java enforces, an out-of-range error is thrown.

Other Java types have more than one counterpart in PL/SQL with different capabilities. A Java String can be represented by both `VARCHAR2` and `CLOB`, but `VARCHAR2` has a maximum limit of 4000 bytes. When retrieving `TEXT` data from map, stream, and bytes message types, a `CLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `VARCHAR2` or `CLOB`.

Similarly, a Java `BYTE ARRAY` can be represented by both `RAW` and `BLOB`, with `RAW` having a maximum size of 32767. When retrieving `BYTE ARRAY` data from map, stream, and bytes message types, a `BLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `RAW` or `BLOB`.

### See Also:

JMS specification 3.11.3, Conversion Provided by `StreamMessage` and `MapMessage`

### New JMS Support in Oracle Database 10g

In Oracle Database 10g, a new `AQ$_JMS_VALUE` ADT has been added in the `sys` schema for OJMS PL/SQL users. It is specifically used to implement the `read_object` procedure of `aq$_jms_stream_message` and `get_object` procedure of `aq$_jms_map_message`, to mimic the Java general object class `Object`. `AQ$_JMS_VALUE` ADT can represent any datatype that JMS `StreamMessage` and `MapMessage` can hold.

The collection ADT `AQ$_JMS_NAMEARRAY` was added for the `getNames` method of `MapMessage`. It holds an array of names.

In this release the ADT `AQ$_JMS_EXCEPTION` was added to represent a Java exception thrown in an OJMS JAVA stored procedure on the PL/SQL side. Now you can retrieve a Java exception thrown by an OJMS stored procedure and analyze it on the PL/SQL side.

## 284.4 More on Bytes, Stream and Map Messages

Oracle uses Java stored procedure to implement some of the procedures of `AQ$_MAP_MESSAGE`, `AQ$_JMS_STREAM_MESSAGE`, and `AQ$_JMS_BYTES_MESSAGE` types. These types have some common functionality that are different from `AQ$_JMS_TEXT_MESSAGE` type. This section discusses this common functionality.

This section contains these topics:

- Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages
- Initialize the Jserv Static Variable
- Get the Payload Data Back to PL/SQL
- Garbage Collect the Static Variable
- Use a Message Store: A Static Variable Collection
- Typical Calling Sequences
- Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages
- Differences Between Bytes and Stream Messages
- Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

### Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages

The major difference between map, stream, bytes, and other messages is that the message payload is encoded as a byte stream by JAVA. Retrieving and updating these payloads in PL/SQL therefore requires Oracle JAVA stored procedures.

A message payload is stored in two places during processing. On the PL/SQL side it is stored as the data members of a JMS message ADT, and on the Jserv side it is stored as a static variable. (Jserv is the JVM inside Oracle Database.) When the payload is processed, the payload data is first transformed to a static variable on the Jserv side. Once the static variable is initialized, all later updates on the message payload are performed on this static variable. At the end of processing, payload data is flushed back to the PL/SQL side.

Oracle provides member procedures that maintain the status of the Jserv static variable and enforce rules when calling these member procedures. These procedures are in the following ADTs:

- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

### Initialize the Jserv Static Variable

Before you make any other calls to manipulate the payload data, the Jserv static variable must be properly initialized. This is done by calling the `prepare` or `clear_body` procedure. The `prepare` procedure uses the payload data in PL/SQL ADTs to initialize the static variable, while `clear_body` initializes the static variable to an empty payload (empty hashtable or stream).

#### Note:

It is important to call the `prepare` or `clear_body` procedure before any other calls to properly initialize the Jserv static variables. Usually these two methods are called once at the beginning. But they can be called multiple times for one message. Any call of these two methods without first calling the `flush` procedure wipes out all updates made to the messages.

### Get the Payload Data Back to PL/SQL

Calling the `flush` procedure synchronizes changes made to the Jserv static variable back to the PL/SQL ADTs. The `flush` call is required when you want the changes made to be reflected in the ADT payload. It is important to synchronize the changes back to the ADT, because it is the ADT payload that matters.

### Garbage Collect the Static Variable

The `clean` procedure forces garbage collection of the static variable. It is there to do cleanup and free JVM memory. You can avoid memory leaks by doing it immediately after finishing processing the message.

### Use a Message Store: A Static Variable Collection

Instead of a single static variable, Oracle uses a collection of static variables to process the message payload on the Jserv side. This collection is called the message store. Each map, bytes, or stream message type has its own message store within one session.

Oracle uses the operation ID parameter to locate the correct static variable to work on within the message store. Initialization calls such as `prepare` and `clear_body` give users an operation ID, which is used in later message access.

After users complete message processing, they must call the `clean` procedure with the operation ID to clean up the message store. This avoids possible memory leaks. The `clean_all` static procedures of message ADTs `aq$_jms_bytes_message`, `aq$_jms_map_message`, and `aq$_jms_stream_message` clean up all static variables of their corresponding message stores.

## Typical Calling Sequences

This section describes typical procedures for retrieving and populating messages.

Here is a typical procedure for retrieving messages

1. Call `prepare` for a message.  
This call also gives you an operation ID if you do not specify one.
2. Call multiple retrieving procedures with the provided operation ID.
3. Call the `clean` procedure with the provided operation ID.

Here is a typical procedure for populating messages:

1. Call `clear_body` for a message.  
For `aq$_jms_map_message`, you can also call `prepare` to update the message based on the existing payload. This call also gives you an operation ID if you do not specify one.
2. Call multiple updating procedures with the provided operation ID.
3. Call the `flush` method with the provided operation ID.
4. Call the `clean` procedure with the provided operation ID.

## Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages

According to the JMS specification, when a message is received, its body is read-only. Users can call the `clear_body` method to make the body writable. This method erases the current message body and sets the message body to be empty.

The OJMS JAVA API follows the rule set by JMS specification. In updating the JMS message ADTs in PL/SQL, however, Oracle enforces the rule selectively:

- Map messages  
The restriction is relaxed, because adding more entries on top of an existing map payload is a convenient way for users to update the payload. Therefore there are no read-only or write-only modes for map messages.
- Stream and bytes messages  
The restriction is not relaxed, because these payloads use a stream when reading and writing data. It is difficult to update the payload while in the middle of a stream. Oracle enforces read-only and write-only modes in processing stream and bytes message payloads. Calling the `prepare` procedure initializes the message payload in read-only mode. Calling the `clear_body` procedure initializes the message payload in write-only mode.

Calling the `reset` procedure resets the pointer to the beginning of the stream and switches the mode from write-only to read-only. The `reset` procedure keeps the updates made to the message payload in the `Jserv` static variable.

The `prepare` procedure, on the other hand, overwrites the message payload in the `Jserv` static variable with the payload in the PL/SQL ADT.

Oracle provides member function `get_mode` for users to query the mode.

## Differences Between Bytes and Stream Messages

Member functions of bytes messages are not exactly the same as those of stream messages. Stream messages are encoded using Java `ObjectOutputStream` and bytes messages are encoded using Java `DataOutputStream`. In stream messages each primitive type is written and read as a Java Object, but in a bytes message they are written and read as raw bytes according to the encoding mechanism of `DataOutputStream`.

For stream messages, the `read_bytes` method works on a stream of bytes to the end of the byte array field written by the corresponding `write_bytes` method. The `read_bytes` method of bytes message works on a stream of bytes to the end of the whole byte stream. This is why the `read_bytes` member procedure of `aq$bytes_message` also requires a `length` parameter to tell how long it is to read.

You will not see a type conversion error raised by bytes message, because bytes messages do not support type conversion.

Methods `get_unsigned_byte` and `get_unsigned_short` are available for bytes messages, but not for stream messages. This is because stream messages read Java objects, and there are no Java objects as unsigned bytes or unsigned shorts.

Methods `read_string` and `write_string` methods are not available for bytes messages. The bytes message ADT must enforce some character encoding. It has methods `read_utf` and `write_utf` which support utf-8 encoding.

### Note:

All data written by bytes messages use `DataOutputStream` as the basis. See JDK API documentation [JavaSoft.com](http://JavaSoft.com) for details on how the data is encoded into bytes.

## Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

The payloads of bytes, map, and stream message types are stored as either `RAW` or `BLOB` in the database. In this release Oracle Database Advanced Queuing provides the following member functions to set and get these payloads as raw bytes without interpreting them:

```
set_bytes(payload IN BLOB)
set_bytes(payload IN RAW)
get_bytes(payload OUT BLOB)
get_bytes(payload OUT RAW)
```

These functions were provided for bytes messages in Oracle9i Release 2 (9.2).

## 284.5 Upcasting and Downcasting Between General and Specific Messages

OJMS ADT `aq$jms_message` is used to represent a general message, so that different types of messages can reside on the same Oracle Database Advanced Queuing queue. Oracle Database Advanced Queuing supports retrieving and populating of

`aq$_jms_message` by supporting upcasting and downcasting between this ADT and ADTs of specific message types.

To read an `aq$_jms_message`, you must first downcast it to a specific message type according to its `message_type` field

To populate an `aq$_jms_message`, you must first populate a specific message and upcast it to `aq$_jms_message`. This avoids copying all member functions of other specific message ADTs to this ADT. It also guarantees that the manipulation of this ADT is consistent with other specific message ADTs.

## 284.6 JMS Types Error Reporting

This table lists Oracle JMS types related errors.

**Table 284-1 Oracle JMS Types Errors**

ORA error number	dbms_jms_plsql package constants	Explanation
ORA-24190	ERROR_DATA_OVERFLOW	The payload data exceeds the size that an out parameter can hold. For example, the <code>get_text</code> procedure with a <code>VARCHAR2</code> parameter of <code>aq\$_jms_text_message</code> or <code>get_bytes</code> procedure with a <code>RAW</code> parameter of <code>aq\$_jms_bytes_message</code> .
ORA-24191	ERROR_PROP_NAME_EXIST	Setting a property that is previous set
ORA-24192	ERROR_PROP_NAME_NULL	Occurs when setting a property with null property name.
ORA-24193	ERROR_EXCEED_RANGE	PL/SQL number type exceeds the valid range of the respective Java type. For example <code>set_byte_property</code> , <code>set_short_property</code> of <code>aq\$_jms_head</code> ADT; <code>set_byte</code> and <code>set_short</code> of <code>aq\$_jms_map_message</code> ADT; <code>write_byte</code> and <code>write_short</code> of <code>aq\$_jms_stream_message</code> and <code>aq\$_jms_bytes_message</code> ADT.
ORA-24194	ERROR_TYPE_MISMATCH	The type conversion between the Java type of the retrieving method and the Java type of a field of the payload is not valid.
ORA-24195	ERROR_MAP_TOO_LARGE	The size of the map exceeds the <code>aq\$_jms_namearray</code> ADT capacity. The current size limit is 1024. You can use the <code>get_names</code> function with <code>offset</code> and <code>length</code> parameters to retrieve the name array in multiple small chunks.
ORA-24196	ERROR_WRONG_MODE	The message payload is being accessed with a wrong access mode. For example, trying to read a message payload with write-only mode or trying to write a message payload with the read-only mode.
ORA-24197	ERROR_JAVA_EXCEPTION	ORA-24197 error is raised when a Java exception is raised that does not fit in any of the other error categories. You can use the <code>get_exception</code> static procedure of <code>aq\$_jms_map_message</code> , <code>aq\$_jms_bytes_message</code> , and <code>aq\$_jms_stream_message</code> to retrieve the exception information last thrown by the Java stored procedure.  A single static variable is used to store the last exception and is overwritten if another exception is thrown before you retrieve it. A new ADT <code>aq\$_jms_exception</code> is created to represent the exception information on the PL/SQL side.
ORA-24198	ERROR_INVALID_ID	An invalid operation ID is being provided to access a message.

Table 284-1 (Cont.) Oracle JMS Types Errors

ORA error number	dbms_jms_plsql package constants	Explanation
ORA-24199	ERROR_STORE_OVERFLOW	The number of messages (with the same type) that users are trying to manipulate exceeds the size of the message store on the Java stored procedure side. The current size of the store is 20. It unusual to need to manipulate more than 20 messages at the same time. A common mistake is to forget to call the <code>clean</code> procedure after using one message. The <code>clean</code> procedure frees the message slot for use by other messages attempting access.

## 284.7 Oracle JMS Type Constants

These constants can be useful when dealing with message type functions.

### DBMS\_AQ Package Constants

DBMS\_AQ package constants specify different types of JMS messages. They are useful when dealing with general message types during upcasting and downcasting or constructing a general message with a specific message type:

```
JMS_TEXT_MESSAGE CONSTANT BINARY_INTEGER;
JMS_BYTES_MESSAGE CONSTANT BINARY_INTEGER;
JMS_STREAM_MESSAGE CONSTANT BINARY_INTEGER;
JMS_MAP_MESSAGE CONSTANT BINARY_INTEGER;
JMS_OBJECT_MESSAGE CONSTANT BINARY_INTEGER;
```

### SYS.DBMS\_JMS\_PLSQL Package Constants

SYS.DBMS\_JMS\_PLSQL package constants are new in Oracle Database 10g.

These constants specify the mode of message payload. They are useful when interpreting the mode of the message payload returned from the `get_mode` function:

```
MESSAGE_ACCESS_READONLY CONSTANT PLS_INTEGER;
MESSAGE_ACCESS_WRITEONLY CONSTANT PLS_INTEGER;
```

These constants specify the ADT type of an Oracle Database Advanced Queuing queue. They are useful during the conversion of JMS selectors to Oracle Database Advanced Queuing rules:

```
DESTPLOAD_JMSTYPE CONSTANT PLS_INTEGER;
DESTPLOAD_USERADT CONSTANT PLS_INTEGER;
DESTPLOAD_ANYDATA CONSTANT PLS_INTEGER;
```

These constants specify the type of data that can be held by a `aq$_jms_value` type. They are useful when interpreting the `aq$_jms_value` returned by the `get_object` method of `AQ$_JMS_MAP_MESSAGE` or `read_object` method of `AQ$_JMS_STREAM_MESSAGE`:

```
DATA_TYPE_BYTE CONSTANT PLS_INTEGER;
DATA_TYPE_SHORT CONSTANT PLS_INTEGER;
DATA_TYPE_INTEGER CONSTANT PLS_INTEGER;
DATA_TYPE_LONG CONSTANT PLS_INTEGER;
DATA_TYPE_FLOAT CONSTANT PLS_INTEGER;
DATA_TYPE_DOUBLE CONSTANT PLS_INTEGER;
DATA_TYPE_BOOLEAN CONSTANT PLS_INTEGER;
```

```

DATA_TYPE_CHARACTER CONSTANT PLS_INTEGER;
DATA_TYPE_STRING CONSTANT PLS_INTEGER;
DATA_TYPE_BYTES CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_BYTE CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_SHORT CONSTANT PLS_INTEGER;

```

These constants specify the error number of the ORA errors that can be raised by the functions of message type ADTs. They are useful in user error handlers:

```

ERROR_DATA_OVERFLOW CONSTANT PLS_INTEGER := -24190;
ERROR_PROP_NAME_EXIST CONSTANT PLS_INTEGER := -24191;
ERROR_PROP_NAME_NULL CONSTANT PLS_INTEGER := -24192;
ERROR_EXCEED_RANGE CONSTANT PLS_INTEGER := -24193;
ERROR_TYPE_MISMATCH CONSTANT PLS_INTEGER := -24194;
ERROR_MAP_TOO_LARGE CONSTANT PLS_INTEGER := -24195;
ERROR_WRONG_MODE CONSTANT PLS_INTEGER := -24196;
ERROR_JAVA_EXCEPTION CONSTANT PLS_INTEGER := -24197;
ERROR_INVALID_ID CONSTANT PLS_INTEGER := -24198;
ERROR_STORE_OVERFLOW CONSTANT PLS_INTEGER := -24199;

```

## 284.8 CONVERT\_JMS\_SELECTOR

Oracle Database includes three stored procedures to help users convert JMS selectors into Oracle Database Advanced Queuing rules. These rules can be used in `ADD_SUBSCRIBER` operations as subscriber rules or in `DEQUEUE` operations as dequeue conditions. These procedures are in the `SYS.dbms_jms_plsql` package.

### Convert with Minimal Specification

The first procedure assumes the destination payload type is one of the JMS ADTs whose corresponding constant is `dbms_jms_plsql.DESTPLOAD_JMSTYPE` and also assumes that the J2EE compliant mode is true.

### Syntax

```
Function convert_jms_selector(selector IN VARCHAR2) RETURN VARCHAR2
```

### Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

### Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

### Convert with Destination Payload Type Specified

The second procedure takes one more parameter: `dest_pload_type`. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if this parameter is `SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if `dest_pload_type` parameter is none of these three constants.

This function assumes that the J2EE compliant mode is true.

### Syntax

```
Function convert_jms_selector(
 selector IN VARCHAR2,
 dest_pload_type IN PLS_INTEGER)
RETURN VARCHAR2
```

### Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

### Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

### Convert with Destination Payload Type and Compliant Mode Specified

The third procedure takes a `dest_pload_type` parameter and a `compliant` parameter. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if the `dest_pload_type` parameter is

`SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if the `dest_pload_type` parameter is none of these three constants.

The `compliant` parameter controls if the conversion is in J2EE compliant mode or not. The noncompliant conversion of a JMS selector is for backward compatibility.

### Syntax

```
Function convert_jms_selector(
 selector IN VARCHAR2,
 dest_pload_type IN PLS_INTEGER,
 compliant IN BOOLEAN)
```

### Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

### Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

## 284.9 Summary of JMS Types

This lists shows the JMS types.

- [SYS.AQ\\$\\_JMS\\_MESSAGE Type](#) (page 284-11)
- [SYS.AQ\\$\\_JMS\\_TEXT\\_MESSAGE Type](#) (page 284-16)
- [SYS.AQ\\$\\_JMS\\_BYTES\\_MESSAGE Type](#) (page 284-20)
- [SYS.AQ\\$\\_JMS\\_MAP\\_MESSAGE Type](#) (page 284-29)
- [SYS.AQ\\$\\_JMS\\_STREAM\\_MESSAGE Type](#) (page 284-39)
- [SYS.AQ\\$\\_JMS\\_OBJECT\\_MESSAGE Type](#) (page 284-48)

- [SYS.AQ\\$\\_JMS\\_NAMEARRAY Type](#) (page 284-48)
- [SYS.AQ\\$\\_JMS\\_VALUE Type](#) (page 284-49)
- [SYS.AQ\\$\\_JMS\\_EXCEPTION Type](#) (page 284-49)

## 284.9.1 SYS.AQ\$\_JMS\_MESSAGE Type

This ADT type can represent any of five different JMS message types: text message, bytes message, stream message, map message, or object message. Queues created using this ADT can therefore store all five types of JMS messages.

This section contains these topics:

- [CONSTRUCT Static Functions](#) (page 284-12)
- [Cast Methods](#) (page 284-13)
- [JMS Header Methods](#) (page 284-13)
- [System Properties Methods](#) (page 284-14)
- [User Properties Methods](#) (page 284-14)
- [Payload Methods](#) (page 284-16)

### Syntax

```

TYPE AQ$_JMS_MESSAGE AS OBJECT(
 header aq$_jms_header,

```

### CONSTRUCT Static Functions

There are six `CONSTRUCT` static functions in this type.

#### **STATIC FUNCTION construct (mtype IN INT) RETURN aq\$\_jms\_message**

Creates an instance of `aq$_jms_message`, which can hold a specific type of JMS message (TextMessage, BytesMessage, MapMessage, StreamMessage or ObjectMessage). The message type of the created `aq$_jms_message` instance depends on the `mtype` parameter passed to the `construct` method. Once a message has been constructed, it can be used to store JMS messages of the type it has been constructed to hold.

The `mtype` parameter must be one of the following constants described in "[Oracle JMS Type Constants](#) (page 284-8)":

```

DBMS_AQ.JMS_TEXT_MESSAGE
DBMS_AQ.JMS_BYTES_MESSAGE
DBMS_AQ.JMS_STREAM_MESSAGE
DBMS_AQ.JMS_MAP_MESSAGE
DBMS_AQ.JMS_OBJECT_MESSAGE

```

**STATIC FUNCTION construct (text\_msg IN aq\$\_jms\_text\_message) RETURN aq\$\_jms\_message**

Creates an aq\$\_jms\_message from an aq\$\_jms\_text\_message.

**STATIC FUNCTION construct (bytes\_msg IN aq\$\_jms\_bytes\_message) RETURN aq\$\_jms\_message;**

Creates an aq\$\_jms\_message from an aq\$\_jms\_bytes\_message.

**STATIC FUNCTION construct (stream\_msg IN aq\$\_jms\_stream\_message) RETURN aq\$\_jms\_message;**

Creates an aq\$\_jms\_message from an aq\$\_jms\_stream\_message.

**STATIC FUNCTION construct (map\_msg IN aq\$\_jms\_map\_message) RETURN aq\$\_jms\_message;**

Creates an aq\$\_jms\_message from an aq\$\_jms\_map\_message.

**STATIC FUNCTION construct (object\_msg IN aq\$\_jms\_object\_message) RETURN aq\$\_jms\_message;**

Creates an aq\$\_jms\_message from an aq\$\_jms\_object\_message.

**Cast Methods****cast\_to\_bytes\_msg RETURN aq\$\_jms\_bytes\_message**

Casts an aq\$\_jms\_message to an aq\$\_jms\_bytes\_message. Returns an aq\$\_jms\_bytes\_message or null if the message\_type attribute of the aq\$\_jms\_message is not DBMS\_AQ.JMS\_BYTES\_MESSAGE. This function raises ORA-24198 if the message\_type field of the aq\$\_jms\_message is not DBMS\_AQJMS.JMS\_BYTES\_MESSAGE.

**cast\_to\_map\_msg RETURN aq\$\_jms\_map\_message**

Casts an aq\$\_jms\_message to an aq\$\_jms\_map\_message. Returns an aq\$\_jms\_map\_message or null if the message\_type attribute of the aq\$\_jms\_message is not DBMS\_AQ.JMS\_MAP\_MESSAGE. This function raises ORA-24198 if the message\_type field of the aq\$\_jms\_message is not DBMS\_AQJMS.JMS\_MAP\_MESSAGE.

**cast\_to\_object\_msg RETURN aq\$\_jms\_object\_message**

Casts an aq\$\_jms\_message to an aq\$\_jms\_object\_message. Returns an aq\$\_jms\_object\_message or null if the message\_type attribute of the aq\$\_jms\_message is not DBMS\_AQ.JMS\_OBJECT\_MESSAGE. This function raises ORA-24198 if the message\_type field of the aq\$\_jms\_message is not DBMS\_AQJMS.JMS\_OBJECT\_MESSAGE.

**cast\_to\_stream\_msg RETURN aq\$\_jms\_stream\_message**

Casts an aq\$\_jms\_message to an aq\$\_jms\_stream\_message. Returns an aq\$\_jms\_stream\_message or null if the message\_type attribute of the aq\$\_jms\_message is not DBMS\_AQ.JMS\_STREAM\_MESSAGE. This function raises ORA-24198 if the message\_type field of the aq\$\_jms\_message is not DBMS\_AQJMS.JMS\_STREAM\_MESSAGE.

**cast\_to\_text\_msg RETURN aq\$\_jms\_text\_message**

Casts an aq\$\_jms\_message to an aq\$\_jms\_text\_message. Returns an aq\$\_jms\_text\_message or null if the message\_type attribute of the aq\$\_jms\_message is not DBMS\_AQ.JMS\_TEXT\_MESSAGE. This function raises ORA-24198 if the message\_type field of the aq\$\_jms\_message is not DBMS\_AQJMS.JMS\_TEXT\_MESSAGE.

**JMS Header Methods****set\_replyto (replyto IN sys.aq\$\_agent)**

Sets the replyto parameter, which corresponds to JMSReplyTo.

**get\_replyto RETURN sys.aq\$\_agent**

Returns `replyto`, which corresponds to `JMSReplyTo`.

**set\_type (type IN VARCHAR)**

Sets the JMS type, which can be any text and corresponds to `JMSType`.

**get\_type RETURN VARCHAR**

Returns `type`, which corresponds to `JMSType`.

**System Properties Methods**

**set\_userid (userid IN VARCHAR)**

Sets `userid`, which corresponds to `JMSXUserID`.

**set\_appid (appid IN VARCHAR)**

Sets `appid`, which corresponds to `JMSXAppID`.

**set\_groupid (groupid IN VARCHAR)**

Sets `groupid`, which corresponds to `JMSXGroupID`.

**set\_groupseq (groupseq IN INT)**

Sets `groupseq`, which corresponds to `JMSXGroupSeq`.

**get\_userid RETURN VARCHAR**

Returns `userid`, which corresponds to `JMSXUserID`.

**get\_appid RETURN VARCHAR**

Returns `appid`, which corresponds to `JMSXAppID`.

**get\_groupid RETURN VARCHAR**

Returns `groupid`, which corresponds to `JMSXGroupID`.

**get\_groupseq RETURN VARCHAR**

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

**User Properties Methods**

**clear\_properties**

Clears all user properties. This procedure does not affect system properties.

**set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value` in an internal representation (a `NUMBER` type). Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `byte` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because the `INT` datatype is 38 bits in PL/SQL and Oracle Database. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods****set\_text (payload IN VARCHAR2)**

Sets the payload, a `VARCHAR2` value, to an internal representation.

**set\_text (payload IN CLOB),**

Sets the payload, a `CLOB` value, to an internal representation.

**set\_bytes (payload IN RAW)**

Sets the payload, a `RAW` value, to an internal representation.

**set\_bytes (payload IN BLOB)**

Sets the payload, a `BLOB` value, to an internal representation.

**get\_text (payload OUT VARCHAR2)**

Puts the internal representation of the payload into a `VARCHAR2` variable payload.

**get\_text (payload OUT CLOB)**

Puts the internal representation of the payload into a `CLOB` variable payload.

**get\_bytes (payload OUT RAW)**

Puts the internal representation of the payload into a `RAW` variable payload.

**get\_bytes (payload OUT BLOB)**

Puts the internal representation of the payload into a `BLOB` variable payload.

## 284.9.2 SYS.AQ\$\_JMS\_TEXT\_MESSAGE Type

This type is the ADT used to store a `TextMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- [CONSTRUCT aq\\$\\_jms\\_text\\_message Function \(page 284-18\)](#)

 MEMBER PROCEDURE get_text (payload OUT CLOB));

```

### **CONSTRUCT aq\$\_jms\_text\_message Function**

#### **STATIC FUNCTION construct RETURN aq\$\_jms\_text\_message**

Creates an empty `aq$_jms_text_message`.

### **JMS Header Methods**

#### **set\_replyto (replyto IN sys.aq\$\_agent)**

Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

#### **set\_type (type IN VARCHAR)**

Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

#### **get\_replyto RETURN sys.aq\$\_agent**

Returns `replyto`, which corresponds to `JMSReplyTo`.

#### **get\_type RETURN VARCHAR**

Returns `type`, which corresponds to `JMSType`.

### **System Properties Methods**

#### **set\_userid (userid IN VARCHAR)**

Sets `userid`, which corresponds to `JMSXUserID` in JMS.

#### **set\_appid (appid IN VARCHAR)**

Sets `appid`, which corresponds to `JMSXAppID` in JMS.

#### **set\_groupid (groupid IN VARCHAR)**

Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

#### **set\_groupseq (groupseq IN INT)**

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

#### **get\_userid RETURN VARCHAR**

Returns `userid`, which corresponds to `JMSXUserID`.

#### **get\_appid RETURN VARCHAR**

Returns `appid`, which corresponds to `JMSXAppID`.

#### **get\_groupid RETURN VARCHAR**

Returns `groupid`, which corresponds to `JMSXGroupID`.

#### **get\_groupseq RETURN INT**

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

### **User Properties Methods**

#### **clear\_properties**

Clears all user properties. This procedure does not affect system properties.

#### **set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods****set\_text (payload IN VARCHAR2)**

Sets the payload, a `VARCHAR2` value, to an internal representation.

**set\_text (payload IN CLOB)**

Sets the payload, a `CLOB` value, to an internal representation.

**get\_text (payload OUT VARCHAR2)**

Puts the internal representation of the payload into a `VARCHAR2` variable payload.

**get\_text (payload OUT CLOB)**

Puts the internal representation of the payload into a `CLOB` variable payload.

### 284.9.3 SYS.AQ\$\_JMS\_BYTES\_MESSAGE Type

The `SYS.AQ$_JMS_BYTES_MESSAGE` type is the ADT used to store a `BytesMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- [CONSTRUCT aq\\$\\_jms\\_bytes\\_message Function](#) (page 284-22)
- [JMS Header Methods](#) (page 284-22)
- [System Properties Methods](#) (page 284-22)

- [User Properties Methods \(page 284-23\)](#)
- [Payload Methods \(page 284-25\)](#)

### Syntax

```

### CONSTRUCT aq\$\_jms\_bytes\_message Function

#### STATIC FUNCTION construct RETURN aq\$\_jms\_bytes\_message

Creates an empty aq\$\_jms\_bytes\_message.

### JMS Header Methods

#### set\_replyto (replyto IN sys.aq\$\_agent)

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

#### set\_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

#### get\_replyto RETURN sys.aq\$\_agent

Returns replyto, which corresponds to JMSReplyTo.

#### get\_type RETURN VARCHAR

Returns type, which corresponds to JMSType.

### System Properties Methods

#### set\_userid (userid IN VARCHAR)

Sets userid, which corresponds to JMSXUserID in JMS.

#### set\_appid (appid IN VARCHAR)

Sets appid, which corresponds to JMSXAppID in JMS.

**set\_groupid (groupid IN VARCHAR)**

Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

**set\_groupseq (groupseq IN INT)**

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

**get\_userid RETURN VARCHAR**

Returns `userid`, which corresponds to `JMSXUserID`.

**get\_appid RETURN VARCHAR**

Returns `appid`, which corresponds to `JMSXAppID`.

**get\_groupid RETURN VARCHAR**

Returns `groupid`, which corresponds to `JMSXGroupID`.

**get\_groupseq RETURN NUMBER**

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

**User Properties Methods****clear\_properties**

Clears all user properties. This procedure does not affect system properties.

**set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods****set\_bytes (payload in RAW)**

Sets the payload, a `RAW` value, to an internal representation.

**set\_bytes (payload in BLOB)**

Sets the payload, a `BLOB` value, to an internal representation.

**get\_bytes (payload out RAW)**

Puts the internal representation of the payload into a `RAW` variable payload. Raises exception ORA-24190 if the length of the internal payload is more than 32767 (the maximum length of `RAW` in PL/SQL).

**get\_bytes (payload out BLOB)**

Puts the internal representation of the payload into a `BLOB` variable payload.

**prepare (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Takes the byte array stored in `aq$_jms_bytes_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`.

Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to

`MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**reset (id IN PLS\_INTEGER)**

Resets the starting position of the stream to the beginning and puts the bytes message in read-only mode. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**flush (id IN PLS\_INTEGER)**

Takes the static variable in Jserv and synchronizes the content back to the `aq$_jms_bytes_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clear\_body (id IN PLS\_INTEGER)**

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`. Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call the `reset` or `prepare`

procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

#### **clean (id IN PLS\_INTEGER)**

Closes and cleans up the `DataInputStream` Or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

#### **clean\_all**

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

#### **get\_mode (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Returns the current mode of this message. The return value is either

`SYS.dbms_jms.plsql.MESSAGE_ACCESS_READONLY` Or

`SYS.dbms_jms.plsql.MESSAGE_ACCESS_WRITEONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

#### **read\_boolean (id IN PLS\_INTEGER) RETURN BOOLEAN**

Reads a Boolean value from the bytes message and returns the Boolean value read. Null is returned if the end of the message stream has been reached. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

#### **read\_byte (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads a `BYTE` value from the bytes message and returns the `BYTE` value read. Null is returned if the end of the stream has been reached. Because there is no `BYTE` type in PL/SQL, Oracle Database uses `PLS_INTEGER` to represent a `BYTE`. Although PL/SQL users get a `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

#### **read\_bytes (id IN PLS\_INTEGER, value OUT NO COPY BLOB, length IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads length of the bytes from bytes message stream into `value` and returns the total number of bytes read. If there is no more data (because the end of the stream has been reached), then it returns -1. Raises exceptions ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

#### **read\_char (id IN PLS\_INTEGER) RETURN CHAR**

Reads a character value from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored

procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_double (id IN PLS\_INTEGER) RETURN DOUBLE PRECISION**

Reads a double from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_float (id IN PLS\_INTEGER) RETURN FLOAT**

Reads a float from the bytes message and returns the float read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_int (id IN PLS\_INTEGER) RETURN INT**

Reads an `INT` from the bytes message and returns the `INT` read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_long (id IN PLS\_INTEGER) RETURN NUMBER**

Reads a long from the bytes message and returns the long read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_short (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads a short value from the bytes message and returns the short value read. Null is returned if the end of the stream has been reached. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a `SHORT`. Although PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_unsigned\_byte (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads an unsigned 8-bit number from the bytes message stream and returns the next byte from the bytes message stream, interpreted as an unsigned 8-bit number. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_unsigned\_short (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads an unsigned 16-bit number from the bytes message stream and returns the next two bytes from the bytes message stream, interpreted as an unsigned 16-bit integer. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_utf (id IN PLS\_INTEGER, value OUT NOCOPY CLOB)**

Reads a string that has been encoded using a UTF-8 format from the bytes message. Null is returned if the end of the stream has been reached. Raises exception

ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_boolean (id IN PLS\_INTEGER, value IN BOOLEAN)**

Writes a Boolean to the bytes message stream as a 1-byte value. The value `true` is written as the value (byte)1. The value `false` is written as the value (byte)0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_byte (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes a byte to the bytes message. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a `BYTE`. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN RAW)**

Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN BLOB)**

Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN RAW, offset IN PLS\_INTEGER, length IN PLS\_INTEGER)**

Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range [`offset`, `offset+length`] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN BLOB, offset IN INT, length IN INT)**

Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range [`offset`, `offset+length`] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_char (id IN PLS\_INTEGER, value IN CHAR)**

Writes a character value to the bytes message. If this value has multiple characters, it is the first character that is written. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_double (id IN PLS\_INTEGER, value IN DOUBLE PRECISION)**

Writes a double to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_float (id IN PLS\_INTEGER, value IN FLOAT)**

Writes a float to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_int (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes an `INT` to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_long (id IN PLS\_INTEGER, value IN NUMBER)**

Writes a long to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_short (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes a short to the bytes message as two bytes, high byte first. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exception ORA-24193 if the parameter value exceeds the valid range, ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_utf (id IN PLS\_INTEGER, value IN VARCHAR2)**

Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_utf (id IN PLS\_INTEGER, value IN CLOB)**

Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

## 284.9.4 SYS.AQ\$\_JMS\_MAP\_MESSAGE Type

This type is the ADT used to store a `MapMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- [CONSTRUCT aq\\$\\_jms\\_map\\_message Function](#) (page 284-31)
- [JMS Header Methods](#) (page 284-31)
- [System Properties Methods](#) (page 284-32)
- [User Properties Methods](#) (page 284-32)
- [Payload Methods](#) (page 284-34)

**Syntax**

```
TYPE aq$_jms_map_message AS object(
 header aq$_jms_header,
 bytes_len int,
 bytes_raw raw(2000),
 bytes_lob blob,
 STATIC FUNCTION construct RETURN aq$_jms_map_message,
```

```

### CONSTRUCT aq\$\_jms\_map\_message Function

#### STATIC FUNCTION construct RETURN aq\$\_jms\_map\_message

Creates an empty aq\$\_jms\_map\_message object.

### JMS Header Methods

#### set\_replyto (replyto IN sys.aq\$\_agent)

Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

#### set\_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

#### get\_replyto RETURN sys.aq\$\_agent

Returns `replyto`, which corresponds to `JMSReplyTo`.

#### get\_type RETURN VARCHAR

Returns `type`, which corresponds to `JMSType`.

### System Properties Methods

#### **set\_userid (userid IN VARCHAR)**

Sets `userid`, which corresponds to `JMSXUserID` in JMS.

#### **set\_appid (appid IN VARCHAR)**

Sets `appid`, which corresponds to `JMSXAppID` in JMS.

#### **set\_groupid (groupid IN VARCHAR)**

Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

#### **set\_groupseq (groupseq IN INT)**

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

#### **get\_userid RETURN VARCHAR**

Returns `userid`, which corresponds to `JMSXUserID`.

#### **get\_appid RETURN VARCHAR**

Returns `appid`, which corresponds to `JMSXAppID`.

#### **get\_groupid RETURN VARCHAR**

Returns `groupid`, which corresponds to `JMSXGroupID`.

#### **get\_groupseq RETURN NUMBER**

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

### User Properties Methods

#### **clear\_properties**

Clears all user properties. This procedure does not affect system properties.

#### **set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

#### **set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

#### **set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

#### **set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods****set\_bytes (payload IN RAW)**

Sets the internal payload as a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `RAW` variable without interpreting it.

**set\_bytes (payload IN BLOB)**

Sets the internal payload as a `BLOB` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `BLOB` variable without interpreting it.

**get\_bytes (payload OUT RAW)**

Puts the internal payload into a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exceptions ORA-24190 if the length of internal payload is more than 32767.

**get\_bytes (payload OUT BLOB)**

Puts the internal payload into a `BLOB` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` without interpreting it.

**prepare (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Takes the byte array stored in `aq$_jms_map_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**flush (id IN PLS\_INTEGER)**

Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_map_message`. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clear\_body (id IN PLS\_INTEGER)**

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**clean (id IN PLS\_INTEGER)**

Closes and cleans up the `DataInputStream` Or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clean\_all**

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

**set\_boolean (id IN PLS\_INTEGER, name IN VARCHAR2, value IN BOOLEAN)**

Sets the Boolean value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_byte (id IN PLS\_INTEGER, name IN VARCHAR2, value IN PLS\_INTEGER)**

Sets the `BYTE` value with the specified name in the map. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value IN RAW)**

Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value IN RAW, offset IN INT, length IN INT)**

Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [`offset ... offset+length`] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value IN BLOB)**

Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value IN BLOB, offset IN INT, length IN INT)**

Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of

bytes to use. If the range [offset ... offset+length] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure, and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_char (id IN PLS\_INTEGER, name IN VARCHAR2, value IN CHAR)**

Sets the character value with the specified name in the map. If this value has multiple characters, then it is the first character that is used. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_double (id IN PLS\_INTEGER, name IN VARCHAR2, value IN DOUBLE PRECISION)**

Sets the double value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_float (id IN PLS\_INTEGER, name IN VARCHAR2, value IN FLOAT)**

This procedure is to set the float value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_int (id IN PLS\_INTEGER, name IN VARCHAR2, value IN PLS\_INTEGER)**

Sets the int value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_long (id IN PLS\_INTEGER, name IN VARCHAR2, value IN NUMBER)**

Sets the long value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_short (id IN PLS\_INTEGER, name IN VARCHAR2, value IN PLS\_INTEGER)**

Sets the short value with the specified name in the map. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a short. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_string (id IN PLS\_INTEGER, name IN VARCHAR2, value IN VARCHAR2)**

Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_string (id IN PLS\_INTEGER, name IN VARCHAR2, value IN CLOB)**

Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**get\_boolean (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN BOOLEAN**

Retrieves the Boolean value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_byte (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN PLS\_INTEGER**

Retrieves the `BYTE` value with the specified name. If there is no item by this name, then null is returned. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `set_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value OUT NOCOPY BLOB)**

Retrieves the byte array value with the specified name. If there is no item by this name, then null is returned. Because the size of the array might be larger than the limit of PL/SQL `RAW` type, a `BLOB` is always returned here. The `BLOB` returned is a copy, which means it can be modified without affecting the message payload. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_char (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN CHAR**

Retrieves and returns the character value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

**get\_double (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN DOUBLE PRECISION**

Retrieves and returns the double value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

**get\_float (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN FLOAT**

Retrieves the float value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_int (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN PLS\_INTEGER**

Retrieves the `INT` value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_long (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN NUMBER**

Retrieves the long value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_short (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN PLS\_INTEGER**

Retrieves the short value with the specified name. If there is no item by this name, then null is returned. Because there is no `short` type in PL/SQL, `INT` is used to

represent a `short`. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java `short` value range. If this value is issued with a `set_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_string (id IN PLS\_INTEGER, name IN VARCHAR2, value OUT NOCOPY CLOB)**

Retrieves the string value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_names (id IN PLS\_INTEGER) RETURN aq\$\_jms\_namearray**

Retrieves all the names within the map message and returns them in a varray. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if the size of the name array of the payload exceeds the limit. Raises exception ORA-24195 if the size of the name array or the size of a name exceeds the limit.

**get\_names (id IN PLS\_INTEGER, names OUT aq\$\_jms\_namearray, offset IN PLS\_INTEGER, length IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Retrieves a portion of the names within the map message. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if either limits are exceeded during the retrieval. (This means there is no sense to put a `length` parameter greater than 1024.) The index of the names of a map messages begins from 0. Parameter `offset` is the offset from which to start retrieving.

The function returns the number of names that have been retrieved. The names retrieved is the intersection of the interval `[offset, offset+length-1]` and interval `[0, size-1]` where `size` is the size of this map message. If the intersection is an empty set, then names will be returned as null and the function returns 0 as the number of names retrieved. If users iterate the names by retrieving in small steps, then this can be used to test that there are no more names to read from map message.

Raises exception ORA-24195 if the size of the name array or the size of a name exceed the limit, ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**get\_object (id IN PLS\_INTEGER, name IN VARCHAR2, value OUT NOCOPY AQ\$\_JMS\_VALUE)**

Returns a general value ADT `AQ$_JMS_VALUE`. If there is no item by this name, then null is returned. Users can use the `type` attribute of this ADT to interpret the data. See the map in the `AQ$_JMS_VALUE` ADT for the correspondence among `dbms_jms_plsql` package constants, Java datatype and `AQ$_JMS_VALUE` attribute. Note this member procedure might bring additional overhead compared to other `get` member procedures or functions. It is used only if the user does not know the datatype of the fields within a message before hand. Otherwise it is a good idea to use a specific `get` member procedure or function. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**get\_size (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Retrieves the size of the map message. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**item\_exists (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN BOOLEAN**

Indicates that an item exists in this map message by returning `TRUE`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

## 284.9.5 SYS.AQ\$\_JMS\_STREAM\_MESSAGE Type

This type is the ADT used to store a `StreamMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- [CONSTRUCT aq\\$\\_jms\\_stream\\_message Function](#) (page 284-40)
- [JMS Header Methods](#) (page 284-41)
- [System Properties Methods](#) (page 284-41)
- [User Properties Methods](#) (page 284-41)
- [Payload Methods](#) (page 284-43)

### Syntax

```
TYPE aq$_jms_stream_message AS object(
 header aq$_jms_header,

```

**CONSTRUCT aq\$\_jms\_stream\_message Function****STATIC FUNCTION construct RETURN aq\$\_jms\_stream\_message**

Creates an empty aq\$\_jms\_stream\_message object.

### JMS Header Methods

**set\_replyto (replyto IN sys.aq\$\_agent)**

Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

**set\_type (type IN VARCHAR)**

Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

**get\_replyto RETURN sys.aq\$\_agent**

Returns `replyto`, which corresponds to `JMSReplyTo`.

**get\_type RETURN VARCHAR**

Returns `type`, which corresponds to `JMSType`.

### System Properties Methods

**set\_userid (userid IN VARCHAR)**

Sets `userid`, which corresponds to `JMSXUserID` in JMS.

**set\_appid (appid IN VARCHAR)**

Sets `appid`, which corresponds to `JMSXAppID` in JMS.

**set\_groupid (groupid IN VARCHAR)**

Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

**set\_groupseq (groupseq IN INT)**

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

**get\_userid RETURN VARCHAR**

Returns `userid`, which corresponds to `JMSXUserID`.

**get\_appid RETURN VARCHAR**

Returns `appid`, which corresponds to `JMSXAppID`.

**get\_groupid RETURN VARCHAR**

Returns `groupid`, which corresponds to `JMSXGroupID`.

**get\_groupseq RETURN NUMBER**

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

### User Properties Methods

**clear\_properties**

Clears all user properties. This procedure does not affect system properties.

**set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception `ORA-24191` if the property name exists or `ORA-24192` if the property name is null.

**set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception `ORA-24191` if the

property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods****get\_bytes (payload OUT RAW)**

Puts the internal payload into a `RAW` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exception ORA-24190 if the length of internal payload is more than 32767.

**get\_bytes (payload OUT BLOB)**

Puts the internal payload into a `BLOB` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` variable without interpreting it.

**set\_bytes (payload IN RAW)**

Sets the internal payload as the `RAW` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as raw bytes without interpreting it.

**set\_bytes (payload IN BLOB)**

Sets the internal payload as the `BLOB` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `BLOB` variable without interpreting it.

**prepare (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Takes the byte array stored in `aq$_jms_stream_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`. Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**reset (id IN PLS\_INTEGER)**

Resets the starting position of the stream to the beginning and puts the stream message in `MESSAGE_ACCESS_READONLY` mode.

**flush (id IN PLS\_INTEGER)**

Takes the static variable in `Jserv` and synchronizes the content back to `aq$_jms_stream_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clear\_body (id IN PLS\_INTEGER)**

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`. Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call the `reset` or `prepare` procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**clean (id IN PLS\_INTEGER)**

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clean\_all**

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

**get\_mode (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Returns the current mode of this message. The return value is either `SYS.dbms_aqjms.READ_ONLY` or `SYS.dbms_aqjms.WRITE_ONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**read\_boolean (id IN PLS\_INTEGER) RETURN BOOLEAN**

Reads and returns a Boolean value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if

the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_byte (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads and returns a byte value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_bytes (id IN PLS\_INTEGER) RETURN BLOB**

Reads and returns a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

**read\_bytes (id IN PLS\_INTEGER, value OUT NOCOPY BLOB)**

Reads a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_char (id IN PLS\_INTEGER) RETURN CHAR**

Reads and returns a character value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_double (id IN PLS\_INTEGER) RETURN DOUBLE PRECISION**

Reads and returns a double from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_float (id IN PLS\_INTEGER) RETURN FLOAT**

Reads and returns a float from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_int (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads and returns an `INT` from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type

conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_long (id IN PLS\_INTEGER) RETURN NUMBER**

Reads and returns a long from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_short (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads and returns a short value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a `SHORT`. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_string RETURN CLOB**

Reads and returns a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

**read\_string (id IN PLS\_INTEGER, value OUT NOCOPY CLOB)**

Reads a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_object (id IN PLS\_INTEGER, value OUT NOCOPY AQ\$\_JMS\_VALUE)**

Returns a general value ADT `AQ$_JMS_VALUE`. Users can use the type attribute of this ADT to interpret the data. See [Table 284-2](#) (page 284-49) for the correspondence among `dbms_jms_plsql` package constants, Java datatype and `AQ$_JMS_VALUE` attribute. This member procedure might bring additional overhead compared to other read member procedures or functions. It is used only if the user does not know the datatype of the fields within a message beforehand. Otherwise it is a good idea to use a specific read member procedure or function.

Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_boolean (id IN PLS\_INTEGER, value IN BOOLEAN)**

Writes a Boolean to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_byte (id IN PLS\_INTEGER, value IN INT)**

Writes a byte to the stream message. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN RAW)**

Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN RAW, offset IN INT, length IN INT)**

Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN BLOB)**

Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN BLOB, offset IN INT, length IN INT)**

Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_char (id IN PLS\_INTEGER, value IN CHAR)**

Writes a character value to the stream message. If this value has multiple characters, then it is the first character that is written. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_double (id IN PLS\_INTEGER, value IN DOUBLE PRECISION)**

Writes a double to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_float (id IN PLS\_INTEGER, value IN FLOAT)**

Writes a float to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_int (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes an `INT` to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_long (id IN PLS\_INTEGER, value IN NUMBER)**

Writes a long to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_short (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes a short to the stream message. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_string (id IN PLS\_INTEGER, value IN VARCHAR2)**

Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_string (id IN PLS\_INTEGER, value IN CLOB)**

Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

## 284.9.6 SYS.AQ\$\_JMS\_OBJECT\_MESSAGE Type

This type is the ADT used to store an `ObjectMessage` in an Oracle Database Advanced Queuing queue.

**Syntax**

```
TYPE aq$_jms_object_message AS object(
 header aq$_jms_header,
 bytes_len int,
 bytes_raw raw(2000),
 bytes_lob blob);
```

## 284.9.7 SYS.AQ\$\_JMS\_NAMEARRAY Type

This type represents the name array returned by the `get_names` procedure of `aq$_jms_map_message`.

The maximum number of names this type can hold is 1024. The maximum length of each name is 200 characters.

**Syntax**

```
CREATE OR REPLACE TYPE AQ$_JMS_NAMEARRAY AS VARRAY(1024) OF VARCHAR(100);
```

## Usage Notes

If the names array in the message payload is greater than 1024, then use the following function to retrieve the names in multiple portions:

```
MEMBER FUNCTION get_names(id IN PLS_INTEGER, names OUT aq$_jms_namearray,
 offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER;
```

## 284.9.8 SYS.AQ\$\_JMS\_VALUE Type

This type represents the general data returned by the `get_object` procedure of `aq$_jms_map_message` and the `read_object` procedure of `aq$_jms_stream_message`.

The `type` field in this ADT is used to decide which type of data this object is really holding. The following table lists the mapping between the `sys.dbms_jms_plsql` type constants, the corresponding Java type, and the data field of ADT `aq$_jms_value` which effectively holds the data.

### Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_VALUE AS object(
 type number(2),
 num_val number,
 char_val char(1),
 text_val clob,
 bytes_val blob);
```

**Table 284-2 AQ\$\_JMS\_VALUE Type Fields and Java Fields**

Type	Java Type	aq\$_jms_value Data Field
DBMS_JMS_PLSQL.DATA_TYPE_BYTE	byte	num_val
DBMS_JMS_PLSQL.DATA_TYPE_SHORT	short	num_val
DBMS_JMS_PLSQL.DATA_TYPE_INTEGER	int	num_val
DBMS_JMS_PLSQL.DATA_TYPE_LONG	long	num_val
DBMS_JMS_PLSQL.DATA_TYPE_FLOAT	float	num_val
DBMS_JMS_PLSQL.DATA_TYPE_DOUBLE	double	num_val
DBMS_JMS_PLSQL.DATA_TYPE_BOOLEAN	boolean	num_val: 0 FALSE, 1 TRUE
DBMS_JMS_PLSQL.DATA_TYPE_CHARACTER	char	char_val
DBMS_JMS_PLSQL.DATA_TYPE_STRING	java.lang.String	text_val
DBMS_JMS_PLSQL.DATA_TYPE_BYTES	byte[]	bytes_val

## 284.9.9 SYS.AQ\$\_JMS\_EXCEPTION Type

This type represents a Java exception thrown on the Java stored procedure side.

The `id` field is reserved for future use. The `exp_name` stores the Java exception name, the `err_msg` field stores the Java exception error message, and the `stack` field stores the stack trace of the Java exception.

## Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_EXCEPTION AS OBJECT (
 id number, -- Reserved and not used. Right now always return 0.
 exp_name varchar(200),
 err_msg varchar(500),
 stack varchar(4000));
```

# JSON Data Structures

To work with JSON data in PL/SQL, you can use these data structures.

- [JSON\\_ELEMENT\\_T Object Type](#) (page 285-1)
- [JSON\\_OBJECT\\_T Object Type](#) (page 285-4)
- [JSON\\_ARRAY\\_T Object Type](#) (page 285-7)
- [JSON\\_SCALAR\\_T Object Type](#) (page 285-9)
- [JSON\\_KEY\\_LIST Type](#) (page 285-9)

## Related Topics:

- [Oracle Database JSON Developer's Guide](#)
- [The JSON standard](#)

## 285.1 JSON\_ELEMENT\_T Object Type

`JSON_ELEMENT_T` is the supertype for the `JSON_OBJECT_T`, `JSON_SCALAR_T`, and `JSON_ARRAY_T` object types.

### Description

Note the following:

- To create an instance of `JSON_ELEMENT_T`, use the `parse` function. See the “Constructors” section below for details.
- You cannot create an empty `JSON_ELEMENT_T` instance. To create an empty JSON container, create it based on one of the subtypes.
- To cast a `JSON_ELEMENT_T` into a subtype (for example, `JSON_OBJECT_T`), you need to perform an explicit cast using `TREAT AS`. For example:

```
TREAT (elem AS JSON_OBJECT_T)
```

### Constructors

You create a `JSON_ELEMENT_T` instance using the `parse` function. The function takes as input `VARCHAR2`, `CLOB`, or `BLOB` data, and returns a `JSON_ELEMENT_T` instance.

```
STATIC FUNCTION parse(json VARCHAR2) RETURN JSON_ELEMENT_T
STATIC FUNCTION parse(json CLOB) RETURN JSON_ELEMENT_T
STATIC FUNCTION parse(json BLOB) RETURN JSON_ELEMENT_T
```

Only UTF8-encoded JSON is passed as a `BLOB`.

The `parse` function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not valid JSON, then an error message is raised. Valid JSON has to pass the lax check of the “IS JSON” SQL condition.

## Serialization

Serialization is the inverse of the `parse` function. The serialization operation takes the in-memory representation of the JSON data and prints it to a string. The serialization functions and procedures are:

```
MEMBER FUNCTION to_String RETURN VARCHAR2
MEMBER FUNCTION to_Number RETURN NUMBER
MEMBER FUNCTION to_Date RETURN DATE
MEMBER FUNCTION to_Timestamp RETURN TIMESTAMP
MEMBER FUNCTION to_Boolean RETURN BOOLEAN
MEMBER FUNCTION to_Clob RETURN CLOB
MEMBER FUNCTION to_Blob RETURN BLOB

MEMBER PROCEDURE to_Clob(c IN OUT CLOB)
MEMBER PROCEDURE to_Blob(c IN OUT BLOB)
```

The `to_Clob` and `to_Blob` *procedures* accept a CLOB or BLOB input and enable you to provide a LOB to be used as the serialization destination. For instance, `EMPTY_LOB` can be provided. The input LOB cannot be `NULL`.

If the `to_Clob` *function* is used, then a new CLOB is created. If you do not want to create a CLOB first, then you can use the `to_Clob` or `to_Blob` *functions*, which take no parameter and generate a temp lob.

`to_Blob` serializes to UTF8 format only.

## Introspection

Introspection enables you to discover properties of JSON objects without modifying them. The introspection functions are:

```
MEMBER FUNCTION is_Object RETURN BOOLEAN
MEMBER FUNCTION is_Array RETURN BOOLEAN
MEMBER FUNCTION is_Scalar RETURN BOOLEAN
MEMBER FUNCTION is_String RETURN BOOLEAN
MEMBER FUNCTION is_Number RETURN BOOLEAN
MEMBER FUNCTION is_Boolean RETURN BOOLEAN
MEMBER FUNCTION is_True RETURN BOOLEAN
MEMBER FUNCTION is_False RETURN BOOLEAN
MEMBER FUNCTION is_Null RETURN BOOLEAN
MEMBER FUNCTION is_Date RETURN BOOLEAN
MEMBER FUNCTION is_Timestamp RETURN BOOLEAN
MEMBER FUNCTION get_Size RETURN NUMBER
```

The return value of the `get_size` function depends on the JSON type:

- For a scalar, it returns 1.
- For an object, it returns the number of keys.
- For an array, it returns the number of items.

Note that JSON does not support dates and timestamps natively. Instead they are typically modeled as strings. The DOM API enables you to add dates and timestamps as scalar values and preserve them until serialization to JSON, where they are printed as string following the ISO 8601 format. If a SQL value of type date or timestamp has been added, then the `is_Date` and `is_Timestamp` functions return true. If a date has been added as a string (e.g. as ISO 8601), then the `is_Date` and `is_Timestamp` functions

return false. You can use Oracle conversion function `to_Date` and `to_Timestamp` to convert a string representation of a date, and timestamp to the Oracle representation.

### Error Handling

You can set the level of error handling for JSON processing. You might not want an error to be raised for every mismatch. The `on_Error` procedure enables you to specify when errors should be raised:

```
MEMBER PROCEDURE on_Error(value NUMBER)
```

The `on_Error` procedure defines what happens if an error is encountered during a PL/SQL operation, for instance, a get call.

The default is to not raise an error but to return NULL instead.

You invoke `on_error` on a `JSON_ELEMENT_T` instance and it sets the error behavior for all subsequent calls. To reset the behavior to the default, you can call `on_Error(0)`.

Values for the `value` parameter are:

**Table 285-1 Values for the value Parameter in the ON\_ERROR Procedure**

Value	Description
0	Reset to the default behavior, which is to return NULL instead of raising an error.
1	Raise all errors.
2	Raise an error if no value is detected.
3	Raise an error if the data types do not match, for example, if you call <code>GET_NUMBER</code> on a string value.
4	Raise an error if the input is invalid, for example, if the array is out of bounds.

You can combine values. For example, you can specify 7 to indicate a combination of 3 and 4.

In the following example, an error is raised because the value of "a" is "xyz", which cannot be converted to a number. If the `on_Error` procedure had not been called, then NULL would be returned, and no error would be raised.

```
declare
 jo JSON_OBJECT_T;
begin
 jo := JSON_OBJECT_T.parse('{a:"xyz"}');
 jo.on_error(1);
 dbms_output.put_line(jo.get_Number('a'));
end;
/
```

## 285.2 JSON\_OBJECT\_T Object Type

JSON\_OBJECT\_T is a subtype of the JSON\_ELEMENT\_T object type. It corresponds to the JSON object structure.

### Constructors

You can create an empty JSON\_OBJECT\_T instance using the following constructor.

```
CONSTRUCTOR FUNCTION JSON_OBJECT_T RETURN SELF AS RESULT
```

You can create a JSON\_OBJECT\_T instance using one of the following `parse` functions:

```
STATIC FUNCTION parse(json VARCHAR2) RETURN JSON_OBJECT_T
STATIC FUNCTION parse(json CLOB) RETURN JSON_OBJECT_T
STATIC FUNCTION parse(json BLOB) RETURN JSON_OBJECT_T
```

You can also create a JSON\_OBJECT\_T instance using one of the following constructors:

```
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn VARCHAR2) RETURN SELF AS RESULT,
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn CLOB) RETURN SELF AS RESULT,
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn BLOB) RETURN SELF AS RESULT,
CONSTRUCTOR FUNCTION JSON_OBJECT_T(e JSON_ELEMENT_T) RETURN SELF AS RESULT
```

Only UTF8-encoded JSON is passed as a BLOB.

The `parse` function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not a valid JSON object, then an error message is raised. The input has to specify a JSON object, not an array.

### Get Functions and Procedures

The following functions and procedures enable you to retrieve the value of the JSON object:

```
MEMBER FUNCTION get(key VARCHAR2) RETURN JSON_ELEMENT_T
MEMBER FUNCTION get_String(key VARCHAR2) RETURN VARCHAR2
MEMBER FUNCTION get_Number(key VARCHAR2) RETURN NUMBER
MEMBER FUNCTION get_Date(key VARCHAR2) RETURN DATE
MEMBER FUNCTION get_Timestamp(key VARCHAR2) RETURN TIMESTAMP
MEMBER FUNCTION get_Boolean(key VARCHAR2) RETURN BOOLEAN
MEMBER FUNCTION get_Clob(key VARCHAR2) RETURN CLOB
MEMBER FUNCTION get_Blob(key VARCHAR2) RETURN BLOB
MEMBER FUNCTION get_Object(key VARCHAR2) RETURN JSON_OBJECT_T
MEMBER FUNCTION get_Array(key VARCHAR2) RETURN JSON_ARRAY_T

MEMBER PROCEDURE get_Clob(key NUMBER, c IN OUT CLOB)
MEMBER PROCEDURE get_Blob(key NUMBER, c IN OUT BLOB)
```

Note:

- The `get` function has reference semantics. This means that if the returned JSON\_ELEMENT\_T is modified, then the containing JSON\_ELEMENT\_T is also changed. See the [Reference Semantics](#) (page 285-6) section below for details.

- The `GET_STRING` function converts the value to a string if it is not already a string. Thus, the `GET_STRING` function returns a non-null value even if `IS_STRING` returns `false`.
- All the “get” functions perform a conversion if possible. If no conversion is possible, then an error might be raised, depending on what `ON_ERROR` is set to.

The `GET_CLOB` and `GET_BLOB` *procedures*, which accept a CLOB or BLOB as input, enable you to provide a LOB to be used as serialization destination. For instance, `EMPTY_LOB` can be provided. If you use the `GET_CLOB` *function* instead, then a new CLOB will be created implicitly. The input LOB cannot be `NULL`. If you do not want to create a BLOB or CLOB first, you can use the `GET_CLOB` or `GET_BLOB` functions, which take no parameter and generates a temp LOB.

`GET_BLOB` serializes to UTF8 format only.

### Set Procedures

The following procedures enable you to set the value of a JSON object. Existing values, if present, will be overwritten.

```
MEMBER PROCEDURE put(key VARCHAR2, value JSON_ELEMENT_T)
MEMBER PROCEDURE put(key VARCHAR2, value VARCHAR2)
MEMBER PROCEDURE put(key VARCHAR2, value NUMBER)
MEMBER PROCEDURE put(key VARCHAR2, value BOOLEAN)
MEMBER PROCEDURE put(key VARCHAR2, value DATE)
MEMBER PROCEDURE put(key VARCHAR2, value TIMESTAMP)
MEMBER PROCEDURE put_Null(key VARCHAR2)
```

### Introspection Functions

Introspection enables you to discover properties of JSON objects without modifying them. The introspection functions are:

```
MEMBER FUNCTION has(key VARCHAR2) RETURN BOOLEAN
MEMBER FUNCTION get_Type(key VARCHAR2) RETURN VARCHAR2
MEMBER FUNCTION get_Keys RETURN JSON_KEY_LIST
```

The `GET_KEYS` function returns an object type of `JSON_KEY_LIST`, which is a varray of `VARCHAR2(4000)`. The varray contains the names of keys in the JSON object. The example below walks through the items of the varray to build a `JSON_ARRAY_T` object that contains all key names.

```
declare
 jo JSON_OBJECT_T;
 ja JSON_ARRAY_T;
 keys JSON_KEY_LIST;
 keys_string VARCHAR2(100);

begin
 ja := new JSON_ARRAY_T;
 jo := JSON_OBJECT_T.parse('{"name":"fred",
 "jobTitle":"codemonkey",
 "projects":["json", "xml"]}');

 keys := jo.get_keys;
 for i in 1..keys.count loop
 ja.append(keys(i));
 end loop;

 keys_string := ja.to_string;
 dbms_output.put_line(keys_string);
```

```
end;
/
```

The output is:

```
["name", "jobTitle", "projects"]
```

### Modification Procedures

The following procedures enable you to remove or rename keys in a JSON object.

```
MEMBER PROCEDURE remove(key VARCHAR2)
MEMBER PROCEDURE rename_Key(keyOld VARCHAR2, keyNew VARCHAR2)
```

Duplicate key names are not supported and will raise an error.

### Clone Function

This function makes a copy of the JSON object. Reference semantics is changed to value semantics.

```
MEMBER FUNCTION clone RETURN JSON_OBJECT_T
```

### Reference Semantics

Calling the `get` function that returns a `JSON_ELEMENT_T` object always returns a reference to the complex values instead of a copy. This means that changing the returned value affects its container. See the example below.

```
declare
 data JSON_OBJECT_T;
 address JSON_OBJECT_T;
 zip number;

begin

 data := new JSON_OBJECT_T('{
 "first": "John",
 "last": "Doe",
 "address": {
 "country": "USA",
 "zip": "94065"
 }
 }');

 address := data.get_object('address');
 dbms_output.put_line(address.to_string);

 -- 1) VALUE SEMANTICS for scalar values
 -- (changing the value has no effect on container)
 zip := address.get_number('zip');
 dbms_output.put_line(zip);
 zip := 12345;
 dbms_output.put_line(zip);
 -- address is still the same
 dbms_output.put_line(address.to_string);

 -- 2) REFERENCE SEMANTICS for complex values
 -- 'address' is a reference to the complex address values inside 'data'
 address.put('zip', 12345);
 address.put('street', 'Detour Road');
```

```

 dbms_output.put_line(data.to_string);
end;
/

```

In cases where you do not want the reference semantics, you can use the `clone` function to create a copy of the returned object. This decouples the value from its container. In the example above, you can create a copy of the “address” object by replacing this line:

```
address := data.get_object('address');
```

with this line:

```
address := data.get_object('address').clone;
```

After this, changing the address with have no effect on the value of the ‘data’ containing object.

### Update Example

The following example updates the price of an item by 10%.

```

WITH
 FUNCTION updatePrice(jsonTxt in VARCHAR2) RETURN VARCHAR2 IS
 jo JSON_OBJECT_T;
 oldPrice NUMBER;

 BEGIN
 jo := new JSON_OBJECT_T(jsonTxt);
 oldPrice := jo.get_number('price');
 jo.put('price', oldPrice * 1.1);
 RETURN jo.to_string();
 END;
SELECT updatePrice(col)
FROM t1;

```

## 285.3 JSON\_ARRAY\_T Object Type

`JSON_ARRAY_T` is a subtype of the `JSON_ELEMENT_T` object type. `JSON_ARRAY_T` corresponds to the JSON array structure.

### Constructors

You can create an empty `JSON_ARRAY_T` instance using the following constructor.

```
CONSTRUCTOR FUNCTION JSON_ARRAY_T RETURN SELF AS RESULT
```

You can create a `JSON_ARRAY_T` instance using one the following `parse` functions:

```

STATIC FUNCTION parse(json VARCHAR2) RETURN JSON_ARRAY_T
STATIC FUNCTION parse(json CLOB) RETURN JSON_ARRAY_T
STATIC FUNCTION parse(json BLOB) RETURN JSON_ARRAY_T

```

You can also create a `JSON_ARRAY_T` instance using one the following constructors:

```

CONSTRUCTOR FUNCTION JSON_Array_T(jsn VARCHAR2) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(jsn CLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(jsn BLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(e JSON_ELEMENT_T) RETURN SELF AS RESULT

```

Only UTF8-encoded JSON is passed as a BLOB.

The `parse` function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not valid JSON, then an error message is raised. The input has to specify a JSON array, not an object.

### Get Functions and Procedures

The following functions and procedures enable you to retrieve the value of the JSON array:

```
MEMBER FUNCTION get(pos NUMBER) RETURN JSON_ELEMENT_T
MEMBER FUNCTION get_String(pos NUMBER) RETURN VARCHAR2
MEMBER FUNCTION get_Number(pos NUMBER) RETURN NUMBER
MEMBER FUNCTION get_Date(pos NUMBER) RETURN DATE
MEMBER FUNCTION get_Timestamp(pos NUMBER) RETURN TIMESTAMP
MEMBER FUNCTION get_Boolean(pos NUMBER) RETURN BOOLEAN
MEMBER FUNCTION get_Clob(pos NUMBER) RETURN CLOB
MEMBER FUNCTION get_Blob(pos NUMBER) RETURN BLOB

MEMBER PROCEDURE get_Clob(pos NUMBER, c IN OUT CLOB)
MEMBER PROCEDURE get_Blob(pos NUMBER, c IN OUT BLOB)
```

#### Note:

- The `get` function has reference semantics. This means that if the returned `JSON_ELEMENT_T` is modified, then the containing `JSON_ELEMENT_T` is changed too.
- The `GET_STRING` function converts the value to a string if it is not already a string. The function returns a non-null value even if `IS_STRING` returns false.
- All the “get” functions perform a conversion if possible. If no conversion is possible, then an error might be raised, depending on what `ON_ERROR` is set to.

The `GET_CLOB` and `GET_BLOB` *procedures*, which accept a CLOB or BLOB as input, enable you to provide a LOB to be used as serialization destination. For instance, `EMPTY_LOB` can be provided. If you use the `GET_CLOB` *function* instead, then a new CLOB will be created implicitly. The input LOB cannot be NULL. If you do not want to create a BLOB or CLOB first, you can use the `GET_CLOB` or `GET_BLOB` functions, which take no parameter and generates a temp LOB.

`GET_BLOB` serializes to UTF8 format only.

### Set Procedures

The following procedures enable you to set the value at the specified position in the JSON array. These procedures insert (not overwrite) at the specified position unless overwrite is requested.

```
MEMBER PROCEDURE put(pos NUMBER, value VARCHAR2, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value NUMBER, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value BOOLEAN, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value JSON_ELEMENT_T, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value DATE, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value TIMESTAMP, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put_Null(pos NUMBER, overwrite BOOLEAN DEFAULT FALSE)
```

The following procedures append the specified value to the end of the JSON array:

```
MEMBER PROCEDURE append(value JSON_ELEMENT_T)
MEMBER PROCEDURE append(value VARCHAR2)
MEMBER PROCEDURE append(value NUMBER)
MEMBER PROCEDURE append(value BOOLEAN)
MEMBER PROCEDURE append(value DATE)
MEMBER PROCEDURE append(value TIMESTAMP)
MEMBER PROCEDURE append_Null
```

### Introspection Function

Introspection enables you to discover properties of the JSON array without modifying them.

```
MEMBER FUNCTION get_Type(pos NUMBER) RETURN VARCHAR2
```

### Modification Procedure

The following procedure enables you to remove the value at the specified position in the JSON array.

```
MEMBER PROCEDURE remove(pos NUMBER)
```

### Clone Function

This function makes a copy of the JSON array. Reference semantics is changed to value semantics.

```
MEMBER FUNCTION clone RETURN JSON_ARRAY_T
```

## 285.4 JSON\_SCALAR\_T Object Type

JSON\_SCALAR\_T is a subtype of the JSON\_ELEMENT\_T object type.

### Description

A JSON\_SCALAR\_T instance captures one scalar values, for example, the string “fred” or the number 1. This type does not have any functions or procedures other than the ones inherited from JSON\_ELEMENT\_T. You cannot create an instance of this type directly.

## 285.5 JSON\_KEY\_LIST Type

JSON\_KEY\_LIST is a varray of VARCHAR2(4000).

### Description

This type is used by the `get_Keys` function in the [JSON\\_OBJECT\\_T Object Type](#) (page 285-4).

# Logical Change Record TYPEs

This chapter describes the logical change record (LCR) types.

This chapter contains these topics:

- [Overview](#) (page 286-1)
- [Security Model](#) (page 286-1)
- [Summary of Logical Change Record Types](#) (page 286-1)
- [Common Subprograms for LCR\\$\\_DDL\\_RECORD and LCR\\$\\_ROW\\_RECORD](#) (page 286-35)

## 286.1 Logical Change Record TYPEs Overview

In Oracle Streams, logical change records (LCRs) are message payloads that contain information about changes to a database. These changes can include changes to the data, which are data manipulation language (DML) changes, and changes to database objects, which are data definition language (DDL) changes.

When you use Oracle Streams, the capture process captures changes in the form of LCRs and enqueues them into a queue. These LCRs can be propagated from a queue in one database to a queue in another database. Finally, the apply process can apply LCRs at a destination database. You also have the option of creating, enqueueing, and dequeuing LCRs manually.

### See Also:

*Oracle Streams Concepts and Administration* for more information about LCRs

## 286.2 Logical Change Record Types Security Model

PUBLIC is granted EXECUTE privilege on the types described in this chapter.

## 286.3 Summary of Logical Change Record Types

This table lists the Logical Change Record TYPEs and briefly describes them.

**Table 286-1 Logical Change Record (LCR) Types**

Type	Description
<a href="#">LCR\$_DDL_RECORD Type</a> (page 286-2)	Represents a data definition language (DDL) change to a database object

**Table 286-1 (Cont.) Logical Change Record (LCR) Types**

Type	Description
<a href="#">LCR\$_ROW_RECORD Type</a> (page 286-11)	Represents a data manipulation language (DML) change to a database object
<a href="#">LCR\$_ROW_LIST Type</a> (page 286-47)	Identifies a list of column values for a row in a table
<a href="#">LCR\$_ROW_UNIT Type</a> (page 286-47)	Identifies the value for a column in a row

These logical change record (LCR) types can be used with the following Oracle-supplied PL/SQL packages:

- DBMS\_APPLY\_ADM
- DBMS\_AQ
- DBMS\_AQADM
- DBMS\_CAPTURE\_ADM
- DBMS\_PROPAGATION\_ADM
- DBMS\_RULE
- DBMS\_RULE\_ADM
- DBMS\_STREAMS
- DBMS\_STREAMS\_ADM
- DBMS\_TRANSFORM

### 286.3.1 LCR\$\_DDL\_RECORD Type

This type represents a data definition language (DDL) change to a database object.

If you create or modify a DDL logical change record (DDL LCR), then make sure the `ddl_text` is consistent with the `base_table_name`, `base_table_owner`, `object_type`, `object_owner`, `object_name`, and `command_type` attributes.

This topic contains information about the constructor for row LCRs and information about the member subprograms for this type.

 **Note:**

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

### LCR\$\_DDL\_RECORD Constructor

Creates a SYS.LCR\$\_DDL\_RECORD object with the specified information.

```

STATIC FUNCTION CONSTRUCT(
 source_database_name IN VARCHAR2,
 command_type IN VARCHAR2,
 object_owner IN VARCHAR2,
 object_name IN VARCHAR2,
 object_type IN VARCHAR2,
 ddl_text IN CLOB,
 logon_user IN VARCHAR2,
 current_schema IN VARCHAR2,
 base_table_owner IN VARCHAR2,
 base_table_name IN VARCHAR2,
 tag IN RAW DEFAULT NULL,
 transaction_id IN VARCHAR2 DEFAULT NULL,
 scn IN NUMBER DEFAULT NULL,
 position IN RAW DEFAULT NULL,
 edition_name IN VARCHAR2 DEFAULT NULL,
 root_name IN VARCHAR2 DEFAULT NULL)
RETURN SYS.LCR$_DDL_RECORD;

```

### LCR\$\_DDL\_RECORD Constructor Function Parameters

**Table 286-2 Constructor Function Parameters for LCR\$\_DDL\_RECORD**

Parameter	Description
source_database_name	The database where the DDL statement occurred If the LCRs originated in a multitenant container database (CDB), then this field specifies the global name of the container where the DDL change occurred. If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the function specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.

**Table 286-2 (Cont.) Constructor Function Parameters for LCR\$\_DDL\_RECORD**

Parameter	Description
command_type	<p>The type of command executed in the DDL statement Set this parameter to a non-NULL value.</p> <p><b>See Also:</b> The "SQL Command Codes" table in the <i>Oracle Call Interface Programmer's Guide</i> for a complete list of command types</p> <p>The following command types <i>are not supported</i> in DDL LCRs:</p> <p>ALTER MATERIALIZED VIEW ALTER MATERIALIZED VIEW LOG ALTER SUMMARY CREATE SCHEMA CREATE MATERIALIZED VIEW CREATE MATERIALIZED VIEW LOG CREATE SUMMARY DROP MATERIALIZED VIEW DROP MATERIALIZED VIEW LOG DROP SUMMARY RENAME</p> <p>The snapshot equivalents of the materialized view command types are also not supported.</p>
object_owner	The user who owns the object on which the DDL statement was executed
object_name	The database object on which the DDL statement was executed
object_type	<p>The type of object on which the DDL statement was executed The following are valid object types:</p> <p>CLUSTER FUNCTION INDEX LINK OUTLINE PACKAGE PACKAGE BODY PROCEDURE SEQUENCE SYNONYM TABLE TRIGGER TYPE USER VIEW</p> <p>LINK represents a database link.</p> <p>NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.</p>
ddl_text	<p>The text of the DDL statement Set this parameter to a non-NULL value.</p>
logon_user	The user whose session executed the DDL statement

**Table 286-2 (Cont.) Constructor Function Parameters for LCR\$\_DDL\_RECORD**

Parameter	Description
current_schema	The schema that is used if no schema is specified explicitly for the modified database objects in <code>ddl_text</code> If a schema is specified in <code>ddl_text</code> that differs from the one specified for <code>current_schema</code> , then the function uses the schema specified in <code>ddl_text</code> . Set this parameter to a non-NULL value.
base_table_owner	If the DDL statement is a table-related DDL (such as <code>CREATE TABLE</code> and <code>ALTER TABLE</code> ), or if the DDL statement involves a table (such as creating a trigger on a table), then <code>base_table_owner</code> specifies the owner of the table involved. Otherwise, <code>base_table_owner</code> is NULL.
base_table_name	If the DDL statement is a table-related DDL (such as <code>CREATE TABLE</code> and <code>ALTER TABLE</code> ), or if the DDL statement involves a table (such as creating a trigger on a table), then <code>base_table_name</code> specifies the name of the table involved. Otherwise, <code>base_table_name</code> is NULL.
tag	A binary tag that enables tracking of the LCR For example, this tag can be used to determine the original source database of the DDL statement if apply forwarding is used. <b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i>
transaction_id	The identifier of the transaction
scn	The SCN at the time when the change record for a captured LCR was written to the redo log The SCN value is meaningless for a user-created LCR.
position	The position of the LCR LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product. <b>See Also:</b> <i>Oracle Database XStream Guide</i>
edition_name	The name of the edition in which the DDL statement was executed
root_name	If the LCRs is associated with a CDB, then this field specifies the global name of the root in the CDB. If the LCR is associated with a non-CDB, then this field is NULL.

**Summary of LCR\$\_DDL\_RECORD Subprograms**

**Table 286-3 LCR\$\_DDL\_RECORD Type Subprograms**

Subprogram	Description
<a href="#">EXECUTE Member Procedure</a> (page 286-6)	Executes the LCR under the security domain of the current user
<a href="#">GET_BASE_TABLE_NAME Member Function</a> (page 286-7)	Gets the base (dependent) table name
<a href="#">GET_BASE_TABLE_OWNER Member Function</a> (page 286-7)	Gets the base (dependent) table owner

**Table 286-3 (Cont.) LCR\$\_DDL\_RECORD Type Subprograms**

Subprogram	Description
<a href="#">GET_CURRENT_SCHEMA Member Function</a> (page 286-7)	Gets the default schema (user) name
<a href="#">GET_DDL_TEXT Member Procedure</a> (page 286-7)	Gets the DDL text in a CLOB
<a href="#">GET_EDITION_NAME Member Function</a> (page 286-8)	Gets the name of the edition in which the DDL statement was executed
<a href="#">GET_LOGON_USER Member Function</a> (page 286-8)	Gets the logon user name
<a href="#">GET_OBJECT_TYPE Member Function</a> (page 286-8)	Gets the type of the object involved for the DDL
<a href="#">SET_BASE_TABLE_NAME Member Procedure</a> (page 286-8)	Sets the base (dependent) table name
<a href="#">SET_BASE_TABLE_OWNER Member Procedure</a> (page 286-9)	Sets the base (dependent) table owner
<a href="#">SET_CURRENT_SCHEMA Member Procedure</a> (page 286-9)	Sets the default schema (user) name
<a href="#">SET_DDL_TEXT Member Procedure</a> (page 286-9)	Sets the DDL text
<a href="#">SET_EDITION_NAME Member Procedure</a> (page 286-10)	Sets the name of the edition in which the DDL statement was executed
<a href="#">SET_LOGON_USER Member Procedure</a> (page 286-10)	Sets the logon user name
<a href="#">SET_OBJECT_TYPE Member Procedure</a> (page 286-10)	Sets the object type
Common Subprograms	See " <a href="#">Common Subprograms for LCR\$_DDL_RECORD and LCR\$_ROW_RECORD</a> (page 286-35)" for a list of subprograms common to the SYS.LCR\$_ROW_RECORD and SYS.LCR\$_DDL_RECORD types

**EXECUTE Member Procedure**

Executes the DDL LCR under the security domain of the current user. Apply handlers are not run when the LCR is applied using this procedure.

 **Note:**

The EXECUTE member procedure can be invoked only in an apply handler for an Oracle Streams apply process.

**Syntax**

```
MEMBER PROCEDURE EXECUTE;
```

### GET\_BASE\_TABLE\_NAME Member Function

Gets the base (dependent) table name.

#### Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_NAME()
RETURN VARCHAR2;
```

### GET\_BASE\_TABLE\_OWNER Member Function

Gets the base (dependent) table owner.

#### Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_OWNER()
RETURN VARCHAR2;
```

### GET\_CURRENT\_SCHEMA Member Function

Gets the current schema name.

#### Syntax

```
MEMBER FUNCTION GET_CURRENT_SCHEMA()
RETURN VARCHAR2;
```

### GET\_DDL\_TEXT Member Procedure

Gets the DDL text in a CLOB.

For example, the following PL/SQL code uses this procedure to get the DDL text in a DDL LCR:

```
CREATE OR REPLACE PROCEDURE ddl_in_lcr (ddl_lcr in SYS.LCR$_DDL_RECORD)
IS
 ddl_text CLOB;
BEGIN
 DBMS_OUTPUT.PUT_LINE(' -----');
 DBMS_OUTPUT.PUT_LINE(' Displaying DDL text in a DDL LCR: ');
 DBMS_OUTPUT.PUT_LINE(' -----');
 DBMS_LOB.CREATETEMPORARY(ddl_text, true);
 ddl_lcr.GET_DDL_TEXT(ddl_text);
 DBMS_OUTPUT.PUT_LINE('DDL text:' || ddl_text);
 DBMS_LOB.FREETEMPORARY(ddl_text);
END;
/
```

#### Note:

GET\_DDL\_TEXT is a member procedure and not a member function to make it easier for you to manage the space used by the CLOB. Notice that the previous example creates temporary space for the CLOB and then frees the temporary space when it is no longer needed.

### Syntax

```
MEMBER FUNCTION GET_DDL_TEXT(
 ddl_text IN/OUT CLOB);
```

### Parameter

**Table 286-4 GET\_DDL\_TEXT Procedure Parameter**

Parameter	Description
ddl_text	The DDL text in the DDL LCR

### GET\_EDITION\_NAME Member Function

Gets the name of the edition in which the DDL statement was executed.

#### See Also:

*Oracle Database Development Guide*

### Syntax

```
MEMBER FUNCTION GET_EDITION_NAME()
RETURN VARCHAR2;
```

### GET\_LOGON\_USER Member Function

Gets the logon user name.

### Syntax

```
MEMBER FUNCTION GET_LOGON_USER()
RETURN VARCHAR2;
```

### GET\_OBJECT\_TYPE Member Function

Gets the type of the object involved for the DDL.

### Syntax

```
MEMBER FUNCTION GET_OBJECT_TYPE()
RETURN VARCHAR2;
```

### SET\_BASE\_TABLE\_NAME Member Procedure

Sets the base (dependent) table name.

### Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_NAME(
 base_table_name IN VARCHAR2);
```

## Parameter

**Table 286-5 SET\_BASE\_TABLE\_NAME Procedure Parameter**

Parameter	Description
base_table_name	The name of the base table

## SET\_BASE\_TABLE\_OWNER Member Procedure

Sets the base (dependent) table owner.

### Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_OWNER(
 base_table_owner IN VARCHAR2);
```

## Parameter

**Table 286-6 SET\_BASE\_TABLE\_OWNER Procedure Parameter**

Parameter	Description
base_table_owner	The name of the base table owner

## SET\_CURRENT\_SCHEMA Member Procedure

Sets the default schema (user) name.

### Syntax

```
MEMBER PROCEDURE SET_CURRENT_SCHEMA(
 current_schema IN VARCHAR2);
```

## Parameter

**Table 286-7 SET\_CURRENT\_SCHEMA Procedure Parameter**

Parameter	Description
current_schema	The name of the schema to set as the current schema Set this parameter to a non-NULL value.

## SET\_DDL\_TEXT Member Procedure

Sets the DDL text.

### Syntax

```
MEMBER PROCEDURE SET_DDL_TEXT(
 ddl_text IN CLOB);
```

## Parameter

**Table 286-8 SET\_DDL\_TEXT Procedure Parameter**

Parameter	Description
ddl_text	The DDL text Set this parameter to a non-NULL value.

## SET\_EDITION\_NAME Member Procedure

Sets the name of the edition in which the DDL statement was executed.

### See Also:

*Oracle Database Development Guide*

## Syntax

```
MEMBER PROCEDURE SET_EDITION_NAME(
 edition_name IN VARCHAR2);
```

## Parameter

**Table 286-9 SET\_EDITION\_NAME Procedure Parameter**

Parameter	Description
edition_name	Name of the edition

## SET\_LOGON\_USER Member Procedure

Sets the logon user name.

## Syntax

```
MEMBER PROCEDURE SET_LOGON_USER(
 logon_user IN VARCHAR2);
```

## Parameter

**Table 286-10 SET\_LOGON\_USER Procedure Parameter**

Parameter	Description
logon_user	The name of the schema to set as the logon user

## SET\_OBJECT\_TYPE Member Procedure

Sets the object type.

### Syntax

```
MEMBER PROCEDURE SET_OBJECT_TYPE(
 object_type IN VARCHAR2);
```

### Parameter

**Table 286-11 SET\_OBJECT\_TYPE Procedure Parameter**

Parameter	Description
object_type	<p>The object type</p> <p>The following are valid object types:</p> <p>CLUSTER FUNCTION INDEX LINK OUTLINE PACKAGE PACKAGE BODY PROCEDURE SEQUENCE SYNONYM TABLE TRIGGER TYPE USER VIEW</p> <p>LINK represents a database link.</p> <p>NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.</p>

## 286.3.2 LCR\$\_ROW\_RECORD Type

This type represents a data manipulation language (DML) change to a row in a table. This type uses the LCR\$\_ROW\_LIST type.

If you create or modify a row logical change record (row LCR), then make sure the `command_type` attribute is consistent with the presence or absence of old column values and the presence or absence of new column values.

This topic contains information about the constructor for DDL LCRs and information about the member subprograms for this type.

 **Note:**

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

 **See Also:**

[LCR\\$\\_ROW\\_LIST Type](#) (page 286-47)

**LCR\$\_ROW\_RECORD Constructor**

Creates a SYS.LCR\$\_ROW\_RECORD object with the specified information.

```

STATIC FUNCTION CONSTRUCT(
 source_database_name IN VARCHAR2,
 command_type IN VARCHAR2,
 object_owner IN VARCHAR2,
 object_name IN VARCHAR2,
 tag IN RAW DEFAULT NULL,
 transaction_id IN VARCHAR2 DEFAULT NULL,
 scn IN NUMBER DEFAULT NULL,
 old_values IN SYS.LCR$_ROW_LIST DEFAULT NULL,
 new_values IN SYS.LCR$_ROW_LIST DEFAULT NULL,
 position IN RAW DEFAULT NULL,

 statement IN VARCHAR2 DEFAULT NULL,

 bind_variables IN SYS.LCR$_ROW_LIST DEFAULT NULL,

 bind_by_position IN VARCHAR2 DEFAULT 'N',

 root_name IN VARCHAR2 DEFAULT NULL)
RETURN SYS.LCR$_ROW_RECORD;
```

## LCR\$\_ROW\_RECORD Constructor Function Parameters

**Table 286-12 Constructor Function Parameters for LCR\$\_ROW\_RECORD**

Parameter	Description
source_database_name	<p>The database where the row change occurred</p> <p>If the LCRs originated in a CDB, then this field specifies the global name of the container where the row change occurred.</p> <p>If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify <code>DBS1</code> and the local domain is <code>EXAMPLE.COM</code>, then the function specifies <code>DBS1.EXAMPLE.COM</code> automatically. Set this parameter to a non-NULL value.</p>
command_type	<p>The type of command executed in the DML statement</p> <p>Set this parameter to a non-NULL value.</p> <p>Valid values are the following:</p> <p>INSERT UPDATE DELETE LOB ERASE LOB WRITE LOB TRIM</p> <p>If <code>INSERT</code>, then ensure that the LCR has a <code>new_values</code> collection that is not empty and an empty or <code>NULL</code> <code>old_values</code> collection.</p> <p>If <code>UPDATE</code>, then ensure that the LCR has a <code>new_values</code> collection that is not empty and an <code>old_values</code> collection that is not empty.</p> <p>If <code>DELETE</code>, then ensure that the LCR has a <code>NULL</code> or empty <code>new_values</code> collection and an <code>old_values</code> collection that is not empty.</p> <p>If <code>LOB ERASE</code>, <code>LOB WRITE</code>, or <code>LOB TRIM</code>, then ensure that the LCR has a <code>new_values</code> collection that is not empty and an empty or <code>NULL</code> <code>old_values</code> collection.</p>
object_owner	<p>The user who owns the table on which the row change occurred</p> <p>Set this parameter to a non-NULL value.</p>
object_name	<p>The table on which the DML statement was executed</p> <p>Set this parameter to a non-NULL value.</p>
tag	<p>A binary tag that enables tracking of the LCR</p> <p>For example, this tag can be used to determine the original source database of the DML change when apply forwarding is used.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i></p>
transaction_id	<p>The identifier of the transaction</p>
scn	<p>The SCN at the time when the change record was written to the redo log</p> <p>The SCN value is meaningless for a user-created LCR.</p>

**Table 286-12 (Cont.) Constructor Function Parameters for LCR\$\_ROW\_RECORD**

Parameter	Description
old_values	The column values for the row before the DML change If the DML statement is an UPDATE or a DELETE statement, then this parameter contains the values of columns in the row before the DML statement. If the DML statement is an INSERT statement, then there are no old values.
new_values	The column values for the row after the DML change If the DML statement is an UPDATE or an INSERT statement, then this parameter contains the values of columns in the row after the DML statement. If the DML statement is a DELETE statement, then there are no new values. If the LCR reflects a LOB operation, then this parameter contains the supplementally logged columns and any relevant LOB information.
position	The position of the LCR LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product. <b>See Also:</b> <i>Oracle Database XStream Guide</i>
statement	This parameter is reserved for internal use only.
bind_variables	This parameter is reserved for internal use only.
bind_by_position	This parameter is reserved for internal use only.
root_name	If the LCRs is associated with a CDB, then this field specifies the global name of the root in the CDB. If the LCR is associated with a non-CDB, then this field is NULL.

**Summary of LCR\$\_ROW\_RECORD Subprograms****Table 286-13 LCR\$\_ROW\_RECORD Type Subprograms**

Subprogram	Description
<a href="#">ADD_COLUMN Member Procedure</a> (page 286-15)	Adds the value as old or new, depending on the value type specified, for the column
<a href="#">CONVERT_LONG_TO_LOB_CHUNK Member Procedure</a> (page 286-17)	Converts LONG data in a row LCR into fixed width CLOB, or converts LONG RAW data in a row LCR into a BLOB
<a href="#">DELETE_COLUMN Member Procedure</a> (page 286-18)	Deletes the old value, the new value, or both, for the specified column, depending on the value type specified
<a href="#">EXECUTE Member Procedure</a> (page 286-18)	Executes the LCR under the security domain of the current user
<a href="#">GET_LOB_INFORMATION Member Function</a> (page 286-19)	Gets the LOB information for the column
<a href="#">GET_LOB_OFFSET Member Function</a> (page 286-20)	Gets the LOB offset for the specified column

**Table 286-13 (Cont.) LCR\$\_ROW\_RECORD Type Subprograms**

Subprogram	Description
<a href="#">GET_LOB_OPERATION_SIZE Member Function</a> (page 286-21)	Gets the operation size for the LOB column
<a href="#">GET_LONG_INFORMATION Member Function</a> (page 286-21)	Gets the LONG information for the column
<a href="#">GET_ROW_TEXT Member Procedure</a> (page 286-22)	Gets the SQL statement for the change that is encapsulated in the LCR
<a href="#">GET_VALUE Member Function</a> (page 286-23)	Gets the old or new value for the specified column, depending on the value type specified
<a href="#">GET_VALUES Member Function</a> (page 286-23)	Gets a list of old or new values, depending on the value type specified
<a href="#">GET_WHERE_CLAUSE Member Procedure</a> (page 286-24)	Gets a WHERE clause for the change that is encapsulated in the row LCR
<a href="#">GET_XML_INFORMATION Member Function</a> (page 286-26)	Gets the XML information for the specified column
<a href="#">IS_STATEMENT_LCR Member Function</a> (page 286-26)	Reserved for internal use only
<a href="#">KEEP_COLUMNS Member Procedure</a> (page 286-27)	Keeps a list of columns a row LCR
<a href="#">RENAME_COLUMN Member Procedure</a> (page 286-27)	Renames a column in an LCR
<a href="#">SET_LOB_INFORMATION Member Procedure</a> (page 286-28)	Sets LOB information for the column
<a href="#">SET_LOB_OFFSET Member Procedure</a> (page 286-29)	Sets the LOB offset for the specified column
<a href="#">SET_LOB_OPERATION_SIZE Member Procedure</a> (page 286-29)	Sets the operation size for the LOB column
<a href="#">SET_ROW_TEXT Member Procedure</a> (page 286-30)	Reserved for internal use only
<a href="#">SET_VALUE Member Procedure</a> (page 286-30)	Overwrites the value of the specified column
<a href="#">SET_VALUES Member Procedure</a> (page 286-32)	Replaces the existing old or new values for the LCR, depending on the value type specified
<a href="#">SET_XML_INFORMATION Member Procedure</a> (page 286-34)	Sets the XML information for the column
Common Subprograms	See <a href="#">Common Subprograms for LCR\$_DDL_RECORD</a> and <a href="#">LCR\$_ROW_RECORD</a> (page 286-35) for a list of subprograms common to the SYS.LCR\$_ROW_RECORD and SYS.LCR\$_DDL_RECORD types

**ADD\_COLUMN Member Procedure**

Adds the value as old or new, depending on the value type specified, for the column. An error is raised if a value of the same type already exists for the column.

 **Note:**

To set a column value that already exists, run `SET_VALUE`.

 **See Also:**

[SET\\_VALUE Member Procedure](#) (page 286-30)

### Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), you use this member procedure in the handler procedure to add a LOB column to a row LCR. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure to add a LOB column to a row LCR.

To use a DML or error handler to add a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `ADD_COLUMN` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to add an LOB column that is set incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure to add a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure to add a `LONG` or `LONG RAW` column.

### Syntax

```
MEMBER PROCEDURE ADD_COLUMN(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2,
 column_value IN ANYDATA);
```

## Parameters

**Table 286-14 ADD\_COLUMN Procedure Parameters**

Parameter	Description
value_type	The type of value to add for the column Specify <code>old</code> to add the old value of the column. Specify <code>new</code> to add the new value of the column.
column_name	The column name This name is not validated. An error can be raised during application of the LCRs if an invalid name is specified.
column_value	The value of the column If <code>NULL</code> , then this procedure raises an error. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then a LOB locator can be specified. A <code>NULL</code> column value can be specified by encapsulating the <code>NULL</code> value in an <code>ANYDATA</code> wrapper.

### CONVERT\_LONG\_TO\_LOB\_CHUNK Member Procedure

Converts `LONG` data in a row LCR into a `CLOB`, or converts `LONG RAW` data in a row LCR into a `BLOB`.

This procedure can change the operation code from `LONG WRITE` to `LOB WRITE` for the row LCR.

This member procedure can be used in rule-based transformations.

The following restrictions apply to this member procedure:

- This member procedure cannot be used in apply handlers.
- `LONG` data can be sent as a part of a row LCR with one of the following operation codes: `INSERT`, `UPDATE`, or `LONG_WRITE`. Because `LONG` data can be sent in multiple pieces, make sure that this method is invoked on either none or all `LONG` pieces.
- `LOB` to `LONG` conversion is not supported.
- A row LCR on which this procedure is executed must have been created by a capture process. That is, this procedure does not support persistent row LCRs.

 **See Also:**

*Oracle Streams Replication Administrator's Guide*

### Syntax

```
MEMBER PROCEDURE CONVERT_LONG_TO_LOB_CHUNK;
```

## DELETE\_COLUMN Member Procedure

Deletes the old value, the new value, or both, for the specified column, depending on the value type specified.

### Syntax

```
MEMBER PROCEDURE DELETE_COLUMN(
 column_name IN VARCHAR2,
 value_type IN VARCHAR2 DEFAULT '*');
```

### Parameters

**Table 286-15** DELETE\_COLUMN Procedure Parameters

Parameter	Description
column_name	The column name An error is raised if the column does not exist in the LCR.
value_type	The type of value to delete for the column Specify <code>old</code> to delete the old value of the column. Specify <code>new</code> to delete the new value of the column. If <code>*</code> is specified, then the procedure deletes both the old and new values.

## EXECUTE Member Procedure

Executes the row LCR under the security domain of the current user. Any apply handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

This member procedure can be run on a row LCR under any of the following conditions:

- The LCR is being processed by an apply handler.
- The LCR is in a queue and was last enqueued by a mechanism other than an Oracle Streams capture process, such as an Oracle Streams apply process or an application.
- The LCR has been constructed using the `LCR$_ROW_RECORD` constructor function but has not been enqueued.
- The LCR is in the error queue.

### Note:

Do not run this member procedure in a custom rule-based transformation on a row LCR. Doing so could execute the row LCR outside of its transactional context.

## Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lob` parameter is set to

TRUE for the handler), this member procedure executes the assembled row LCR. An assembled row LCR represents a LOB value with a LOB locator or NULL.

If `assemble_lob` is set to FALSE for the handler, then this member procedure executes the nonassembled row LCRs. Nonassembled row LCRs represent LOB values with VARCHAR2 and RAW data types. These nonassembled row LCRs might have been modified by the handler.

An error is raised under the following conditions:

- A DML or error handler configured with `assemble_lob` set to FALSE attempts to execute a row LCR that contains a LOB locator.
- A DML or error handler configured with `assemble_lob` set to TRUE attempts to execute a row LCR that contains one or more LOB values represented with VARCHAR2 or RAW data types.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

### Syntax

```
MEMBER PROCEDURE EXECUTE(
 conflict_resolution IN BOOLEAN);
```

### Parameters

**Table 286-16 EXECUTE Procedure Parameters**

Parameter	Description
<code>conflict_resolution</code>	<p>If TRUE, then any conflict resolution defined for the table using the <code>SET_UPDATE_CONFLICT_HANDLER</code> procedure in the <code>DBMS_APPLY_ADM</code> package is used to resolve conflicts resulting from the execution of the LCR.</p> <p>If FALSE, then conflict resolution is not used.</p> <p>An error is raised if this parameter is not specified or is set to NULL.</p>

### GET\_LOB\_INFORMATION Member Function

Gets the LOB information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LOB CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LOB CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LOB CONSTANT NUMBER := 3;
DBMS_LCR.EMPTY_LOB CONSTANT NUMBER := 4;
DBMS_LCR.LOB_CHUNK CONSTANT NUMBER := 5;
DBMS_LCR.LAST_LOB_CHUNK CONSTANT NUMBER := 6;
```

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the `use_old` parameter is a convenient way to get the value of the columns.

## Syntax

```
MEMBER FUNCTION GET_LOB_INFORMATION(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2,
 use_old IN VARCHAR2 DEFAULT 'Y')
RETURN NUMBER;
```

## Parameters

**Table 286-17 GET\_LOB\_INFORMATION Function Parameters**

Parameter	Description
value_type	The type of value to return for the column, either <code>old</code> or <code>new</code>
column_name	The name of the column
use_old	If <code>Y</code> and <code>value_type</code> is <code>new</code> , and no new value exists, then the function returns the corresponding old value. If <code>N</code> and <code>value_type</code> is <code>new</code> , then the function does not return the old value if no new value exists.  If <code>value_type</code> is <code>old</code> or if the <code>command_type</code> of the row LCR is not <code>UPDATE</code> , then the function ignores the value of the <code>use_old</code> parameter.  <code>NULL</code> is not a valid specification for the <code>use_old</code> parameter.

## GET\_LOB\_OFFSET Member Function

Gets the LOB offset for the specified column in the number of characters for `CLOB` columns and the number of bytes for `BLOB` columns. Returns a non-`NULL` value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB. That is, the information is `DBMS_LCR.LAST_LOB_CHUNK` or `DBMS_LCR.LOB_CHUNK`
- The command type is `LOB ERASE` or `LOB WRITE`

Otherwise, returns `NULL`.

## Syntax

```
GET_LOB_OFFSET(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2)
RETURN NUMBER;
```

## Parameters

**Table 286-18 GET\_LOB\_OFFSET Function Parameters**

Parameter	Description
value_type	The type of value to return for the column Currently, only <code>new</code> can be specified.
column_name	The name of the LOB column

### GET\_LOB\_OPERATION\_SIZE Member Function

Gets the operation size for the LOB column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB
- The command type is LOB ERASE OR LOB TRIM
- The information is DBMS\_LCR.LAST\_LOB\_CHUNK

Otherwise, returns NULL.

#### Syntax

```
MEMBER FUNCTION GET_LOB_OPERATION_SIZE(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2)
RETURN NUMBER,
```

#### Parameters

**Table 286-19 GET\_LOB\_OPERATION\_SIZE Function Parameters**

Parameter	Description
value_type	The type of value to return for the column Currently, only new can be specified.
column_name	The name of the LOB column

### GET\_LONG\_INFORMATION Member Function

Gets the LONG information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LONG CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LONG CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LONG CONSTANT NUMBER := 3;
DBMS_LCR.LONG_CHUNK CONSTANT NUMBER := 4;
DBMS_LCR.LAST_LONG_CHUNK CONSTANT NUMBER := 5;
```

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use\_old parameter is a convenient way to get the value of the columns.

#### Syntax

```
MEMBER FUNCTION GET_LONG_INFORMATION(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2,
 use_old IN VARCHAR2 DEFAULT 'Y')
RETURN NUMBER;
```

## Parameters

**Table 286-20 GET\_LONG\_INFORMATION Function Parameters**

Parameter	Description
value_type	The type of value to return for the column, either <code>old</code> or <code>new</code>
column_name	The name of the column
use_old	<p>If <code>Y</code> and <code>value_type</code> is <code>new</code>, and no new value exists, then the function returns the corresponding old value. If <code>N</code> and <code>value_type</code> is <code>new</code>, then the function does not return the old value if no new value exists.</p> <p>If <code>value_type</code> is <code>old</code> or if the <code>command_type</code> of the row LCR is not <code>UPDATE</code>, then the function ignores the value of the <code>use_old</code> parameter.</p> <p><code>NULL</code> is not a valid specification for the <code>use_old</code> parameter.</p>

## GET\_ROW\_TEXT Member Procedure

Gets the SQL statement for the change that is encapsulated in the row LCR. This method performs SQL generation in PL/SQL.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

## Syntax

The following procedure returns the SQL statement in a `CLOB` datatype.

```
MEMBER PROCEDURE GET_ROW_TEXT(
 row_text IN/OUT CLOB);
```

The following procedure returns the SQL statement with bind variables in a `CLOB` datatype.

```
MEMBER PROCEDURE GET_ROW_TEXT(
 row_text IN/OUT CLOB,
 variable_list IN/OUT LCR$_ROW_LIST,
 bind_var_syntax IN VARCHAR2 DEFAULT ':');
```

### See Also:

["LCR\\$\\_ROW\\_LIST Type \(page 286-47\)"](#)

## Parameters

**Table 286-21 GET\_ROW\_TEXT Procedure Parameters**

Parameter	Description
row_text	The SQL statement for the change that is encapsulated in the LCR

**Table 286-21 (Cont.) GET\_ROW\_TEXT Procedure Parameters**

Parameter	Description
variable_list	The values for the bind variables in the order of the bind variables
bind_var_syntax	The syntax for the bind variables One of the following values is valid: <ul style="list-style-type: none"> <li>Specify :, the default, for bind values to be in the form :1, :2, and so on.</li> <li>Specify ? for bind values to be in the form ?.</li> </ul>

### GET\_VALUE Member Function

Gets the old or new value for the specified column, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use\_old parameter is a convenient way to get the value of a column.

### Syntax

```
MEMBER FUNCTION GET_VALUE(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2,
 use_old IN VARCHAR2 DEFAULT 'Y')
RETURN ANYDATA;
```

### Parameters

**Table 286-22 GET\_VALUE Function Parameters**

Parameter	Description
value_type	The type of value to return for the column Specify old to get the old value for the column. Specify new to get the new value for the column.
column_name	The column name If the column is present and has a NULL value, then the function returns an ANYDATA instance containing a NULL value. If the column value is absent, then the function returns a NULL.
use_old	If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function returns NULL if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

### GET\_VALUES Member Function

Gets a list of old or new values, depending on the value type specified.

If the command type of the row LCR is `UPDATE`, then specifying `'Y'` for the `use_old` parameter is a convenient way to get the values of all columns.

### Syntax

```
MEMBER FUNCTION GET_VALUES(
 value_type IN VARCHAR2,
 use_old IN VARCHAR2 DEFAULT 'Y')
RETURN SYS.LCR$_ROW_LIST;
```

### Parameters

**Table 286-23 GET\_VALUES Function Parameters**

Parameter	Description
<code>value_type</code>	The type of values to return Specify <code>old</code> to return a list of old values. Specify <code>new</code> to return a list of new values.
<code>use_old</code>	If <code>Y</code> and <code>value_type</code> is <code>new</code> , then the function returns a list of all new values in the LCR. If a new value does not exist in the list, then the function returns the corresponding old value. Therefore, the returned list contains all existing new values and the old values where there are no new values.  If <code>N</code> and <code>value_type</code> is <code>new</code> , then the function returns a list of all new values in the LCR without returning any old values.  If <code>value_type</code> is <code>old</code> or if the <code>command_type</code> of the row LCR is not <code>UPDATE</code> , then the function ignores the value of the <code>use_old</code> parameter.  NULL is not a valid specification for the <code>use_old</code> parameter.

### GET\_WHERE\_CLAUSE Member Procedure

Gets a `WHERE` clause for the change that is encapsulated in the row LCR.

Use the `WHERE` clause returned by `GET_WHERE_CLAUSE` instead of using the `ROWID`, because the `ROWID` is not ANSI compatible. The generated `WHERE` clause might not match the `WHERE` clause in the original DML operation.

The `ROWID` of an `INSERT` statement is the `ROWID` of the new row created by the `INSERT`. The `WHERE` clause generated for an `INSERT` operation identifies the new row. Therefore, the generated `WHERE` clause includes all of the new values inserted.

For example, consider the following insert into the `hr.departments` table:

```
INSERT INTO hr.departments (
 department_id, department_name, manager_id, location_id)
VALUES (10, 'HR', 20, 40);
```

The generated `WHERE` clause represents the row with the values 10, 'HR', 20, and 40. Hence, the generated `WHERE` clause is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'HR' AND
 "MANAGER_ID" = 20 AND "LOCATION_ID" = 40
```

The `ROWID` of an `UPDATE` statement is the `ROWID` of the row that was updated. The `WHERE` clause generated for an `UPDATE` operation identifies the row after the `UPDATE` executes. The generated `WHERE` clause is based on the old and new values of the `UPDATE`.

For example, consider the following update to the `hr.departments` table:

```
UPDATE hr.departments SET department_name='Management'
WHERE department_name='Administration' AND location_id = 20 AND
 manager_id = 30 AND department_id = 10;
```

The values of the row after the `UPDATE` are 10, 'Management', 30, and 20. Hence, the generated `WHERE` clause to identify the row is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'MANAGEMENT' AND
 "MANAGER_ID" = 30 AND "LOCATION_ID" = 20
```

Notice that the new value is used for "DEPARTMENT\_NAME", because the new value is the value of the column after the `UPDATE`. For the rest of the columns, the old values are used.

The `ROWID` of a `DELETE` operation is the row that existed before it was deleted. The generated `WHERE` clause consists of all the old column values present in the `DELETE` operation.

LOB columns do not appear in generated `WHERE` clauses. The generated `WHERE` clause is not affected by the presence of LOB columns in the LCR.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

The following procedure returns the `WHERE` clause of a SQL statement in a `CLOB` datatype.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(
 where_clause IN/OUT CLOB);
```

The following procedure returns the `WHERE` clause of a SQL statement with bind variables in a `CLOB` datatype.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(
 where_clause IN/OUT CLOB,
 variable_list IN/OUT LCR$ROW_LIST,
 bind_var_syntax IN VARCHAR2 DEFAULT ':');
```

### See Also:

- [LCR\\$ROW\\_LIST Type](#) (page 286-47)
- *Oracle Streams Concepts and Administration*

### Parameters

**Table 286-24** GET\_WHERE\_CLAUSE Procedure Parameters

Parameter	Description
<code>where_clause</code>	The <code>WHERE</code> clause of the SQL statement for the change that is encapsulated in the LCR

**Table 286-24 (Cont.) GET\_WHERE\_CLAUSE Procedure Parameters**

Parameter	Description
variable_list	The values for the bind variables in the order of the bind variables
bind_var_syntax	The syntax for the bind variables One of the following values is valid: <ul style="list-style-type: none"> <li>Specify :, the default, for bind values to be in the form :1, :2, and so on.</li> <li>Specify ? for bind values to be in the form ?.</li> </ul>

### GET\_XML\_INFORMATION Member Function

Gets the XML information for the specified column.

The return value can be one of the following:

```
DBMS_LCR.NOT_XML CONSTANT NUMBER := 1;
DBMS_LCR.XML_DOC CONSTANT NUMBER := 2;
DBMS_LCR.XML_DIFF CONSTANT NUMBER := 3;

DBMS_LCR.XML_DIFF CONSTANT NUMBER := 3;
```

DBMS\_LCR.NOT\_XML indicates that the column is not an XMLType column.

DBMS\_LCR.XML\_DOC indicates that the column contains an XML document.

DBMS\_LCR.XML\_DIFF indicates that the column contains an XML document that describes a change made by an update operation. This XML document describes the differences in the column's XML document. The entire XML document is not replaced.

DBMS\_LCR.XML\_DIFF indicates that the column contains differences between old and new XML documents for an update operation.

Returns NULL if the specified column does not exist.

### Syntax

```
MEMBER FUNCTION GET_XML_INFORMATION(
 column_name IN VARCHAR2)
RETURN NUMBER;
```

### Parameter

**Table 286-25 GET\_XML\_INFORMATION Function Parameter**

Parameter	Description
column_name	The column name

### IS\_STATEMENT\_LCR Member Function

This function is reserved for internal use only.

## KEEP\_COLUMNS Member Procedure

This procedure keeps a list of columns in a row LCR. The procedure deletes columns that are not in the list from the row LCR.

### Syntax

```
MEMBER PROCEDURE KEEP_COLUMNS(
 column_list IN VARCHAR2,
 value_type IN VARCHAR2 DEFAULT '*');
```

### Parameters

**Table 286-26** KEEP\_COLUMNS Procedure Parameters

Parameter	Description
column_list	The names of the columns kept for the row LCR Specify a comma-delimited list of type VARCHAR2. This procedure removes columns that are not in the list from the current row LCR.
value_type	The type of value for which to keep the columns Specify <code>old</code> to keep the old values of the columns. An error is raised if the old values do not exist in the LCR. Specify <code>new</code> to keep the new values of the columns. An error is raised if the new values do not exist in the LCR. If <code>*</code> is specified, then the procedure keeps both the old and the new columns.

## RENAME\_COLUMN Member Procedure

Renames a column in a row LCR.

### Syntax

```
MEMBER PROCEDURE RENAME_COLUMN(
 from_column_name IN VARCHAR2,
 to_column_name IN VARCHAR2,
 value_type IN VARCHAR2 DEFAULT '*');
```

### Parameters

**Table 286-27** RENAME\_COLUMN Procedure Parameters

Parameter	Description
from_column_name	The existing column name
to_column_name	The new column name An error is raised if a column with the specified name already exists.

**Table 286-27 (Cont.) RENAME\_COLUMN Procedure Parameters**

Parameter	Description
value_type	<p>The type of value for which to rename the column</p> <p>Specify <code>old</code> to rename the old value of the column. An error is raised if the old value does not exist in the LCR.</p> <p>Specify <code>new</code> to rename the new value of the column. An error is raised if the new value does not exist in the LCR.</p> <p>If <code>*</code> is specified, then the procedure renames the column names for both old and new value. The procedure raises an error if either column value does not exist in the LCR.</p>

### SET\_LOB\_INFORMATION Member Procedure

Sets LOB information for the column.

#### Note:

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

### Syntax

```
MEMBER PROCEDURE SET_LOB_INFORMATION(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2,
 lob_information IN NUMBER);
```

### Parameters

**Table 286-28 SET\_LOB\_INFORMATION Procedure Parameters**

Parameter	Description												
value_type	<p>The type of value to set for the column, either <code>old</code> or <code>new</code></p> <p>Specify <code>old</code> only if <code>lob_information</code> is set to <code>DBMS_LCR.NOT_A_LOB</code>.</p>												
column_name	<p>The name of the column.</p> <p>An exception is raised if the column value does not exist. You might need to set this parameter for non-LOB columns.</p>												
lob_information	<p>Specify one of the following values:</p> <table border="0"> <tr> <td><code>DBMS_LCR.NOT_A_LOB</code></td> <td><code>CONSTANT NUMBER := 1;</code></td> </tr> <tr> <td><code>DBMS_LCR.NULL_LOB</code></td> <td><code>CONSTANT NUMBER := 2;</code></td> </tr> <tr> <td><code>DBMS_LCR.INLINE_LOB</code></td> <td><code>CONSTANT NUMBER := 3;</code></td> </tr> <tr> <td><code>DBMS_LCR.EMPTY_LOB</code></td> <td><code>CONSTANT NUMBER := 4;</code></td> </tr> <tr> <td><code>DBMS_LCR.LOB_CHUNK</code></td> <td><code>CONSTANT NUMBER := 5;</code></td> </tr> <tr> <td><code>DBMS_LCR.LAST_LOB_CHUNK</code></td> <td><code>CONSTANT NUMBER := 6;</code></td> </tr> </table>	<code>DBMS_LCR.NOT_A_LOB</code>	<code>CONSTANT NUMBER := 1;</code>	<code>DBMS_LCR.NULL_LOB</code>	<code>CONSTANT NUMBER := 2;</code>	<code>DBMS_LCR.INLINE_LOB</code>	<code>CONSTANT NUMBER := 3;</code>	<code>DBMS_LCR.EMPTY_LOB</code>	<code>CONSTANT NUMBER := 4;</code>	<code>DBMS_LCR.LOB_CHUNK</code>	<code>CONSTANT NUMBER := 5;</code>	<code>DBMS_LCR.LAST_LOB_CHUNK</code>	<code>CONSTANT NUMBER := 6;</code>
<code>DBMS_LCR.NOT_A_LOB</code>	<code>CONSTANT NUMBER := 1;</code>												
<code>DBMS_LCR.NULL_LOB</code>	<code>CONSTANT NUMBER := 2;</code>												
<code>DBMS_LCR.INLINE_LOB</code>	<code>CONSTANT NUMBER := 3;</code>												
<code>DBMS_LCR.EMPTY_LOB</code>	<code>CONSTANT NUMBER := 4;</code>												
<code>DBMS_LCR.LOB_CHUNK</code>	<code>CONSTANT NUMBER := 5;</code>												
<code>DBMS_LCR.LAST_LOB_CHUNK</code>	<code>CONSTANT NUMBER := 6;</code>												

### SET\_LOB\_OFFSET Member Procedure

Sets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns.

 **Note:**

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

### Syntax

```
MEMBER PROCEDURE SET_LOB_OFFSET(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2,
 lob_offset IN NUMBER);
```

### Parameters

**Table 286-29 SET\_LOB\_OFFSET Procedure Parameters**

Parameter	Description
value_type	The type of value to set for the column Currently, only new can be specified.
column_name	The column name An error is raised if the column value does not exist in the LCR.
lob_offset	The LOB offset number Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.

### SET\_LOB\_OPERATION\_SIZE Member Procedure

Sets the operation size for the LOB column in the number of characters for CLOB columns and bytes for BLOB columns.

 **Note:**

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

### Syntax

```
MEMBER PROCEDURE SET_LOB_OPERATION_SIZE(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2,
 lob_operation_size IN NUMBER);
```

## Parameters

**Table 286-30 SET\_LOB\_OPERATION\_SIZE Procedure Parameters**

Parameter	Description
value_type	The type of value to set for the column Currently, only <code>new</code> can be specified.
column_name	The name of the LOB column An exception is raised if the column value does not exist in the LCR.
lob_operation_size	If <code>lob_information</code> for the LOB is or will be <code>DBMS_LCR.LAST_LOB_CHUNK</code> , then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to <code>DBMS_LOB.LOBMAXSIZE</code> . A LOB TRIM value must be a nonnegative integer less than or equal to <code>DBMS_LOB.LOBMAXSIZE</code> . Otherwise, set to <code>NULL</code> .

### SET\_ROW\_TEXT Member Procedure

This procedure is reserved for internal use only.

### SET\_VALUE Member Procedure

Overwrites the old or new value of the specified column.

One reason to overwrite an old value for a column is to resolve an error that resulted from a conflict.

**Note:**

To add a column to a row LCR, run `ADD_COLUMN`.

**See Also:**

[ADD\\_COLUMN Member Procedure](#) (page 286-15)

### Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), you can use this member procedure in the handler procedure on a LOB column in a row LCR. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure on a LOB column.

To use a DML or error handler to set the value of a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `SET_VALUE` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed

with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on a `LONG` or `LONG RAW` column.

### Considerations for XMLType Columns

When processing a row LCR with `XMLType` columns with a procedure DML handler or error handler, any `XMLType` columns and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more `XMLType` columns.

To use a DML or error handler to set the value an `XMLType` column, specify the `XMLType` for the `column_value` parameter. The `SET_VALUE` member procedure verifies that an `ANYDATA` encapsulated `XMLType` is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated `XMLType`.
- An attempt is made to set a `XMLType` column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the `XMLType` column is represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 11.1.0 or higher to process row LCRs with `XMLType` columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on `XMLType` columns.

## Syntax

```
MEMBER PROCEDURE SET_VALUE(
 value_type IN VARCHAR2,
 column_name IN VARCHAR2,
 column_value IN ANYDATA);
```

## Parameters

**Table 286-31 SET\_VALUE Procedure Parameters**

Parameter	Description
value_type	The type of value to set Specify <code>old</code> to set the old value of the column. Specify <code>new</code> to set the new value of the column.
column_name	The column name An error is raised if the specified <code>column_value</code> does not exist in the LCR for the specified <code>column_type</code> .
column_value	The new value of the column If <code>NULL</code> is specified, then this procedure raises an error. To set the value to <code>NULL</code> , encapsulate the <code>NULL</code> in an <code>ANYDATA</code> instance. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify a LOB locator for LOB columns.

## SET\_VALUES Member Procedure

Replaces all old values or all new values for the LCR, depending on the value type specified.

### Considerations for LOB Columns

You can use this procedure when processing a row LCR with LOB columns with a procedure DML handler or error handler. If the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), then you can use this member procedure in the handler procedure. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure on a row LCR.

To use a DML or error handler to set the value of one or more LOB columns in a row LCR, specify a LOB locator for each LOB column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB columns are represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on LOB columns.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on LONG or LONG RAW columns.

### Considerations for XMLType Columns

When processing a row LCR with `XMLType` columns with a procedure DML handler or error handler, any `XMLType` and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more `XMLType` columns.

To use a DML or error handler to set the value of one or more `XMLType` columns in a row LCR, specify an `XMLType` for each `XMLType` column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an `ANYDATA` encapsulated `XMLType` is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated `XMLType`.
- An attempt is made to set a `XMLType` incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the `XMLType` columns are represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 11.1.0 or higher to process row LCRs with `XMLType` columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on `XMLType` columns.

### Syntax

```
MEMBER PROCEDURE SET_VALUES(
 value_type IN VARCHAR2,
 value_list IN SYS.LCR$_ROW_LIST);
```

## Parameters

**Table 286-32 SET\_VALUES Procedure Parameters**

Parameter	Description
value_type	The type of values to replace Specify <code>old</code> to replace the old values. Specify <code>new</code> to replace the new values.
value_list	List of values to replace the existing list Use a <code>NULL</code> or an empty list to remove all values. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify one or more LOB locators for LOB columns.

## SET\_XML\_INFORMATION Member Procedure

Sets the XML information for the column.

### Syntax

```
MEMBER PROCEDURE SET_XML_INFORMATION(
 column_name IN VARCHAR2,
 xml_information IN NUMBER);
```

## Parameters

**Table 286-33 SET\_XML\_INFORMATION Procedure Parameters**

Parameter	Description
column_name	The name of the column An exception is raised if the column value does not exist in the LCR.
xml_information	Specify one of the following values:  DBMS_LCR.NOT_XML    CONSTANT NUMBER := 1; DBMS_LCR.XML_DOC     CONSTANT NUMBER := 2; DBMS_LCR.XML_DIFF    CONSTANT NUMBER := 3;  DBMS_LCR.XML_DIFF    CONSTANT NUMBER := 3;  DBMS_LCR.NOT_XML indicates that the column is not an XMLType column. DBMS_LCR.XML_DOC indicates that the column contains an XML document. DBMS_LCR.XML_DIFF indicates that the column contains differences between old and new XML documents for an update operation. DBMS_LCR.XML_DIFF indicates that the column contains an XML document that describes a change made by an update operation. This XML document describes the differences in the column's XML document. The entire XML document is not replaced.

## 286.3.3 Common Subprograms for LCR\$\_DDL\_RECORD and LCR\$\_ROW\_RECORD

These functions and procedures are common to both the `LCR$_DDL_RECORD` and `LCR$_ROW_RECORD` type.

### See Also:

For descriptions of the subprograms for these types that are exclusive to each type:

- ["LCR\\$\\_DDL\\_RECORD Type \(page 286-2\)"](#)
- ["LCR\\$\\_ROW\\_RECORD Type \(page 286-11\)"](#)

**Table 286-34 Summary of Common Subprograms for DDL and Row LCR Types**

Subprogram	Description
<a href="#">GET_COMMAND_TYPE Member Function (page 286-36)</a>	Gets the command type of the logical change record (LCR)
<a href="#">GET_COMMIT_SCN Member Function (page 286-36)</a>	Gets the commit system change number (SCN) of the transaction to which the current LCR belongs
<a href="#">GET_COMMIT_SCN_FROM_POSITION Static Function (page 286-37)</a>	Gets the commit SCN of a transaction from the input position, which is generated by an XStream outbound server
<a href="#">GET_COMMIT_TIME (page 286-37)</a>	Gets the commit time of the transaction to which the current LCR belongs
<a href="#">GET_COMPATIBLE Member Function (page 286-38)</a>	Gets the minimal database compatibility required to support the LCR
<a href="#">GET_EXTRA_ATTRIBUTE Member Function (page 286-39)</a>	Gets the value for the specified extra attribute in the LCR
<a href="#">GET_OBJECT_NAME Member Function (page 286-40)</a>	Gets the name of the object that is changed by the LCR
<a href="#">GET_OBJECT_OWNER Member Function (page 286-40)</a>	Gets the owner of the object that is changed by the LCR
<a href="#">GET_POSITION Member Function (page 286-41)</a>	Gets the position of the current LCR
<a href="#">GET_ROOT_NAME Member Function (page 286-41)</a>	Gets the global name of the root for a CDB.
<a href="#">GET_SCN Member Function (page 286-41)</a>	Gets the SCN of the LCR
<a href="#">GET_SCN_FROM_POSITION Static Function (page 286-41)</a>	Gets the SCN from the input position, which is generated by an XStream outbound server
<a href="#">GET_SOURCE_DATABASE_NAME Member Function (page 286-42)</a>	Gets the source database name.

**Table 286-34 (Cont.) Summary of Common Subprograms for DDL and Row LCR Types**

Subprogram	Description
<a href="#">GET_SOURCE_TIME Member Function</a> (page 286-42)	Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created
<a href="#">GET_TAG Member Function</a> (page 286-42)	Gets the tag for the LCR
<a href="#">GET_THREAD_NUMBER Member Function</a> (page 286-43)	Gets the thread number of the database instance that made the change that is encapsulated in the LCR
<a href="#">GET_TRANSACTION_ID Member Function</a> (page 286-43)	Gets the transaction identifier of the LCR
<a href="#">IS_NULL_TAG Member Function</a> (page 286-43)	Returns Y if the tag for the LCR is NULL, or returns N if the tag for the LCR is not NULL
<a href="#">SET_COMMAND_TYPE Member Procedure</a> (page 286-43)	Sets the command type in the LCR
<a href="#">SET_EXTRA_ATTRIBUTE Member Procedure</a> (page 286-44)	Sets the value for the specified extra attribute in the LCR
<a href="#">SET_OBJECT_NAME Member Procedure</a> (page 286-45)	Sets the name of the object that is changed by the LCR
<a href="#">SET_OBJECT_OWNER Member Procedure</a> (page 286-46)	Sets the owner of the object that is changed by the LCR
<a href="#">SET_ROOT_NAME Member Procedure</a> (page 286-46)	Sets the global name of the root in a CDB.
<a href="#">SET_SOURCE_DATABASE_NAME Member Procedure</a> (page 286-46)	Sets the source database name of the object that is changed by the LCR
<a href="#">SET_TAG Member Procedure</a> (page 286-47)	Sets the tag for the LCR

**GET\_COMMAND\_TYPE Member Function**

Gets the command type of the LCR.

**See Also:**

The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

**Syntax**

```
MEMBER FUNCTION GET_COMMAND_TYPE()
RETURN VARCHAR2;
```

**GET\_COMMIT\_SCN Member Function**

Gets the commit system change number (SCN) of the transaction to which the current LCR belongs.

The commit SCN for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit SCN might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit SCN. If the commit SCN is not available for an LCR, then this function returns `NULL`.

### Syntax

```
MEMBER FUNCTION GET_COMMIT_SCN()
RETURN NUMBER;
```

### GET\_COMMIT\_SCN\_FROM\_POSITION Static Function

Gets the commit system change number (SCN) of a transaction from the input position, which is generated by an XStream outbound server.

### Syntax

```
STATIC FUNCTION GET_COMMIT_SCN_FROM_POSITION(
 position IN RAW)
RETURN NUMBER;
```

### Parameters

**Table 286-35 GET\_COMMIT\_SCN\_FROM\_POSITION Function Parameter**

Parameter	Description
position	The position You can obtain the position by using the <code>GET_POSITION</code> member function or by querying the <code>DBA_XSTREAM_OUTBOUND_PROGRESS</code> data dictionary view.

### Note:

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

### GET\_COMMIT\_TIME

Gets the commit time of the transaction to which the current LCR belongs.

The commit time for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit time might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit time. If the commit time is not available for an LCR, then this function returns `NULL`.

### Syntax

```
MEMBER FUNCTION GET_COMMIT_TIME()
RETURN DATE;
```

### GET\_COMPATIBLE Member Function

Gets the minimal database compatibility required to support the LCR. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

The return value for this function can be one of the following:

Return Value	COMPATIBLE Initialization Parameter Equivalent
<code>DBMS_STREAMS.COMPATIBLE_9_2</code>	9.2.0
<code>DBMS_STREAMS.COMPATIBLE_10_1</code>	10.1.0
<code>DBMS_STREAMS.COMPATIBLE_10_2</code>	10.2.0
<code>DBMS_STREAMS.COMPATIBLE_11_1</code>	11.1.0
<code>DBMS_STREAMS.COMPATIBLE_11_2</code>	11.2.0

DDL LCRs always return `DBMS_STREAMS.COMPATIBLE_9_2`.

You can use the following functions in the `DBMS_STREAMS` package for constant compatibility return values:

- The `COMPATIBLE_9_2` function returns the `DBMS_STREAMS.COMPATIBLE_9_2` constant.
- The `COMPATIBLE_10_1` function returns `DBMS_STREAMS.COMPATIBLE_10_1` constant.
- The `COMPATIBLE_10_2` function returns `DBMS_STREAMS.COMPATIBLE_10_2` constant.
- The `COMPATIBLE_11_1` function returns `DBMS_STREAMS.COMPATIBLE_11_1` constant.
- The `COMPATIBLE_11_2` function returns `DBMS_STREAMS.COMPATIBLE_11_2` constant.
- The `MAX_COMPATIBLE` function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

You can use these functions with the `GET_COMPATIBLE` member function for an LCR in rule conditions and apply handlers.

#### Note:

You can determine which database objects in a database are not supported by Oracle Streams by querying the `DBA_STREAMS_UNSUPPORTED` data dictionary view.

#### See Also:

- *Oracle Streams Concepts and Administration* for examples of rules that discard changes that are not supported by Oracle Streams
- [DBMS\\_STREAMS](#) (page 161-1) and [DBMS\\_STREAMS\\_ADM](#) (page 162-1)
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

### Syntax

```
MEMBER FUNCTION GET_COMPATIBLE()
RETURN NUMBER;
```

### GET\_EXTRA\_ATTRIBUTE Member Function

Gets the value for the specified extra attribute in the LCR. The returned extra attribute is contained within an `ANYDATA` instance. You can use the `INCLUDE_EXTRA_ATTRIBUTE` procedure in the `DBMS_CAPTURE_ADM` package to instruct a capture process to capture one or more extra attributes.

#### See Also:

[INCLUDE\\_EXTRA\\_ATTRIBUTE Procedure](#) (page 32-28)

### Syntax

```
MEMBER FUNCTION GET_EXTRA_ATTRIBUTE(
 attribute_name IN VARCHAR2)
RETURN ANYDATA;
```

## Parameters

**Table 286-36 GET\_EXTRA\_ATTRIBUTE Function Parameter**

Parameter	Description
attribute_name	<p>The name of the extra attribute to return</p> <p>Valid names are:</p> <ul style="list-style-type: none"> <li>row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is UROWID.</li> <li>serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER.</li> <li>session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER.</li> <li>thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER.</li> <li>tx_name The name of the transaction that includes the LCR. The type is VARCHAR2.</li> <li>username The name of the current user who performed the change captured in the LCR. The type is VARCHAR2.</li> </ul> <p>An error is raised if the specified attribute_name is not valid.</p> <p>If no value exists for the specified extra attribute, then the function returns a NULL.</p> <p><b>See Also:</b> <i>Oracle Database PL/SQL Language Reference</i> for more information about the current user</p>

### GET\_OBJECT\_NAME Member Function

Gets the name of the object that is changed by the LCR.

#### Syntax

```
MEMBER FUNCTION GET_OBJECT_NAME()
RETURN VARCHAR2;
```

### GET\_OBJECT\_OWNER Member Function

Gets the owner of the object that is changed by the LCR.

#### Syntax

```
MEMBER FUNCTION GET_OBJECT_OWNER()
RETURN VARCHAR2;
```

### GET\_POSITION Member Function

Gets the position of the current LCR. The position uniquely identifies each LCR. The position strictly increases within each transaction and across transactions.

LCR position is commonly used in XStream configurations.

#### Syntax

```
MEMBER FUNCTION GET_POSITION()
RETURN RAW;
```

 **Note:**

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

### GET\_ROOT\_NAME Member Function

Gets the global name of the root in a CDB, which is the root name for the LCR.

#### Syntax

```
MEMBER FUNCTION GET_ROOT_NAME()
RETURN VARCHAR2;
```

### GET\_SCN Member Function

Gets the system change number (SCN) of the LCR.

#### Syntax

```
MEMBER FUNCTION GET_SCN()
RETURN NUMBER;
```

### GET\_SCN\_FROM\_POSITION Static Function

Gets the system change number (SCN) from the input position, which is generated by an XStream outbound server.

#### Syntax

```
STATIC FUNCTION GET_SCN_FROM_POSITION(
 position IN RAW)
RETURN NUMBER;
```

## Parameters

**Table 286-37 GET\_SCN\_FROM\_POSITION Function Parameter**

Parameter	Description
position	The position You can obtain the position by using the GET_POSITION member function or by querying the DBA_XSTREAM_OUTBOUND_PROGRESS data dictionary view.

### Note:

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

## GET\_SOURCE\_DATABASE\_NAME Member Function

Gets the global name of the source database. The source database is the database where the change occurred.

### Syntax

```
MEMBER FUNCTION GET_SOURCE_DATABASE_NAME()
RETURN VARCHAR2;
```

## GET\_SOURCE\_TIME Member Function

Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.

### Syntax

```
MEMBER FUNCTION GET_SOURCE_TIME()
RETURN DATE;
```

## GET\_TAG Member Function

Gets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DML or DDL change when apply forwarding is used.

### See Also:

*Oracle Streams Replication Administrator's Guide* for more information about tags

### Syntax

```
MEMBER FUNCTION GET_TAG()
RETURN RAW;
```

### GET\_THREAD\_NUMBER Member Function

Gets the thread number of the database instance that made the change that is encapsulated in the LCR. Typically, the thread number is relevant in an Oracle Real Application Clusters configuration.

#### See Also:

*Oracle Real Application Clusters Administration and Deployment Guide*

### Syntax

```
MEMBER FUNCTION GET_THREAD_NUMBER()
RETURN NUMBER;
```

### GET\_TRANSACTION\_ID Member Function

Gets the transaction identifier of the LCR.

### Syntax

```
MEMBER FUNCTION GET_TRANSACTION_ID()
RETURN VARCHAR2;
```

### IS\_NULL\_TAG Member Function

Returns Y if the tag for the LCR is NULL, or returns N if the tag for the LCR is not NULL.

#### See Also:

*Oracle Streams Replication Administrator's Guide* for more information about tags

### Syntax

```
MEMBER FUNCTION IS_NULL_TAG()
RETURN VARCHAR2;
```

### SET\_COMMAND\_TYPE Member Procedure

Sets the command type in the LCR. If the command type specified cannot be interpreted, then this procedure raises an error. For example, changing INSERT to GRANT would raise an error.

 **See Also:**

- The description of the `command_type` parameter in [LCR\\$\\_DDL\\_RECORD Constructor Function Parameters](#) (page 286-3)
- The description of the `command_type` parameter in [LCR\\$\\_ROW\\_RECORD Type](#) (page 286-11)
- The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

**Syntax**

```
MEMBER PROCEDURE SET_COMMAND_TYPE(
 command_type IN VARCHAR2);
```

**Parameter****Table 286-38 SET\_COMMAND\_TYPE Procedure Parameter**

Parameter	Description
<code>command_type</code>	The command type Set this parameter to a non-NULL value.

**SET\_EXTRA\_ATTRIBUTE Member Procedure**

Sets the value for the specified extra attribute in the LCR. You can use the `INCLUDE_EXTRA_ATTRIBUTE` procedure in the `DBMS_CAPTURE_ADM` package to instruct a capture process to capture one or more extra attributes.

 **See Also:**

[INCLUDE\\_EXTRA\\_ATTRIBUTE Procedure](#) (page 32-28)

**Syntax**

```
MEMBER PROCEDURE SET_EXTRA_ATTRIBUTE(
 attribute_name IN VARCHAR2,
 attribute_value IN ANYDATA);
```

## Parameters

**Table 286-39 SET\_EXTRA\_ATTRIBUTE Procedure Parameter**

Parameter	Description
attribute_name	<p>The name of the extra attribute to set</p> <p>Valid names are:</p> <ul style="list-style-type: none"> <li>row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is VARCHAR2.</li> <li>serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER.</li> <li>session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER.</li> <li>thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER.</li> <li>tx_name The name of the transaction that includes the LCR. The type is VARCHAR2.</li> <li>username The name of the current user who performed the change captured in the LCR. The type is VARCHAR2.</li> </ul> <p>An error is raised if the specified attribute_name is not valid.</p> <p><b>See Also:</b> <i>Oracle Database PL/SQL Language Reference</i> for more information about the current user</p>
attribute_value	<p>The value to which the specified extra attribute is set</p> <p>If set to NULL, then this procedure removes the specified extra attribute from the LCR. To set to NULL, encapsulate the NULL in an ANYDATA instance.</p>

## SET\_OBJECT\_NAME Member Procedure

Sets the name of the object that is changed by the LCR.

### Syntax

```
MEMBER PROCEDURE SET_OBJECT_NAME(
 object_name IN VARCHAR2);
```

### Parameter

**Table 286-40 SET\_OBJECT\_NAME Procedure Parameter**

Parameter	Description
object_name	The name of the object

### SET\_OBJECT\_OWNER Member Procedure

Sets the owner of the object that is changed by the LCR.

#### Syntax

```
MEMBER PROCEDURE SET_OBJECT_OWNER(
 object_owner IN VARCHAR2);
```

#### Parameter

**Table 286-41 SET\_OBJECT\_OWNER Procedure Parameter**

Parameter	Description
object_owner	The schema that contains the object

### SET\_ROOT\_NAME Member Procedure

Sets the global name of the root in a CDB. The setting is the root name for the LCR.

#### Syntax

```
MEMBER PROCEDURE SET_ROOT_NAME(
 root_name IN VARCHAR2);
```

#### Parameter

**Table 286-42 SET\_ROOT\_NAME Procedure Parameter**

Parameter	Description
root_name	The global name of the root.

### SET\_SOURCE\_DATABASE\_NAME Member Procedure

Sets the source database name of the object that is changed by the LCR.

#### Syntax

```
MEMBER PROCEDURE SET_SOURCE_DATABASE_NAME(
 source_database_name IN VARCHAR2);
```

#### Parameter

**Table 286-43 SET\_SOURCE\_DATABASE\_NAME Procedure Parameter**

Parameter	Description
source_database_name	The source database of the change If you do not include the domain name, then the procedure appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.

### SET\_TAG Member Procedure

Sets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the change when apply forwarding is used.

#### See Also:

*Oracle Streams Replication Administrator's Guide* for more information about tags

### Syntax

```
MEMBER PROCEDURE SET_TAG(
 tag IN RAW);
```

### Parameter

**Table 286-44 SET\_TAG Procedure Parameter**

Parameter	Description
tag	The binary tag for the LCR The size limit for a tag value is two kilobytes.

## 286.3.4 LCR\$\_ROW\_LIST Type

This type identifies a list of column values for a row in a table.

It uses the LCR\$\_ROW\_UNIT type and is used in the LCR\$\_ROW\_RECORD type.

#### See Also:

- [LCR\\$\\_ROW\\_UNIT Type](#) (page 286-47)
- [LCR\\$\\_ROW\\_RECORD Type](#) (page 286-11)

### Syntax

```
CREATE TYPE SYS.LCR$_ROW_LIST AS TABLE OF SYS.LCR$_ROW_UNIT
/
```

## 286.3.5 LCR\$\_ROW\_UNIT Type

This type identifies the value for a column in a row.

It is used in the LCR\$\_ROW\_LIST type.

**See Also:**

[LCR\\$\\_ROW\\_LIST Type \(page 286-47\)](#)

**Syntax**

```
CREATE TYPE LCR$_ROW_UNIT AS OBJECT (
 column_name VARCHAR2(4000),
 data ANYDATA,
 lob_information NUMBER,
 lob_offset NUMBER,
 lob_operation_size NUMBER,
 long_information NUMBER);
/
```

**Attributes**

**Table 286-45 LCR\$\_ROW\_UNIT Attributes**

Attribute	Description
column_name	The name of the column
data	The data contained in the column
lob_information	<p>Contains the LOB information for the column and contains one of the following values:</p> <pre> DBMS_LCR.NOT_A_LOB          CONSTANT NUMBER := 1; DBMS_LCR.NULL_LOB         CONSTANT NUMBER := 2; DBMS_LCR.INLINE_LOB       CONSTANT NUMBER := 3; DBMS_LCR.EMPTY_LOB        CONSTANT NUMBER := 4; DBMS_LCR.LOB_CHUNK        CONSTANT NUMBER := 5; DBMS_LCR.LAST_LOB_CHUNK   CONSTANT NUMBER := 6; </pre>
lob_offset	<p>The LOB offset specified in the number of characters for CLOB columns and the number of bytes for BLOB columns</p> <p>Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.</p>
lob_operation_size	<p>If lob_information for the LOB is DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE.</p> <p>If lob_information is not DBMS_LCR.LAST_LOB_CHUNK and for all other operations, is NULL.</p>
long_information	<p>Contains the LONG information for the column and contains one of the following values:</p> <pre> DBMS_LCR.not_a_long CONSTANT NUMBER := 1; DBMS_LCR.null_long  CONSTANT NUMBER := 2; DBMS_LCR.inline_long CONSTANT NUMBER := 3; DBMS_LCR.long_chunk CONSTANT NUMBER := 4; DBMS_LCR.last_long_chunk CONSTANT NUMBER := 5; </pre>

## Oracle Multimedia ORDAudio TYPE

The Oracle Multimedia ORDAudio object type supports the storage and management of audio data.

Audio data can have different formats, encoding types, compression types, numbers of channels, sampling rates, sample sizes, and playing times (duration) depending upon how the audio data is digitally recorded. Oracle Multimedia ORDAudio can store and retrieve audio data of any data format. Oracle Multimedia ORDAudio can extract metadata from audio data of a variety of popular audio formats. Oracle Multimedia ORDAudio can also extract application attributes and store them in the `comments` attribute of the object in XML form.

For a complete description of this type within the context of Oracle Multimedia, see ORDAudio in the *Oracle Multimedia Reference*.

## Oracle Multimedia ORDDicom TYPE

The Oracle Multimedia ORDDicom object type supports the storage, management, and manipulation of Digital Imaging and Communications in Medicine (DICOM) data.

 **Note:**

Oracle Multimedia ORDDicom is deprecated in Oracle Database 12c Release 2 (12.2). Oracle recommends that you do not use deprecated features. Support for deprecated features is for backward compatibility only.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other objects. These include objects such as single frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

Oracle Multimedia ORDDicom provides methods to extract standard and private DICOM metadata from DICOM content into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM objects. Oracle Multimedia ORDDicom also provides methods to check DICOM objects for conformance based on a set of user-specified conformance rules, and to make DICOM objects anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

For a complete description of this type within the context of Oracle Multimedia, see ORDDicom in the *Oracle Multimedia DICOM Developer's Guide*.

## Oracle Multimedia ORDDoc TYPE

The Oracle Multimedia ORDDoc object type supports the storage and management of heterogeneous media data including image, audio, and video.

Heterogeneous media data can have different formats depending upon the application generating the media data. Oracle Multimedia can store and retrieve media data of any data format. Oracle Multimedia ORDDoc datatype can be used in applications that require you to store different types of heterogeneous media data in the same column so you can build a common metadata index on all the different types of media data. Using this index, you can search across all the different types of heterogeneous media data. However, you cannot use this same search technique if the different types of heterogeneous media data are stored in different types of objects in different columns of relational tables.

For a complete description of this type within the context of Oracle Multimedia, see ORDDoc in the *Oracle Multimedia Reference*.

## Oracle Multimedia ORDIImage TYPE

The Oracle Multimedia `ORDImage` object type supports the storage, management, and manipulation of image data.

Digitized images consist of the image data (digitized bits) and attributes that describe and characterize the image data.

The image data (pixels) can have varying depths (bits for each pixel) depending on how the image was captured, and can be organized in various ways. The organization of the image data is known as the data format. Oracle Multimedia `ORDImage` can store and retrieve image data of any data format. Oracle Multimedia `ORDImage` can process (cut, scale, and generate thumbnails) of images, convert the format of images, extract properties of images of a variety of popular data formats, and extract and embed application metadata in images.

For a complete description of this type within the context of Oracle Multimedia, see `ORDImage` in the *Oracle Multimedia Reference*.

# Oracle Multimedia SQL/MM Still Image TYPES

Oracle Multimedia provides support for the SQL/MM Still Image Standard, which supports the storage, retrieval, and modification of images in the database and the ability to locate images using visual predicates.

 **Note:**

SQL/MM Still Image is deprecated in Oracle Database 12c Release 2 (12.2). Oracle recommends that you do not use deprecated features. Support for deprecated features is for backward compatibility only.

The following object relational types for images and image characteristics are included in this support:

- SI\_AverageColor
- SI\_Color
- SI\_ColorHistogram
- SI\_FeatureList
- SI\_PositionalColor
- SI\_StillImage
- SI\_Texture

For a complete description of this type within the context of Oracle Multimedia, see *SQL/MM Still Image* in the *Oracle Multimedia Reference*.

## Oracle Multimedia ORDVidEO TYPE

The Oracle Multimedia ORDVidEO object type supports the storage and management of video data.

Digitized video consists of the video data (digitized bits) and the attributes that describe and characterize the video data. Video applications sometimes associate application-specific information, such as the description of the video training tape, date recorded, instructor's name, producer's name, and so on, within the video data.

The video data can have different formats, compression types, frame rates, frame sizes, frame resolutions, playing times, compression types, number of colors, and bit rates depending upon how the video data was digitally recorded. Oracle Multimedia ORDVidEO can store and retrieve video data of any data format. Oracle Multimedia ORDVidEO can extract metadata from video data of a variety of popular video formats. Oracle Multimedia ORDVidEO can also extract application attributes and store them in the `comments` attribute of the object in XML form.

For a complete description of this type within the context of Oracle Multimedia, see ORDVidEO in the *Oracle Multimedia Reference*.

## MGD\_ID Package Types

The `MGD_ID` package provides an extensible framework that supports current radio-frequency ID (RFID) tags with the standard family of EPC bit encodings for the supported encoding types. The `MGD_ID` Package also supports new and evolving tag encodings that are not included in the current EPC standard (EPC v1.1 specification).

The `MGD_ID` package contains several predefined types.

### See Also:

*Oracle Database Development Guide* for more information.

This chapter contains the following topics:

- [Security Model](#) (page 293-1)
- [Summary of Types](#) (page 293-2)
- [Summary of MGD\\_ID Subprograms](#) (page 293-4)

The method described in this reference chapter show examples based on the examples shown in the constructor functions.

The examples in this chapter assume that the you have run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by mgduser;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

### 293.1 MGD\_ID Package Types Security Model

You must run the `catmgd.sql` script to load the `DBMS_MGD_ID_UTL` package and create the required Identity Code Package schema objects in the `MGDSYS` schema.

`MGD_ID` is a `MGDSYS`-owned object type. Any `MGD_ID` subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

A user must be granted connect and resource roles to use the `MGD_ID` object type and its subprograms.

`EXECUTE` privilege is granted to `PUBLIC` for this ADT: `MGD_ID`.

A public synonym, by the same name, is created for this ADT: `MGD_ID`.

## 293.2 Summary of Types

This table lists and briefly describes the `MGD_ID` Package object types.

**Table 293-1 MGD\_ID Package Object Types**

Object Type Name	Description
<a href="#">MGD_ID_COMPONENT Object Type</a> (page 293-2)	Datatype that specifies the name and value pair attributes that define a component
<a href="#">MGD_ID_COMPONENT_VARRAY Object Type</a> (page 293-2)	Datatype that specifies a list of up to 128 components as name-value attribute pairs used in two constructor functions for creating an identity code type object
<a href="#">MGD_ID Object Type</a> (page 293-3)	Represents an <code>MGD_ID</code> object that specifies the category identifier for the code category for this identity code and its list of components

### 293.2.1 MGD\_ID\_COMPONENT Object Type

The `MGD_ID_COMPONENT` type is a datatype that specifies the name and value pair attributes that define a component.

#### Syntax

```
MGD_ID_COMPONENT as object (name VARCHAR2(256),
 value VARCHAR2(1024));
```

#### Attributes

**Table 293-2 MGD\_ID\_COMPONENT Attributes**

Attribute	Description
name	Name of component
value	Value of the component as a character

#### Examples

See the [MGD\\_ID Constructor Function](#) (page 293-4) for an example.

### 293.2.2 MGD\_ID\_COMPONENT\_VARRAY Object Type

The `MGD_ID_COMPONENT_VARRAY` type is a datatype that specifies a list of up to 128 components as name-value attribute pairs for use in two constructor functions for creating a product code type object with its list of components.

#### Syntax

```
MGD_ID_COMPONENT_VARRAY is VARRAY (128) of MGD_ID_COMPONENT;
```

## Examples

See the [MGD\\_ID Constructor Function](#) (page 293-4) for an example.

## 293.2.3 MGD\_ID Object Type

The `MGD_ID` type represents an identity code in an RFID application. This type represents RFID tags with standard EPC bit encoding as well as tag encodings that are not included in the EPC standard.

### Syntax

```
MGD_ID as object (category_id VARCHAR2(256),
 components MGD_ID_COMPONENT_VARRAY);
```

### Attributes

**Table 293-3 MGD\_ID Object Type Attributes**

Attribute	Description
<code>category_id</code>	Category identifier for the code category of this code
<code>components</code>	List of components as name-value attributes

### Methods

[Table 293-5](#) (page 293-4) describes the methods of the `MGD_ID` object type.

**Table 293-4 MGD\_ID Methods**

Method	Description
<code>MGD_ID</code> constructor function	Creates an <code>MGD_ID</code> object based on the parameters passed in and returns self as a result
<code>FORMAT</code> function	Returns the string representation of the <code>MGD_ID</code> in the specified format
<code>GET_COMPONENT</code> function	Returns the string value of the specified <code>MGD_ID</code> component
<code>TO_STRING</code> function	Returns the string value of semicolon (;) separated component name value pairs of the <code>MGD_ID</code> object
<code>TRANSLATE</code> function	Returns the result of the conversion of the identifier from one format to the specified format

## Examples

See the [Summary of MGD\\_ID Subprograms](#) (page 293-4) section and the section about using the Identity Code package in *Using the Identity Code Package in Oracle Database Development Guide* for examples.

## 293.3 Summary of MGD\_ID Subprograms

This table describes the subprograms in the `MGD_ID` object type.

All the values and names passed to the procedures defined in the `MGD_ID` object type are case insensitive unless otherwise mentioned. To preserve the case, enclose the values with double quotation marks.

**Table 293-5 MGD\_ID Object Type Subprograms**

Subprogram	Description
<a href="#">MGD_ID Constructor Function</a> (page 293-4)	Creates an <code>MGD_ID</code> object based on the parameters passed in and returns self as a result
<a href="#">FORMAT Function</a> (page 293-7)	Returns the string representation of the <code>MGD_ID</code> object in the specified format
<a href="#">GET_COMPONENT Function</a> (page 293-8)	Returns the string value of the specified <code>MGD_ID</code> component
<a href="#">TO_STRING Function</a> (page 293-9)	Returns the string value of semicolon (;) separated component name value pairs of the <code>MGD_ID</code> object
<a href="#">TRANSLATE Function</a> (page 293-10)	Returns the result of the conversion of the identifier from one format to the specified format

### 293.3.1 MGD\_ID Constructor Function

This constructor function constructs an identity code type object, `MGD_ID`. The constructor function is overloaded. The different functionality of each form of syntax is presented along with the definitions.

#### Syntax

Constructs an `MGD_ID` object type based on the category ID and a list of components.

```
MGD_ID (
 category_id IN VARCHAR2,
 components IN MGD_ID_COMPONENT_VARRAY)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an `MGD_ID` object type based on the category ID, the identifier string, and the list of additional parameters required to create it.

```
MGD_ID (
 category_id VARCHAR2,
 identifier VARCHAR2,
 parameter_list VARCHAR2)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an `MGD_ID` object type based on the category name, category version, and a list of components.

```
MGD_ID (
 category_name VARCHAR2,
 category_version VARCHAR2,
 components MGD_ID_COMPONENT_VARRAY)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an `MGD_ID` object type based on the category name, category version, the identifier string, and the list of additional parameters required to create it.

```
MGD_ID (
 category_name VARCHAR2,
 category_version VARCHAR2,
 identifier VARCHAR2,
 parameter_list VARCHAR2)
RETURN SELF AS RESULT DETERMINISTIC;
```

## Parameters

**Table 293-6 MGD\_ID Constructor Function Parameters**

Parameter	Description
<code>category_id</code>	Category identifier
<code>components</code>	List of component name value pairs
<code>category_name</code>	Category name, such as EPC
<code>category_version</code>	Category version. If <code>NULL</code> , the latest version for the specified category name will be used.
<code>identifier</code>	Identifier string in any format of an encoding scheme in the specified category. For example, for SGTIN-96 encoding, the identifier can be in the format of <code>BINARY</code> , <code>PURE_IDENTITY</code> , <code>TAG_ENCODING</code> , or <code>LEGACY</code> .  Express this identifier as a string according to the appropriate grammar or pattern in the tag data translation (TDT) markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as <code>gtin=00037000302414;serial=10419703</code> for a SGTIN coding scheme.
<code>parameter_list</code>	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows:  <code>filter=3;companyprefixlength=7;taglength=96</code>

## Usage Notes

- Use `MGD_ID_UTL.EPC_ENCODING_CATEGORY_ID` as `category_id`.
- If the category is not already registered, an error is raised.
- If the `bit_length` parameter is `NULL`, the `bit_length` is `8 * the length of bit_encoding`.
- If the component list does not contain all required components, an exception `MGD_ID_UTL.e_LackComponent` will be thrown.

## Examples

The following examples construct identity code type objects.

Construct an `MGD_ID` object (SGTIN-64) passing in the category ID and a list of components.

```
--Contents of constructor11.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
 MGD_ID_COMPONENT_VARRAY(
 MGD_ID_COMPONENT('companyprefix','0037000'),
 MGD_ID_COMPONENT('itemref','030241'),
 MGD_ID_COMPONENT('serial','1041970'),
 MGD_ID_COMPONENT('schemes','SGTIN-64')
)
) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor11.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
 MGD_ID_COMPONENT('itemref', '030241'),
 MGD_ID_COMPONENT('serial', '1041970'),
 MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
.
.
.
```

**Constructs an MGD\_ID object (SGTIN-64) passing in the category ID, the tag identifier, and the list of additional parameters that may be required to create it.**

```
--Contents of constructor22.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
 'urn:epc:id:sgtin:0037000.030241.1041970',
 'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor22.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
 MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
 MGD_ID_COMPONENT('companyprefixlength', '7'),
 MGD_ID_COMPONENT('companyprefix', '0037000'),
 MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
 MGD_ID_COMPONENT('serial', '1041970'),
 MGD_ID_COMPONENT('itemref', '030241')))
.
.
.
```

**Construct an MGD\_ID object (SGTIN-64) passing in the category name, category version (if NULL, then the latest version will be used), and a list of components.**

```
--Contents of constructor33.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
 MGD_ID_COMPONENT_VARRAY(
 MGD_ID_COMPONENT('companyprefix','0037000'),
 MGD_ID_COMPONENT('itemref','030241'),
)
) from dual;
```

```

 MGD_ID_COMPONENT('serial', '1041970'),
 MGD_ID_COMPONENT('schemes', 'SGTIN-64')
)
) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor33.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
 MGD_ID_COMPONENT('itemref', '030241'),
 MGD_ID_COMPONENT('serial', '1041970'),
 MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
.
.
.

```

Constructs an `MGD_ID` object (SGTIN-64) passing in the category name and category version, the tag identifier, and the list of additional parameters that may be required to create it.

```

--Contents of constructor44.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
 'urn:epc:id:sgtin:0037000.030241.1041970',
 'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor4.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
 MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
 MGD_ID_COMPONENT('companyprefixlength', '7'),
 MGD_ID_COMPONENT('companyprefix', '0037000'),
 MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
 MGD_ID_COMPONENT('serial', '1041970'),
 MGD_ID_COMPONENT('itemref', '030241')))
.
.
.

```

## 293.3.2 FORMAT Function

This function returns the string representation of the `MGD_ID` object in the specified format.

### Syntax

```

FORMAT (parameter_list IN VARCHAR2,
 output_format IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;

```

## Parameters

**Table 293-7** FORMAT Function Parameters

Parameter	Description
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows:  filter=3;companyprefixlength=7;taglength=96
output_format	One of the supported output formats into which an MGD_ID component is formatted: <ul style="list-style-type: none"> <li>• BINARY</li> <li>• LEGACY</li> <li>• TAG_ENCODING</li> <li>• PURE_IDENTITY</li> <li>• ONS_HOSTNAME</li> </ul>

## Examples

See the example for the [GET\\_COMPONENT Function](#) (page 293-8).

## 293.3.3 GET\_COMPONENT Function

This function returns the value of the specified MGD\_ID component.

### Syntax

```
GET_COMPONENT (
 component_name IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

## Parameters

**Table 293-8** GET\_COMPONENT Function Parameter

Parameter	Description
component_name	Name of component

## Usage Notes

- If the code is an invalid code, meaning its structure is not defined in the metadata table, an error is raised.
- If the code is valid, but it does not contain the required component, NULL is returned.

## Examples

The following example returns the general manager, object class, and serial number components for this GID-96 identity component:

```

--Contents of get_components.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));

 --PURE_IDENTIT

 dbms_output.put_line('..Testing constructor with pure identity');

 -- PURE_IDENTITY representation can be translated to BINARY and
 -- TAG_ENCODING ONLY when BOTH scheme and filer are provided.

 id := MGD_ID('EPC', NULL, 'urn:epc:id:sgtin:0037000.030241.1041970', 'scheme=SGTIN-64;filter=3');
 dbms_output.put_line(id.to_string);
 dbms_output.put_line('filter = ' || id.get_component('filter'));
 dbms_output.put_line('company prefix = ' || id.get_component('companyprefix'));
 dbms_output.put_line('itemref = ' || id.get_component('itemref'));
 dbms_output.put_line('serial = ' || id.get_component('serial'));
 dbms_output.put_line('BINARY format = ' || id.format(NULL, 'BINARY'));
 dbms_output.put_line('PURE_IDENTITY format = ' || id.format(NULL, 'PURE_IDENTITY'));
 dbms_output.put_line('TAG_ENCODING format = ' || id.format(NULL, 'TAG_ENCODING'));
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();
SQL> @get_component.sql
.
.
.
..Testing constructor with pure identity
category_id=1;filter = 3;schemes = SGTIN-64;companyprefixlength =
7;companyprefix = 0037000;scheme = SGTIN-64;serial = 1041970;itemref = 030241
filter = 3
company prefix = 0037000
itemref = 030241
serial = 1041970
BINARY format =1001100000000000001000001110110001000010000011111110011000110010
PURE_IDENTITY format = urn:epc:id:sgtin:0037000.030241.1041970
TAG_ENCODING format = urn:epc:tag:sgtin-64:3.0037000.030241.1041970
PL/SQL procedure successfully completed.
.
.
.

```

## 293.3.4 TO\_STRING Function

This function returns the semicolon (;) separated component name value pairs of the MGD\_ID object.

### Syntax

```

TO_STRING
RETURN VARCHAR2;

```

### Examples

The following example converts the MGD\_ID object into a string value:

```
-- Contents of tostring3.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
 dbms_output.put_line('..Testing to_string');
 id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970', 'scheme=GID-96');
 DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
 DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();
connect / as sysdba;
drop user mgduser cascade;

SQL> @tostring3.sql
.
.
.
..Testing to_string
mgd_id object as a string
category_id =1;schemes = GID-96;objectclass = 30241;generalmanager =
0037000;scheme = GID-96;1 = 1;serial = 1041970
PL/SQL procedure successfully completed.
.
.
```

## 293.3.5 TRANSLATE Function

This static function translates between different representations directly without first constructing an `MGD_ID` object.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

Converts the identifier in one format to another given the category name, the tag identifier, the parameter list, and the output format.

```
TRANSLATE (
 category_name IN VARCHAR2,
 identifier IN VARCHAR2,
 parameter_list IN VARCHAR2,
 output_format IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Converts the identifier in one format to another given the category name, category version, the tag identifier, the parameter list, and the output format.

```
TRANSLATE (
 category_name IN VARCHAR2,
 category_version IN VARCHAR2,
 identifier IN VARCHAR2,
 parameter_list IN VARCHAR2,
 output_format IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

## Parameters

**Table 293-9 TRANSLATE Function Parameters**

Parameter	Description
category_name	Name of category
category_version	Category version. If NULL, the latest version of the specified category name will be used.
identifier	EPC identifier, expressed as a string in accordance with one of the grammars or patterns in the TDT markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as gtin=00037000302414;serial=10419703 for a SGTIN coding scheme.
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows:  filter=3;companyprefixlength=7;taglength=96
output_format	One of the supported output formats into which an MGD_ID component shall be converted: <ul style="list-style-type: none"> <li>• BINARY</li> <li>• LEGACY</li> <li>• TAG_ENCODING</li> <li>• PURE_IDENTITY</li> <li>• ONS_HOSTNAME</li> </ul>

## Usage Notes

When converting from a pure identity representation to a binary representation, the filter value must be supplied as a value using the `parameter_list` parameter.

## Examples

The following examples translates one GID-96 representation into another:

```
-- Contents of translatel.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
 dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is BINARY');
 dbms_output.put_line(
 mgd_id.translate('EPC',
 NULL, '0011010100000000000000100100001000100000000000011101100010000100000000000000011111110011000110010
',
 NULL, 'BINARY'));
 dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is PURE_IDENTITY');
 dbms_output.put_line(
 mgd_id.translate('EPC',
 NULL, '0011010100000000000000100100001000100000000000011101100010000100000000000000011111110011000110010
',
```

```

, NULL, 'PURE_IDENTITY'));
dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is TAG_ENCODING');
 dbms_output.put_line(
 mgd_id.translate('EPC',
NULL, '0011010100000000000100100001000100000000000111011000100001000000000000011111110011000110010
',
, NULL, 'TAG_ENCODING'));
dbms_output.put_line('Category ID is EPC, Identifier is TAG_ENCODING, Output format is BINARY');
dbms_output.put_line(
 mgd_id.translate('EPC', NULL,
 'urn:epc:tag:gid-96:0037000.30241.1041970',
 NULL, 'BINARY'));
dbms_output.put_line('Category ID is EPC, Identifier is TAG_ENCODING, Output format is
PURE_IDENTITY');
dbms_output.put_line(
 mgd_id.translate('EPC', NULL,
 'urn:epc:tag:gid-96:0037000.30241.1041970',
 NULL, 'PURE_IDENTITY'));
dbms_output.put_line('Category ID is EPC, Identifier is TAG_ENCODING, Output format is TAG_ENCODING');
dbms_output.put_line(
 mgd_id.translate('EPC', NULL,
 'urn:epc:tag:gid-96:0037000.30241.1041970',
 NULL, 'TAG_ENCODING'));
dbms_output.put_line('Category ID is EPC, Identifier is PURE_IDENTITY, Output format is BINARY');
dbms_output.put_line(
 mgd_id.translate('EPC', NULL,
 'urn:epc:id:gid:0037000.30241.1041970',
 NULL, 'BINARY'));
dbms_output.put_line('Category ID is EPC, Identifier is PURE_IDENTITY, Output format is
PURE_IDENTITY');
dbms_output.put_line(
 mgd_id.translate('EPC', NULL,
 'urn:epc:id:gid:0037000.30241.1041970',
 NULL, 'PURE_IDENTITY'));
dbms_output.put_line('Category ID is EPC, Identifier is PURE_IDENTITY, Output format is
TAG_ENCODING');
dbms_output.put_line(
 mgd_id.translate('EPC', NULL,
 'urn:epc:id:gid:0037000.30241.1041970',
 NULL, 'TAG_ENCODING'));
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();

# Rule TYPES

This chapter describes the types used with rules, rule sets, and evaluation contexts.

This chapter contains the following topics:

- [Overview](#) (page 294-1)
- [Security Model](#) (page 294-1)
- [Summary of Rule Types](#) (page 294-1)

## 294.1 Rule TYPES Overview

These types are used in rules and enable clients to evaluate rules with the rules engine.

### See Also:

- [DBMS\\_RULE](#) (page 140-1)
- [DBMS\\_RULE\\_ADM](#) (page 141-1)
- *Oracle Streams Extended Examples* for examples that use rule types

## 294.2 Rule TYPES Security Model

`PUBLIC` is granted `EXECUTE` privilege on these `RULE` types.

### See Also:

*Oracle Database Security Guide* for more information about user group `PUBLIC`

## 294.3 Summary of Rule Types

This table lists the `Rule Types` and briefly describes them.

**Table 294-1 Rule Types**

Type	Description
<a href="#">RE\$ATTRIBUTE_VALUE Type</a> (page 294-3)	Specifies the value of a variable attribute

**Table 294-1 (Cont.) Rule Types**

Type	Description
<a href="#">RE\$ATTRIBUTE_VALUE_LIST Type</a> (page 294-4)	Identifies a list of attribute values
<a href="#">RE\$COLUMN_VALUE Type</a> (page 294-4)	Specifies the value of a table column
<a href="#">RE\$COLUMN_VALUE_LIST Type</a> (page 294-4)	Identifies a list of column values
<a href="#">RE\$NAME_ARRAY Type</a> (page 294-4)	Identifies a list of names
<a href="#">RE\$NAME_ARRAY Type</a> (page 294-4)	Identifies a list of name-value pairs
<a href="#">RE\$NV_LIST Type</a> (page 294-5)	Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context and the action context for a rule
<a href="#">RE\$NV_NODE Type</a> (page 294-7)	Identifies a name-value pair
<a href="#">RE\$RULE_HIT Type</a> (page 294-8)	Specifies a rule found because of evaluation
<a href="#">RE\$RULE_HIT_LIST Type</a> (page 294-8)	Identifies a list of rules found because of evaluation
<a href="#">RE\$RULE_NAME Type</a> (page 294-8)	Allows users to pass a list of rule as argument.
<a href="#">RE\$RULE_NAME_LIST Type</a> (page 294-9)	Identifies a list of Rule Name values
<a href="#">RE\$TABLE_ALIAS Type</a> (page 294-9)	Provides the table corresponding to an alias used in a rule evaluation context
<a href="#">RE\$TABLE_ALIAS_LIST Type</a> (page 294-10)	Identifies a list of table aliases used in a rule evaluation context
<a href="#">RE\$TABLE_VALUE Type</a> (page 294-10)	Specifies the value of a table row using a ROWID
<a href="#">RE\$TABLE_VALUE_LIST Type</a> (page 294-11)	Identifies a list of table values
<a href="#">RE\$VALUE Type</a> (page 294-11)	Represents one datapoint value element
<a href="#">RE\$VALUE_LIST Type</a> (page 294-11)	Defines a list of RE\$VALUE type
<a href="#">RE\$VARIABLE_TYPE Type</a> (page 294-12)	Provides the type of a variable used in a rule evaluation context
<a href="#">RE\$VARIABLE_TYPE_LIST Type</a> (page 294-14)	Identifies a list of variables and their types used in a rule evaluation context
<a href="#">RE\$VARIABLE_VALUE Type</a> (page 294-14)	Specifies the value of a variable
<a href="#">RE\$VARIABLE_VALUE_LIST Type</a> (page 294-14)	Identifies a list of variable values

Rule types are used with the following Oracle-supplied PL/SQL packages:

- DBMS\_RULE

- DBMS\_RULE\_ADM

You can use the `DBMS_RULE_ADM` package to create and administer rules, rule sets, and evaluation contexts, and you can use the `DBMS_RULE` package to evaluate rules.

When you use Oracle Streams, rules determine which changes are captured by a capture process, which messages are propagated by a propagation, which messages are applied by an apply process, and which messages are dequeued by a messaging client. The following Oracle Streams packages use rules:

- DBMS\_APPLY\_ADM
- DBMS\_CAPTURE\_ADM
- DBMS\_PROPAGATION\_ADM
- DBMS\_STREAMS
- DBMS\_STREAMS\_ADM
- DBMS\_STREAMS\_AUTH

#### See Also:

*Oracle Streams Concepts and Administration*

## 294.3.1 RE\$ATTRIBUTE\_VALUE Type

`RE$ATTRIBUTE_VALUE` type specifies the value of a variable attribute.

#### Note:

Enclose the variable name and attribute name in double quotation marks (") if the name contains special characters.

#### Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE (
 variable_name VARCHAR2(32),
 attribute_name VARCHAR2(4000),
 attribute_value ANYDATA);
```

#### Attributes

**Table 294-2 RE\$ATTRIBUTE\_VALUE Attributes**

Attribute	Description
<code>variable_name</code>	Specifies the variable used in a rule
<code>attribute_name</code>	Specifies the attribute name. The attribute name can be a multi-component name, such as <code>a1.b2.c3</code> .
<code>attribute_value</code>	Specifies the attribute value

## 294.3.2 RE\$ATTRIBUTE\_VALUE\_LIST Type

The `RE$ATTRIBUTE_VALUE_LIST` type identifies a list of attribute values.

### Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$ATTRIBUTE_VALUE;
```

## 294.3.3 RE\$COLUMN\_VALUE Type

`RE$COLUMN_VALUE` type specifies the value of a table column.

### Note:

Enclose the column name in double quotation marks (") if the name contains special characters.

### Syntax

```
TYPE SYS.RE$COLUMN_VALUE (
 table_alias VARCHAR2(32),
 column_name VARCHAR2(4000),
 column_value ANYDATA);
```

### Attributes

**Table 294-3 RE\$COLUMN\_VALUE Attributes**

Attribute	Description
<code>table_alias</code>	Specifies the alias used for the table in a rule
<code>column_name</code>	Specifies the column name
<code>column_value</code>	Specifies the column value

## 294.3.4 RE\$COLUMN\_VALUE\_LIST Type

`RE$COLUMN_VALUE_LIST` type identifies a list of column values.

### Syntax

```
TYPE SYS.RE$COLUMN_VALUE_LIST AS VARRAY(1024) OF SYS.RE$COLUMN_VALUE;
```

## 294.3.5 RE\$NAME\_ARRAY Type

`RE$NAME_ARRAY` type identifies a list of names.

### Syntax

```
TYPE SYS.RE$NAME_ARRAY AS VARRAY(1024) OF VARCHAR2(30);
```

## 294.3.6 RE\$NV\_ARRAY Type

RE\$NV\_ARRAY type identifies a list of name-value pairs.

### Syntax

```
TYPE SYS.RE$NV_ARRAY AS VARRAY(1024) OF SYS.RE$NV_NODE;
```

## 294.3.7 RE\$NV\_LIST Type

identifies an object containing a list of name-value pairs and methods that operate on this list.

This object type is used to represent the event context for rule set evaluation and the action context for a rule.

### Syntax

```
TYPE SYS.RE$NV_LIST AS OBJECT(
 actx_list SYS.RE$NV_ARRAY);
```

### Attributes

**Table 294-4 RE\$NV\_LIST Attributes**

Attribute	Description
actx_list	The list of name-value pairs

### RE\$NV\_LIST Subprograms

This section describes the following member procedures and member functions of the SYS.RE\$NV\_LIST type:

- [ADD\\_PAIR Member Procedure](#) (page 294-5)
- [GET\\_ALL\\_NAMES Member Function](#) (page 294-6)
- [GET\\_VALUE Member Function](#) (page 294-6)
- [REMOVE\\_PAIR Member Procedure](#) (page 294-6)

### ADD\_PAIR Member Procedure

Adds a name-value pair to the list of name-value pairs.

 **Note:**

Enclose the name in double quotation marks (") if the name contains special characters.

### Syntax

```
MEMBER PROCEDURE ADD_PAIR(
 name IN VARCHAR2,
 value IN ANYDATA);
```

### Parameters

**Table 294-5 ADD\_PAIR Procedure Parameters**

Parameter	Description
name	The name in the name-value pair being added to the list. If the name exists in the list, then this procedure raises an error.
value	The value in the name-value pair being added to the list

### GET\_ALL\_NAMES Member Function

Returns a list of all the names in the name-value pair list.

#### Syntax

```
MEMBER FUNCTION GET_ALL_NAMES()
RETURN SYS.RE$NAME_ARRAY;
```

### GET\_VALUE Member Function

Returns the value for the specified name in a name-value pair list.

#### Note:

Enclose the name in double quotation marks (") if the name contains special characters.

#### Syntax

```
MEMBER FUNCTION GET_VALUE(
 name IN VARCHAR2)
RETURN ANYDATA;
```

### Parameters

**Table 294-6 GET\_VALUE Function Parameters**

Parameter	Description
name	The name whose value to return

### REMOVE\_PAIR Member Procedure

Removes the name-value pair with the specified name from the name-value pair list.

 **Note:**

Enclose the name in double quotation marks (") if the name contains special characters.

**Syntax**

```
MEMBER PROCEDURE REMOVE_PAIR(
 name IN VARCHAR2);
```

**Parameters****Table 294-7 REMOVE\_PAIR Procedure Parameters**

Parameter	Description
name	The name of the pair to remove

## 294.3.8 RE\$NV\_NODE Type

RE\$COLUMN\_VALUE type identifies a name-value pair.

 **Note:**

Enclose the name in double quotation marks (") if the name contains special characters.

**Syntax**

```
TYPE SYS.RE$NV_NODE (
 nvn_name VARCHAR2(30),
 nvn_value ANYDATA);
```

**Attributes****Table 294-8 RE\$NV\_NODE Attributes**

Attribute	Description
nvn_name	Specifies the name in the name-value pair
nvn_value	Specifies the value in the name-value pair

## 294.3.9 RE\$RULE\_HIT Type

The RE\$RULE\_HIT type specifies a rule found because of an evaluation.

### See Also:

- [CREATE\\_RULE Procedure](#) (page 141-10)
- [ALTER\\_RULE Procedure](#) (page 141-6)

### Syntax

```
TYPE SYS.RE$RULE_HIT (
 rule_name VARCHAR2(65),
 rule_action_context RE$NV_LIST);
```

### Attributes

**Table 294-9 RE\$RULE\_HIT Attributes**

Attribute	Description
rule_name	The rule name in the form <i>schema_name.rule_name</i> . For example, a rule named <code>employee_rule</code> in the <code>hr</code> schema is returned in the form <code>"hr"."employee_rule"</code> .
rule_action_context	The rule action context as specified in the <code>CREATE_RULE</code> or <code>ALTER_RULE</code> procedure of the <code>DBMS_RULE_ADM</code> package

## 294.3.10 RE\$RULE\_HIT\_LIST Type

The RE\$RULE\_HIT\_LIST type identifies a list of rules found because of an evaluation.

### Syntax

```
TYPE SYS.RE$RULE_HIT_LIST AS VARRAY(1024) OF SYS.RE$RULE_HIT;
```

## 294.3.11 RE\$RULE\_NAME Type

The RE\$RULE\_HIT type is create to allow use to pass a list of rule as argument.

### Syntax

```
CREATE OR REPLACE TYPE SYS.RE$RULE_NAME AS OBJECT(
 rule_name IN varchar2,
 evaluation_context IN varchar2);
```

## Attributes

**Table 294-10 RE\$RULE\_NAME Attributes**

Attribute	Description
rule_name	The rule name in the form <i>SCHEMA_NAME.RULE_NAME</i> . For example, a rule named <code>employee_rule</code> in the <code>hr</code> schema is returned in the form <code>"hr"."employee_rule"</code> .
Evaluation_context	The evaluation context as specified in the <code>CREATE_RULE</code> or <code>ALTER_RULE</code> procedure of the <code>DBMS_RULE_ADM</code> package

## 294.3.12 RE\$RULE\_NAME\_LIST Type

`RE$RULE_HIT_LIST` type Identifies a list of Rule Name values.

### Syntax

```
CREATE OR REPLACE TYPE SYS.RE$RULE_NAME_LIST AS VARRAY(1024) OF SYS.RE$RULE_NAME;
```

## 294.3.13 RE\$TABLE\_ALIAS Type

`RE$TABLE_ALIAS` type provides the table corresponding to an alias used in a rule evaluation context.

A specified table name must satisfy the schema object naming rules.

### Note:

Enclose the table name in double quotation marks (") if the name contains special characters.

### See Also:

*Oracle Database SQL Language Reference* for information about schema object naming rules

### Syntax

```
TYPE SYS.RE$TABLE_ALIAS IS OBJECT(
 table_alias VARCHAR2(32),
 table_name VARCHAR2(194));
```

## Attributes

**Table 294-11 RE\$TABLE\_ALIAS Attributes**

Attribute	Description
table_alias	The alias used for the table in a rule
table_name	The table name referred to by the alias. A synonym can be specified. The table name is resolved in the evaluation context schema. The format is one of the following:  <i>schema_name.table_name</i>  <i>table_name</i>  For example, if the <i>schema_name</i> is <i>hr</i> and the <i>table_name</i> is <i>employees</i> , then enter the following:  <i>hr.employees</i>

## 294.3.14 RE\$TABLE\_ALIAS\_LIST Type

The `RE$TABLE_ALIAS_LIST` type identifies a list of table aliases used in a rule evaluation context.

### Syntax

```
TYPE SYS.RE$TABLE_ALIAS_LIST AS VARRAY(1024) OF SYS.RE$TABLE_ALIAS;
```

## 294.3.15 RE\$TABLE\_VALUE Type

The `RE$TABLE_VALUE` type specifies the value of a table row using a `ROWID`.

### Syntax

```
TYPE SYS.RE$TABLE_VALUE(
 table_alias VARCHAR2(32),
 table_rowid VARCHAR2(18));
```

## Attributes

**Table 294-12 RE\$TABLE\_VALUE Attributes**

Attribute	Description
table_alias	Specifies the alias used for the table in a rule
table_rowid	Specifies the rowid for the table row

## 294.3.16 RE\$TABLE\_VALUE\_LIST Type

The `RE$TABLE_VALUE_LIST` type identifies a list of table values.

 **Note:**

Each table alias in the list in the list must be unique.

### Syntax

```
TYPE SYS.RE$TABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$TABLE_VALUE;
```

## 294.3.17 RE\$VALUE Type

The `RE$VALUE` type represents one datapoint value element.

### Syntax

```
TYPE SYS.RE$VALUE (
 table_values IN SYS.RE$TABLE_VALUE_LIST:= NULL,
 column_values IN SYS.RE$COLUMN_VALUE_LIST:=NULL,
 variable_values IN SYS.RE$VARIABLE_VALUE_LIST:=NULL,
 attribute_values IN SYS.RE$ATTRIBUTE_VALUE_LIST:=NULL)
```

### Attributes

**Table 294-13 RE\$VALUE Attributes**

Attribute	Description
<code>table_values</code>	ROWID of table row for expression evaluation
<code>column_values</code>	Values of columns referred in the expression
<code>variable_values</code>	Values of variables referred in expressio
<code>attribute_values</code>	Values of attributes referred in expression

## 294.3.18 RE\$VALUE\_LIST Type

`RE$TABLE_VALUE_LIST` type is a varray for defining a list of `RE$VALUE` type. It represents a list of datapoint element.

### Syntax

```
CREATE OR REPLACE TYPE SYS.RE$VALUE_LIST AS VARRAY(1024) OF SYS.RE$VALUE;
```

## 294.3.19 RE\$VARIABLE\_TYPE Type

The `RE$VARIABLE_TYPE` type provides the type of a variable used in a rule evaluation context. A specified variable name must satisfy the schema object naming rules.

 **Note:**

Enclose the variable name in double quotation marks (") if the name contains special characters.

 **See Also:**

*Oracle Database SQL Language Reference* for information about schema object naming rules

### Syntax

```
TYPE SYS.RE$VARIABLE_TYPE (
 variable_name VARCHAR2(32),
 variable_type VARCHAR2(4000),
 variable_value_function VARCHAR2(228),
 variable_method_function VARCHAR2(228));
```

### Attributes

**Table 294-14** RE\$VARIABLE\_TYPE Attributes

Attribute	Description
<code>variable_name</code>	The variable name used in a rule
<code>variable_type</code>	The type that is resolved in the evaluation context schema. Any valid Oracle built-in datatype, user-defined type, or Oracle-supplied type can be specified. See the <i>Oracle Database SQL Language Reference</i> for more information about these types.
<code>variable_value_function</code>	A value function that can be specified for implicit variables. A synonym can be specified. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context.  See the " <a href="#">Usage Notes</a> (page 294-13)" for more information.

**Table 294-14 (Cont.) RE\$VARIABLE\_TYPE Attributes**

Attribute	Description
<code>variable_method_function</code>	<p>Specifies a value function, which can return the result of a method invocation. Specifying such a function can speed up evaluation, if there are many simple rules that invoke the method on the variable. The function can be a synonym or a remote function.</p> <p>The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context.</p> <p>See the "<a href="#">Usage Notes</a> (page 294-13)" for more information.</p>

### Usage Notes

The functions for both the `variable_value_function` parameter and `variable_method_function` parameter have the following format:

```
schema_name.package_name.function_name@dblink
```

Any of the following parts of the format can be omitted: `schema_name`, `package_name`, and `@dblink`.

For example, if the `schema_name` is `hr`, the `package_name` is `var_pac`, the `function_name` is `func_value`, and the `dblink` is `dbs1.net`, then enter the following:

```
hr.var_pac.func_value@dbs1.net
```

The following sections describe the signature of the functions.

### Signature for `variable_value_function`

The function must have the following signature:

```
FUNCTION variable_value_function_name(
 evaluation_context_schema IN VARCHAR2,
 evaluation_context_name IN VARCHAR2,
 variable_name IN VARCHAR2,
 event_context IN SYS.RE$NV_LIST)
RETURN SYS.RE$VARIABLE_VALUE;
```

### Signature for `variable_method_function`

This function must have the following signature:

```
FUNCTION variable_method_function_name(
 evaluation_context_schema IN VARCHAR2,
 evaluation_context_name IN VARCHAR2,
 variable_value IN SYS.RE$VARIABLE_VALUE,
 method_name IN VARCHAR2,
 event_context IN SYS.RE$NV_LIST)
RETURN SYS.RE$ATTRIBUTE_VALUE;
```

## 294.3.20 RE\$VARIABLE\_TYPE\_LIST Type

The `RE$VARIABLE_TYPE_LIST` type identifies a list of variables and their types used in a rule evaluation context.

### Syntax

```
TYPE SYS.RE$VARIABLE_TYPE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_TYPE;
```

## 294.3.21 RE\$VARIABLE\_VALUE Type

The `RE$VARIABLE_VALUE` type specifies the value of a variable.

### Note:

Enclose the variable name in double quotation marks (") if the name contains special characters.

### Syntax

```
TYPE SYS.RE$VARIABLE_VALUE (
 variable_name VARCHAR2(32),
 variable_data ANYDATA);
```

### Attributes

**Table 294-15 RE\$VARIABLE\_VALUE Attributes**

Attribute	Description
<code>variable_name</code>	Specifies the variable name used in a rule
<code>variable_data</code>	Specifies the data for the variable value

## 294.3.22 RE\$VARIABLE\_VALUE\_LIST Type

The `RE$VARIABLE_VALUE_LIST` type identifies a list of variable values.

### Syntax

```
TYPE SYS.RE$VARIABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_VALUE;
```

# UTL Streams Types

UTL Streams Types describe abstract types used with Oracle XML functionality.

Four abstract PL/SQL streams are introduced and defined within the 'SYS' schema. The streams may be referenced by PUBLIC and are described in the following sections.

This chapter contains the following topics:

- [Security Model](#) (page 295-1)
- [Summary of UTL Binary Streams Types](#) (page 295-1)

## See Also:

For more information, see Oracle XML DB Developer's Guide

## 295.1 UTL Streams Types Security Model

EXECUTE on UTL Streams Types is granted to PUBLIC.

## 295.2 Summary of UTL Binary Streams Types

This table lists the UTL Binary Streams Types and briefly describes them.

**Table 295-1 UTL Streams Types**

Type	Description
<a href="#">UTL_BINARYINPUTSTREAM Type</a> (page 295-1)	Reads bytes and closes a stream.
<a href="#">UTL_BINARYOUTPUTSTREAM Type</a> (page 295-2)	Writes bytes and closes a stream.
<a href="#">UTL_CHARACTERINPUTSTREAM Type</a> (page 295-3)	Reads chars and closes a stream.
<a href="#">UTL_CHARACTEROUTPUTSTREAM Type</a> (page 295-4)	Writes chars and closes a stream.

### 295.2.1 UTL\_BINARYINPUTSTREAM Type

This type is similar to `java.io.InputStream` in that it can only read and close a stream.

#### Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryInputStream AS OBJECT (
```

```

MEMBER FUNCTION available (
 self IN OUT NOCOPY Utl_BinaryInputStream)
RETURN INTEGER,

MEMBER FUNCTION read (
 self IN OUT NOCOPY Utl_BinaryInputStream,
 numBytes IN INTEGER DEFAULT 1)
RETURN RAW,

MEMBER PROCEDURE read (
 self IN OUT NOCOPY Utl_BinaryInputStream,
 bytes IN OUT NOCOPY RAW,
 numBytes IN OUT INTEGER),

MEMBER PROCEDURE read (
 self IN OUT NOCOPY Utl_BinaryInputStream,
 bytes IN OUT NOCOPY RAW,
 offset IN INTEGER,
 numBytes IN OUT INTEGER),

member function close (
 self In Out Nocopy Utl_BinaryInputStream)

) NOT FINAL;

```

## Attributes

**Table 295-2 UTL\_BINARYINPUTSTREAM Type Member Subprograms**

Member Subprogram	Description
AVAILABLE	Returns the number of bytes available to be read
READ	<ul style="list-style-type: none"> <li>#1 - Reads the number of bytes specified by <code>numBytes</code> (default is 1) and returns the bytes as a <code>RAW</code>. If there are no remaining bytes a value of <code>NULL</code> is returned.</li> <li>#2 - Reads the number of bytes specified in <code>numBytes</code> into the parameter <code>bytes</code>. Additionally, the actual number of bytes read is returned in parameter <code>numBytes</code>. If this parameter is set to 0 then there are no more bytes to be read.</li> <li>#3 - Reads the number of bytes specified in <code>numBytes</code> into the parameter <code>bytes</code>, beginning at the offset specified by parameter <code>offset</code>. The actual number of bytes read is returned in parameter <code>numBytes</code>. If this value is 0, then there are no additional bytes to be read.</li> </ul>
CLOSE	Releases all resources held on the node to support the stream

## 295.2.2 UTL\_BINARYOUTPUTSTREAM Type

This type is similar to `java.io.OutputStream` in that it can only write and close a stream.

### Syntax

```

CREATE OR REPLACE TYPE Utl_BinaryOutputStream AS OBJECT (

MEMBER FUNCTION write (
 self IN OUT NOCOPY sys.utl_BinaryOutputStream,
 bytes IN RAW,
 numBytes IN INTEGER DEFAULT 1)
-- #1

```

```

RETURN INTEGER,

MEMBER PROCEDURE write (-- #2
 self IN OUT NOCOPY sys.utl_BinaryOutputStream,
 bytes IN NOCOPY RAW,
 numBytes IN OUT INTEGER),

MEMBER PROCEDURE write (-- #3
 self IN OUT NOCOPY utl_BinaryOutputStream, bytes IN
 NOCOPY RAW,
 offset IN INTEGER,
 numBytes IN OUT INTEGER),

MEMBER PROCEDURE flush (
 self IN OUT NOCOPY utl_BinaryOutputStream),

MEMBER PROCEDURE close (
 self IN OUT NOCOPY utl_BinaryOutputStream)

) NOT FINAL;

```

### Attributes

**Table 295-3 UTL\_BINARYOUTPUTSTREAM Type Member Subprograms**

Member Subprogram	Description
WRITE	<ul style="list-style-type: none"> <li>#1 - Writes the number of bytes specified by <code>numBytes</code> (default is 1) from RAW into the stream. The actual number of bytes written is returned.</li> <li>#2 - Writes the number of bytes specified in parameter <code>numBytes</code> from parameter <code>bytes</code> to the stream. The actual number of bytes written is returned in parameter <code>numBytes</code>.</li> <li>#3 - Writes the number of bytes specified by <code>numBytes</code> to the stream, beginning at the offset specified by parameter <code>offset</code>. The actual number of bytes written is returned in parameter <code>numBytes</code>.</li> </ul>
FLUSH	Insures that any buffered bytes are copied to the node destination
CLOSE	Frees all resources associated with the stream

## 295.2.3 UTL\_CHARACTERINPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (chars) and close a stream.

### Syntax

```

CREATE OR REPLACE TYPE Utl_CharacterInputStream AS OBJECT (

 MEMBER FUNCTION available (
 self IN OUT NOCOPY utl_CharacterInputStream)
 RETURN INTEGER,

 MEMBER FUNCTION read (-- #1
 self IN OUT NOCOPY utl_CharacterInputStream,
 numChars IN INTEGER DEFAULT 1,
 lineFeed IN BOOLEAN DEFAULT FALSE)
 RETURN VARCHAR2,

```

```

MEMBER PROCEDURE read (-- #2
 self IN OUT NOCOPY utl_CharacterInputStream,
 chars IN OUT NOCOPY VARCHAR2,
 numChars IN OUT INTEGER,
 lineFeed IN BOOLEAN DEFAULT FALSE),

MEMBER PROCEDURE read (-- #3
 self IN OUT NOCOPY utl_CharacterInputStream,
 chars IN OUT NOCOPY VARCHAR2,
 offset IN INTEGER,
 numChars IN OUT INTEGER,
 lineFeed IN BOOLEAN DEFAULT FALSE),

MEMBER PROCEDURE close (
 self IN OUT NOCOPY utl_CharacterInputStream)
) NOT FINAL;

```

### Attributes

**Table 295-4 UTL\_CHARACTERINPUTSTREAM Type Member Subprograms**

Member Subprogram	Description
AVAILABLE	Returns the number of bytes available to be read
READ	<ul style="list-style-type: none"> <li>#1 - Returns the number of characters remaining to be read</li> <li>#2 - Reads the number of characters specified by <code>numChars</code> (default value is 1) and returns the characters as a <code>VARCHAR2</code>. If the value of <code>lineFeed</code> is true (default value is <code>FALSE</code>) then the reading stops if a linefeed character is found. If there are no remaining characters a value of <code>NULL</code> is returned.</li> <li>#3 - Reads reads the number of characters specified by parameter <code>numChars</code> into the parameter <code>chars</code>. Additionally, the actual number of characters read is returned in parameter <code>numChars</code>. If this value is 0, then there are no more characters to be read. If the value of <code>lineFeed</code> is <code>TRUE</code> (default is <code>FALSE</code>), then reading stops if a linefeed character is encountered.</li> </ul>
CLOSE	Releases all resources held by the stream

## 295.2.4 UTL\_CHARACTEROUTPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (`chars`) and close a stream.

### Syntax

```

CREATE OR REPLACE TYPE utl_CharacterOutputStream AS OBJECT (

MEMBER FUNCTION write (-- #1
 self IN OUT NOCOPY utl_CharacterOutputStream,
 chars IN VARCHAR2,
 numChars IN INTEGER DEFAULT 1,
 lineFeed IN BOOLEAN DEFAULT FALSE)
RETURN INTEGER,

MEMBER PROCEDURE write (-- #2
 self IN OUT NOCOPY utl_CharacterOutputStream,
 chars IN OUT NOCOPY VARCHAR2,
 numChars IN OUT INTEGER,

```

```

 lineFeed IN BOOLEAN DEFAULT FALSE),

member procedure write (-- #3
 self IN OUT NOCOPY utl_CharacterOutputStream,
 chars IN NOCOPY varchar2,
 offset IN integer,
 numChars IN OUT integer,
 lineFeed IN boolean default false),

MEMBER PROCEDURE flush (
 self IN OUT NOCOPY utl_CharacterOutputStream),

MEMBER PROCEDURE close (
 self IN OUT NOCOPY utl_CharacterOutputStream)

) NOT FINAL;

```

### Attributes

**Table 295-5 UTL\_CHARACTEROUTPUTSTREAM Type Member Subprograms**

Member Subprogram	Description
WRITE	<ul style="list-style-type: none"> <li>• #1 - Writes the number of characters specified by <code>numChars</code> (default is 1) from parameter <code>chars</code> into the stream and returns the actual number of characters written. If the value of <code>lineFeed</code> is TRUE (default is FALSE) a <code>lineFeed</code> character is inserted after the last character.</li> <li>• #2 - writes the number of characters specified by parameter <code>numChars</code>, from parameter <code>chars</code> into the stream. The actual number of characters written is returned in parameter <code>numChars</code>. If the value of <code>lineFeed</code> is true (default is FALSE) a <code>lineFeed</code> character is inserted after the last character.</li> <li>• #3 - Writes the number of characters specified by parameter <code>numChars</code>, from parameter <code>chars</code>, beginning at <code>offset</code> specified by parameter <code>offset</code>. The actual number of characters written is returned in parameter <code>numChars</code>. If the value of <code>lineFeed</code> is true (default is FALSE) a <code>lineFeed</code> character is inserted after the last character .</li> </ul>
FLUSH	Copies all characters that may be contained within buffers to the node value
CLOSE	Releases all resources held by the stream

# XMLTYPE

`XMLType` is a system-defined opaque type for handling XML data. It has predefined member functions on it to extract XML nodes and fragments.

You can create columns of `XMLType` and insert XML documents into it. You can also generate XML documents as `XMLType` instances dynamically using the `SYS_XMLAGG` SQL function.

This chapter contains the following topics:

- [Summary of XMLType Subprograms](#) (page 296-1)

## See Also:

- *Oracle XML DB Developer's Guide*

## 296.1 Summary of XMLType Subprograms

This table summarizes functions and procedures of `XMLType`.

**Table 296-1 XMLTYPE Subprograms**

Method	Description
<a href="#">CREATENONSCHEMABASEDXML</a> (page 296-2)	Creates a non schema based XML from the input schema based instance.
<a href="#">CREATESCHEMABASEDXML</a> (page 296-2)	Creates a schema based <code>XMLType</code> instance from the non-schema based instance using the input schema URL.
<a href="#">CREATEXML</a> (page 296-3)	Static function for creating and returning an <code>XMLType</code> instance.
<a href="#">EXISTSNODE</a> (page 296-5)	Takes a <code>XMLType</code> instance and a <code>XPath</code> and returns 1 or 0 indicating if applying the <code>XPath</code> returns a non-empty set of nodes.
<a href="#">EXTRACT</a> (page 296-5)	Takes a <code>XMLType</code> instance and an <code>XPath</code> , applies the <code>XPath</code> expression and returns the results as an <code>XMLType</code> .
<a href="#">GETBLOBVAL</a> (page 296-6)	Returns the value of the <code>XMLType</code> instance as a <code>BLOB</code>
<a href="#">GETCLOBVAL</a> (page 296-6)	Returns the value of the <code>XMLType</code> instance as a <code>CLOB</code> .
<a href="#">GETNAMESPACE</a> (page 296-6)	Returns the namespace for the top level element in a schema based document.
<a href="#">GETNUMBERVAL</a> (page 296-7)	Returns the value of the <code>XMLType</code> instance as a <code>NUMBER</code> . This is only valid if the input <code>XMLType</code> instance contains a simple text node and is convertible to a number.

**Table 296-1 (Cont.) XMLTYPE Subprograms**

Method	Description
<a href="#">GETROOTELEMENT</a> (page 296-7)	Returns the root element of the input instance. Returns <code>NULL</code> if the instance is a fragment
<a href="#">GETSCHEMAURL</a> (page 296-7)	Returns the XML schema URL if the input is an XML Schema based.
<a href="#">GETSTRINGVAL</a> (page 296-7)	Returns the value of the <code>XMLType</code> instance as a string.
<a href="#">ISFRAGMENT</a> (page 296-8)	Checks if the input <code>XMLType</code> instance is a fragment or not. A fragment is a XML instance, which has more than one root element.
<a href="#">ISSCHEMABASED</a> (page 296-8)	Returns 1 or 0 indicating if the input <code>XMLType</code> instance is a schema based one or not.
<a href="#">ISSCHEMAVALID</a> (page 296-8)	Checks if the input instance is schema valid according to the given schema URL.
<a href="#">ISSCHEMAVALIDATED</a> (page 296-9)	Checks if the instance has been validated against the schema.
<a href="#">SCHEMAVALIDATE</a> (page 296-9)	Validates the input instance according to the XML Schema. Raises error if the input instance is non-schema based.
<a href="#">SETSCHEMAVALIDATED</a> (page 296-9)	Sets the schema valid flag to avoid costly schema validation.
<a href="#">TOOBJECT</a> (page 296-9)	Converts the <code>XMLType</code> instance to an object type.
<a href="#">TRANSFORM</a> (page 296-10)	Takes an <code>XMLType</code> instance and an associated stylesheet (which is also an <code>XMLType</code> instance), applies the stylesheet and returns the result as XML.
<a href="#">XMLTYPE</a> (page 296-10)	Constructs an instance of the <code>XMLType</code> datatype. The constructor can take in the XML as a <code>CLOB</code> , <code>VARCHAR2</code> or take in a object type.

### 296.1.1 CREATENONSCHEMABASEDXML

This member function creates a non-schema based XML document from a schema based instance.

#### Syntax

```
MEMBER FUNCTION CREATENONSCHEMABASEDXML
return XMLType deterministic;
```

### 296.1.2 CREATESCHEMABASEDXML

This member function creates a schema based `XMLType` instance from a non-schema based `XMLType` value.

It uses either the supplied `SCHEMA URL`, or the `SCHEMALOCATION` attribute of the instance.

**Syntax**

```
MEMBER FUNCTION createSchemaBasedXML(
schema IN varchar2 := NULL)
return XMLType deterministic;
```

**Table 296-2 CREATESCHEMABASEDXML Subprogram Parameters**

Parameter	Description
schema	Optional XMLSchema URL used to convert the value to the specified schema.

## 296.1.3 CREATEXML

This static function creates and returns an XMLType instance. The string and CLOB parameters used to pass in the data must contain well-formed and valid XML documents.

The options are described in the following table.

**Table 296-3 CREATEXML Subprograms**

Syntax	Description
<pre>STATIC FUNCTION createXML(   xmlData IN varchar2) RETURN XMLType deterministic;</pre>	Creates the XMLType instance from a string.
<pre>STATIC FUNCTION createXML(   xmlData IN clob) RETURN XMLType deterministic;</pre>	Creates the XMLType instance from a CLOB.
<pre>STATIC FUNCTION createXML (   xmlData IN clob,   schema IN varchar2,   validated IN number := 0,   wellformed IN number := 0 ) RETURN XMLType deterministic;</pre>	This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.
<pre>STATIC FUNCTION createXML (   xmlData IN varchar2,   schema IN varchar2,   validated IN number := 0,   wellformed IN number := 0) RETURN XMLType deterministic;</pre>	This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.
<pre>STATIC FUNCTION createXML (   xmlData IN "&lt;ADT_1&gt;",   schema IN varchar2 := NULL,   element IN varchar2 := NULL,   validated IN NUMBER := 0) RETURN XMLType deterministic;</pre>	Creates an XML instance from an instance of an user-defined type.

**Table 296-3 (Cont.) CREATEXML Subprograms**

Syntax	Description
<pre> STATIC FUNCTION createXML (   xmlData IN SYS_REFCURSOR,   schema IN VARCHAR2 := NULL,   element IN VARCHAR2 := NULL,   validated IN NUMBER := 0) RETURN XMLType deterministic; </pre>	Creates an XML instance from a cursor reference. You can pass in any arbitrary SQL query as a CURSOR.
<pre> STATIC FUNCTION createXML (   xmlData IN AnyData,   schema IN VARCHAR2 := NULL,   element IN VARCHAR2 := NULL,   validated IN NUMBER := 0) RETURN sys.XMLType deterministic   parallel_enable </pre>	Creates an XML instance from ANYDATA. If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.
<pre> STATIC FUNCTION createXML (   xmlData IN blob,   csid IN number,   schema IN VARCHAR2,   validated IN NUMBER := 0,   wellformed IN NUMBER := 0) return sys.XMLType deterministic </pre>	Creates an XML instance from a BLOB.
<pre> STATIC FUNCTION createXML (   xmlData IN bfile,   csid IN number,   Schema IN VARCHAR2,   validated IN NUMBER := 0,   wellformed IN NUMBER := 0) return sys.XMLType deterministic </pre>	Creates an XML instance from a BFILE.

**Table 296-4 CREATEXML Parameters**

Parameter	Description
xmlData	The actual data in the form of a BFILE, BLOB, CLOB, REF cursor, VARCHAR2 or object type.
schema	Optional Schema URL to be used to make the input conform to the given schema. <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ).
validated	Flag to indicate that the instance is valid according to the given XML Schema. (Default is 0)
wellformed	Flag to indicate that the input is well formed. If set, then the database would not do well formed check on the input instance. (Default is 0)

**Table 296-4 (Cont.) CREATEXML Parameters**

Parameter	Description
element	Optional element name in the case of the <code>ADT_1</code> or <code>REF CURSOR</code> constructors. (Default is <code>NULL</code> ). <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ).
csid	The character set id of input XML data.

## 296.1.4 EXISTSNODE

This member function checks if the node exists.

If the XPath string is `NULL` or the document is empty, then a value of 0 is returned, otherwise returns 1.

The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION existsNode(   xpath IN varchar2) RETURN number deterministic;</pre>	Given an XPath expression, checks if the XPath applied over the document can return any valid nodes.
<pre>MEMBER FUNCTION existsNode(   xpath in varchar2,   nsmap in varchar2) RETURN number deterministic;</pre>	This member function uses the XPath expression with the namespace information and checks if applying the XPath returns any nodes or not.

**Table 296-5 EXISTSNODE Subprogram Parameters**

Parameter	Description
xpath	The XPath expression to test.
nsmap	Optional namespace mapping.

## 296.1.5 EXTRACT

This member function extracts an `XMLType` fragment and returns an `XMLType` instance containing the result nodes. If the XPath does not result in any nodes, it then returns `NULL`.

The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION extract(   xpath IN varchar2) RETURN XMLType deterministic;</pre>	Given an XPath expression, applies the XPath to the document and returns the fragment as an <code>XMLType</code> .

Syntax	Description
<pre>MEMBER FUNCTION extract(     xpath IN varchar2,     nsmap IN varchar2) RETURN XMLType deterministic;</pre>	<p>This member function applies the XPath expression and namespace mapping, over the XML data to return a XMLType instance containing the resultant fragment.</p>

**Table 296-6 EXTRACT Subprogram Parameters**

Parameter	Description
xpath	The XPath expression to apply.
nsmap	Optional prefix to namespace mapping information.

## 296.1.6 GETBLOBVAL

This member function returns a BLOB containing the serialized XML representation. If the BLOB returned is temporary, it must be freed after use.

### Syntax

```
MEMBER FUNCTION getBlobVal(
 csid IN NUMBER)
RETURN BLOB DETERMINISTIC;
```

**Table 296-7 GETBLOBVAL Subprogram Parameters**

Parameter	Description
csid	The desired character set ID of output BLOB

## 296.1.7 GETCLOBVAL

This member function returns a CLOB containing the serialized XML representation. If the CLOB returned is temporary, it must be freed after use.

### Syntax

```
MEMBER FUNCTION getClobVal()
RETURN clob deterministic;
```

## 296.1.8 GETNAMESPACE

GETNAMESPACE is a member function. It returns the namespace of the top level element in the instance. It returns NULL if the input is a fragment or is a non-schema based instance.

### Syntax

```
MEMBER FUNCTION getNamespace
return varchar2 deterministic;
```

## 296.1.9 GETNUMBERVAL

This is a member function. It returns a numeric value, formatted from the text value pointed to by the `XMLType` instance. The `XMLType` must point to a valid text node that contains a numerical value.

The options are described in the following table.

### Syntax

```
MEMBER FUNCTION getNumberVal()
RETURN number deterministic;
```

## 296.1.10 GETROOTELEMENT

this member function gets the root element of the `XMLType` instance. It returns `NULL` if the instance is a fragment.

### Syntax

```
MEMBER FUNCTION getRootElement
return varchar2 deterministic;
```

## 296.1.11 GETSCHEMAURL

This member function returns the XML Schema URL corresponding to the `XMLType` instance, if the `XMLType` instance is a schema-based document. Otherwise, it returns `NULL`.

### Syntax

```
MEMBER FUNCTION getSchemaURL
return varchar2 deterministic;
```

## 296.1.12 GETSTRINGVAL

This member function returns the document as a string. It returns a string containing the serialized XML representation, or in the case of text nodes, the text itself.

If the XML document exceeds the `VARCHAR2` maximum size (4000), then an error is raised at run time.

### Syntax

```
MEMBER FUNCTION getStringVal()
RETURN varchar2 deterministic;
```

## 296.1.13 ISFRAGMENT

ISFRAGMENT determines if the XMLType instance corresponds to a well-formed document, or a fragment. It returns 1 or 0 indicating if the XMLType instance contains a fragment or a well-formed document.

### Syntax

```
MEMBER FUNCTION isFragment()
RETURN number deterministic;
```

## 296.1.14 ISSCHEMABASED

This member function determines whether the XMLType instance is schema-based or not. It returns 1 or 0 depending on whether the XMLType instance is schema-based.

### Syntax

```
MEMBER FUNCTION isSchemaBased
return number deterministic;
```

## 296.1.15 ISSCHEMAVALID

This member function checks if the input instance conforms to a specified schema. It does not change the validation status of the XML instance.

If an XML Schema URL is not specified and the xml document is schema based, the conformance is checked against the XMLType instance's own schema.

### Syntax

```
member function isSchemaValid(
schurl IN VARCHAR2 := NULL,
elem IN VARCHAR2 := NULL)
return NUMBER deterministic;
```

**Table 296-8 ISSCHEMAVALID Subprogram Parameters**

Parameter	IN / OUT	Description
schurl	(IN)	The URL of the XML Schema against which to check conformance.
elem	(IN)	Element of a specified schema, against which to validate. This is useful when we have a XML Schema which defines more than one top level element, and we want to check conformance against a specific one of these elements.

## 296.1.16 ISSCHEMAVALIDATED

This member function returns the validation status of the `XMLType` instance to tell if a schema-based instance has been actually validated against its schema. It returns 1 if the instance has been validated against the schema, 0 otherwise.

### Syntax

```
MEMBER FUNCTION isSchemaValidated
return NUMBER deterministic;
```

## 296.1.17 SCHEMAVALIDATE

This member procedure validates the XML instance against its schema, if it has not already been done.

For non-schema based documents an error is raised. If validation fails an error is raised; else, the document's status is changed to validated.

### Syntax

```
MEMBER PROCEDURE schemaValidate(
self IF OUT NOCOPY XMLType);
```

**Table 296-9 SCHEMAVALIDATE Subprogram Parameters**

Parameter	IN / OUT	Description
self	(OUT)	XML instance being validated against the schema.

## 296.1.18 SETSCHEMAVALIDATED

This member function sets the `VALIDATION` state of the input XML instance.

### Syntax

```
MEMBER PROCEDURE setSchemaValidated(
self IF OUT NOCOPY XMLType,
flag IN BINARY_INTEGER := 1);
```

**Table 296-10 SERTSSCHEMAVALIDATED Subprogram Parameters**

Parameter	IN / OUT	Description
self	(OUT)	XML instance.
flag	(IN)	0 - NOT VALIDATED; 1 - VALIDATED (Default)

## 296.1.19 TOOBJECT

This member procedure converts the XML value to an object type using the `XMLSCHEMA` mapping, if available. If a `SCHEMA` is not supplied or the input is a non-schema based

XML, the procedure uses canonical mapping between elements and object type attributes.

### Syntax

```
MEMBER PROCEDURE toObject(
 SELF in XMLType,
 object OUT "<ADT_1>",
 schema in varchar2 := NULL,
 element in varchar2 := NULL);
```

**Table 296-11 TOBJECT Subprogram Parameters**

Parameter	IN / OUT	Description
SELF	(IN)	Instance to be converted. Implicit if used as a member procedure.
object	(IN)	Converted object. An object instance of the required type may be passed in to this function
schema	(IN)	Schema URL. The mapping of the XMLType instance to the converted object instance may be specified using a schema. <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ).
element	(IN)	Top-level element name. An XML Schema document does not specify the top-level element for a conforming XML instance document without this parameter. <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ).

## 296.1.20 TRANSFORM

This member function transforms the XML data using the XSL stylesheet argument and the top-level parameters passed as a string of name=value pairs

If any of the arguments other than the parammap is NULL, then a NULL is returned.

### Syntax

```
MEMBER FUNCTION transform(
 xsl IN XMLType,
 parammap in varchar2 := NULL)
RETURN XMLType deterministic;
```

**Table 296-12 TRANSFORM Subprogram Parameters**

Parameter	IN / OUT	Description
xsl	(IN)	The XSL stylesheet describing the transformation
parammap	(IN)	Top level parameters to the XSL - string of name=value pairs

## 296.1.21 XMLTYPE

This is an XMLType constructor.

The options are described in the following table.

**Table 296-13 XMLTYPE Member Subprogram Parameters**

Syntax	Description
<pre> constructor function XMLType(   xmlData IN clob,   schema IN varchar2 := NULL,   validated IN number := 0,   wellformed IN Number := 0) return self as result deterministic; </pre>	<p>This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.</p>
<pre> constructor function XMLType(   xmlData IN varchar2,   schema IN varchar2 := NULL,   validated IN number := 0,   wellformed IN number := 0) return self as result deterministic; </pre>	<p>This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.</p>
<pre> constructor function XMLType (   xmlData IN "w&lt;ADT_1&gt;",   schema IN varchar2 := NULL,   element IN varchar2 := NULL,   validated IN number := 0) return self as result deterministic; </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified object type parameter.</p>
<pre> constructor function XMLType(   xmlData IN SYS_REFCURSOR,   schema in varchar2 := NULL,   element in varchar2 := NULL,   validated in number := 0) return self as result deterministic; </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified REF CURSOR parameter.</p>
<pre> constructor function XMLType(   xmlData IN AnyData,   schema IN varchar2 := NULL,   element IN varchar2 := NULL,   validated IN number := 0) return self as result deterministic parallel_enable </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified ANYDATA parameter. If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.</p>
<pre> constructor function XMLType(   xmlData IN blob, csid IN number,   schema IN varchar2 := NULL,   validated IN number := 0,   wellformed IN number := 0) return self as result deterministic </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified BLOB parameter.</p>

**Table 296-13 (Cont.) XMLTYPE Member Subprogram Parameters**

Syntax	Description
<pre> constructor function XMLType(   xmlData IN bfile,   csid IN number,   schema IN varchar2 := NULL,   validated IN number := 0,   wellformed IN number := 0) return self as result deterministic </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified BFILE parameter.</p>

**Table 296-14 XMLTYPE Constructor Subprogram Parameters**

Parameter	Description
xmlData	The data in the form of a BFILE, BLOB, CLOB, REFS, VARCHAR2 or object type.
schema	Optional Schema URL to be used to make the input conform to the given schema. <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ).
validated	Indicates that the instance is valid to the given XML Schema.
wellformed	Indicates that the input is well formed. If set, then the database would not do well formed check on the input instance.
element	Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL). <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ).
csid	The character set id of input XML data.
